

What's The Difference Between An Audiologist And A Hearing Aid Dealer?

Hearing aid dealers - high school diploma or equivalent education

They must pass a qualified exam for the proper selecting and fitting and sales of hearing aids. They can't provide a full comprehensive medical hearing evaluation and cannot deal with any practice in the field of dizziness or balance impairments.

Audiologists- must have doctoral degree in audiology

"Practice of audiology" means the planning, directing, supervising, and conducting of rehabilitative counseling programs for individuals or groups of individuals who have (been diagnosed) or are suspected of having disorders of hearing or balance; any service in audiology, including prevention, identification, evaluation, consultation, rehabilitation, instruction, and research; participating in hearing and balance conservation, hearing aid sales, hearing molds and assistive listening devices.

What You Can Expect From Us At Eartech!

- *Doctorate- With expertise in additional extensive specialty trainings.*
- *Dedicated to providing you the most advanced state-of-the-art technology in hearing and balance equipment and diagnostics.*

- *Swim Plugs*
- *Musician's Monitors And Earplugs*
- *Tinnitus Evaluation and Treatment*
- *Pediatric Evaluation Treatment*
- *ABR*
- *Cerumen/Wax Removal*

Services, Diagnosis And Treatment Of Dizziness

Eartech Audiology is a leader in the technology of balance disorders. We offer state-of-the-art diagnostic equipment not found in even the hospitals. We are currently the only clinic with the Inter Acoustics VNG and VEMP system in the region - a new computer based diagnostic equipment instrument which can make important contributions to the diagnostic and treatment of dizziness and other balance disorders. Also offered is our Ecog test which is specific and valuable in diagnosing Meniere's Disease.

A Distinct Experience

Dizziness is the second common medical complaint. It's more common than most people think. Dizziness doesn't feel the same to all people. For some people, it's light-headedness. Some feel faint. Some feel as if they are moving when they're not. To some, it feels as if the world is spinning all around them.

Other Common Symptoms

Dizziness often occurs along with other symptoms, such as; nausea, anxiety, hearing loss, pressure, fullness in the head and/or ears, or a ringing in the ears called tinnitus.

The Complete Balance Assessment

Diagnosing dizziness can be complex, and the process usually requires several tests. In most cases you'll start with a detailed medical history and a physical examination.

The Anatomy Underlying Eye Movement Testing

Your balance system is located primarily in the inner ear, it is connected with the brain and brainstem, the eyes, and the sensory nerves throughout your body. One clearly measurable sign of what's going on with your balance system is a rapid, involuntary eye movement called nystagmus. By stimulating the nervous system in various ways and then measuring your eye movements, we can learn much about any abnormalities in your vestibular system.
