

Create Providers

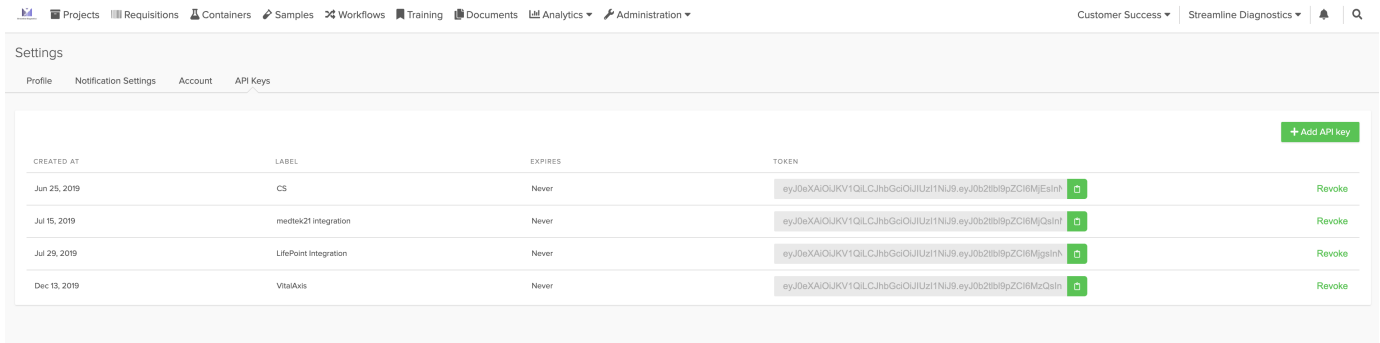

Using our REST API to create a Provider

The Create Providers request is an HTTP POST call to the following urls:

- staging - https://lab-services-staging.ovation.io/v3/provider_accounts/{id}/providers
- sandbox - https://lab-services-sandbox.ovation.io/v3/provider_accounts/{id}/providers
- production - https://lab-services.ovation.io/v3/provider_accounts/{id}/providers

Authentication

The call requires a Bearer token to be sent in the HTTP Authorization header. This token can be generated by signing into your staging, sandbox, or production environment, selecting User Settings > API Keys and Add API Key.

The screenshot shows the 'Settings' page in the Ovation application, specifically the 'API Keys' section. It features a table with columns for 'CREATED AT', 'LABEL', 'EXPIRES', and 'TOKEN'. There are four entries in the table, each with a 'Revoke' button. A '+ Add API key' button is located in the top right corner of the table area. The top navigation bar includes links for 'Projects', 'Requisitions', 'Containers', 'Samples', 'Workflows', 'Training', 'Documents', 'Analytics', and 'Administration', along with user status indicators for 'Customer Success' and 'Streamline Diagnostics'.

CREATED AT	LABEL	EXPIRES	TOKEN

Required data to from Ovation

The following data must be provided by Ovation in order to call the API. Different values must be configured for staging, sandbox and production

- authorization token
- provider_account_id (used in URL)

How to build the payload

Ovation differentiates provider accounts according to the type of licensing registry, these are the valid license registries:

```
[ 'NPI', 'Australian Health Practitioner Registry', 'European Physician', 'ex-US / clinical trial', 'Philippines PRC', 'South American Physician' ]
```

NPI Registry API:

You probably want to use the NPI license registration, for this case you just need to send us the registryIdentifier. By default the licensngRegistry value is NPI

```
{  
  "provider": {  
    "registryIdentifier": "string"  
  }  
}
```

Note: Ovation will pull the NPI Registry API data for you given the `registryIdentifier` and then it'll associate it with the Provider Account specified in the URL. If the `licensingRegistry` is not NPI, then the others fields will be required.

Create Provider Payload

```
{
  "provider": {
    "name": "John Smith",
    "registryIdentifier": '654856899',
    "licensingRegistry": "Australian Health Practitioner Registry"
  }
}
```
