

Byteball

A cryptocurrency
platform ready
for real world
adoption

Background

How Byteball came to exist

Byteball founder and lead developer Anton Churyumov (Tony for short) became interested in the technical side of cryptocurrencies during 2014. Having been trained as a scientist, he felt he could apply his science methodologies to design a better cryptocurrency. His first focus was on redesigning blockchain technology to reduce it to the smallest number of basic entities (blockchains have two entities, blocks and transactions).

Tony's aim was to get rid of the blocks, leaving only the transactions and simplifying the design. This led him to build the Byteball platform using directed acyclic graph (DAG) technology, eliminating the need for blocks.

Byteball was launched on Christmas Day (December 25) 2016.

Background of founder

Tony has extensive experience in various technologies ventures. He was co-founder and CEO of Teddy ID (online identity verification) as well as co-founder and CIO of Platron (an on-line payments solution) and SMS Traffic, a technology business serving banks and retailers.

Tony attended the National Research Nuclear University MEPhI (Moscow Engineering Physics Institute) from 1991-1997 and is a PhD in physics and math.
