

The Mean Value Theorem

Let **function** f be continuous on $[a,b]$ and differentiable on (a,b) .

then there is at least one number c in (a,b) such that...

$$\begin{array}{l} \text{Slope of Tangent} \\ \text{Line at } c \end{array} f'(c) = \frac{f(b) - f(a)}{b - a} \quad \begin{array}{l} \text{Slope of Secant Line} \\ \text{of } f \text{ between } a \text{ and } b \end{array}$$

The Mean Value Theorem

Let **function** f be continuous on $[a,b]$ and differentiable on (a,b) .

then there is at least one number c in (a,b) such that...

$$\begin{array}{l} \text{Slope of Tangent} \\ \text{Line at } c \end{array} f'(c) = \frac{f(b) - f(a)}{b - a} \quad \begin{array}{l} \text{Slope of Secant Line} \\ \text{of } f \text{ between } a \text{ and } b \end{array}$$

Use the Mean Value Theorem to find the value of c for the following

$$f(x) = -x^2 + 3 \text{ on } [0,2]$$

Use the Mean Value Theorem to find the value of c for the following

$$f(x) = x^2 + 4x \text{ on } [-3,0]$$

Use the Mean Value Theorem to find the value of c for the following

$$f(x) = x^3 - 3x^2 + 2 \text{ on } [-1,3]$$

Use the Mean Value Theorem to find the value of c for the following

$$f(x) = -2x^3 + 3x^2 - 1 \text{ on } [-1,2]$$

The Mean Value Theorem

Let function f be continuous on $[a,b]$ and differentiable on (a,b) .

then there is at least one number c in (a,b) such that...

$$\begin{array}{l} \text{Slope of Tangent} \\ \text{Line at } c \end{array} f'(c) = \frac{f(b) - f(a)}{b - a} \quad \begin{array}{l} \text{Slope of Secant Line} \\ \text{of } f \text{ between } a \text{ and } b \end{array}$$
