

Formula Friday

It's important for students to continue to review what they've learned in math all year. Here is a question from a unit that we taught earlier in the year:

Solve this question below. Remember to show all of your steps.

$$56 - 2 \times 6 \div 2$$

Now add in one set of brackets. Solve the question again, but this time with the brackets. Did your answer change? Why or why not? Show your work and explain your thinking.

$$56 - 2 \times 6 \div 2$$
