Contents

1	Getting Started	5
1.1	Components	5
1.2	Requirements	5
1.3	Install necessary packages	5
1.4	Launching the dashboard	6
2	Getting the Data	9
2.1	Reading in the data into a pandas DataFrame	9
2.2	Naming conventions	9
2.3	Downloading the data	10
2.4	Saving the data locally	12
3	Data Cleaning and Transformation	15
3.1	Selecting the correct columns	15
3.2	Updating area names	17
3.3	Aggregate repeating areas	18
3.4	Transposing the data to time series	19
3.5	Finding and handling bad data	20
3.6	Data preparation complete	24
3.7	Encapsulate all steps into a single class	24
4	Data Smoothing	25
4.1	Smoothing the data	25
4.2	Smoothing methods	27
4.3	LOWESS	32
5	Exponential Growth and Decline Modeling	35
5.1	Exponential growth and decline	35
5.2	Modeling total deaths with scipy's <code>curve_fit</code>	36
5.3	Modeling exponential decline	41
5.4	Modeling growth rate as a function of time	46
5.5	Modeling with smoothed data	47
5.6	Exponential Function Summary	50
6	Logistic Growth Models	53
6.1	Asymptotes	53
6.2	S-Curves	54
6.3	Estimating logistic function parameters	58
6.4	Modeling the growth rate as a function of time	63
7	Encapsulation into Classes	69
7.1	Make predictions for all areas for deaths and cases	72

7.2	Combine predictions with actual data	73
7.3	Add USA to world tables	73
7.4	Creating a single table to store results	74
7.5	Create summary table	76
7.6	Create class to make all predictions	77
7.7	Classes written in python files	79
8	Running the Workflow	81
8.1	Running the workflow from the command line	81
9	Visualizations with Plotly	83
9.1	Plotly vs Dash	83
9.2	Introduction to Plotly	83
9.3	Plotly Figure Object	84
9.4	Creating a figure with multiple traces	88
9.5	Creating subplots	90
9.6	Adding annotations	92
9.7	Choropleth maps	94
9.8	Plotly Summary	100
9.9	More to Plotly	101
