Twitter app for windows 7 free

Windows has a few good to-do apps up its sleeve, not to mention more web apps than you can shake a stick at. Our favorite of the bunch is Wunderlist, a sync, complete, and free app for multiple platforms. WunderlistPlatform: Windows, Mac OS X and more price: Free Download PageFeaturesSyncs with Wunderlist web app and Wunderlist app for Mac, Android, iPhone, and BlackBerryShare lists with friends via Facebook, Twitter, and other apps to collaborate with (or motivate) each other on certain tasksAdding notes to tasksOrganize tasks through a drag-and-drop interfaceAdd deadlines to tasksFilter tasks by status or dateStar important tasksAdding tasks via emailChoose from multiple themes to personalize WunderlistWhere It ExcelsWunderlist is not the simplest to-do app around (it would be notepad or pen and paper), but it is the easiest to use. Its main goal is to make task management simple and accessible on all your devices, which it does very well. Adding tasks, dragging them around, starring them, and otherwise managing them is very easy. It's also available on virtually any platform you'd want, which is important for to-do apps — and if you're on a computer that doesn't have Wunderlist installed, you can just as easily check the web app and manage your tasks from there. Plus, it's all free. Where the Falls ShortWunderlist would be almost perfect if it had a few more features, like the ability to label tasks or get them to repeat. Right now, you can only filter by status and date, which is fine — and you can create different to-do lists — but it would be nice to see a little more organizational power. But it's a good middle ground between the features you need and being incredibly easy to use, two things that often butt heads with each other. GIO Media can get a commissionCompetitionIf you are more a fan of gtd method to manage your tasks, GeeTeeDee is a great client for Windows. Its interface is very simple, but its got a lot more advanced features that Wunderlist doesn't have, although they can just get in the way of most people. If Wunderlist is a little too dim for you, GeeTeeDee is a good alternative. If you prefer things on the other side of the spectrum - that is, super minimalist- try TodoPaper or our very own Gina Trapani's Todo.txt. TodoPaper is a Windows clone of Mac favorite Taskpaper, which puts your tasks in a very simple text file with a few additional to-do features, like check boxes, tags and projects. It's a bit pricey at \$30, though, so if you want something more low price, Todo.txt's very a lot of a lot. However, instead of working in a window, you can add, remove, and view tasks from a Terminal application. You can use a client as Todotxt.net if the command line is a bit too scary, though. If you okay with using a web app, you have even more options. Remember the milk has long been a favorite users everywhere. It is available on multiple mobile platforms, and has a lot of organizational features (but frankly, takes a lot of clicks to do something in the web interface). Many people like Google Tasks for its integration with Gmail and Google Calendar, although it is a bit feature-poor for those who want more advanced management. It's also not the most intuitive to use. If you want a more advanced to-do app that integrates with Google Calendar and Gmail, Producteev is a better option, which has some good advanced management, useful collaboration features, and an app for Mac (with a Windows version on the way). Finally, Toodledo is a very powerful manager who is a bit hard to get started with in the first place, but lets you greatly customize how you manage your tasks so you don't have to linger with a method pushed by an app. These are just a few of the great to-do apps out there – as there are many – so if you have a favorite we didn't mention, let us know in the comments. Lifehacker's App Directory is a new and growing library of recommendations for the best applications and tools in a number of given categories. Twitter announced that its upcoming V1.1 API update will very strictly control which apps can hook up to Twitter and how much they can syphon from its stream of updates. For some users, and some developers of third-party apps, this is a terrible thing. Essentially Twitter tightens the rules on how third-party apps, be it desktop PC apps, mobile apps or whatever, have access to pieces of code Twitter is made to allow access to its tweet stream and its users. Access to some of these pieces of code (in tech speech, make an API call) allows third-party apps to tap into the flow of status updates. It also allows them to insert tweets into the stream and to do other things like connect a tweeter to a new follower. And there are some great third-party apps, much loved by some users-apps like Tweetbot or Echofon and more, and some of them allow functionality that Twitter itself doesn't (like delayed scheduled tweets) or has a UI that is somehow better than Twitter's official, which is occasionally non-ideal. The rule tightening is pretty simple. This means that apps will now have to approve themselves with Twitter to access the API so that the company knows which third-party apps are run by whom, and it can thus map out exactly who is running piggyback on its core business offering. This also cuts off the misuse of Twitter by bots and data-scraping systems that put in a disproportionate number of requests to access Twitter's data. Twitter also limits the number of API calls a third-party app can make and the number of users an app can sign up for - it can payment for use beyond these limits. It also limits how apps can display status updates. None of this is difficult to Twitter's stream of updates is its lifeblood, and the interconnected network of users is the pattern of arteries and veins that makes it all thrum along. The new rules are designed to stop people from jamming a fat needle in a vein to extracting Twitter's blood for their own money making purposes without paying Twitter any money. They are also designed to stop some abuse of its system—a mosquito net, if you think that analogy through, to stop thousands of really persistent insects sipping on its blood supply and maybe even taste the total flow or damage the network. Sure, some power users won't like that their favorite Twitter apps may have limited functionality going forward, or even that they may be forced to close. And you could argue that Twitter is shutting down some opportunities for innovation, whereby a third-party app could invent something either in terms of Twitter power or UI design that Twitter itself could benefit from. But it's probably fair to say that the average user is unlikely to notice the changes when the V1.1 of the API goes live. Twitter's decision to tighten the rules and insist on a consistent experience is akin to Coca-Cola insisting that if third-party fast food stores sell its very popular product, they must deliver it on a quality that doesn't sudge the coke brand. It's even a bit like Apple insists that only it controls which computers its OS runs on and which third-party devices can be licensed to connect up to iPhones or iPads. A few days ago, a new version of the Twitter app appeared in the Windows Store, but it couldn't be downloaded. So along with the Windows 10 debut on Wednesday, Twitter rolled out the new Windows look exclusively for Windows 10 users. The new app update is the first significant change to Twitter's Store app since it first debuted in March 2013. Twitter for Windows 10. The original version of the app, once you got right down to it, was pretty bad. It hardly did anything beyond the basics of creating tweets, retweeting, and seeing your timeline. It didn't even update the timeline on a regular basis, requiring manual updates much of the time. Twitter is doing a bad job with Snap in Windows 8.1.Oh—sorry When Microsoft added new features to Windows 8.1 like Snap, which lets a modern UI app and desktop share the same screen, Twitter's app did little to take advantage of it. In fact, the app was even worse when it was snapped: It shrunk to the dimensions of a smartphone app with an incredible amount of wasted space. But let us not dwell on the past. Twitter's new app is an excellent update that is worth using. Most importantly, the app is current with Twitter's features elsewhere. You can view animated GIFs, play Vine videos, and media content tweets to preview your just like you would expect. You can also share images in direct and upload up to four photos per tweet. Twitter says the new app also uses Windows 10's Live Tiles feature, but I honestly can't remember if the older app did so well. That's why it matters: Twitter is only one app, but it's great to see any Windows app with a name and brand brand get a new coat of paint and improved functionality. The new app also takes advantage of Microsoft's universal framework, meaning it can scale up to a large desktop screen and down to a small handheld device. Perhaps Twitter's revitalized app is an example of what's to come from big app makers who embrace the Windows ecosystem. Then again, this could just be part of Twitter's efforts to reinvigorate its user growth by reaching out on multiple platforms. Hands-on with Twitter for Windows Twitter for Windows 10 descending down nicely for quadrants. Twitter for Windows is really a nice app, arguably for the first time. The app adjusts beautifully when you snap it to the side of the screen or use the Quadrants-style that takes up only a quarter of a screen. The app still has a lot of blank space, but that may be inevitable given the core simplicity of Twitter. While Twitter for Windows 10 is nice, it could use a little work. The app can't open links in situ, for example, throwing you out to the browser instead. That includes not only displaying third-party web pages, but even connected Tweets.That could change in the near future, however. Twitter promises continued improvements to Twitter for Windows in the coming days and months. Note: When you buy something after clicking on links in our articles, we can earn a small commission.
