RE: MCS-1000 Tier 4 Models, Clutch Override Button

On occasion when preparing to change gears on the drive engine transmission, it may be difficult to shift into the desired gear due to gear teeth being in random alignment. As a running change, we have added a clutch override button as pictured below within the enclosure mounted by the DEF tank.

In these cases, momentarily push the override button to engage the clutch and allow the gears to rotate, then release the button. Gently shift into your desired gear. (button must be released before shift is made)

Please contact technical service at 918-321-3330 with any additional questions.
