

# HEL-FIRE<sup>®</sup>

## Herbicide Activator

### **For Faster, More Complete Weed Control**

Hel-Fire from Helena is a unique herbicide activator that utilizes a three-way blend of ingredients to improve results from your weed control application.

In one product, Hel-Fire increases weed absorption of active ingredient, improves spray deposition and prevents antagonisms caused by poor water quality. Hel-Fire is particularly effective with glyphosate-based applications. If other herbicides are in the tank mix, Hel-Fire helps prevent antagonism problems which can affect performance.

Plus, Hel-Fire enhances performance in cool weather, as well as hot & dry conditions! It also gives you an edge on tougher-to-control weeds such as lambsquarters, wild buckwheat, velvetleaf and common waterhemp.

- **Increases ai absorption**
- **Improves deposition**
- **Good wetting properties**
- **Corrects hard water antagonisms**
- **Improves rainfastness**
- **Good performance in weather extremes**
- **Easy dispersion in water**
- **Easier tank cleanout from oil-free formulation**

**Here are a few reasons why Hel-Fire offers better field performance than simple pre-mixes of AMS and surfactant.**

- The surfactant system in Hel-Fire is highly stable in acid solutions and has been proven effective in commercial applications and in field trials.
- Hel-Fire is an excellent choice for enhancing herbicides under tough weed-killing conditions.
- Hel-Fire has an excellent crop safety record.
- Hel-Fire complements the performance of glyphosate/Select Max<sup>®</sup> spray mixes and it can prevent compatibility problems with this spray mix.
- Hel-Fire can be applied at the convenient rate of 1-2 quarts/100 gal, compared with 10-20X more with pre-mixes of AMS/surfactant.
- Hel-Fire is much more effective in correcting iron problems in spray water than AMS/surfactant pre-mixes.
- Hel-Fire can remove carbonates, while AMS/surfactant pre-mixes are weak in this category.
