## Stay sharp with a hearing check!

Having an untreated hearing loss may increase your risk of Alzheimer's. A study by Baltimore's Johns Hopkins School of Medicine demonstrated that for every 10-decibel loss in hearing, your risk increases 20%!

According to Frank R. Lin M.D., "When hearing is a constant struggle, your brain shuffles more of its resources toward deciphering what's being said, and that can sap your ability to form and keep memories. What's more, being hard of hearing is isolating and the less people socialize, the faster their brains age."

*As reported in Woman's World, Jan 2, 2012*

## Annual Hearing Checkup

If it has been more than one year since your last hearing evaluation, schedule now for a current test at little or no cost to you. Your insurance will usually cover the cost, and we accept most if not all insurances.

**Now - August**, bring in or mention this newsletter and receive **\$100.00 off** each new hearing aid purchased.

## WOW, I've been missing this the whole time!"

That was the comment of one of our patients when they heard the whisper of their grandchild for the first time. They were wearing a new hearing device that picks up the quiet, soft sounds that were missing with their previous hearing aids.

- Small, lightweight and discreet.
- Hear the sounds of life more naturally.
- Hear better in noisy places.
- Distinguish sounds better in groups of people.
- Effortlessly use the telephone.
- So comfortable that you'll hardly know you're wearing it!
- Simple to use. Wear it and forget it!

Doctor of Audiology

Eartech Audiology is a leader in the technology of balance disorders. We offer state-of-the-art diagnostic equipment not even found in the hospitals. We are currently the only clinic with the Interacoustics VNG and VEMP system in the region - a new computer based diagnostic equipment instrument which can make important contributions to the diagnostic and treatment of dizziness and other balance disorders.

Your balance system is located primarily in the inner ear and is connected with the brain, eyes and sensory nerves throughout your body. By stimulating the nervous system we can learn much about any abnormalities in your vestibular system.
