WHY IS CLIMATE **IMPORTANT?**

Hurricane Sandy is an example of weather (Figure 2.1). Weather describes the conditions of the air in a particular place and on a particular date. It describes what it is like outside today. A description of a day's weather could include the temperature, whether it is sunny or cloudy, whether there is rain or snow, and how windy it is. How does weather affect your day?

Climate, on the other hand, refers to the average weather of an area over decades or even centuries. It does not describe any particular event or any particular date. You can use climate information to predict what conditions might be like in a particular place at a certain time of year.

HOW CLIMATE AFFECTS US

Just as landforms can shape our way of life, so can climate. Climate affects what we eat by limiting the types and amount of food that can be grown. For example, tropical fruits such as pineapples and bananas can grow only in warm, sunny climates.

Climate also affects what we wear and the types of shelters we build. People living in colder climates wear warm clothes and live in shelters that protect them from harsh weather. People living in warmer climates wear light clothes and build shelters that protect them from the Sun and keep them cool.

EARTH'S CHANGING CLIMATE

Earth has a long history of changing climate. Scientists have used samples of ancient ice to determine that Earth has gone through many periods of warming and cooling.

Climate change means a change in long-term weather patterns. This could include changes in temperature, moisture, or wind patterns. Climate change is natural. In the past, the climate changed over hundreds or thousands of years. Now, climate changes are happening over decades or even from year to year. Figure 2.2 shows how the Trift Glacier in Switzerland has changed since 1948.

Most geographers and other scientists agree that human actions are causing our climate to change more quickly than ever before. Global temperatures are getting warmer. The increase in average global temperatures is called **global warming**.

FIGURE 2.1 This satellite image shows Hurricane Sandy over the Atlantic Ocean, moving north.

How can technology help me to understand and predict weather?

weather the short-term conditions of the air in a particular place and on a particular date

climate the average weather of an area over a long period of time

climate change changes in long-term weather patterns caused by natural events or human activity

global warming an increase in average global temperatures near Earth's surface

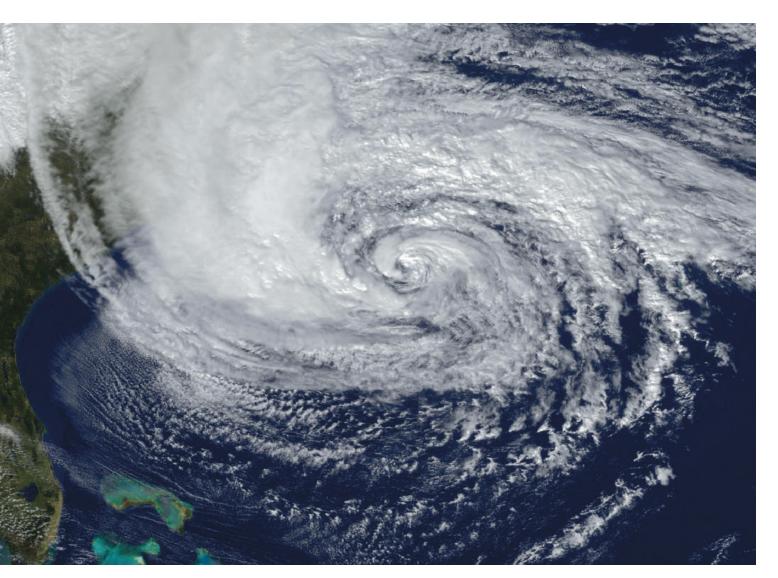

FIGURE 2.2 The Trift Glacier in Switzerland has noticeably shrunk in the past 50 years. This rapidly shrinking glacier is one piece of evidence that our climate is becoming warmer. (A) 1948; (B) 2002; (C) 2006

I wonder what other glaciers are affected by climate change?

IMPACTS OF A CHANGING CLIMATE

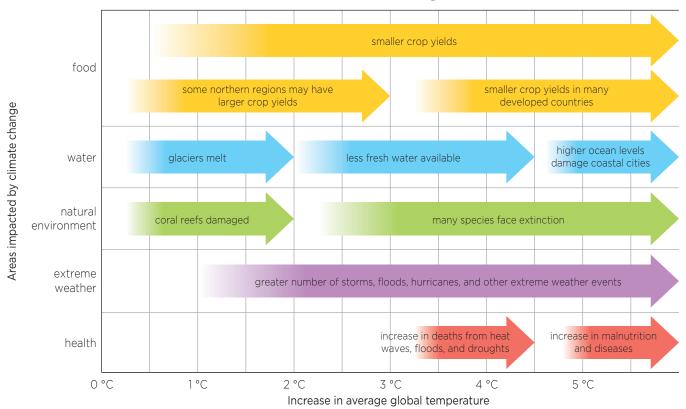

Climate change will have a significant impact on how people live around the globe. Hotter, drier climates are changing the types and amounts of crops that can be grown. Some areas are experiencing drought, or severe water shortages.

Global warming is also melting ice around the world. The area and thickness of Arctic sea ice has decreased dramatically. Ice sheets in Greenland and Antarctica as well as glaciers in other parts of the world are melting. The water from the melting ice is causing sea levels to rise. Some coastal areas are experiencing damaging conditions due to the increase in sea level.

Climate change will also increase the occurrence of extreme weather events such as Hurricane Sandy, as well as floods and tornadoes. Communities around the world, including Canada, will have to make major changes to protect their safety. **Figure 2.3** identifies some projected impacts of climate change.

FIGURE 2.3 Even a small increase in average global temperature can have large impacts on many areas of our lives.

How Will Climate Change Affect Earth?

Wealthier countries, such as Canada, have many advantages that can help overcome changing climate conditions. Some areas within developing regions, such as areas in Africa, Asia, and Central America, already struggle to live with poor climate conditions. Climate change will have a greater negative impact on them because they do not have enough money to build stronger shelters and buy more resources. For people in these regions, climate change is a life-or-death situation (Figure 2.4).

COMPARING THE EFFECTS OF CLIMATE CHANGE

Let's examine how climate change will affect Canada and Africa.

8°

o°

°C

Canada

High-latitude regions like Canada will become dramatically warmer. The far north of Canada will face the most change.

In 100 years, scientists predict that northern Canada will be 12 °C warmer than it is now.

Scientists predict that temperatures in Ontario will rise 2-4.5 °C by 2050.

Some predict that average temperatures in Africa may increase by 7-8 °C by the 2080s.

2050

By 2050, average temperatures in many areas of Africa will increase by 1.5-3 °C.

Africa will feel the effects of climate change more than any other continent. Its location, level of poverty, and low development will make it harder to cope.

AGRICULTURE

Warmer temperatures in Canada will reduce crops by 10-30%. By 2020, African crops will reduce by 50%

SEA LEVELS

Bv **2100**

sea levels will rise 15-95 cm worldwide. 56 million people in Africa will be affected.

Coastal cities in Canada, like

Halifax and Vancouver will flood.

WATER

By **2020**

75–250 million African

people will have difficulty finding fresh water.

In Africa, annual rainfall will decrease in northern Sahara. leading to droughts.

In Canada, there will be more precipitation in the winter and less precipitation in the summer.

HEALTH

In **2010**

106 people died from heat-related causes in Montreal.

By **2020**

460 Montrealers will die in heat waves.

By **2080**

in Africa could die of diseases directly caused by climate change.

ECOSYSTEM

Global warming will alter 65% of the natural habitat in Canada's northern regions.

In Africa, deserts will grow as the land dries out.

By **2080**

deserts will grow by 5-8%.

EXTREME WEATHER

Both Canada and Africa will experience more extreme weather events, such as floods, tornadoes, and hurricanes.

FIGURE 2.4 Climate change will affect food production, water supply, and frequency of extreme weather events.

CHECK-IN

- 1. INTERRELATIONSHIPS How does the climate where you live affect your way of life and day-to-day activities?
- 2. GATHER AND ORGANIZE Think about the information you need in order to better understand the challenges of climate change. Make a list of topics you need more information about. As you work through this chapter, keep notes about your selected topics.
- 3. EVALUATE AND DRAW CONCLUSIONS What can you do to protect yourself from the effects of climate change where you live?
- **4. GEOGRAPHIC PERSPECTIVE** With a partner study Figure 2.4. Discuss what other aspects of our lives would be affected by climate change. Choose one aspect. Write a brief paragraph comparing how it would affect Canada and one other country.
