

Real-World Scenario 11-5: Configuring User and Group Permissions

Scenario: You are required to configure permissions for users on your network. To simplify the process, also create user groups that will allow you to group the users together (most likely by the department of your organization) and apply permissions to multiple users within the group at one time.

Using the book and the Internet, research how you would apply permissions to users, and how you can create groups on a Windows computer.

Real-World Scenario 11-5 Solution

One great resource on the Internet for details about configuring permissions is Microsoft TechNet (<https://technet.microsoft.com>). It has all kinds of step-by-step instructions that show you how to do just about anything in Windows operating systems. Case in point: working with users and groups, whether on a Windows client or server. Practice working with users and groups, and watch the video on this subject on the website.
