New Biomarker Identifies Uveal Melanoma Patients at High Risk for Metastasis

**Bottom Line:** Among uveal melanomas categorized as class 1, those with high levels of PRAME mRNA were more likely to metastasize than those with low levels of PRAME mRNA, suggesting that patients who have class 1 uveal melanoma with high levels of PRAME mRNA should be monitored more closely for metastatic disease.

**Journal in Which the Study was Published:** *Clinical Cancer Research*, a journal of the American Association for Cancer Research

**Author:** J. William Harbour, MD, associate director for Basic Research and leader of the Eye Cancer Site Disease Group at Sylvester Comprehensive Cancer Center at the University of Miami Miller School of Medicine. Harbour, is also a professor and vice chairman for Translational Research, the Mark J. Daily Endowed Chair, and director of the Ocular Oncology Service at the Bascom Palmer Eye Institute at UHealth – the University of Miami Health System.

**Background:** There are about 2,000 to 3,000 cases of uveal melanoma diagnosed each year in the United States, according to Harbour, who went on to explain that these tumors are categorized into class 1 and class 2 by gene expression profiling and that class 1 tumors have a much lower chance of metastasizing than class 2 tumors. “However, about 10 percent of patients with class 1 uveal melanoma do develop metastasis,” said Harbour. “The main purpose of this study was to identify a clinically useful biomarker for this subgroup of class 1 uveal melanomas, which in turn might help in the development of precision medicines for melanoma patients.”

**Author Comment:** “We were surprised to find that one biomarker alone—PRAME—was sufficient to identify the subgroup of class 1 tumors with increased metastatic risk,” said Harbour. “These findings could have immediate clinical impact. The data imply that patients with class 1 uveal melanomas with increased PRAME expression should be managed differently than patients with class 1 uveal melanomas without PRAME expression. They should be monitored more
closely for metastatic disease and they should be considered for clinical trials of adjuvant therapy.”

**How the Study Was Conducted and Results:** Harbour and colleagues performed genome-wide analysis of mRNA isolated from five class 1 uveal melanomas that metastasized and eight class 1 tumors that did not metastasize. The most highly overexpressed mRNA in the tumors that metastasized was PRAME. Further analysis of PRAME mRNA levels by quantitative PCR showed that seven of seven class 1 tumors that metastasized had high levels of PRAME mRNA and that 16 of 19 class 1 tumors that did not metastasize had minimal levels of PRAME mRNA.

Among 64 class 1 uveal melanoma samples analyzed by quantitative PCR, 39 (61 percent) had low levels of PRAME mRNA (PRAME negative) and 25 (39 percent) had high levels of PRAME mRNA (PRAME positive). None of the patients with PRAME-negative tumors developed metastasis while seven of the patients with PRAME-positive tumors did. The estimated five-year rate of metastasis was 0 percent for PRAME mRNA–low class 1 uveal melanomas and 38 percent for PRAME mRNA–high class 1 uveal melanomas.

To validate the association between high levels of PRAME mRNA and metastasis for class 1 uveal melanomas, the researchers analyzed two additional datasets. The first was a combination of two independently published datasets and the second was a dataset from Leiden University. In both these datasets, PRAME-positive tumors had a significantly increased risk for metastasis compared with PRAME-negative tumors.

**Study Limitations:** Harbour noted that this is a retrospective study, meaning that the researchers identified PRAME by looking back at patients who had been treated in the past. As a result, the researchers are planning a prospective, multicenter study to validate the findings. Harbor explained that the class 1/class 2 gene expression profile test remains the only prognostic assay for uveal melanoma that has ever been prospectively validated in a multicenter study and that they will hold PRAME to this same high standard of prospective validation.

**Funding & Disclosures:** The study was supported by the National Institutes of Health, the National Cancer Institute, Research to Prevent Blindness, the Melanoma Research Alliance, the Melanoma Research Foundation, the 2015 AACR-Ocular Melanoma Foundation Fellowship, and the Department of Defense. Harbour is the inventor of intellectual property used in the study and receives royalties from its commercialization. He is a paid consultant for Castle Biosciences and licensee of intellectual property reported in this study.

About the American Association for Cancer Research
Founded in 1907, the American Association for Cancer Research (AACR) is the world's oldest and largest professional organization dedicated to advancing cancer research and its mission to prevent and cure cancer. AACR membership includes more than 35,000 laboratory, translational, and clinical researchers; population scientists; other health care professionals; and patient advocates residing in 101 countries. The AACR marshals the full spectrum of expertise of the cancer community to accelerate progress in the prevention, biology, diagnosis, and treatment of cancer by annually convening more than 30 conferences and educational workshops, the largest of which is the AACR Annual Meeting with almost 19,300 attendees. In addition, the AACR publishes eight prestigious, peer-reviewed scientific journals and a magazine for cancer survivors, patients, and their caregivers. The AACR funds meritorious research directly as well as in cooperation with numerous cancer organizations. As the Scientific Partner of Stand Up To Cancer, the AACR provides expert peer review, grants administration, and scientific oversight of team science and individual investigator grants in cancer research that have the potential for near-term patient benefit. The AACR actively communicates with legislators and other policymakers about the value of cancer research and related biomedical science in saving lives from cancer. For more information about the AACR, visit www.AACR.org.
