

Formula Fridays
Due December 6

Test your mean, median and mode knowledge by answering the following questions:

1. Pick six different numbers (between 20 and 100) and find out the mean, median, and mode for those six numbers.
2. Pick one more number (between 20 and 100) and add it to the set of six numbers you had from question number one. Figure out the new mean, median, and mode.
3. Reflect on your answers. Did adding a number change your answers? Why or why not? Explain your thinking.
