

On April 28th, I peeled some leaves back on some wheat that was planted about the first 2 weeks in October. The flag leaf is about 1 week away from emergence if we get normal heat units. I look for it to be fully out around the 7th of May and for the heads to be out a week later. So if you want to apply fungicide on the flag leaf, I would shoot for around the 10th of May. And if you want to put Prosaro on for head scab I would probably shoot for the week of the 14th.
