### 1-Sample Sign Test
This is used to test the probability of a sample median being equal to hypothesized value.

### Attribute Data
Attribute data is purely binary in nature. Good or Bad, Yes or No. No analysis can be performed on attribute data.

### 5 Why’s
The 5 why’s typically refers to the practice of asking, five times, why the failure has occurred in order to get to the root cause/causes of the problem. There can be more than one cause to a problem as well. In an organizational context, generally root cause analysis is carried out by a team of persons related to the problem. No special technique is required.

### 5S
5S is the Japanese concept for housekeeping.
1.) Sort (Seiri)
2.) Straighten (Seiton)
3.) Shine (Seiso)
4.) Standardize (Seiketsu)
5.) Sustain (Shitsuke)

### 7 QC Tools
- Histograms
- Cause and Effect Diagram
- Check Sheets
- Pareto Diagrams
- Graphs
- Control Charts
- Scatter Diagrams

These are 7 QC tools also known as ISHIKAWA'S 7QC tools which revolutionized the Japan & the World in Sixties & Seventies

### 7 Wastes Of Lean
The 7 wastes consist of:
1. Defects
2. Overproduction
3. Transportation
4. Waiting
5. Inventory
6. Motion
7. Processing
Use the acronym ‘DOTWIMP’ to remember the 7 Wastes of Lean.

<tbody>
<tr>
<td>The alternate hypothesis (Ha) is a statement that the means, variance, etc. of the samples being tested are not equal. In software program which present a p value in lieu of F Test or T Test When the P value is less than or equal to your agreed upon decision point (typically 0.05) you accept the Ha as being true and reject the Null Ho. (Ho always assumes that they are equal)</td>
<td>This test is used to determine if there is a difference in variance between 3 or more samples/groups. It is usefull for testing the assumption of equal variances, which is required for one-way ANOVA.</td>
