## Introduction

The world is changing every day, more people are born, and more people die. Countries “war” with each other, and so many other things happen. Advances are made in all kinds of things, from medicine, to military technology. But how are they made? Well, with research and technology. And in my opinion, the most rapidly, and ever-changing thing, is technology.

I wrote this short book to examine the good and bad sides of technology. And it contains my opinions on different issues, as well as facts and articles from those who have their own opinions on technology. Do I like technology? Yes, but I also realize the negative effects it can have on us, and society. And I want those who read this book to know as well.

## Chapter One: Ups

In today's world, technology is used and depended upon heavily. It's involved in almost everything, From our jobs, to our daily lives. It's the way we get things done throughout the day. And it's getting more, and more involved.

Now this isn't all bad, but of course there's always a negative, and I'll move to that later. The growth of technology is astounding, (and that could be an understatement.) We have machines, or personal assistants, robots, etc. These things are everywhere, and it seems that the growth won't stop. Advancements made in sciences, and medicine, such as prosthetic legs, artificial arms, and hands, and artificial organs have been made partly because of the technology we have available.

Entertainment has changed. Before people had to crowd in front of a radio to know what's happening on the news, or in any kind of broadcast. If you wanted to play video games, you had to go to an arcade to play them, and then there was things like Sagas, and the Nintendo that came out. And then we fast forward to 2018, and we've got Xbox 1 X, and PS4, and multiplayer gaming along with Virtual Reality, and the list keeps getting longer.

And over all, technology has allowed us to learn more about the world around us, the universe, our bodies, and so much more. From the smart-phone, tablet, or computer that your reading this e-book on, to the Xbox, or PlayStation that you play Forza Horizon on, it's a normal thing to have around you.

I'll start things off with this article by Paul Boutin written in 2013 titled, 10 Life-Changing Technologies. In it, he lists 10 ways that technology has changed our lives, but I'm only going to include a few.

“So many new technologies have appeared in the past half century that it's impossible to list them all. But these 10 high-tech breakthroughs stand out over the last 50 years because they've revolutionized the way Americans live. We look back at their beginnings, as well as where they've taken us today.

8. Electronic funds transfer. The Federal Reserve Bank of San Francisco set up a paperless transfer system with the Los Angeles branch in 1972. By the end of the decade, instantaneous transfers of millions of dollars in value between banks, insurance companies and other financial institutions had become common. The real appeal of EFT today is its trickle down to the individual: You get

grab cash from your bank account anywhere in the world, and use PayPal to buy and sell stuff on eBay without sending money or checks through the mail.

7. Nuclear power. When the Queen herself threw the switch on the world's first atomic power plant at Calder Hall outside London in 1956, nuclear reactors were seen as a source of cheap, pollution-free energy. But a partial meltdown in 1979 at the Three Mile Island reactor in Pennsylvania soured Americans on nukes as safe power. Nonetheless, the United States today has about 100 active plants that generate 20 percent of the country's electricity — second only to coal as a source of power — and have been steadily increasing their capacity. Will the next 50 years bring a better alternative? \*

---

Informative book meant to analyse the good and bad side of technology, and the affects in our modern society.
