Acronyms and Abbreviations

AMP – Alternative Monitoring Plan

BOEM – Bureau of Ocean Energy Management

CPA – Closest Point of Approach

DMA – Dynamic Management Area

EOL – End of Line

EZ – Exclusion Zone

GSS – Geo SubSea

HRG – High-resolution geophysical

IHA – Incidental Harassment Authorization

kts - Knots

m - Meter

NARW – North Atlantic right whale

NOAA – National Oceanic and Atmospheric Administration

NMFS - National Marine Fisheries Service

OCS-A – Outer Continental Shelf Area

OECC – Offshore Export Cable Corridor

PSO – Protected Species Observers

RPS – RPS Group Inc

SOL – Start of Line

SBP – Sub Bottom Profiler

VNE – Vineyard Northeast, LLC

VSA - Vessel strike avoidance

1 EXECUTIVE SUMMARY

This Final Protected Species Observer (PSO) Report is prepared in accordance with Condition 6 of the Incidental Harassment Authorization (IHA) issued on July 27, 2022 to Vineyard Northeast LLC (VNE). The IHA authorizes take of marine mammals incidental to HRG survey activities (the “Survey”) as described in VNE’s application and requires the employment of National Marine Fisheries Service (NMFS)-approved PSOs to monitor and report PSO effort and observations. These surveys were conducted in accordance with the Leases and survey plans for OCS-A 0522 and OCS-A 0544 approved by Bureau of Ocean Energy Management (BOEM).The Survey was conducted on behalf of VNE by Fugro USA Marine, Inc (Fugro) and TDI-Brooks within lease areas OCS-A 0522 and OCS-A 0544 and associated offshore export cable corridors.

This report covers the protected species monitoring and mitigation undertaken by PSOs that were provided by RPS and deployed to each HRG survey vessel that undertook HRG operations, specifically when certain acoustic sources such as impulsive boomers and/or sparkers or non-impulsive: non-parametric sub-bottom profilers were operated, as defined in Section 4(a) of the IHA.

Survey vessels were in operation from July 2022 to January 2023 and April to July 2023.Teams of one to seven PSOs were deployed per vessel to undertake visual observations and implement mitigation to support both the day and night survey operations Mitigation protocols for the survey included the establishment of mitigation zones for marine protected species, visual monitoring, and vessel strike avoidance mitigation measures. Daytime and nighttime visual observations were conducted by PSOs for a total of 12,733 hours and 19 minutes.

A total of 1,114 visual detection events of protected species were made during the survey. Additionally, there was one dead dolphin observed, while the vessel was in transit and was not related to survey operations.

In accordance with stipulations set forth in the IHA, a total of 46 sound source mitigation actions were implemented which included 36 delays to source activation and 10 shutdowns of the HRG equipment for incursions of whales and dolphins. Vessel strike avoidance (VSA) measures were implemented on 794 occasions during the Survey; along with eight occasions when precautionary VSA measures were requested.

During HRG operations, there were 482 detections of protected species, consisting of 4579 individuals, observed within 141 meters of the active sparker (Level B Harassment Zone). The majority of those detections were species exempt from shutdown mitigation per IHA condition 4(e)(iv). While there were animals observed within the Level B Harassment Zone, no behaviors were documented that suggested adverse impacts had occurred to any protected species encountered that can be attributed to the survey activities undertaken.

2 INTRODUCTION

This Final Protected Species Observer (PSO) Report is prepared in accordance with Condition 6 of the Incidental Harassment Authorization (IHA) issued on July 27, 2022 to Vineyard Northeast LLC (VNE) (see Appendix A). The IHA authorizes take of marine mammals incidental to HRG survey activities (the "Survey") as described in VNE's application and requires the employment of National Marine Fisheries Service (NMFS)-approved PSOs to monitor and report PSO effort and observations. These surveys were conducted in accordance with the Leases and survey plans for OCS-A 0522 and OCS-A 0544 approved by Bureau of Ocean Energy Management (BOEM).

Under contract to VNE, Fugro and TDI-Brooks conducted high-resolution geophysical (HRG) surveys off the coast of New York and New Jersey within lease areas OCS-A 0522 and OCS-A 0544 and associated offshore export cable corridors (OECCs). Survey vessels used by Fugro and TDI-Brooks are described in Section 3.1 and acquisition instrumentation used is described in Section 3.2 of this report. Under contract to VNE, Geo SubSea (GSS) served has field program manager to coordinate vessel activity, data transfer and PSO coverage.

VNE contracted PSOs through a third-party provider, RPS, to conduct monitoring and mitigation for protected species, including marine mammals, during HRG survey activities. Protected species monitoring was conducted in accordance with the IHA issued on 27 July 2022. Monitoring and mitigation procedures that were implemented during the surveys are described in Section 4 of this report.

2.1 NMFS Reporting Requirements

This report summarizes the information required by the IHA as outlined in Table 1. An Environmental Management Plan (EMP), inclusive of NMFS issued IHA and BOEM approved Alternative Monitoring Plan (AMP), was prepared for the survey and is included in Appendix A.

Table 1 Reporting requirements per the Vineyard Northeast IHA and location in this technical report.

Required Content	Source Reference	Location Addressed in Technical Report
Reporting – Vineyard Northeast must submit a draft comprehensive report on all activities and monitoring results within 90 days of the completion of the survey or expiration of the IHA, whichever comes sooner. The report must describe all activities conducted and sightings of marine mammals, must provide full documentation of methods, results, and interpretation pertaining to all monitoring, and must summarize the dates and locations of survey operations and all marine mammal sightings (dates, times, locations, activities, associated survey activities). The draft report must also include geo-referenced, time-stamped vessel tracklines for all time periods during which acoustic sources were operating. Tracklines must include points recording any change in acoustic source status (*e.g.,* when the sources began operating, when they were turned off, or when they changed operational status such as from full array to single gun or vice versa). GIS files must be provided in ESRI shapefile format and include the UTC date and time, latitude in decimal degrees, and longitude in decimal degrees. All coordinates must be referenced to the WGS84 geographic coordinate system. In addition to the report, all raw observational data must be made available. A final report must be submitted within 30 days following resolution of any comments on	IHA section 6	This report satisfies this reporting as detailed further below.

Required Content	Source Reference	Location Addressed in Technical Report
the draft report.		
If a North Atlantic right whale is observed at any time by any project vessels, during surveys or during vessel transit, Vineyard Wind Northeast must immediately report sighting information to the NMFS North Atlantic Right Whale Sighting Advisory System: (866) 755-6622. North Atlantic right whale sightings in any location may also be reported to the U.S. Coast Guard via channel 16.	IHA section 6(d)(i) and 6(d)(ii)	Section 4.5.2, Appendix G
Discovery of injured or dead marine mammal – In the event that personnel involved in the survey activities covered by the authorization discover an injured or dead marine mammal, Vineyard Northeast must report the incident to the Office of Protected Resources (OPR) (301-427-8401), NMFS and to the New England/Mid-Atlantic Regional Stranding Coordinator (866-755-6622) as soon as feasible. The report must include the following information: Time, date, and location (latitude/longitude) of the first discovery (and updated location information if known and applicable); Species identification (if known) or description of the animal(s) involved; Condition of the animal(s) (including carcass condition if the animal is dead); Observed behaviors of the animal(s), if alive; If available, photographs or video footage of the animal(s); and General circumstances under which the animal was discovered	IHA section 6(e)(i)	Section 4.5.1, Appendix I
Vessel Strike – In the event of a ship strike of a marine mammal by any vessel involved in the survey activities, Vineyard Northeast must report the incident to NMFS OPR and the NMFS Office of Protected Resources and the NMFS New England/Mid-Atlantic Stranding Network by phone (866-755-6622) and by email (*nmfs.gar.stranding@noaa.gov* and *PR.ITP.MonitoringReports@noaa.gov*) as soon as feasible but within 24 hours. The report must include the following information: Time, date, and location (latitude/longitude) of the incident; Species identification (if known) or description of the animal(s) involved; Vessel's speed during and leading up to the incident; Vessel's course/heading and what operations were being conducted (if applicable); Status of all sound sources in use; Description of avoidance measures/requirements that were in place at the time of the strike and what additional measures	IHA section 6(e)(ii)	N/A – no instances of vessel strike

Required Content	Source Reference	Location Addressed in Technical Report
were taken, if any, to avoid strike; Environmental conditions (e.g., wind speed and direction, Beaufort sea state, cloud cover, visibility) immediately preceding the strike; Estimated size and length of animal that was struck; Description of the behavior of the marine mammal immediately preceding and following the strike; If available, description of the presence and behavior of any other marine mammals immediately preceding the strike; Estimated fate of the animal (e.g., dead, injured but alive, injured and moving, blood or tissue observed in the water, status unknown, disappeared); and To the extent practicable, photographs or video footage of the animal(s).		

3 PROJECT OVERVIEW

VNE conducted surveys to collect data that will be used to develop ground models for the Lease Areas and OECCs, to ensure the seabed is clear of obstructions, and to start detection of any buried archaeological features. Survey activities were conducted in accordance with the BOEM-approved survey plans and the Guidelines for Submission of Spatial Data for Atlantic Offshore Renewable Energy Development Site Characterization Surveys (May 27, 2020).

The *R/V Go Explorer, R/V Go Discovery, R/V Westerly and R/V Go Pursuit* began data acquisition for the OCS-A 0522 Offshore Development Area on July 27, 2023, while the *R/V Brooks McCall* began data acquisition on November 1, 2022. For the OCS-A 0544 Offshore Development Area survey, the *R/V Go Discovery* began data acquisition on August 4, 2022. The *Brooks McCall* began data acquisition on April 14, 2023, and the *R/V Bella Marie* started on June 14, 2023. Throughout both campaigns, the vessels periodically returned to ports in Connecticut, Massachusetts, New Jersey, and New York. Each vessel concluded operations on different dates that can be found in Table 2.

Vessel and the location of their operations is summarized in Table 2. A high-level overview of survey events for the vessels is outlined in Table 3.

Table 2 Survey summary of vessels, locations, and scope of work for the HRG Survey.

3.1 Vessel Summary

The survey vessels utilized for the 2022 and 2023 HRG Surveys were the *R/V Go Discovery, R/V Go Pursuit, R/V Go Explorer, R/V Westerly, R/V Brooks McCall,* and the *R/V Bella Marie* (Figure 2, Appendix B). The survey vessels were operated by Fugro and TDI-Brooks; vessel specifications are provided in Table 4.

Table 4 Vessel specifications for HRG operations

Vessel	Length Meters (m)	Width (m)	Speed	Vessel Configuration Description
R/V GO Pursuit	84	17.6	10 kts (Max) 3 – 5 kts (Survey)	Multi-role survey vessel for coastal and offshore survey areas
R/V Go Explorer	51	11	9 kts (Max) 4 kts (Survey)	Multi-role survey vessel for coastal and offshore survey areas
R/V Go Discovery	51	11	9 kts (Max) 4 kts (Survey)	Multi-role survey vessel for coastal and offshore survey areas
R/V Westerly	14	5	12 kts (Max) 3 – 5 kts (Survey)	Multi-role survey vessel for coastal and offshore survey areas
R/V Brooks McCall	48.46	12	10 kts (Max) 3 – 5 kts (Survey)	Multi-role survey vessel for coastal and offshore survey areas
R/V Bella Marie	10	5	12 kts (Max) 3 – 5 kts (Survey)	Multi-role survey vessel for coastal and offshore survey areas
R/V GO Pursuit	84	17.6	10 kts (Max) 3 – 5 kts (Survey)	Multi-role survey vessel for coastal and offshore survey areas

3.2 Summary of HRG Survey Equipment Used

As specified in the IHA, certain HRG equipment and operations are subject to protected species monitoring, mitigation, and reporting. These activities include the use of a non-impulsive: non-parametric sub-bottom profilers (SBP) and impulsive boomers or sparkers.

The HRG equipment that operated on each vessel that were subject to the protected species protocols are summarized in Table 5

Table 5 HRG survey equipment operated on each survey vessel

Vessel	Operation	Equipment Specification	Description of Operations
R/V GO Pursuit	HRG Data acquisition	Innomar Medium 100 SBP, Geo-Spark 2 KJ Ultra Hi-res sparker	Operations were to tow HRG equipment for data acquisition
R/V Go Discovery	HRG Data acquisition	Innomar Medium 100 SBP, GeoMarine survey systems sparker	Operations were to tow HRG equipment for data acquisition
R/V Go Explorer	HRG Data acquisition	Innomar Medium 100 SBP, GeoMarine survey systems sparker	Operations were to tow HRG equipment for data acquisition
R/V Westerly	HRG Data acquisition	Geo-Spark 2 KJ Ultra Hi-res sparker	Operations were to tow HRG equipment for data acquisition
R/V Brooks McCall	HRG Data acquisition	Geo-Spark Sparker, Sparker 400 TIPS	Operations were to tow HRG equipment for data acquisition
R/V Bella Marie	HRG Data acquisition	Single Channel Seismic (S-UHRS), GMSS Geo-spark 200 LW (or equivalent) with 8 element Geo-Sense Streamer	Operations were to tow HRG equipment for data acquisition

Figure 2: Survey vessels

4 MONITORING AND MITIGATION PROGRAM

This section describes the protected species monitoring and mitigation measures established to meet the requirements of the July 27, 2022 IHA. Mitigation measures were designed to minimize potential impacts of the survey activities on marine mammals, and other protected species of interest.

The following monitoring protocols were implemented to meet these objectives, and each are described in detail in a sub-section below:

- Visual observations were conducted day and night to provide real-time sighting data, allowing for the implementation of mitigation procedures as necessary.
- Species-specific exclusion zones (EZs) were established around the regulated sound sources, where delays to initiation and shutdowns of active sources were implemented when protected species were detected inside their respective EZ.
- Species-specific separation distances were established around the vessel, where strike avoidance maneuvers were implemented, if safe to do so, when protected species were observed inside the specific separation distances.

4.1 Monitoring: Protected Species Observers

There were trained and experienced PSOs onboard the survey vessel during the Survey to conduct the monitoring for protected species, record and report detections, and request mitigation actions in accordance with the established regulatory requirements and monitoring plan.

RPS, the PSO Provider, was responsible for ensuring that each PSO deployed met the minimum requirements set forth in the IHA and BOEM Lease stipulations. Additionally, NMFS reviewed and approved each PSO prior to their deployment as an offshore wind farm PSO in the U.S Atlantic, as per the IHA. Both BOEM and NMFS PSO requirements include training in protected species identification and behavior in addition to field experience in protected species observation in the Atlantic Ocean and/or the Gulf of Mexico.

The PSO Provider was responsible for:

- Providing training certifications and curriculum vitaes to be reviewed and approved by VNE and NMFS prior to deployment on the vessel.
- Providing the PSOs with vessel and survey contractor-specific training.
- Coordinating attendance of PSOs at Environmental Project Inductions and training specific to VNE and provided by RPS, Fugro, and TDI-Brooks during project kick-off meetings held prior to the start of survey operations and scheduled crew changes.

All certified PSOs deployed during the 2022 and 2023 Surveys are listed in Appendix D.

4.2 Visual Monitoring: Protocols and Methods

To meet the monitoring requirements of each survey vessel, teams of one to seven PSOs were deployed as outlined in Table 6. PSOs monitored while the vessel was in transit, prior to, and during all HRG operations conducted by the vessel. Visual monitoring was also conducted during all downtime between survey activities to collect additional protected species data and to implement vessel strike avoidance monitoring. PSOs rotated monitoring shifts as needed to maximize concentration and to meet the watch requirements of the Lease and IHA (watch periods not to exceed four hours without a minimum two-hour break and a maximum duration of 12 hours in a 24-hour period).

Visual monitoring locations on the vessel were selected in consideration of the following factors:

1. To afford PSOs a 360-degree viewpoint around the vessel and acoustic sources, such that the EZs around the sound sources and the strike avoidance separation distances could be simultaneously monitored,
2. Provide the highest vantage point possible to allow for monitoring out to the greatest distances ahead and around the vessel,
3. Provide shelter from inclement weather, as needed,
4. Provide real-time communication with vessel and other project vessels as necessary.

PSOs conducted their visual monitoring by actively scanning with the naked eye out to the furthest observation points visible, methodically sweeping areas closer to the vessel and focusing on the EZs and ahead of the vessel. PSOs conducted regular sweeps of the surrounding areas using magnification devices as described below. PSOs monitored for cues that might indicate the presence of protected species including but not limited to splashing, footprints, blows, and presence of other marine species (diving seabirds, fish feeding activity).

Table 6 Visual monitoring methodology on each HRG vessel

	Go Discovery	*Go Explorer*	*Go Pursuit*	*Westerly*	*Brooks McCall*	*Bella Marie*
Total Number of PSOs	7	7	7	4	5	2
Number of PSOs on Watch - Day	2	2	2	2	1	1

Primary Monitoring Location-Visual	Bridge & bridge wings	Bridge & bridge wings	Bridge & bridge wings	Bridge & bridge wings	Bridge & bridge wings	Bridge & bridge wings

Displays inside the bridge showed current information about the vessel (e.g., position, speed, heading, etc.), sea conditions (e.g., water depth, sea temperature, etc.), and weather (e.g., wind speed and direction, air temperature, etc.). Environmental conditions, along with vessel and acoustic source activity, were recorded at least once an hour, during line change, and when PSOs changed shifts, or every time there was a change of one or more of the variables.

4.2.1 Daylight Visual

The PSOs on board were equipped with 7x50 reticle binoculars as well as DSLR cameras with 200mm and 800mm zoom lens to aid in visual monitoring watches conducted during the day. PSO teams used field notebooks to record data while on watch and laptops were used to enter data.

Range estimates were made by comparison to object of known distance, as well as with reticle binoculars. Reticle binoculars were calibrated whenever possible to ensure accuracy of distance data. These reticle calibration tables are provided in Appendix F.

4.2.2 Night-time and Reduced Visibility Visual Observations

Aboard the vessels that were conducting 24-hour operations, two PSOs conducted visual monitoring during all nighttime operations whenever the vessel was not in port or at anchor.

If visibility became reduced (the largest mitigation zone was not fully visible), then no mitigated equipment could be deployed. Additionally, the operation of that equipment could not be continued if already in use when visibility was lost.

PSOs were equipped with night vision goggles and handheld infrared thermals. Specifications for the visual night monitoring equipment can be found in Appendix E.

4.3 Monitoring: Data Collection

During or immediately after each sighting event, the PSOs recorded the detection details in a standardized detection datasheet provided to them by RPS. Excel data forms included tabs for project data, monitoring effort data, geotechnical operations data, and protected species detection data. RPS supplied a set of standardized variables for specific data fields that were to be implemented on the data form provided to their PSOs.

Each sighting event was linked to an entry on an effort datasheet where specific environmental conditions and vessel activity were logged.

Species identifications were made whenever the distance of the animal(s), length of the sighting, and visual observation conditions allowed. Whenever possible during detections, photographs were taken with DSLR cameras that had telephoto lenses. Marine mammal identification manuals were consulted, and photos were examined during observation breaks to confirm identifications.

4.3.1 Data Collection Requirements & Methods

.

PSOs collected data in handwritten notepads or on portable / tablet devices during watches. During watch breaks and at the end of daylight hours, data was compiled in proprietary data forms on laptop computers and backed up on portable hard drives. Excel data sheets of monitoring effort, mitigable source activity, and detections of protected species during the Survey are provided in Appendix G.

4.3.2 Methods of Cross-Vessel Detection Coordination

Protected species detections were communicated to other ships on the project by email and by portable device messenger applications. RPS project managers coordinated these communications between vessel teams and monitored them in real time throughout the project, assisting in disseminating the information when necessary.

4.3.3 North Atlantic Right Whale External Sighting Monitoring Protocol

PSOs monitored the Dynamic Management Areas (DMA) and Right Whale Slow Zones in their permitted survey area and surrounding areas regularly:

1. Lead PSOs checked the NMFS website for new DMAs and Right Whale Slow Zones at the start of each day.
2. PSOs used mobile devices to check the web application Whale Alert.
3. RPS project managers were signed up to receive automatic notifications of DMAs, Right Whale Slow Zones, and NARW sightings throughout survey operations.

4.4 Mitigation Measures & Methodology

The PSO monitoring and mitigation program implemented on the HRG vessels was established to meet the requirements set forth in the IHA to minimize the potential impacts of the survey activities on marine mammals.

These mitigation measures include implementing mitigation zones, visual monitoring by approved PSOs, search periods of clearance zones prior to the commencement of HRG operations, ramp-up of survey equipment, delays to initiation and shutdown of HRG operations for protected species detections, and vessel strike avoidance procedures. Specific source mitigation and vessel strike avoidance procedures can be found in the AMP (Appendix B).

4.5 Reporting

The IHA requires that a final survey report be prepared detailing operations, PSO effort, and detection of protected species. Reporting of dead/injured protected species during survey operations is also a requirement of the IHA.

4.5.1 Injured or Dead Protected Species

Any injured or dead marine mammal observed either by a PSO on watch or by a crew member was required to be reported as described in Table 1. Reporting requirements included a phone notification to NMFS and local stranding networks made by shore based PSO Provider.

The Lead PSO would also prepare a written report in accordance with standard reporting guidelines and using the template provided by RPS for submittal to the agencies.

There was one dead protected species observed during the campaign. A deceased dolphin was observed while the vessel was in transit; not related to survey activities.

4.5.2 NARW Sightings

Reporting of NARW sightings to external monitoring resources was conducted as required and described in the Lease and IHA:

1. The RPS PSO Project Manager would inform the GSS Project Manager
2. The GSS Project Manager would report the sighting to the NMFS North Atlantic Right Whale Sighting Advisory System on behalf of Vineyard wind as required by IHA condition 6(d)(i)(ii).
3. The vessel’s Captain would report the sighting to the United States Coast Guard on channel 16.

4. PSOs would then prepare a sighting report including a description of the detection event, including date, time, distance to vessel, vessel and HRG equipment activity, observed behaviors, and any photographs or screenshots taken during the sighting.

There were ten NARW detections during the Surveys. Details of the detection are described Appendix G.

4.5.3 Final Report

RPS have prepared this technical report to meet the NMFS reporting requirements outlined in Table 1 of this report. The required elements of final PSO reporting are addressed within the appropriate sections in this report.

5 DATA RECORDS AND ANALYSIS METHODS

5.1 Operation Activity

PSOs collected the regulated equipment's operational status each day that they were deployed on each of the vessels.

The vessels recorded the start of line (SOL) times and the end of line (EOL) times for the equipment during acquisition. The vessels also recorded the status of the equipment while acquisition occurred by noting full power or shutdowns due to mitigation actions. These entries were made for each regulated source or for combinations of regulated sources (for example, the non-impulsive, non-parametric Sub-Bottom profiler and sparker operating at frequencies below 180kHz).

During the R/V *Bella Marie* campaign, extended vessel transits between sites while the sparker remained active occurred on four occasions. Measures were implemented to ensure such instances do not recur during future surveys.

5.2 Monitoring Effort

PSOs recorded monitoring effort by entering start of watch and end of watch times into data sheets where the vessel position and environmental data was also documented for that duration.

Total monitoring effort was calculated by summing the durations of each watch period. Each monitoring effort entry also indicated the equipment's operational status for that monitoring period.

Visual monitoring while the acoustic source was off included monitoring conducted during transit to survey sites and any other recorded silent periods (mitigation action, equipment downtime, or weather standby time).

5.2.1 Summary of Environmental Conditions

Environmental conditions that were present during each PSO watch were recorded on data sheets. Environmental variables were recorded every 30 to 60 minutes or when conditions changed.

Beaufort Sea state was recorded for each monitoring period using the accepted scale (Table 7):

Table 7 Beaufort Sea state scale

Beaufort number	Description	Wave height (m)	Sea conditions
0	Calm	0	Sea like a mirror
1	Light air	0–0.3	Ripples with appearance of scales are formed, without foam crests
2	Light breeze	0.3–0.6	Small wavelets still short but more pronounced; crests have a glassy appearance but do not break
3	Gentle breeze	0.6–1.2	Large wavelets: crests begin to break; foam of glassy appearance; perhaps scattered white horses
4	Moderate breeze	1–2	Small waves becoming longer; fairly frequent white horses
5	Fresh breeze	2–3	Moderate waves taking a more pronounced long form; many white horses are formed; chance of some spray
6	Strong breeze	3–4	Large waves begin to form; the white foam crests are more extensive everywhere; probably some spray
7	High wind	4–5.5	Sea heaps up and white foam from breaking waves begins to be blown in streaks along the direction of the wind; spindrift begins to be seen

8	Gale	5.5–7.5	Moderately high waves of greater length; edges of crests break into spindrift; foam is blown in well-marked streaks along the direction of the wind
9	Severe gale	7–10	High waves; dense streaks of foam along the direction of the wind; sea begins to roll; spray affects visibility
10	Storm	9–12.5	Very high waves with long overhanging crests; resulting foam in great patches is blown in dense white streaks along the direction of the wind; on the whole the surface of the sea takes on a white appearance; rolling of the sea becomes heavy; visibility affected
11	Violent storm	11.5–16	Exceptionally high waves: small- and medium-sized ships might be for a long time lost to view behind the waves; sea is covered with long white patches of foam; everywhere the edges of the wave crests are blown into foam; visibility affected
12	Hurricane force	>14	The air is filled with foam and spray; sea is completely white with driving spray; visibility very seriously affected

Swell heights in meters (m) were recorded by all the vessel PSO teams. The swell heights were categorized as less than 2 m, 2 to 4 m, and greater than 4 m.

PSOs categorized visibility during visual monitoring effort in kilometers (km) and/or meters (m) as less than 500 m, 500 m to 1 km, 1 to 2 km, 2 to 5 km and greater than 5 km.

5.3 Visual Sightings of Protected Species

PSOs used standardized reporting forms provided by RPS to record all detections of marine mammals made during survey operations. These records were completed any time a sighting was made, regardless of distance, not just for detections where mitigation was implemented.

Sighting ID or detection event numbers were assigned chronologically for all protected species observed on a vessel throughout that vessel's survey activity. A new detection number was assigned for a new species sighting or when enough time had passed between observations of animals of the same species such that PSOs could not be certain that they were observing the same animals previously documented. A standard duration of time was to be applied between observations: 15 minutes for delphinid and pinniped detections and 30 minutes for large whales. If there were multiple species in a single detection, the same sighting ID or detection event was used.

Protected species movement relative to the vessel, pace, and initial and subsequent behavior states were recorded for each protected species sighting where standardized categories for each were provided as controlled fields in the provided data form.

5.3.1 Closest point of approach

All PSOs recorded the closest point of approach (CPA) of all protected species detections to the vessel and the source, and the equipment's operational status at the time of the closest point of approach.

5.3.2 Detection rate

Detection rate was calculated using the number of protected species events per hour of monitoring effort.

5.4 Level B Take / Exposure Estimation

Under the Marine Mammal Protection Act (MMPA) 16 United States Code (USC) 1362, 'Take' is defined as " "to harass, hunt, capture, or kill, or attempt to harass, hunt capture or kill."

The MMPA further defines that 'harassment' refers to acts that have the potential to injure or disturb a marine mammal or marine mammal stock in the wild. Disturbing can be caused by disrupting behavioral patterns, including, but not limited to, migration, breathing, nursing, breeding, feeding, or sheltering.

NMFS considers exposure of marine mammals exposed to received sound levels of 160 dB (rms) to be potentially disturbing, and therefore classifies the exposure as a Level B take.

5.5 Monitoring Tools Efficacy and Comparisons Assessment

The PSO team was equipped with multiple monitoring tools to support daytime visual monitoring and nighttime visual monitoring. A comparison of the efficacy of utilized monitoring tools will be conducted by examining the detection rates of each method (Section 6.7).

5.6 Mitigation Measures Implemented

Mitigation measures were implemented on the vessel as previously described. The onboard PSO team communicated requested mitigation in real time to survey operators that controlled the operation of the regulated sound sources or to the vessel crew operating the vessel, depending on the type of action required. Communications were conducted in person or via handheld radio.

Implemented mitigation actions were recorded on PSO data sheets in the detection data form and in the operations activity logs.

5.7 Data Quality Control

The RPS data analysts reviewed all the PSO data sets received and conducted QC as described in Table 8.

Table 8 Quality control editing performed by RPS on PSO datasets by data field

Data type	Data field	Corrections made
Monitoring effort	Start of watch / End of watch	• Times were corrected or added where errors were evident, typically by inconsistency with adjacent times
	Daytime vs. Night-time	• Failures to adjust the time to UTC were corrected. • Times were corrected when the end of effort overlapped with the start of subsequent effort
Source operations	Testing	• Testing status was not used as a separate category. Based on the survey days and monitoring effort times, testing was either added to the "on" status or not included in operations totals.
Protected species detections	Position	• Positions that plotted out of place were corrected using effort positions or vessel track line positions of corresponding times, where available
	Combining Unidentified categories	• Unidentified mysticetes/delphinids/pinnipeds were combined within an Unidentified category for data analysis

6 RESULTS

This section of the report details HRG operations, protected species monitoring effort, environmental conditions during monitoring effort and distribution, and sighting data inside and outside the Lease Area and cable corridors, during source operation and source silence, and during transits to and from port during the Survey.

The monitoring effort, HRG operations and protected species detections for each vessel are provided as an Excel dataset in Appendix G.

6.1 Operation Summary

Survey operations began with the vessel conducting source calibrations at the dock and then in the survey area before proceeding to acquisition, according to the survey plan. Survey operations were briefly suspended when necessary for weather, crew changes and equipment maintenance.

The dates of operation, total days of survey activity and hours of regulated source operations by survey vessel are provided in Table 9.

Each vessels' port calls and transit times are summarized in Appendix C.

Table 9 Summary of regulated sound source operations on each survey vessel

Vessel	Dates of Operation	Total Survey Days	Total Hours of Regulated Source Operations (HHHH.HH)
Go Discovery	OCS-A 0522 27 July 2022 – 4 August 2022 OCS-A 0544 4 August 2022 – 30 December 2022	8 / 149	1363.07
Go Explorer	OCS-A 0522 27 July 2022 – 31 January 2023	189	1340.82
Go Pursuit	OCS-A 0522 27 July 2022 – 12 January 2023	170	1087.18
Westerly	OCS-A 0522 27 July 2022 – 28 July 2022	2	16.00
Brooks McCall	OCS-A 0522 1 November 2022 – 19 January 2023 OCS-A 0544 14 April 2023 – 26 July 2023	80 / 104	1821.48
Bella Marie	OCS-A 0544 14 June 2023 – 15 July 2023	32	114.80
Total		734	5743.35

6.2 Monitoring Effort

Visual monitoring effort for all survey vessels during the Survey is summarized in Table 10 and 11, shown by survey vessel, by HRG activity status and by monitoring conducted during day and night. Visual monitoring while the HRG equipment was not operating included monitoring conducted during transit to survey sites and other activities including equipment deployment and retrieval, equipment downtime, or weather standby time.

.

6.3 Environmental Conditions

Environmental conditions can have an impact on the probability of detecting protected species in a survey area. The environmental conditions present during visual observations undertaken during this survey program are presented in the tables below.

Visibility

Visibility was classified as ‘excellent’ if it extended to five kilometers or greater, ‘moderate’ if it was between two to four kilometers, and ‘poor’ if it was less than two kilometers. Visibility conditions were favorable for 43.62% of the overall visual monitoring effort (Table 12). Visibility of less than two kilometers was recorded during 50.30% of the overall monitoring effort, these reduced visibility periods included nighttime hours, fog, and rain showers.

Table 12 Summary of visibility during visual monitoring effort

Visibility	Duration (HH:MM)	% of Overall Monitoring Effort
Greater than 5 km	5554:59	43.62%
2 to 5 km	774:18	6.08%
Less than 2 km	6404:02	50.30%

Beaufort State

Monitoring effort was conducted in Beaufort Sea states ranging from Level 0 through Level 9. Visual observations at Level 4 Beaufort Sea State or below were considered favorable conditions for protected species detections and accounted for 89.28% of the total visual monitoring effort (Table 13).

Table 13 Summary of Beaufort Sea state during visual monitoring during the survey

Beaufort Sea State	Duration (HH:MM)	% of Overall Monitoring Effort
B0	36:02	0.28%
B1	696:30	5.47%
B2	2795:14	21.95%
B3	4820:19	37.86%
B4		23.72%
B0 through B4	**11368:27**	**89.28%**
B5	1181:25	9.28%
B6	175:27	1.38%
B7	07:37	0.06%
B8	00:14	0.00%
B9	00:09	0.00%
B5 through B9	**1364:52**	**10.72%**

Swell

Swell heights during visual observations were generally low, with swells of less than two meters recorded for 92.89% of visual monitoring effort (Table 14). Swells exceeded four meters for a minimal amount of time of the overall survey.

Table 14 Summary of Swell Height during visual monitoring during the survey

Swell Height	Duration (HH:MM)	% of Overall Monitoring Effort
Less than 2 meters	11824:20	92.86%
2 to 4 meters	906:53	7.12%
Greater than 4 meters	02:06	0.02%

6.4 Protected Species Detection Data

6.4.1.1 Visual Sightings

This section of the report summarizes visual sightings of protected species (marine mammals) made during the Survey. There was a total of 1114 protected species detection events with 166 whale detections, 905 dolphin detections and 43 pinniped detections.

Of the 1114 detection events, 95.15% (1060 events) were identified to the species level, while the remaining 54 were of animals identified to a family level or a higher taxonomic level (classified as unidentified baleen whale, unidentified whale, unidentified dolphin, or unidentified seal).

A table of all protected species detections is provided as part of an excel datasheet attachment in Appendix G.

Photographs of the identified protected species visually detected during the survey are provided in Appendix H.

Table 15 Detection records collected for each protected species detected during the survey program shows the total number of detection records and the number of individuals detected for each protected species during the survey program.

A map of the distribution of the protected species detected during the survey is provided in Figure 3 below with additional maps provided per species.

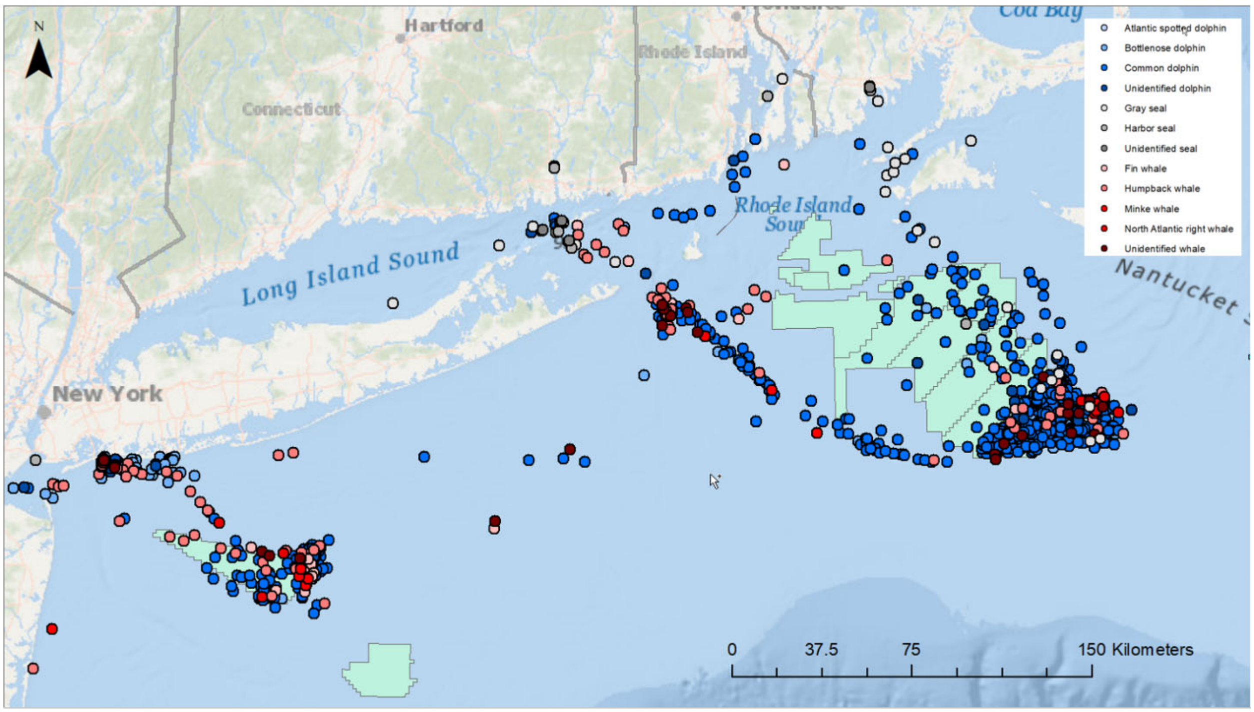

Figure 3: Distribution of marine mammals detected during the survey program

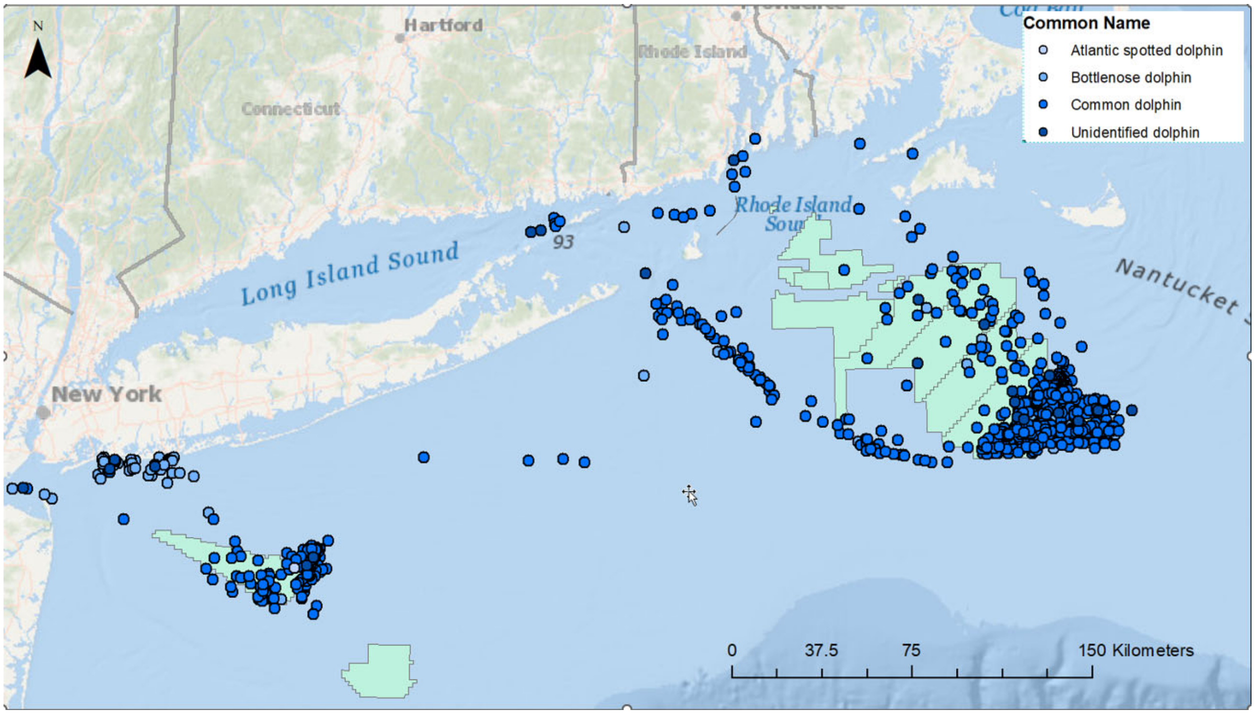

Figure 4: Distribution of delphinid detections during the survey

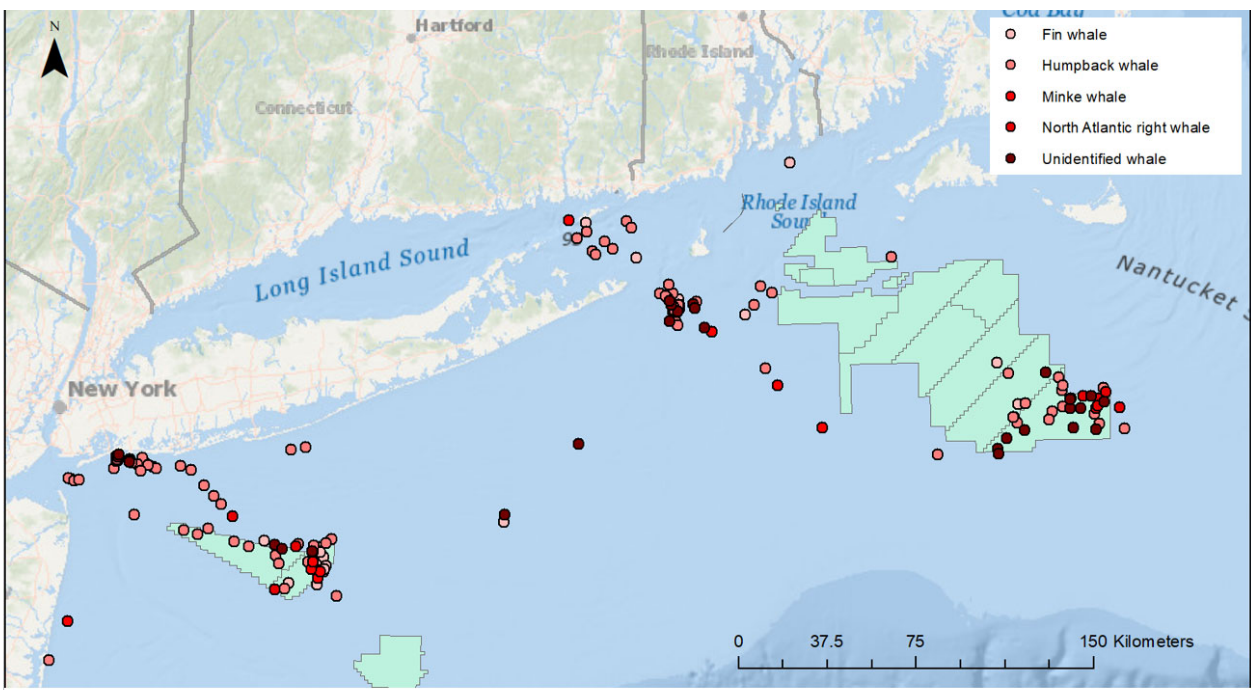

Figure 5: Distribution of whale detections during the survey

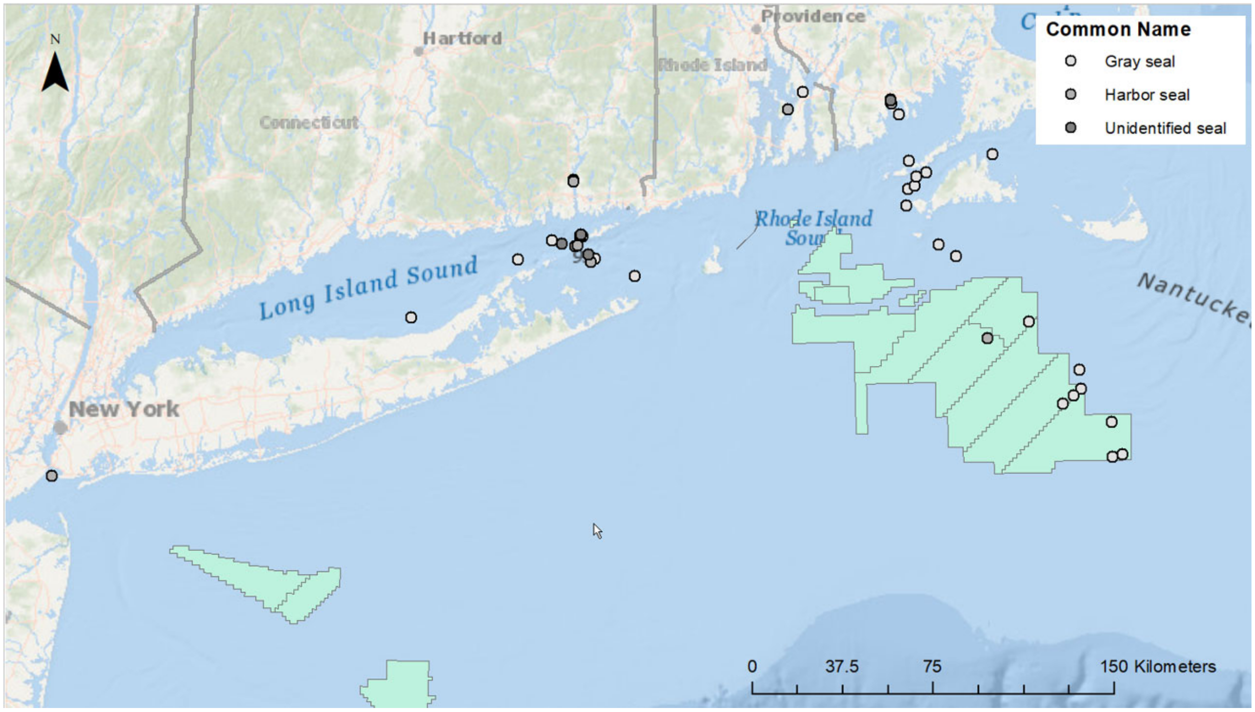

Figure 6: Distribution of pinniped detections during the survey

Table 15 Detection records collected for each protected species detected during the survey program

Species	Total Number of Detection Records	Total Number of Animals

Total	**1114**	**10412**

6.4.2 Detection and Distance Summaries

The number of detection events, approximate number of animals observed, mean group size and detection rate for each species detected over the course of the Survey is provided in Table 16 through Table 18

Four species of whales were identified, as summarized in Table 16. Humpback whales were the most recorded (n=94), while also having the largest mean group size for whale detections (n=1.87). Minke whale had the closest mean initial detection distance at 717 meters. Fin whales had the second closest mean initial detection distance at 1136 meters.

Table 16 Visual detection summary of whales

Whales	Humpback whale	Fin whale	Minke whale	Unidentified whale	Unidentified baleen whale	North Atlantic right whale
Number of detection records	94	25	10	19	8	10
Estimated # of individuals detected	176	46	11	20	8	13
Mean group size	1.87	1.84	1.10	1.05	1.00	1.30
Mean distance (m) at first detection	1372	1136	717	1551	1274	1837
Detection rate	0.0074	0.0020	0.0008	0.0015	0.0006	0.0008

Three species of dolphins were identified during the Survey (Table 17). Common dolphins were the most recorded (n=766), while the Atlantic spotted dolphin had the largest mean group size for dolphin detections (n=25). Most delphinid detections had mean initial detection distances of less than 700 meters, with the exception of the Atlantic spotted dolphins which was 2319 meters.

Table 17 Visual detection summary for dolphins

Dolphins	Common dolphin	Unidentified dolphin	Bottlenose dolphin	Atlantic Spotted dolphin
Number of detection records	766	23	116	1
Estimated # of individuals detected	9027	105	942	25
Mean group size	11.78	4.57	8.12	25.00
Mean distance (m) at first detection	162	661	376	2319
Detection rate	0.0602	0.0018	0.0090	0.0001

The gray seal was the most detected species of pinniped during the Survey (Table 18). The mean detection distance for all species of pinnipeds was less than 300 meters.

Table 18 Visual detection summary for pinnipeds

Pinnipeds	Gray Seal	Harbor Seal	Unidentified seal
Number of detection records	26	13	4
Estimated # of individuals detected	29	14	4
Mean group size	1.12	1.08	1.00
Mean distance (m) at first detection	146	140	228
Detection rate	0.0020	0.0010	0.0003

The sample sizes for detected species were too small to compare CPA to HRG sources by species and operational status. When comparing species groups, whales and dolphins had larger mean CPAs while HRG operations were active, and only pinnipeds had a larger CPA while HRG operations were inactive (Table 19).

Table 19 Average closest observed approach (m) of protected species to active and inactive HRG operations

Species Detected	HRG Operations Active		HRG Operations Inactive	
	Number of detections	Mean closest observed approach to source	Number of detections	Mean closest observed approach to source
Humpback whale	51	961.6	8	743.1
Fin whale	19	799.4	1	738.0
Minke whale	7	664.7	2	215.0
Unidentified whale	14	1569.4	3	1888.3
Unidentified baleen whale	4	1025.0	2	790.0
North Atlantic right whale	8	1790.9	2	1317.0
All whale species	**103**	**1060.98**	**18**	**944.00**
Common dolphin	483	93.8	62	64.1
Unidentified dolphin	10	734.5	1	90.0

All delphinoid species	**563**	**117.43**	**82**	**103.26**
Gray seal	3	183.3	-	-
Harbor seal	4	266.0	1	130.0
Unidentified seal	1	421.0	1	340.0
All pinniped species	**8**	**254.4**	**2**	**235**

*Sightings that occurred while the source was not deployed are not included in Table 19

6.4.3 Protected Species Level B Harassment

For the HRG equipment used during the Survey (Geo Sparkers), the Level B Harassment Zone is 141 meters of the active sound source. Within this zone, animals detected are considered exposed and that exposure can be considered potential harassment or categorized as Level B Harassment. The following section is a summary of the potential Level B Harassments that took place during the Survey.

There were 482 detections (4579 individuals) observed within the 141-meter zone around the sound source (Table 20). Of those detections, 99% (4565 individuals) were small delphinid and pinniped species for which shutdown mitigation was not required per IHA condition 4(e)(iv). While there were animals observed with the Level B Harassment Zone, no behaviors were documented that suggested adverse impacts had occurred to any protected species encountered because of the Survey activities undertaken.

During the detections, PSOs would take note of potential changes that could be considered atypical behavior for each species. Changes in behavior could include the animals changing course, rapid swimming, surfacing quickly followed immediately by diving to move away. However, other factors could account for changes in behaviors of the different species such as vessel traffic, fishing gear, heat runs, and weather.

Of the 482 detections within the Level B Harassment Zone, most animals were observed blowing, bow-riding, fast traveling, porpoising, and swimming at or below the surface. Further details of each detection can be found in Appendix G of this report.

Table 20 Potential Level B Harassment Detections

Species	Total Number of Detection Records	Total Number of Animals
Dolphins		
Common dolphin	437	4280
Bottlenose dolphin	34	257
Atlantic Spotted dolphin	1	25
Unidentified dolphin	2	6
Pinnipeds		
Gray seal	2	2
Harbor seal	1	1
Whales		
Humpback whale	1	1
Fin whale	3	6
Unidentified whale	1	1
Total*	**482**	**4579**

**IHA 4(e)(iv) exempts all pinniped species as well as small delphinid species from the genera: Delphinus, Lagenorhynchus, Stenella or Tursiops. If there was uncertainty regarding the identification of a marine mammal species (i.e., whether the observed marine mammal(s) belonged to one of the delphinid genera for which shutdown is waived), PSOs used their best professional judgment in making the decision to call for a shutdown.*

6.4.4 Protected Species Incident Reporting

The PSO team on the *Bella Marie* observed a single dead marine mammal during the course of this survey.

On July 4, 2023, the PSO on watch observed an unknown object approximately 700 m off the vessel starboard bow. Upon first observations the object was white with a bird standing on top of it. As the vessel moved closer (approximately 200 m) it became apparent that it was a deceased animal, possibly a dead dolphin. A positive ID was not possible due to the animal's advanced state of decomposition. The carcass remained as the vessel continued on a survey line.

More information of the observation can be found in Appendix I.

6.5 Summary of DMAs

During the Survey period (27 July 2022 through 26 July 2023), there were 19 DMAs established within or near the survey area due to North Atlantic right whale sightings (Table 21).

Table 21: DMAs and NARW reported observations in the Vineyard Northeast Renewables Lease Area during survey operations

	Effective Start Date	Reason for DMA	General Location	Restrictions

6.6 Monitoring Efficacy and Comparison Assessment

During the Survey, two different monitoring methods were utilized to detect protected species. Each method is discussed in Section 4.

1) Daytime unaided eye where PSOs made regular and frequent sweeps of the surrounding area with reticle binoculars and/or big-eye reticle binoculars.
2) Night-time unaided eye where PSOs made regular and frequent sweeps of the surrounding area with Night Vision Devices (NVDs)s that were equipped with thermal clips.

PSOs documented the monitoring method used to first detect protected species' presence. Initial detection method for the 1114 observations is displayed in Table 22.

Table 22 Monitoring effort, protected species detections and detection rate for each monitoring method used during the Survey

	Visual Monitoring-Unaided eye with sweeps using binoculars	Visual Monitoring-Unaided eye with sweeps using NVD and thermal
Monitoring effort (hours)	6605:16	6128:03
Number of marine mammal detections	678	431
Detection rate for marine mammals	0.10265	0.07033

*Note: Four thermal detections occurred during daytime overlap monitoring and were not considered in total number of detections for the above calculation. One binocular originated night detection occurred during overlap monitoring and was not considered in total number of detections for the above calculation.

6.6.1 Effectiveness of Unaided Eye (day and night)

A larger number of the detection events were made by the unaided eye, with more detections occurring during the daylight than during the night (432 nighttime sightings as compared to 682 daytime sightings for marine mammals).

PSOs considered monitoring with the unaided eye to be the most effective method for making initial detections of all protected species where binoculars or NVD with thermal could be used to confirm the presence of an animal following a sighting cue or to confirm species identification. The effectiveness of the unaided eye in initial detections was attributed to the wide field of view that could be scanned as compared to the narrow view afforded by either a reticle binocular or an NVD.

The NVDs efficacy was further limited in areas like the side and stern of the vessel where there were frequently bright lights that would interfere with the view, but which were necessary for back deck operations to continue safely.

6.7 Summary of Mitigation Measures Implemented

Mitigation was implemented as described over the course of the Survey to prevent adverse impacts to protected species from physical interactions with vessels and / or towed equipment, through strike avoidance mitigation, or from exposure to potentially harmful levels and frequencies of sound, through delays and shutdowns of HRG activities.

During the course of the Survey, mitigation from regulated sound sources was implemented during 46 detection events: activation of regulated sound sources was delayed on 36 occasions and regulated sources were shut down as a result of incursions into exclusion zones by protected species on 10 occasions (Table 23).

Table 23 Summary of mitigation actions implemented during the survey

Mitigation Action	Dolphins	Whales	Pinnipeds	All Species
	Number	Number	Number	Number
Delay to Initiation of Operation	33	3	0	36
Shutdown of Operation	2	8	0	10
Total Mitigation Actions	**35**	**11**	**0**	**46**

There were a total of 798 strike avoidance measures undertaken throughout the Survey. During the Survey there were various combinations of Vessel Strike Avoidance (VSA) measures applied and further reference to these measures can be found in Appendix G. Table 24 below provides a general overview of VSA per species group.

Table 24 Summary of strike avoidance maneuvers undertaken.

	Strike avoidance maneuver Not Required	Strike avoidance maneuver Required
Dolphins	143	762
Whales	137	29
Pinnipeds	32	11

7 SUMMARY

7.1 Interpretation of the Results

All the marine mammal species that were detected during the Survey were species that occur commonly in the region and are regularly observed by PSOs during HRG and other types of survey operations. All marine mammal species that were detected during the HRG survey were authorized for Level B take under the approved IHA. Each species detected was observed within its predicted range with no species encounters occurring outside the normal range of that species.

For most marine mammal species groups, the mean distance at initial detection and at closest approach was greater when the regulated sound sources were on, apart from the North Atlantic right whale, common dolphins, and unidentified dolphins. No behaviors were documented that suggested adverse impacts had occurred to any protected species encountered as a result of the survey activities undertaken.

Behavior states like swimming and approaching a vessel were exhibited in the expected species such as common dolphins. There were also sightings of blows, surfacing, and acrobatic behavior displayed by delphinids. Whales were sighted exhibiting similar behaviors consisting of blows, diving with flukes, and diving without visible flukes. All are expected actions for the sighted marine mammals.

There were 482 detections of protected species consisting of 4579 individuals observed within 141 meters of the active sparker (Level B Harassment Zone). Of those, 475 detections (4565 individuals) were small delphinid and pinniped species for which shutdown mitigation was not required per IHA condition 4(e)(iv). While there were animals observed with the Level B Harassment Zone, no behaviors were documented that suggested adverse impacts had occurred to any protected species encountered that can be attributed to the survey activities undertaken.

7.2 Effectiveness of all monitoring tasks

In order to minimize the potential impacts to marine protected species, PSOs onboard all survey vessels were prepared to implement mitigation measures whenever protected species were detected approaching, entering, or within the designated exclusion zones. Mitigation actions for regulated sound sources were implemented successfully during the 46 detection events that required mitigation. PSOs searched the monitoring and clearance zones prior to activation of regulated sound sources and survey crew confirmed that clearance zones were clear prior to activating the regulated sound sources, which was then done gradually in ramp-up form wherever possible.

There were 802 strike avoidance maneuvers initiated during the survey. A general overview of VSA can be found in Table 24 and a complete list of the various combinations of VSA can be found in Appendix G. The vessel strike mitigation occurred on all vessels involved in the survey.

In the event that an injured or dead protected species was discovered during the course of the survey program, the incident was to be immediately reported. There was one sighting of a dead protected species which was reported in a timely manner, in accordance with the stipulations laid out in the IHA.

Visual observations yielded a total of 1,114 protected species detections both inside and outside the Lease Area and during vessel transits to and from port. The environmental conditions present during visual monitoring were generally good (visibility greater than 5 kilometers and sea state of less than B4) for detecting protected species, especially inside the exclusion zone.

The monitoring and mitigation measures implemented during the survey appear to have been an effective means to prevent potential impacts to the protected species encountered during survey operations.

1.0 Introduction

Vineyard Offshore has prepared this Environmental Management Plan (EMP or "Plan") for offshore site characterization activities, including benthic, geological and high-resolution geophysical (HRG) surveys associated with Vineyard Northeast (the "Project") and proposed future Vineyard Offshore projects. HRG survey activities will occur within the survey area highlighted in **Figure 1**, which includes Lease Areas OCS-A 0522 and 0544, and associated potential offshore export cable corridors (OECCs). Site characterization surveys will encompass the area of potential effect where any bottom disturbance activities may occur. An overview map of the survey area is provided in **Figure 1**.

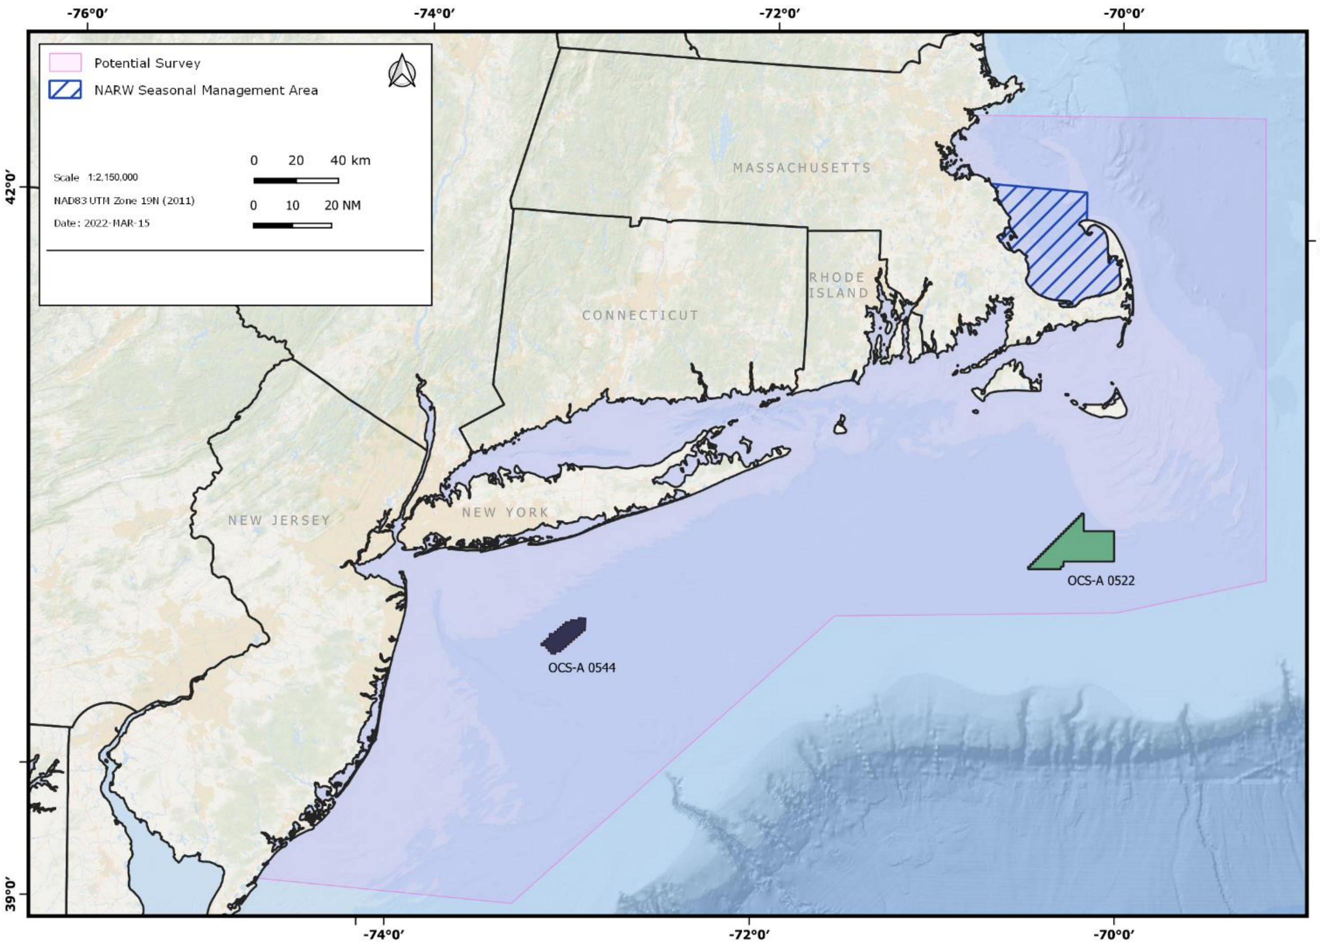

Figure 1: Offshore site characterization survey area

This EMP shall serve as a resource and basic field reference for survey personnel and Protected Species Observers (PSOs) engaged in HRG and other survey activities for the Project. This Plan details the key environmental and archaeological compliance obligations contained within permits, consents, and approvals. It also provides contact information for relevant personnel, describes the communication procedures to be followed during survey activities, and outlines what to do in certain situations (e.g., vessel strike, archaeological discovery, etc.).

This EMP shall be kept up to date, shall not be copied or destroyed, and shall be retained following completion of the survey activities. Updates to this EMP shall be made in the following instances:

- to incorporate additional Project information for each phase of surveys;
- as dictated by Project permits, approvals, authorizations, or agreements;
- to update any changes to contact information;
- to reflect any changes in work conditions or procedures; or
- to include any other change requiring a Plan update as determined by Vineyard Offshore or the contracted survey provider.

The 2022-2023 Vineyard Offshore Geophysical, Geotechnical, and Environmental Site Characterization Campaign Survey Plans (Survey Plan) are provided in **Appendix A.**

1.1 Permits and Approvals

The permits, approvals, authorizations, agreements, and required documentation that have been secured for Vineyard Offshore and apply to this EMP are summarized below and detailed in **Appendix B**:

- Lease OCS-A 0522
- Lease OCS-A 0544
- Alternative Monitoring Plan
- Vineyard Northeast HRG Incidental Harassment Authorization (IHA)
- Project Design Criteria and Best Management Practices for Protected Species Associated with Offshore Wind Data Collection (Offshore Wind PDC & BMPs)
- National Marine Fisheries Service Offshore Wind Site Assessment Programmatic ESA Consultation
- BSEE NTL No. 2015-G03
- Atlantic Reference Guide (species identification)
- Communication Protocol
- BOEM’s Guidelines for Lighting and Marking of Structures Supporting Renewable Energy Development
- US Coast Guard Private Aids to Navigation Requirements
- Visual Observer Log
- Bureau of Safety and Environmental Enforcement (BSEE)-approved material regarding North Atlantic Right Whale (NARW) Seasonal Management Areas, sightings information, and reporting
- Vineyard Offshore Induction Training Slide Deck

Vineyard Offshore, and their contractors, shall ensure full compliance with the permits, approvals, authorizations, agreements, and all conditions cited in Project permits, approvals, authorizations, and agreements. If changes to any approved Project plans result in updates/modifications to existing permits, approvals, authorizations, or agreements, such updates/modifications, including revised permits/approvals and/or consultations, shall be included in **Appendix B**, as appropriate.

All survey vessels must maintain copies of the relevant permits, authorizations, agreements, consultations, references, and logs as outlined below and included in **Appendix B**.

2.0 Project Contacts and Communication Procedures

2.1 Project Contacts

A list of relevant contacts for HRG survey activities is provided in **Table 1**. Contact lists for geotechnical and environmental surveys will be issued in an addendum prior to the start of survey activities. During survey activities, **all communication with Federal, State, Regional, and Local agencies will be coordinated by Vineyard Offshore.**

Table 1: Vineyard Offshore HRG Survey Contact List

Vineyard Offshore HRG Survey Contact List			
Name	**Project Title**	**Company**	**Contact Number**
Martin Christensen	Survey Manager	Vineyard Offshore	610-505-1324
Geoff Neild	HSE Manager	Vineyard Offshore	407-616-4160
Geri Edens	Director of Permitting	Vineyard Offshore	240-271-1334
Laura George	Permitting Manager	Vineyard Offshore	215-407-2041
Nate Mayo	Director of Public Affairs	Vineyard Offshore	617-840-4045
Crista Bank	Fisheries Manager	Vineyard Offshore	508-525-0421
Jeannot Smith	Marine Liaison Officer	Vineyard Offshore	904-613-0134
Laura Giaimo	Environmental Project Manager	Geo Subsea	507-250-3995
Trish Souder	Environmental Project Manager	Geo Subsea	417-543-0810
Megan McManus	Senior Environmental Project Manager	Geo Subsea	724-493-9860
Kathryn Roy	Senior Environmental Specialist	RPS Group	508-524-5556
James Pearl	Marine HSE Advisor	Geo Subsea	281-594-4356

2.2 Fisheries Communication Plan

Vineyard Offshore has developed a Fisheries Communications Plan (FCP) to guide communication with fishermen potentially affected by the development of offshore wind projects, to improve project design and avoid gear interaction and conflicts. The FCP is a living document that is updated regularly and available online at wwww.vineyardwind.com/fisheries and in **Appendix C**.

The FCP includes offshore communication protocols to ensure fishermen are aware of Vineyard Offshore's offshore activities. As part of these protocols, Notices to Mariners are sent to the U.S. Coast Guard (USCG), and Offshore Wind Mariner Updates (OWMUs) are issued on public fora to inform the commercial and recreational fishermen, as well as other interested stakeholders, about survey activities. The OWMUs include a survey vessel picture, vessel contact information, a chart showing the location and approximate duration of vessel activity, and relevant contact information. Vineyard Offshore also posts the OWMUs on the company's primary social media channels – LinkedIn, Facebook, Twitter, and Instagram. Additional information is available in the FCP.

3.0 Environmental Management Plan Distribution

The EMP, whether hard-copy or electronic, shall be located on all survey vessels for easy reference and use if available, the on-vessel copy of the EMP shall not be removed, destroyed, or copied. The Vineyard Offshore Compliance Team will distribute copies of this EMP to the contracted survey provider, Vineyard Offshore Survey Team (including all client representatives), and the Vineyard Offshore Environmental Affairs Department (electronic).

4.0 Field Crew Induction / Training / Orientation

Induction/Training /Orientation for all survey crews will be performed prior to the initiation of survey activities, when new personnel are introduced to the survey team, and when a change in the anticipated plan of work or site conditions warrant follow-up training. Inductions will, at a minimum, include the following:

- Health, Safety, Environmental Training;
- Vineyard Offshore Environmental Awareness Training (inclusive of Marine Trash & Debris Prevention); and
- Vineyard Offshore Species Identification Training.

5.0 Marine Protected Species

The OCS-A 0522 and 0544 Leases contain monitoring and mitigation requirements that apply to marine mammals, sea turtles, and other protected species. Additionally, HRG surveys are subject to conditions contained within the National Oceanic and Atmospheric Administration Incidental Harassment Authorization (IHA), issued pursuant to Section 101(a)(5) of the MMPA (16 U.S.C. 1371(a)(5)(D)), which is valid from July 27, 2022, through July 26, 2023.

HRG survey activities shall therefore be conducted in accordance with the measures stipulated in the IHA. While acquiring data within Lease areas, Lease provisions (inclusive of BOEM Lease waivers) apply. **Appendix D**, *Protected Species Monitoring & Mitigation Plan* contains instructions for survey activities that consider all relevant permits. New permit documents and updated plans will be published in an EMP addendum as they become available.

5.1. Protected Species Observers

Protected Species Observers must be present and on duty on each HRG survey when CHIRP subbottom profilers, boomers and sparkers are operating. In addition to source mitigation, PSOs will monitor permit-specified zones to minimize vessel interactions with protected species. All PSOs must be provided by a third party. For Lease OCS-A 0522, Vineyard Offshore must submit a list of NMFS-approved PSOs and their relevant certifications and resumes to BOEM and NMFS no later than 7 calendar days prior to the scheduled start of survey activities. For Lease OCS-A 0544, Vineyard Offshore is required to submit PSO names and certifications to NMFS prior to the start of survey activities and upon request of BOEM.

PSOs must have completed a commercial PSO training program for the Atlantic with an overall examination score of 80 percent or higher

PSOs must have no Project-related tasks other than to monitor permit-specified zones, communicate and initiate mitigation to relevant vessel crew when required, and collect and report data regarding the presence of protected species and mitigation requirements (including brief alerts regarding maritime hazards). PSOs must not be on watch for more than four consecutive hours and must be granted a break of no less than two hours after a four-hour watch. PSOs must not work for more than 12 hours in any 24-hour period unless an alternate schedule is authorized in writing by BOEM. All visual monitoring must occur from a vantage point, on the associated operational platforms, that allows for 360-degree visual coverage around a vessel.

PSO equipment must include binoculars, range-finding equipment, a digital camera, and electronic data recording devices (e.g., a tablet) to adequately monitor the distance of the clearance and shutdown zones, to determine the distance to protected species during surveys, to record sightings and verify species identification, and to record data.

Table 2: PSO Required Equipment

General Equipment	Citation
Global Positioning System (hand-held or vessel)	IHA Section 5(k)
Reticulated Binoculars (as appropriate)	IHA Section 5(k)
Binoculars with the ability to estimate distances or rangefinders	IHA Section 5(k), Offshore Wind PDC & BMPs Section 7.5.2
Night-vision equipment (i.e., night-vision goggles and infrared technology)	IHA Section 5(k) & 5(h)
Digital Camera	IHA Section 5(k), Lease OCS-A 0522 Section 4.3.5

5.2. Crew Lookout

For projects where PSOs are not required for source mitigation, a crew lookout must be posted during all times to avoid interactions with an Endangered Species Act (ESA)-listed species when a vessel is underway. Crew lookouts monitoring the vessel strike avoidance zones may be third-party observers (i.e., PSOs) or vessel crew members, provided that vessel crew members responsible for these duties have sufficient training. If the trained lookout is a vessel crew member, this must be their designated role and primary responsibility while the vessel is transiting. Crew lookouts monitoring vessel strike avoidance zones will fill out a daily log (**Appendix B**).

6.0 Avian and Bat Protection

Any lights used to aid marine navigation by Vineyard Offshore must meet USCG requirements for private aids to navigation and BOEM's Guidelines for Lighting and Marking of Structures Supporting Renewable Energy Development (**Appendix B**). Additionally, Vineyard Offshore is subject to annual reporting of any dead or injured birds or bats found on vessels or structures.

7.0 Cultural Resources

Leases OCS-A 0522 and 0544 contain stipulations addressing the archaeological survey requirements and the unanticipated discovery of archeological resources.

Pursuant to the Leases, a Qualified Marine Archaeologist (QMA) must be informed and may elect to be present during HRG surveys and bottom disturbing activities to ensure avoidance of potential archaeological resources. In the event that the QMA indicates that they wish to be present, the QMA's presence must be facilitated and provided the opportunity to inspect data quality.

All vessels shall not knowingly impact a potential archaeological resource without prior approval from BOEM. In the event of an unanticipated discovery of a potential archaeological resource, such as the presence of a shipwreck (e.g., a sonar image or visual confirmation of an iron, steel, or wooden hull, wooden timbers, anchors, concentrations of historic objects, piles of ballast rock) or evidence of a pre-contact archaeological site (e.g., stone tools, pottery or other pre-contact artifacts) within the project area, the Post-Review Discovery Clause (OCS-A 0522 Lease Section 4.2.7 and OCS-A 0544 Lease Section 5.3.7) must be followed as outlined in section 7.1.

7.1 Unanticipated Discovery of Cultural Materials

If an unanticipated discovery of potential archaeological resources or evidence of a potential archaeological resource is made while conducting bottom-disturbing activities, the following steps shall be taken:

1) The survey vessel will immediately halt seafloor/bottom-disturbing activities within the area of discovery in accordance with all safety procedures and emergency shut down protocols.
2) The Client Representative and Vineyard Offshore Field Project Manager will be notified.
3) The Vineyard Offshore Field Program Manager will immediately notify Vineyard Offshore and the QMA of the discovery.
4) In coordination with Vineyard Offshore, the QMA will notify BOEM and BSEE of the discovery as soon as practicable but no later than 24 hours after discovery. If the discovery is made within state waters, the Massachusetts Board of Underwater Archaeological Resources (MBUAR) and the Massachusetts Historical Commission (MHC) must also be notified.
5) Vineyard Offshore will notify BOEM in writing within 72 hours of the discovery. If the discovery occurs in state waters, the MBUAR and MHC will also be notified in writing.
6) The location of the discovery will be kept confidential, and no action shall be taken that may adversely affect the archaeological resource until BOEM has made an evaluation and instructed Vineyard Offshore on how to proceed.
7) If needed, Vineyard Offshore will conduct additional investigations as directed by BOEM and BSEE to determine if the resource is eligible for listing in the National Register of Historic Places (30 CRF 585.802(b)).

8.0 Marine Trash and Debris Prevention

8.1 Training

Vessel operators, employees, and contractors engaged in offshore activities pursuant to the Leases must complete annual marine trash and debris awareness training, as described in the BSEE NTL No. 2015-G03 or any NTL that supersedes this NTL (**Appendix B**), except that posting placards onboard the vessel will not be required. The annual marine trash and debris awareness training must consist of two parts:

- Viewing a BSEE marine trash and debris training video or slide show; and
- Receiving an explanation from Vineyard Offshore Compliance Team management that emphasizes their commitment to adhere to the requirements. The training program must also include attendance documentation and recordkeeping for inspection by BSEE.

By January 31 of each year, a report describing the marine trash and debris process and certifying that the training process has been followed for the previous calendar year must be submitted to BOEM and BSEE. Vineyard Offshore, in coordination with the contracted survey provider, will submit this annual report.

8.2 Marking

Durable identification markings must be placed on skid-mounted equipment, portable containers, spools or reels, and drums onboard the vessel. Additionally, materials, equipment, tool containers and other items used in activities conducted on the OCS that are likely to snag or damage fishing devices and could be lost or discarded overboard must be clearly marked with the vessel or facility identification and properly secured to prevent loss overboard. Markings must clearly identify the owner and must be durable enough to resist the effects of the environmental conditions to which they may be exposed.

8.3 Recovery and Prevention

Marine trash or debris that is lost or discarded overboard must be recovered if it is likely to:

- cause undue harm or damage to natural resources, including their physical, atmospheric, and biological components, with particular attention to marine trash or debris that could entangle, or be ingested by, marine protected species; or
- significantly interfere with OCS uses (i.e., because it is likely to snag or damage fishing equipment or presents a hazard to navigation).

If the marine trash or debris is located within the boundaries of a potential archaeological resource/avoidance area or a sensitive ecological/benthic resource area, Vineyard Offshore must receive approval prior to recovery efforts.

A Recovery Plan must be submitted no later than 10 calendar days from the date in which the incident occurred. Recovery should be completed as soon as practicable but no later than 30 days from the date the incident occurred. Steps to prevent similar incidents must be enacted, with a description of these steps provided to Vineyard Offshore in writing. All agency reporting as required by the Offshore Wind PDC & BMPs, BMP Section 3 will be carried out by Vineyard Offshore. Agency reporting includes 48-hour notifications and monthly reporting requirements.

9.0 Spill and Discharge Prevention

The OCS-A 0522 and 0544 Leases contain an indemnification condition for any loss or damage to natural resources and for the release of any petroleum or Hazardous Materials. No substance should be intentionally discharged from the vessel. In the event of a spill or discharge, the vessel's USCG-approved spill prevention and containment strategy should be followed. Spills or discharges should be reported immediately as outlined in section 10.5, regardless of if the spill or discharge occurs at sea or on land while the vessel is at dock. Hazardous Material is to be defined as:

1. Any substance or material defined as hazardous, a pollutant, or a contaminant under the Comprehensive Environmental Response, Compensation, and Liability Act at 42 U.S.C. §§ 9601(14) and (33);
2. Any regulated substance as defined by the Resource Conservation and Recovery Act ("RCRA") at 42 U.S.C. § 6991 (7), whether or not contained in or released from underground storage tanks, and any hazardous waste regulated under RCRA pursuant to 42 U.S.C. §§ 6921 et seq.;
3. Oil, as defined by the Clean Water Act at 33 U.S.C. § 1321(a)(l) and the Oil Pollution Act at 33 U.S.C. § 2701(23); or
4. Other substances that applicable Federal, state, tribal, or local laws define and regulate as "hazardous."

10.0 Reporting

10.1 Marine Protected Species Reporting

As a first measure, survey vessel captains or the Client Representative should provide a cell phone number to Vineyard Offshore's Marine Liaison Officer, Jeannot Smith (jsmith@vineyardwind.com), to gain access to the WhatsApp channel for Vineyard Offshore's Marine Coordination chat. All port arrivals and departures must be reported via this chat.

As a second measure, prior to departure, survey vessel captains should also provide a cell phone number to Kathryn Roy (kathryn.roy@rpsgroup.com), RPS Senior Environmental Specialist, to gain access to the WhatsApp channel for Vineyard Offshore's Protected Species vessel chat prior to departure. Any visual detections of ESA-listed marine mammals and sea turtles should be communicated in near real-time to other survey vessel captains associated with the Project via Vineyard Offshore's Protected Species vessel chat on WhatsApp.

Project vessels must immediately report all NARW sightings to Vineyard Offshore's Environmental Project Managers, Laura Giaimo or Trish Souder (522EnvCompliance@geosubseaconsulting.com / 544EnvCompliance@geosubseaconsulting.com or 507-250-3995 / 417-543-0810), or Senior Project Manager, Megan McManus (mmcmanus@geosubseaconsulting.com or 724-493-9860), who will then immediately inform the appropriate authorities. The NARW sighting report to the authorities must include the time, location, and the number of animals sighted, all of which shall be included in the initial report to Vineyard Offshore.

Project vessels must immediately report all potential takes, strikes, or dead or injured protected species to Vineyard Offshore's Environmental Project Managers, Laura Giaimo or Trish Souder (522EnvCompliance@geosubseaconsulting.com / 544EnvCompliance@geosubseaconsulting.com or 507-250-3995 / 417-543-0810), or Senior Project Manager, Megan McManus (mmcmanus@geosubseaconsulting.com or 724-493-9860), who will then immediately inform the appropriate authorities.

Project vessels must immediately report all dead or injured marine mammals and sea turtles to Vineyard Offshore's Environmental Project Managers, Laura Giaimo or Trish Souder (522EnvCompliance@geosubseaconsulting.com / 544EnvCompliance@geosubseaconsulting.com or 507-250-3995 / 417-543-0810), or Senior Project Manager, Megan McManus (mmcmanus@geosubseaconsulting.com or 724-493-9860), who will then immediately inform the appropriate authorities.

10.2 Avian and Bat Reporting

Project vessels must report all dead or injured birds or bats within 24 hours to Vineyard Offshore's Environmental Project Managers, Laura Giaimo or Trish Souder (522EnvCompliance@geosubseaconsulting.com / 544EnvCompliance@geosubseaconsulting.com or 507-250-3995 / 417-543-0810), or Senior Project Manager, Megan McManus (mmcmanus@geosubseaconsulting.com or 724-493-9860). Reports should utilize the Bird/Bat Injury or Mortality Reporting Form provided by Vineyard Offshore.

10.3 Cultural Resource Reporting

If a Project vessel discovers any potential archaeological resource, Vineyard Offshore's Field Program Manager, Donnie Brouillette (dbrouillette.geosubsea@gmail.com) or Ben Williams (bwilliams.geosubsea@gmail.com), and Vineyard Offshore's Senior Environmental Project Manager, Megan McManus (mmcmanus@geosubseaconsulting.com or 724-493-9860), must be notified immediately so they can inform the QMA and appropriate authorities.

10.4 Marine Trash and Debris Reporting

Project vessels must report all marine debris to Vineyard Offshore's Environmental Project Managers, Laura Giaimo or Trish Souder (522EnvCompliance@geosubseaconsulting.com / 544EnvCompliance@geosubseaconsulting.com or 507-250-3995 / 417-543-0810), or Senior Project Manager, Megan McManus (mmcmanus@geosubseaconsulting.com or 724-493-9860) within 24 hours, who will then inform the appropriate authorities within 48 hours of the incident. Reports should utilize the Marine Trash and Debris Reporting Form provided by Vineyard Offshore.

10.5 Spill and Discharge Reporting

Project vessels must immediately report all spills or discharges to Vineyard Offshore's Marine HSE Advisor, James Pearl (GSS-HSE@geosubseaconsulting.com), Environmental Project Managers, Laura Giaimo or Trish Souder (522EnvCompliance@geosubseaconsulting.com / 544EnvCompliance@geosubseaconsulting.com or 507-250-3995 / 417-543-0810), or Senior Project Manager, Megan McManus (mmcmanus@geosubseaconsulting.com or 724-493-9860), who will then immediately inform the appropriate authorities.

11.0 On-Going Conditions

Vineyard Offshore's Survey Manager shall consult with the Vineyard Wind Environmental Compliance Team at the conclusion of HRG survey activities to ensure that conditions of permits, approvals, authorizations, and agreements that extend beyond the last day of acquisition are adequately addressed.

12.0 Record and Documentation Control

Amendments to this EMP shall be recorded in the EMP Plan History and Revision Record included at the beginning of this document after the Table of Contents.

APPENDIX A

2022-23 Vineyard Offshore Geophysical, Geotechnical, and Environmental Site Characterization Campaign Survey Plans

Vineyard Mid-Atlantic LLC*
Lease OCS-A 0544

Survey Plan

Geophysical, Geotechnical, and Environmental Site Characterization Campaign in Support of a Construction and Operations Plan

Submitted: May 4, 2022
Revised: June 13, 2022
Revised: July 13, 2022
Revised: July 25, 2022
Revised: August 4, 2022

*The OCS-A 0544 lease is held by Mid-Atlantic Offshore Wind LLC. Mid-Atlantic Offshore Wind LLC has changed its name to Vineyard Mid-Atlantic LLC with both the Delaware Secretary of State and the Bureau of Ocean Energy Management (BOEM). Vineyard Mid-Atlantic LLC is a Vineyard Offshore LLC affiliate.

Table of Contents

Appendices

LIST OF TABLES

TECHNICAL ACRONYMS

Acronym	Description
CMECS	Coastal and Marine Ecological Classification Standard
CPT	cone penetration testing
CPTU	cone penetration testing with pore pressure
G&G	geological and geophysical
HRG	high resolution geophysical
MLLW	mean lower low water
MBES	multibeam echosounder
MCS	multi-channel seismic
SPI/PV	sediment profile and plan view imagery
SSS	side scan sonar
SCS	single-channel seismic
SIMOPS	simultaneous operations
SV	sound velocity
SBP	subbottom profiler
USBL	ultra-short baseline

I. Introduction

Vineyard Mid-Atlantic LLC (Vineyard Mid-Atlantic), an affiliate of Vineyard Offshore, submits this Survey Plan (Plan) in accordance with Lease OCS-A 0544 (Lease 544) Addendum C, stipulation 2.1 to support the submission of a Site Assessment Plan (SAP) and/or Construction and Operations Plan (COP) for development of Lease 544. This Plan includes geophysical, geotechnical, and environmental investigations that are expected to begin in 2022 and extend into subsequent years until all necessary data to support a COP are obtained. The scope of work covered under this Plan includes geophysical surveying and geotechnical sampling, as well as environmental sampling and remote sensing, which collectively serve the following purposes:

1. Inform cable routing to select the most suitable path(s) between the offshore wind farm and a mainland landfall position(s),
2. Inform cable design and assessment of burial techniques for the given site conditions,
3. Inform foundation design and wind turbine generator (WTG) siting in Lease 544,
4. Inform of site conditions, particularly sensitive environmental areas and potential cultural resources, and the avoidance and mitigation of impact to those areas,
5. Provision of scientific information in support of SAP and/or COP submittals, and
6. Provision of scientific information for engineering and design efforts associated with project and installation planning.

A highly qualified team of experts will support each campaign from start to finish, including professional marine geophysical, geotechnical, and environmental consultants, qualified marine archaeologists (QMAs), federal and state permitting specialists, and other senior-level experts who have extensive experience in the offshore renewables industry.

II. Government Guidelines

Table 1 identifies the guidelines applicable to the coastal and offshore surveys conducted under this Plan. In accordance with Lease 544 stipulation 3.1.2.3 (Agency Communication Plan [ACP]), the relevant state agencies will be consulted for the portions of the site characterization campaigns that occur in state waters.

Table 1 Agency Guidelines and Publications

BOEM Guidelines
Guidelines for Information Requirements for a Renewable Energy Construction and Operations Plan (COP)
Guidelines for Information Requirements for a Renewable Energy Site Assessment Plan (SAP)
Guidelines for Providing Geophysical, Geotechnical, and Geohazard Information Pursuant to 30 CFR Part 585 (BOEM G&G)
BOEM Publication No. 2018-054, Data Gathering Process: Geotechnical Departures for Offshore Wind Energy, DNV GL Doc No. 10071328-HOU-01, September 2018
Guidelines for Providing Archaeological and Historic Property Information Pursuant to 30 CFR Part 585 (Section 106 of the National Historic Preservation Act and National Environmental Policy Act)

BOEM Guidelines
Guidelines for Providing Benthic Habitat Survey Information for Renewable Energy Development on the Atlantic Outer Continental Shelf Pursuant to 30 CFR Part 585
Guidelines for Providing Information on Fisheries Social and Economic Conditions for Renewable Energy Development on the Atlantic OCS Pursuant to 30 CFR Part 585

III. Background

Lease Area OCS-A 0544, within the New York Bight, is a 43,056-acre site located approximately 37 kilometers (km) south of Long Island, New York in water depths of 40 – 46 meters (m) on the Outer Continental Shelf (OCS; Figure 1). Geophysical, geotechnical, and environmental surveys are planned to be conducted throughout Lease 544 and along potential cable routes.

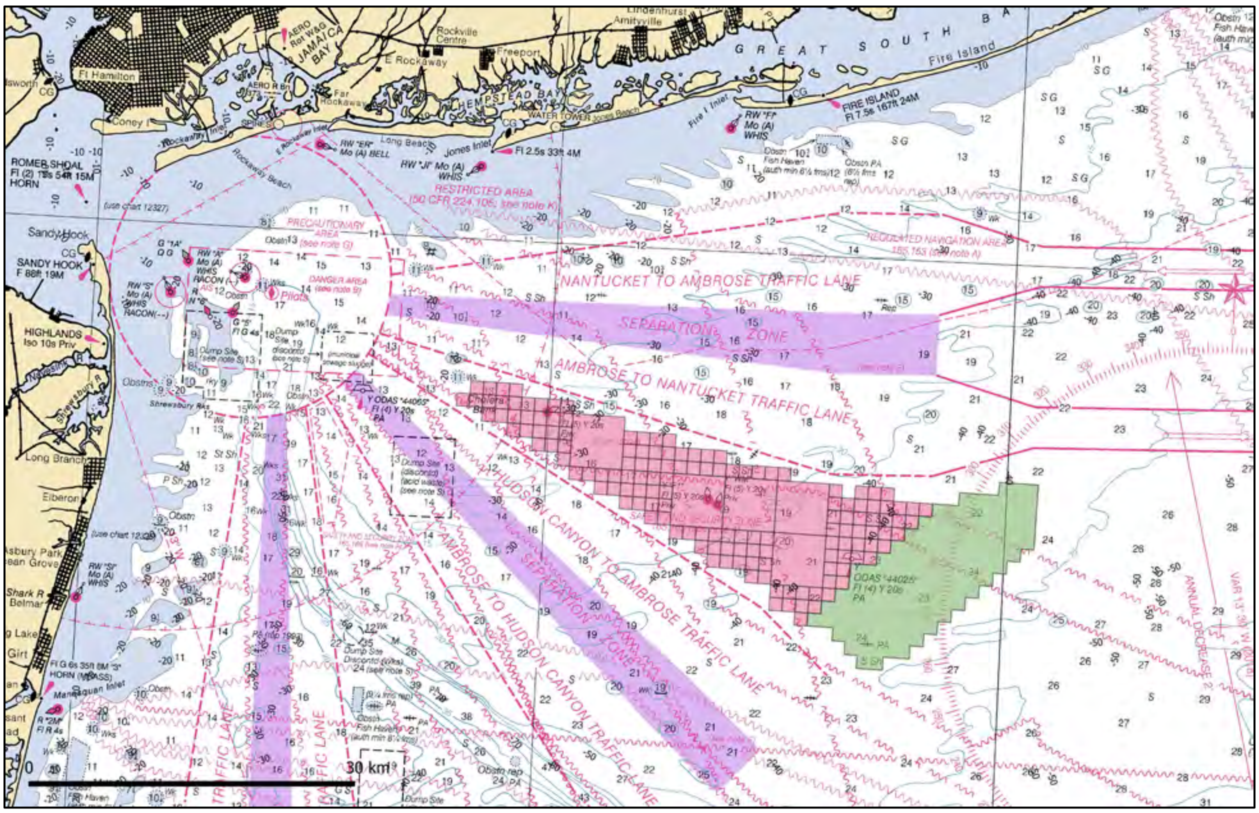

Figure 1: Location of Lease Area OCS-A 0544 (shaded green) in the New York Bight Wind Energy Area. Empire Wind Lease Area OCS-A 0512 (pink shading) is adjacent to the west. Nautical chart 12300 in the background (soundings in fathoms).

Several potential offshore export cable corridors (OECCs) that could connect Lease 544 to landfall locations along the north Atlantic coast are included within this Plan. Due to the sensitive and proprietary nature of this information, the OCS regions and coastal waters where OECCs may occur, and over which surveys described in this Plan will be conducted, are broadly depicted (Figure 2). Siting feasibility for

OECC landfalls is being performed at this time, with potentially viable options located along the south shore of Long Island, the New Jersey coastline, and north up into New York Harbor.

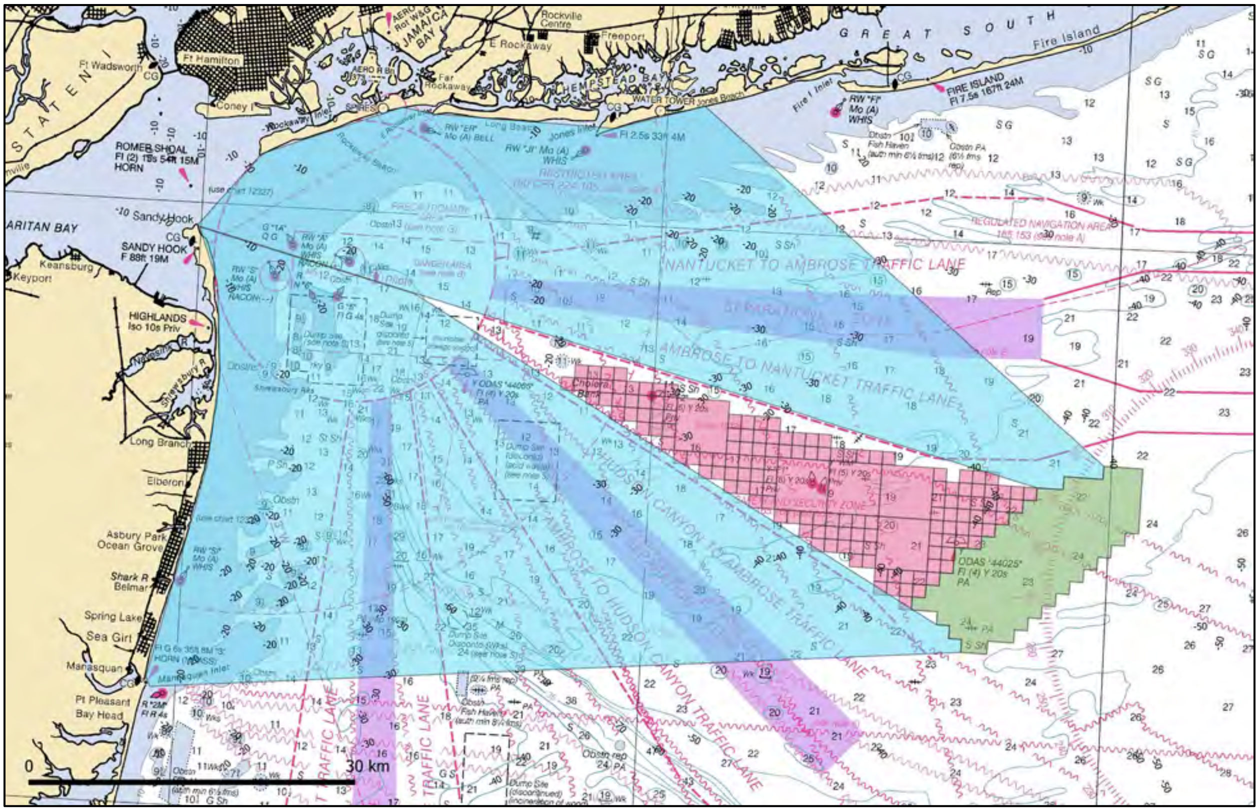

Figure 2: Proposed geophysical, geotechnical, and environmental site characterization campaign area including Lease OCS-A 0544 and potential OECCs (cyan shading) to bring power ashore from Lease 544.

Previous Surveys:

Two site-specific survey datasets were found to exist in the Lease 544 area: the New York State Energy Research and Development Authority (NYSERDA) 2017 Multibeam Echosounder and Benthic Survey dataset and the Hudson North SubArea A 2020 Gardline dataset.

The NYSERDA 2017 Multibeam Echosounder and Benthic Survey was a large-scale bathymetric survey that included some Sediment Profile and Plan View Imagery (SPI/PV) stations performed by Inspire Environmental and subcontractors. As the line spacing for this survey was 3.5 km, this dataset would only be used to provide generalized information of the area. The survey was located east of Lease 544, with the project extents subdivided into four areas (100, 200, 300, 400); Area 200 has minimal overlap with Lease 544 (Figure 3).

The survey produced bathymetric as well as backscatter data from the multibeam echosounder (MBES) system acquisition. SPI/PV is a benthic sediment imaging camera setup. A total of 300 stations were occupied in the survey area.

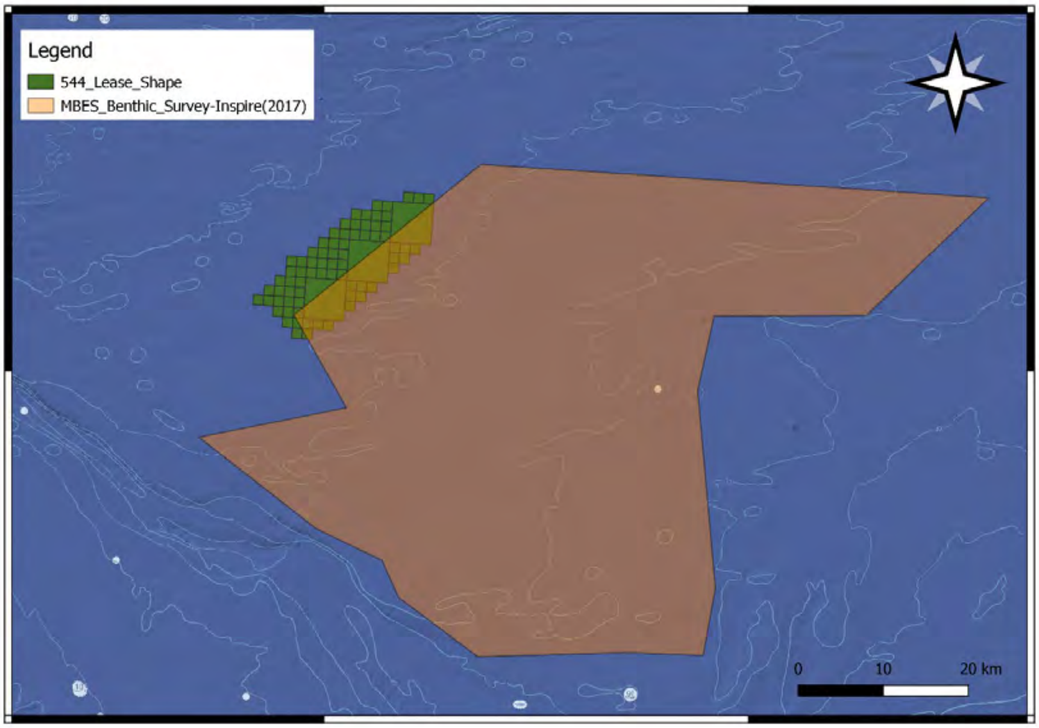

Figure 3: Inspire 2017 survey area 200 coverage (brown shaded area).

The Hudson North Subarea A 2020 Gardline survey was a full geophysical suite reconnaissance investigation. The survey acquired MBES, side scan sonar (SSS), gradiometer, subbottom profiler (SBP), and Ultra High Resolution Seismic data. The primary grid line spacing was 900 m with 4,500-m cross lines (Figure 4) providing reconnaissance level coverage of the original wind energy call area issued by NYSERDA. This dataset could be used to reduce the number of geophysical lines that would be needed for an initial agency submittal.

IV. Survey Plan Details

Surveys will be conducted in accordance with the BOEM Guidelines for Providing Geophysical, Geotechnical, and Geohazard Information Pursuant to 30 CFR Part 585 (May 27, 2020), Guidelines for Providing Archaeological and Historic Property Information Pursuant to 30 CFR Part 585 (May 27, 2020), and other relevant guidelines identified in Table 1. The Plan includes geophysical, geotechnical, and environmental surveys in Lease 544 and along potential OECCs.

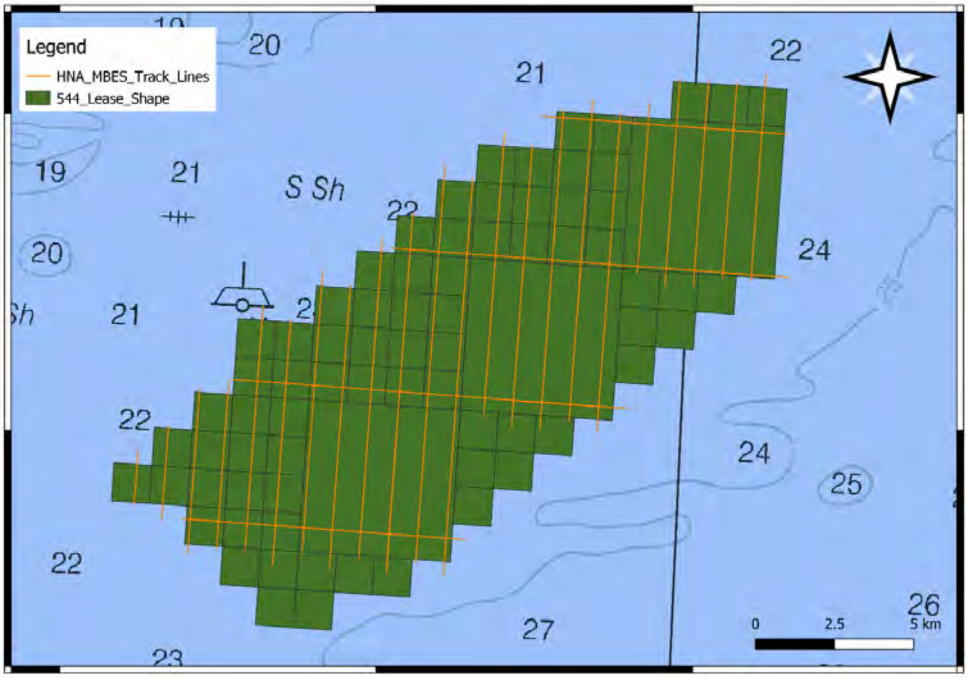

Figure 4: Hudson North Subarea A Gardline reconnaissance survey tracks (2020).

The data acquired in 2022 and beyond will be used to support the preparation of a SAP and/or COP. A full suite of geophysical instrumentation, including multi-channel seismic (MCS), shallow and medium penetration subbottom profilers, MBES, SSS, and gradiometer, as well as geotechnical and benthic sampling equipment (deep boreholes, Cone Penetration Testing [CPT], vibratory corer and grab sampler), and other support systems, may be utilized under this Plan. A final Area of Potential Effect (APE) is not currently known for the project as detailed site data have not been acquired and examined to know the engineering constraints and requirements for the anticipated Project Design Envelope (PDE). Surveys will cover all areas of expected seafloor and subsurface disturbance. Using experience from previous projects as a guide, Vineyard Mid-Atlantic will incorporate conservative lateral and horizontal data coverage to ensure the APE is suitably assessed. Commonly this includes wide corridors (180-700 m) covering component positioning (export and inter-array cables, WTGs, ESPs, landfalls, other construction areas), as well as vertical coverage associated with the same items (cables ~1.5-3 m depths, WTGs-ESPs 40-60 m depths). The APE values will be established as part of the COP submittal in the future.

Note that the surveys described in this Plan will begin in 2022, and will extend as necessary into subsequent years to complete site characterization in support of a COP. The proposed and optional surveys under this Plan include those listed in Table 2.

Table 2 Proposed Surveys[1]

Survey Type	Area to be Surveyed	Anticipated Timeline
Geophysical surveys	Lease 544	August – December 2022
Geophysical surveys	Potential OECCs	August – December 2022 or Spring/Summer 2023
Deep geotechnical reconnaissance investigations	Lease 544	September – December 2022 or Spring 2023
Shallow geotechnical and benthic investigations	Lease 544	August – December 2022 and/or Spring/Summer 2023
Shallow geotechnical and benthic investigations	Potential OECCs	August – December 2022 and/or Spring/Summer/Fall 2023
Unexploded ordnance surveys (optional)	Lease 544 and OECCs	Spring/Summer 2024 – 2025
Full campaign deep geotechnical	Lease 544	Spring/Summer 2024 or 2025

The following sub-sections detail the aim/objective and scope for each survey type. The site characterization campaign for Lease 544 will include multiple vessel mobilizations as required to accommodate the timing of critical tasks (e.g., geotechnical investigations only after the QMA has reviewed geophysical data and cleared) and to complete the full scope of services envisioned for 2022 and beyond.

A. Geophysical Surveys Within Lease 544

The planned geophysical scope in Lease 544 includes full seafloor coverage and data density (line and point spacings) to meet BOEM requirements.

Table 3 General Survey Scope – Geophysical Surveys in Lease 544

Survey Type/Equipment	Description
Geophysical Surveys (systems listed below)	• Full geophysical suite coverage of Lease 544 • 30-m line spacing acquiring all systems on all lines throughout Lease 544

[1] Additional surveys could be required based on results obtained from data collection. Such surveys could include boulder assessment, survey infill and reshoots, compliance studies, etc.

Geotechnical site clearance surveys	• 30-m line spacing centered on proposed sample locations • Minimum 120-m square box for seabed coverage around geotechnical locations • Performed early in the campaign to expedite QMA assessment
Hydrographic Multibeam Echosounder	• Minimum beam width of 120 degrees (60 degrees on each side, system dependent) • Minimum 120-m box covered around geotechnical locations
Side Scan Sonar	• 50-m swath on each side of the centerline • Minimum 120-m box covered around geotechnical locations
Gradiometer survey to identify possible ferrous objects	• Maximum altitude of 6 m • Noise <3 nT to allow picking targets ≥5 nT peak-to-trough
Subbottom Profiling and Single-Channel Seismic	• High frequency, shallow penetration system (e.g., SBP-type or pinger- or chirp-type instrument) • Lower frequency, medium penetration system (e.g., single-channel seismic [SCS] type, boomer, or sparker source instrument) ➢ Suitable for mapping geological horizons and archaeological items of potential interest beneath the OECCs to a minimum depth of 10 m below the seafloor ➢ Suitable for mapping deeper horizons in support of stratigraphic mapping WTG foundation design and engineering, >70m below the seafloor
Multi-Channel Seismic (sparker source; OPTIONAL)	• Suitable for mapping deep geological horizons to >70 m below the seafloor • Ability to resolve beds ~2 m-thick at the greatest depth of interest • Additional lines infilling the 2020 reconnaissance grid may be completed to supplement the SCS data

B. Deep Geotechnical Survey Within Lease 544

The proposed deep geotechnical investigations will be comprised of boreholes, downhole CPTs, and optional seabed CPTs positioned at the WTG locations. The geotechnical data will be used to support ground model development and provide specific engineering properties critical for WTG foundation design.

A subset of the below quantities will be conducted first to provide early deep geotechnical information to support an initial ground model. The initial sampling will be conducted on some WTG locations if they are known at the time. If not, they will be conducted on Lease 544 corners and spread out within the area based on the MCS 2020 data that informs Vineyard Mid-Atlantic of the general subsurface stratigraphy and features present.

Table 4 General Anticipated Survey Scope – Deep Geotechnical in Lease 544

Survey Type/Equipment	Description

Boreholes	• Stations up to 100-m depth with P-S logging, shallower depth at some stations
	• ASTM soil classification standards (or similar recognized standard) will be used
	• Minimum soil disturbance
	• Minimum sample diameter of 70 millimeters (mm)
	• Maximum vertical data gap of 0.2 m
	• Only seawater can be used as drilling fluid unless alternatives are approved
	• Potential sampling and oversampling methods, listed in order of preference:
	  • Piston thin wall sampler
	  • Push thin wall sampler
	  • Push thick wall
	  • Hammer sampler
	  • Rotary coring
	• Storage and transport of soil and rock samples must be in accordance with ASTM D 4220-95(2000) and ASTM D 5079-02
	• Optional near-continuous cone penetration testing with pore pressure (CPTU)
	• 0 – 40 m below seafloor: Maximum data gap = 0.20 m
	• >40 m below seafloor: Next CPTU started from nearest 0.50 m mark from refusal depth of the previous push/test (maximum data gap = 0.50 m)

Continuous piezocone penetration testing (down the hole CPTU)	• Tests up to 100 m depth, shallower depth at some stations
	• Measures tip resistance, sleeve friction, and pore pressure
	• Minimum penetration of 15 m
	• If the 10-m requirement is not met in the first attempt, a second (and possibly a third) re-test will be performed to try to meet the requirements
	• 10 and 15 square centimeters (cm^2) cones will be used
	• Tests carried out in accordance with ISO 22476-1:2012
	• Only class 2 or higher will be assessed in-class and accepted
	• Filter stones will be fully saturated
	• Test stopped if:
	  • Capacity of cone is reached
	  • Inclination of 10 degrees
	  • Sudden jump in inclination or tip resistance is observed

Optional continuous seabed CPTU	• Tests up to 40 m depth • Measures tip resistance, sleeve friction, and pore pressure

Survey Type/Equipment	Description

	• Minimum penetration of 10 m
	• If 10 m requirement is not met in the first attempt, a second (and possibly a third) re-test will be performed to try to meet the requirements
	• 10 or 15 cm^2 cones will be used
	• Tests carried out in accordance with ISO 22476-1:2012
	• Only class 2 or higher will be assessed in-class and accepted
	• Filter stones will be fully saturated
	• Test stopped if:
	  • Capacity of cone is reached
	  • Inclination exceeds 10 degrees
	  • Sudden jump in inclination or tip resistance is observed

C. Geophysical Survey Along Offshore Export Cable Corridors

OECC options for linking the offshore wind farm to shore are being considered based on desktop studies (existing research and data publicly available) to assess expected conditions. Figure 2 shows the OCS region where OECCs may be investigated.

An initial geophysical reconnaissance survey designed for mapping seabed and habitat conditions along potential OECC(s) will be conducted. A full corridor geophysical survey along with shallow geotechnical and environmental sampling along the preferred OECCs will be the next step in the survey sequence.

Table 5 General Survey Scope – OECCs

Survey Type/Equipment	Description
Reconnaissance survey along potential OECCs	OECCs connecting Lease 544 to potential landfall locations in New York and/or New Jersey
Full OECC COP detailed high-resolution geophysical surveys (chosen alignment)	• 30-m line spacing federal waters and line spacing consistent with state requirements in state waters • All systems run on every survey line
Geotechnical site clearance surveys	• Seven primary lines at 30-m spacing, and one tie line through the center • Covers a minimum 120-m square box at each geotechnical location
Hydrographic Multibeam Echosounder	• Minimum beam width of 120 degrees (60 degrees on each side, system dependent) • Minimum 120-m box covered around geotechnical locations
Side Scan Sonar	• Reconnaissance = 75-m sweep range (each side of centerline) • Detail surveys = 50-m sweep range

Survey Type/Equipment	Description
	• Minimum 120-m box covered around geotechnical locations
Magnetometer survey to identify possible ferrous objects along the OECCs	• Single magnetometer or gradiometer used for route reconnaissance surveys only • Maximum altitude of 6 m • Noise <3 nT to allow picking targets ≥5 nT peak-to-trough
Gradiometer survey to identify possible ferrous objects	• Multiple magnetometers used for the preferred OECC detailed COP survey • Maximum altitude of 6 m • Noise <3 nT to allow picking targets ≥5 nT peak-to-trough

Subbottom Profiling and Single-Channel Seismic	• High frequency, shallow penetration system (e.g., SBP type or pinger- or chirp-type instrument)
	• Lower frequency, medium penetration system (e.g., SCS-type, boomer, or sparker source instrument)
	    • Suitable for mapping geological horizons and archaeological items of potential interest beneath the OECCs to a minimum depth of 10 m below the seafloor
	    • Suitable for mapping geologic horizons in support of shallow stratigraphic mapping for the QMA pre-contact assessment to >20m below the seafloor

D. Shallow Geotechnical Surveys

Along with the geophysical and benthic habitat survey, the shallow geotechnical data will be used to assess overall OECC feasibility. The geotechnical data will also be used to ground-truth the geophysical data collected for mapping subsurface geological horizons important for archaeological resource evaluation and cable design and burial assessment. The shallow geotechnical data is acquired along the potential OECC and inter-array cable alignments at variable spacings. Often a larger sample spacing is adequate over expansive homogenous seabed areas, whereas closer sample spacings are necessary in higher variability areas. SBP and SCS profile data are reviewed to inform the team of shallow subsurface features of interest for ground truthing, both from an engineering and archaeological assessment standpoint.

All geotechnical sampling is performed after geophysical data have been analyzed and reviewed by the QMA.

Table 6 General Survey Scope – Shallow Geotechnical

Survey Type/Equipment	Description
CPTs/Vibracores	• CPTs and vibracores spaced approximately every 1 – 2 km along one or more OECC and inter-array alignments • Vibracores and/or CPTs collection guided by the QMA and project geologists following preliminary geophysical data review

Vibracores	• Minimum requirements for first attempt
	  • Penetration of at least 3 m
	  • Recovery of >67% required
	• If minimum requirements are not met in the first attempt, a second (and possibly a third) attempt will be performed to try to meet the requirements
	• Vibracores will be cut in 1-m sections, photographed, logged, and torvane and pocket penetrometer testing will be carried out at section ends. The liner will be sealed, capped, taped securely shut, labeled, and carefully stored for further archaeological and geotechnical testing

Piezocone penetration testing	• Measures tip resistance, sleeve friction, and pore pressure • Minimum penetration of 3 m • If the 3-m requirement is not met in the first attempt, a second (and possibly a third) re-test will be performed to try to meet the requirements • Only class 2 or higher will be assessed in-class and accepted

E. Environmental Surveys

Grab samples and underwater video will be used to perform benthic habitat mapping along the potential OECCs and in Lease 544. General characterization studies detailed in the BOEM Guidelines for Providing Benthic Habitat Survey Information for Renewable Energy Development on the Atlantic OCS Pursuant to 30 CFR 585 (June 2019) are planned. Benthic habitats and organisms will be identified from the grab samples and underwater imagery. The sediment recovered from the grabs will also be described and subjected to grain size analysis. The grab samples will be used to ground-truth the SSS imagery to help determine the nature of the surficial material and distribution of benthic habitats in the survey area. The latest National Marine Fisheries Service (NMFS) guidelines will be followed (March 2021) for habitat mapping with all benthic classifications based on the Coastal and Marine Ecological Classification Standard (CMECS).

Grab samples and underwater video transects throughout the OECCs and Lease 544 at 1 – 2 km spacing will be obtained. Sampling and video transect locations will be guided by sensitive habitat locations and general seabed conditions. Often a larger sample spacing is adequate over expansive homogenous seabed areas, whereas closer sample spacings are necessary in higher variability areas.

Table 7 General Survey Scope – Environmental Surveys

Survey Type/Equipment	Description

Grab sampling methodology	• Attached underwater camera
	• Replicates as needed
	• Photographed, described, and subsampled on deck
	• Benthic analysis (two subsamples)
	    • 500-micron mesh sieve used for enumerating benthic infauna
	    • Grain size analysis (one subsample)

Underwater video	• Video speed <1 kt • Ultra-short baseline (USBL) in water depths >9 m

V. Survey Equipment

A combination of the following equipment (or equivalent) may be utilized for the geophysical, geotechnical, and environmental site characterization campaign based on prior years' experience and knowledge of the industry-standard systems being offered by the survey contractors. Industry-standard equipment includes but is not limited to the equipment presented in Table 8 (geophysical systems), Table 9 (geotechnical equipment), and Table 10 (environmental).

Table 8 Industry Standard Geophysical Systems

Systems	Full geophysical suite of instruments including multibeam, SSS, magnetometer, shallow (chirp) and medium (sparker) penetration single-channel subbottom profilers, and all support systems (positioning, motion sensor, sound velocity profiler, etc.) • Applanix POS MV with Trimble Nav-Beacon/U.S. Coast Guard (USCG) differential receiver • Sonardyne Scout Pro USBL • Reson 7125 MBES • Odom HydroTrac single beam echosounder • Klein 3900 SSS • Geometrics Transverse Gradiometer with dual G882 magnetometers • Teledyne-Benthos CHIRP III shallow subbottom profiler • GeoMarine Geospark 1000J medium penetration SBP with 200 tip sparker source and 8 element single-channel GeoEel streamer • Teledyne-Oceanscience RapidCAST sound velocity profiler • Generation 3 night-vision goggles (NVG) for Protected Species Observer (PSO) mitigation • Atlas H10 Offshore Corrections Differential Global Positioning System • SBG Ekinox 2-U Motion Sensor • Applanix POSMV M5 • Hemisphere VS330 Global Positioning System Receiver • R2Sonic 2024 MBES system • Knudsen 3212 200 kilohertz (kHz) SBES system • Oceanscience Underway CTD system

	• AML Base-X SVP sensor • Valeport Mini SVP sensor • Applied Acoustics Easytrak Nexus 2 USBL System with AA 1019 mini beacons • Edgetech 4200/4205 dual frequency SSS (300/600/900 kHz) with Edgetech topside processor • Knudsen 3260 2x2 SBP Array (3.5kHz) Pinger • Applied Acoustic Dura-spark 200/400 seismic system with AA CSP-N (2400J) power supply • Geometrics G-882 Cesium Marine Magnetometer • Sonardyne Mini-Ranger 2 USBL system for underwater positioning

Table 9 Industry Standard Geotechnical Equipment

Systems	• Top drive power swivel boring rig with split spoon or wireline push sampler • Wireline CPT tool for downhole piezocone penetration testing • 20-ton Seabed CPT for piezocone penetration testing Twin-derrick GMTR120 geotechnical drill rig, a fully heave-compensated rotary flush marine drill with a 5.5-inch API drill string driven by an EDECO Hydraulic power swivel (or equivalent) Downhole tools: • Hydraulic piston/push sampler, percussion/hammer sampler • WISON-APB Piezocone Penetration Test (PCPT) with 5or 10 cm^2 cones • Rock Coring bit / barrel combination • Seismic Cone Penetration Test with 10 cm^2 cones Manta-200kn seabed PCPT with 10 or 15 cm^2 cones Drilling performed with a standard 5-inch API drill pipe fitted with a five wing drag bit. Bottom Hole Assembly, comprised of standard drill collars plus a specially adapted collar containing a series of landing and latching rings designed to accommodate and allow the use of the various sampling, in situ testing, and non-coring tools. "WISON-APB" push sampler system with a minimal 70 mm inner diameter "Shelby" sampling tube mounted on a sample latching tool. "WISON-APB" downhole PCPT system with 10 or 5 cm^2 electrical cones. PS logger probe <u>Vibratory corer</u>, pneumatic and electric systems; 3.5-4-inch diameter, 3 – 4 m long barrels with cutter heads and core/sediment catcher. Designed for shallow subsurface sampling of unconsolidated materials up to gravel and cobble size. Specifically applicable for cable burial assessment and sediment property suitability for housing power cables. <u>Seabed CPT system</u>, shallow penetration (3 – 10 m), e.g., Neptune 3000-5000; CPTU systems mounted on seabed frames with varying thrust capacity, smaller cone sizes (2 – 10 cm^2). Measure axial load, sleeve friction, pore pressure, tip resistance, axial tilt, and hydrostatic pressure. Complementary system to the vibracore for obtaining information on more sediment properties to help define the variations in material layering.

Table 10 Industry Standard Environmental Survey Equipment

Systems	Modified Day grab sampler, Van Veen power grab, or Smith McIntyre grab sampler, each with attached camera; samplers have 0.1 square meter surface area and retain approximately 15-liter volume of material Gravity BM500 Video Sled with DOER Marine HP Lasers, a DeepSea Power and Light W-Eye Camera and DeepSea Power and Light LED wide lights. SeaRover/DSSI SeaMax MK2 Survey Class ROV with Sony UMC S3CA 4K HD video camera, scaling lasers, powerful thrusters, and LED lighting. Kongsberg/Simrad OE Model Cameras with low light-sensitive lens, LED lighting, auto focus, and software overlay tool. Additional support systems (or equivalent) include: • Applanix POSMV OceanMaster with USCG Differential Corrections and PPK capability • Sonardyne Scout Plus/MiniRanger 2 USBL (35 – 55 kHz) • YSI CastAway CTD, AML SVP

VI. Survey Methods and Activities

A. High Resolution Geophysical (HRG)

Nearshore survey operations will be performed to make optimal use of the tidal conditions and, when applicable, tracklines will be run along preferred orientations with respect to the prevailing currents with tight control of vessel speed. This will help maintain towed sensor positions and help keep the vessel on line when surveying potential OECCs. In the open waters of the Atlantic Ocean found within Lease 544, currents are less severe than some constricted waterways nearshore, but still ever-present and variable; therefore, towed sensor position is tracked accurately with an ultra-short baseline (USBL) system, and vessel steering and line keeping monitored constantly.

Sediment transport is common in the area and is observed in the seafloor geomorphology as bedforms that migrate along the bottom. If there are larger, longer period sand waves present along any routes, towed sensors can be raised and lowered to maintain recommended heights for the SSS and gradiometer given appropriate vessel speed. If the wavelength of the bedforms decreases, typically the sensors stay within the 6-m guideline over the troughs and may be much closer to the seafloor over the crests. Careful planning of the preferred survey direction for the given tidal conditions will assist in meeting these requirements.

Specific attributes of the geophysical systems and methods are discussed below.

1. Navigation and Sensor Positioning

Vessel positioning will be accomplished using industry-standard Global Positioning System (GPS) techniques to achieve a total horizontal uncertainty at the 95% confidence level of 2 m (IHO special order survey requirement, worst-case accuracy). It is expected that more accurate positioning can be achieved offshore. Differential GPS (DGPS) solutions (e.g., U.S. Coast Guard [USCG] or private reference stations) will be utilized to obtain this accuracy interfaced to a sophisticated Global Navigation Satellite System aided inertial navigation system. These systems are the most widely used positioning solution for multibeam data acquisition as they provide integrated DGPS, inertial navigation, motion, and heading to obtain highly accurate position and orientation measurements. Additional post-survey applications afford further position processing to increase horizontal and vertical accuracies even more.

All GPS and associated data strings are imported to the navigation software (e.g., QINSy, Hypack, etc.) for positioning other ancillary devices that are a part of the geophysical instrument suite. These software programs allow full control over positioning and recording external system digital data and provide useful post-survey data review and processing tools for offline work onboard the larger vessels.

For towed sensors, a USBL underwater acoustic positioning system will be used in water depths greater than 9 m. This system is interfaced with the navigation software such that range, azimuth, depth, motion, and supporting USBL data are used to calculate the true x, y position of the USBL beacon attached to the towed sensor. Those coordinates are then exported out of the navigation software to the external geophysical towed system's computers (SSS, magnetometer). In this manner, offset and layback corrected positions are recorded in the towed system digital files in real-time.

2. Multibeam Echosounder and Data

A multibeam bathymetry system will be used to record water depth measurements and backscatter ("snippets") in a swath covering the seafloor. These systems typically utilize 200 – 400 kilohertz (kHz) frequencies over 120 – 200 degree angles to cover usable swath widths of three to five times the water depth. Depth values will be adjusted for sound velocity (SV) using CTD or SV profiler measurements. The systems have an SV probe at the transducer for continuous surface measurements, and frequent CTD/SV casts for the entire water column supplement these surface data. Moving vessel profilers are preferred so the vessel does not have to stop to obtain a sound velocity cast. Precision motion data (heave, pitch, roll, yaw) are also recorded to position the soundings accurately on the bottom. During the survey, vessel speed, ping rate, beam width, and other parameters are closely monitored and controlled to ensure that a suitable quantity of soundings per square meter on the seafloor is achieved.

For vertical control and referencing of the water depths to the mean lower low water (MLLW) datum, PSO data logged during the survey contains GPS altitudes that can be post-processed to achieve a tightly coupled PPK (post-processed kinematic) solution. The resulting NAD83 ellipsoid referenced points can be converted to MLLW using the National Oceanic and Atmospheric Administration's VDatum software by applying the smoothed best estimate of trajectory (SBET) file from the POSPac software. The final processed water depth data will meet IHO S-44 Order 1a requirements.

3. Side Scan Sonar and Imagery

Dual-frequency SSS imagery (e.g., 300/600 kHz, 445/900 kHz) will be acquired to record the acoustic reflectivity of the seafloor. The combination of lower and higher frequency transmissions was designed to satisfy the range and resolution desires of operators. A sonar sweep range of 50 – 75 m will be employed to obtain high-resolution imagery in all survey areas. A 50-m sweep range is used for detailed survey work and the 75-m sweep range is utilized for the reconnaissance lines to cover more area. The towfish is "flown" at a height of 10 – 20% of this range above the bottom to obtain optimal image results. During sea trials, sweep range, pulse length, ping rate, and frequency will be optimized to meet a target size detection criterion of 0.5 m.

In deeper water (i.e., > 9 m), the sonar towfish will be positioned using the USBL system with a beacon either integrated into the towfish or attached just above on the tow cable. Properly corrected towfish geo-referenced positions will be input to the digital sonar files in real-time via the navigation software interface. A position accuracy of 3 – 5 m is estimated for the deeper water depths expected for this survey. For shallow water areas where water column noise can affect the USBL, a cable counter is planned for use to provide towfish layback corrections. Overall, position accuracy increases as water depth decreases.

4. Magnetic Intensity Measurements

A gradiometer system, such as a dual Geometrics G882/Transverse gradiometer, will be utilized to detect ferrous materials on and below the seafloor. The system will include an altimeter to measure and record the height of the sensor above the seafloor, which will be maintained at less than 6 m if possible. Each gradiometer sensor will have a counter sensitivity of <0.004 nT/√Hz rms and an absolute accuracy across the range (20,000 – 100,000 nT) of <2 nT. The data sampling rate will be greater than 4.0 hertz (Hz) to ensure sufficient data point density and is typically up to 10 Hz. Data will be constantly monitored to ensure background noise remains below 3 nT. The magnetic data may be recorded by the navigation software or a separate stand-alone computer package.

The gradiometer will be towed at a distance from the survey vessel to minimize magnetic interference from the vessel. This distance is normally expected to be at least three times the length of the vessel, but shorter distances are acceptable if interference levels can be demonstrated to be acceptably low. If the gradiometer is piggy-backed to other equipment, such as a SSS towfish, sufficient distance to prevent interference from the towfish will be ensured. The gradiometer will be positioned using USBL tracking in water depths <10 m and cable layback in shallower waters. In very shallow waters, the magnetic sensor may be floated on the surface and towed separately to optimize data quality and vessel maneuverability without the use of a USBL.

5. Subbottom Profiling

To gather information on the shallow subsurface, two different seismic reflection-type systems will be utilized: a high frequency, shallow penetration SBP-type system (e.g., pinger or chirp source instruments) and a lower frequency, medium penetration, single-channel seismic (SCS) system (e.g., boomer/sparker source instrument). Chirp and pinger SBPs are optimized to investigate the top 10 m below the seabed, but in areas such as Rhode Island Sound, Nantucket Sound, and elsewhere along the OCS, penetration is often limited to the upper few meters due to the presence of compact sands and coarser deposits. In these geologic settings, a lower frequency system is needed to penetrate and resolve sediment layers up to 10 m below the potential depth of disturbance for cable installation and geotechnical sampling. Boomer/sparker and chirp/pinger systems complement each by providing the resolution and penetration needed to assess the shallow subsurface geology. Chirp/pinger systems, due to their higher frequency content, are capable of resolving 30-centimeter-thick layers in the upper 3 m while the boomer/sparker's lower frequency can achieve resolution of 2 m or less in the upper 10 – 20 m. The SCS system will also be utilized to infill the MCS data coverage and image deeper stratigraphy below the seafloor where possible.

Chirp/pinger SBPs are commonly hull-mounted or towed on a short cable off the side or in a moon pool of the vessel. Boomer/sparker systems consist of a towed catamaran that houses the sound source (an electro-mechanical plate or sparker electrodes) and a towed, eight to 10-element hydrophone single-channel streamer, which records the signal. A boomer system will emit a short duration outgoing pulse and the tow configuration will be optimized to minimize ghosting, which masks real subsurface reflectors. Additionally, the boomer system will be configured so that both the source and streamer are positioned outside the vessel wake and prop wash to minimize unwanted noise on the recording.

6. Multi-Channel Seismic

MCS data may be acquired in Lease 544 to provide the information needed to supplement the subsurface ground model to a depth that is 10 m greater than the maximum depth of disturbance from a potential WTG foundation. The MCS survey will make use of a sparker-type seismic source (~500 – 1,000 joules) that can generate a repeatable, broadband (~0.5 – 4 kHz) signal to penetrate nearly 100 m below the seabed and resolve layers as thin as 2 m. The sparker system will be fired approximately every meter and a calibrated hydrophone will monitor the source signature as well as the tow depths of the source and streamer.

The multi-channel streamer used for the survey will have front end and tail buoys with GPS or radio transponders to monitor streamer feathering. The streamer will be towed at a depth of ~0.5 m to ensure the surface ghost does not degrade the frequency spectrum and reduce the vertical resolution. The group interval will be less than 3.125 m to allow for high horizontal resolution and the length of the streamer will be greater than the maximum target depth to improve velocity analysis and multiple suppression.

B. Shallow Geotechnical

Shallow geotechnical information will be obtained in Lease 544 and approximately every 1 – 2 km along the proposed OECCs using co-located as well as alternating vibracores and CPTs. The total number of locations and type of sampling will be finalized after geophysical data has been analyzed and reviewed by the project geologist and QMA. The number of samples may also be driven by the results of initial geotechnical information results as the field program progresses. Sampling may be reduced in areas that present consistent ground conditions.

This approach is consistent with Guidelines for Providing Geophysical, Geotechnical, and Geohazard Information Pursuant to 30 CFR Part 585 (May 27, 2020). Where possible, geotechnical sample stations will be strategically positioned to sample subsurface features interpreted from the subbottom profile data. This could include potential pre-Holocene intact strata (ravinement surface, possible archaeological significance), possible buried paleofeatures or submerged ancient landforms, or coarse deposits suggesting difficult burial conditions.

The vibratory coring method will recover samples with at least a 70-mm diameter, a minimum penetration of 3 m, and a minimum recovery of 67%. If either the penetration or recovery criteria are not achieved, at least one re-test shall be carried out. If the required penetration is not achieved on the re-attempt, the Offshore Client Representative may instruct a third attempt. Core catchers and drill bits will be available to maximize the penetration and recovery in the expected soils. Upon recovery to the deck, the vibracores will be cut in -m sections, photographed, and geologically logged; the section ends will be subjected to torvane and pocket penetrometer testing. The liner will be sealed, capped, taped securely shut, labeled, and carefully stored for further testing.

Piezocone penetration testing will measure soil properties (tip resistance, sleeve friction, and pore pressure) at the same locations and over the same vertical zone (~3 – 4 m) as the vibracores. The size and capacity of the cones will be agreed upon prior to mobilization to produce the best results given the site conditions along the OECCs. A minimum penetration of 3 m is required. Like the vibracore sampling program, if a 3 m penetration is not achieved in the first attempt, a second (and possibly a third) re-test will be performed.

The tests will be carried out in accordance with ISO 22476-1:2012 Geotechnical investigation and testing – Field testing – Part 1: Electrical cone and piezocone penetration test. Zero readings of all sensors shall be recorded before and after each test. The drift readings shall be calculated, and the class of each data reading calculated in accordance with ISO 22476-1:2012. Only class 2 or higher will be assessed as in-class and accepted. Class 3 or lower will be considered out of class. Continuous deck-to-deck readings will be taken and recorded for all tests and filter stones shall be fully saturated before each test. The test will be stopped if the capacity of the cone is reached, an inclination of 10 degrees is reached or a sudden jump in inclination or tip resistance is observed.

C. Deep Geotechnical

A deep geotechnical campaign may be undertaken initially using a large floating drillship that will most likely hold position using a dynamic positioning system – although there is a possibility that anchors may also be used. A heave compensated drill frame will be used that shall have the option to either undertake downhole CPTs or undertake wireline core drilling. Some basic sample testing will be undertaken on board the vessel, however more extensive and advanced testing will be undertaken at onshore laboratories. P-S logging is planned at all boring locations after continuous sampling has been performed. Continuous CPTs may be acquired using a similar vessel with a seabed mounted CPT rig.

The deep geotechnical campaign will consist of multiple continuous sampling boreholes (up to 100 m depth below the seafloor) with P-S logging and multiple downhole near-continuous CPTs (up to 100 m depth). Downhole near-continuous CPT boreholes will require that the maximum data gap allowed between a push/test that met refusal and a subsequent CPT push/test be less than 0.2 m up to 40 m below the seafloor and 0.5 m at depths greater than 40 m. For soil sampling, several methods are being considered. These methods in order of preference are:

- Piston thin wall sampler
- Push thin wall sampler

- Push thick wall
- Hammer sampler
- Rotary coring

Soil borings, sampling, and handling will be carried out in such a way that there is minimum disturbance to the soil to be sampled or tested. The minimum sample diameter acceptable is 70 mm and the maximum vertical data gap between samples will be 0.2 – 0.5 m depending upon the depth below the seafloor. Only seawater can be used as a drilling fluid unless alternatives are approved. The storage and transport of soil and rock samples must be in accordance with ASTM D 4220-95(2000) and ASTM D 5079–02.

Continuous seabed CPT data will be performed in Lease 544 with the same requirements as the shallow geotechnical CPTs except that the minimum penetration accepted is 10 m. The seabed CPT program will consist of multiple tests up to 40 m below the seafloor.

D. Benthic Sampling and Mapping

Grab samples are collected for benthic analysis and provide ground-truthing of the SSS imagery and other geophysical data needed to perform surficial sediment mapping. The samples will be strategically located to provide material and data to support as many analyses and project tasks as possible. The grab sampler will have an underwater camera attached to the frame or downline to record images of the seafloor at the sample locations. Once on deck, the grab sample will be photographed and three subsamples will be retained (one for grain size analysis and two for benthic analysis). Replicates will be obtained to meet NMFS guidelines when appropriate.

An underwater video system will also be used to aid benthic habitat mapping. The video survey speed will be maintained at less than 1 knot to assure the acquired video footage can be used for organism identification on the seafloor. In water depths greater than 9 m, a USBL will be used to position the video sled. Synchronized time on the video camera and navigation systems will allow time tags to be generated post-survey along the USBL tracklines that will show the camera position correlated directly to the time display on the video recording. The imagery will be used to ground-truth surficial sediment types, delineate benthic habitat areas, and identify benthic communities on the seafloor.

Sampling methodology outlined in the NMFS guidelines (March 2021) will generally be followed, with fewer samples considered over large areas of homogenous seabed and habitat conditions. CMECS will be adhered to for defining sediments from the grabs and estimating visual seabed types from the video analysis.

E. Survey Vessels

Multiple vessels may be performing survey duties simultaneously in different sections of the OECCs and within Lease 544. Simultaneous operations (SIMOPS) between vessels will be coordinated to ensure that any separation distances required to avoid overlapping sound signatures are maintained. The maximum quantity of vessels planned at this time is four: two geophysical, one geotechnical, and one environmental. No more than three vessels will work simultaneously in different portions of the project areas.

Furthermore, to increase survey efficiency and production while reducing project costs, and effectively meet the timing required of the geophysical and geotechnical efforts, the vessels, survey equipment, and scientific crews will be mobilized to the site to conduct work for multiple tasks simultaneously. This will be a highly coordinated effort for program logistics with the intention of minimizing the survey time onsite.

More details on survey resources (quantity of vessels, equipment specification sheets, companies involved) will be provided to BOEM toward the end of the procurement when contractor(s) are selected.

VII. Survey Timeline

Field investigations are expected to begin in the summer of 2022 with the duration of the work ultimately dependent on the final scope of the investigations performed. The survey tasks will likely be completed by up to four vessels (nearshore and offshore), subject to any restrictions imposed by the final Incidental Harassment Authorization (IHA) from NMFS. Survey operational scenarios of 12- and 24-hour days are being considered. Depending on contractor and vessel availability, the field operations may not be performed sequentially. Expected activities by year are presented in Table 2.

The detailed survey timeline for the 2022 mobilization is outlined in Table 11.

Table 11 Proposed 2022 Survey Schedule and Pre-survey Requirements

Work	Approx. Date
Survey Plan submittal to BOEM	May 4, 2022
BOEM pre-survey meeting	TBD (at BOEM's request)
Tribal pre-survey meeting invitations sent out via certified mail	June 10, 2022
Tribal pre-survey meetings	June 27 – July 1, 2022
Estimated submittal of PSO resumes to BOEM for NMFS approval	July 26, 2022
Survey Start Date	August 2, 2022
2022 Survey End Date *	December 31, 2022

Notes:
*The above survey dates are estimates and may change subsequent to receipt of updated information from BOEM and the availability of survey resources. Due to the possibility of poor weather in the fall, unforeseeable project variations, and commercial constraints, the planned 2022 field program may extend into 2023.

VIII. Protected Species Impact Mitigation Plan

In accordance with Lease 544 stipulation 5.2.1, Vineyard Mid-Atlantic will comply with the standards in the Project Design Criteria (PDCs) and Best Management Practices (BMPS) dated November 22, 2021, as well as an Incidental Harassment Authorization (IHA) which requires that PDCs 4, 5, and 7 be followed. The draft IHA is available at https://www.fisheries.noaa.gov/action/incidental-take-authorization-vineyard-northeast-llc-marine-site-characterization-surveys.

Based on coordination with BOEM and NMFS, the specific PDCs that will be followed are:

PDC 3 Marine Trash and Debris Awareness and Prevention
PDC 4 Minimize Interactions with Listed Species during Geophysical Survey Operations
PDC 5 Minimize Vessel Interactions with Listed Species
PDC 7 Protected Species Observers
PDC 8 Reporting

Based on its extensive experience on Vineyard Wind 1, Vineyard Mid-Atlantic has well-established protocols and training modules (slide presentations and videos) to ensure that the PDCs are followed. All vessel crews must attend Vineyard Mid-Atlantic's Offshore Environmental Training Program before deployment. The program covers archeological resources, avian and bat protection, marine debris prevention, discharges and spills, marine mammal exposure mitigation, vessel strike avoidance measures, and basic species identification.

Because survey activities may occur at night or during low-visibility conditions, Vineyard Mid-Atlantic has incorporated an Alternative Monitoring Plan (AMP) as required by BMP 7 under PDC 4. Mitigation measures, including the AMP, specific to listed species are presented in Table 12 - Monitoring and Mitigation Measures Implementing PDCs.

Table 12 Monitoring and Mitigation Measures Implementing PDCs

Monitoring and mitigation measure	Description
Seasonal Restrictions	▪ The monitoring team will consult NOAA Fisheries North Atlantic right whale (NARW) reporting systems for any observed NARWs, and established SMAs, DMAs or Slow Zones throughout survey operations.
Clearance Zone	▪ Clearance zones (CZs) will be monitored around the center of the acoustic sources (CHIRP SBPs, boomers and sparkers) for marine mammals. ▪ CZs will be monitored for all listed species for 30 minutes to ensure that no marine mammals are present before any CHIRP SBPs, boomer or sparker sources are initiated. ▪ The following CZs will be implemented during operations of CHIRP SBPs, boomer or sparker sources: o 500 m (656 ft) for all listed species ▪ The CZ must be visible to the naked eye or using appropriate visual technology during the entire clearance period before commencing operations of CHIRP SBPs, boomers and sparkers. ▪ If any marine mammal is observed within the CZ during the 30-minute clearance period, ramp-up will not begin until the animal(s) is/are observed exiting the CZ, or until an additional time period has elapsed with no further sightings (i.e., 30 minutes).
Ramp-up for HRG sources	▪ Ramp-up will not be initiated during periods of inclement conditions or if the CZ cannot be adequately monitored by PSOs using appropriate visual technology for a 30-minute period. ▪ A ramp-up begins with the powering up of the smallest acoustic HRG equipment at its lowest power output. When technically feasible the power is then gradually turned up and other acoustic sources added such that the source level increases gradually. ▪ PSOs will stand-watch for a minimum of 30 minutes to ensure the CZs are clear of marine mammals prior to commencement of ramp-up procedures. If a marine mammal is observed, ramp-up may not begin until the marine mammal has exited the CZ or until additional time periods have elapsed with no further sightings:
Shutdown zone	▪ Shutdown zones (SZs) will be monitored around the center of the sources for marine mammals. ▪ The following SZs will be implemented during all HRG survey activities: - 500 m (656 ft) for NARW; - 100 m (328 ft) for all other listed species
Shutdowns	▪ An immediate shut down of HRG survey equipment specified in the IHA permit will be required if a marine mammal is detected at or within its respective SZ. ▪ The vessel operator must comply immediately with any call for shutdown by the PSO. ▪ Any disagreement between the PSO and vessel operator should be discussed only after shutdown has occurred. ▪ If a species approaches or enters the Level B harassment zone, shutdowns will occur if a marine mammal authorization has not been granted, or, an authorized species' takes have already been met. ▪ If HRG survey equipment is shutdown longer than 30 minutes while PSOs have been monitoring, clearance followed by ramp-up activities will commence. ▪ If another marine mammal enters a SZ during the shutdown period, the HRG equipment may not restart until that animal is confirmed outside the respective exclusion or until the appropriate time has passed from the last sighting of the marine mammal.

Monitoring and mitigation measure	Description
	▪ After shutdown, ramp-up can be initiated once the SZ are visually clear for the respective clearance timing.
Pauses in HRG sources	▪ If the acoustic source is shut down for reasons other than mitigation (e.g., mechanical difficulty) for less than 30 minutes, it may be re-activated again without ramp-up only if PSOs have maintained constant observation and no detections of any marine mammal have occurred within the respective SZ. ▪ Any shutdown exceeding 30 minutes must be followed by full ramp-up procedures.
Protected Species Observers (PSOs) and AMP	▪ Visual monitoring within the established SZ will be performed by NMFS- approved PSOs. ▪ With prior approval from NMFS, Non-third-party observers may be used on a case-by-case basis (such as when vessel capacity is limited in shallow waters) for limited, specific duties in support of approved, independent PSOs. ▪ One PSO per shift will maintain watch during daylight hours when the sources are active. ▪ PSOs will be responsible for visually monitoring and identifying marine mammals approaching or entering the established zones during HRG survey activities. - It will be the responsibility of the lead PSO on duty to communicate the presence of marine mammals as well as to communicate and enforce the action(s) that are necessary to ensure mitigation and monitoring requirements are implemented as appropriate. - PSOs will be equipped with reticule binoculars and other suitable equipment observer to adequately perceive and monitor protected marine species and to estimate distances to marine mammals within the SZ. ▪ PSOs may not perform any other duty while on watch. ▪ PSO will coordinate to ensure 360-degree visual coverage around the vessel from an appropriate vantage point without interfering with navigation or operation of the vessel. ▪ A shift schedule for PSOs that may not exceed four consecutive watch hours; must have a minimum two-hour break between watches; and may not exceed combined watch schedule of more than 12 hours in a 24-hour period. ▪ PSOs will record all sightings and positions of marine mammals. Position data will be recorded using a hand-held or vessel GPS system ▪ Prior to initiation of survey work, all crew members will undergo environmental training, a component of which will focus on the procedures for sighting and protection of marine mammals. Alternative Monitoring Plan for Nighttime and Low-Visibility Conditions: In addition to the standard PSO practices identified above, the following measures will be implemented during nighttime and low-visibility conditions: ▪ During HRG survey activities with CHIRP SBPs, boomers, or sparkers operating at <180 kHz, two PSOs will be on duty per source vessel. ▪ Each PSO will be equipped with NVGs, Clip on Thermal Imagers (COTI) and/or handheld infrared light emitting diode spotlights, which are proven technologies for monitoring and ensuring shutdown zones can be maintained during nighttime and low-visibility conditions. PSOs will monitor the exclusion zone and the 500-meter minimum vessel separation distance from the NARW using the night vision technology. ▪ PSOs will monitor the exclusion zone from a platform with no visual barriers. ▪ Monitoring equipment will be calibrated, when possible, throughout the duration of survey and true distances measured using the ships radar will be compared to those measured using visual monitoring equipment.

Monitoring and mitigation measure	Description
Vessel strike avoidance	▪ All vessel operators and crews will maintain a vigilant watch for marine mammals at all times, and slow down or stop their vessel to avoid striking protected species, except under extraordinary circumstances when complying with this requirement would jeopardize the safety of the vessel or crew. ▪ Monitoring for vessel strike avoidance zone may be performed by PSOs or crew members, however, any crew members responsible for monitoring will be trained to broadly identify protected species and marine mammals, such as the NARW or other whale species. ▪ The likelihood of encountering ESA-listed species is very low in the shallow water areas where non-third-party trained PSOs (vessel crew) would also serve as vessel strike avoidance observers. ▪ All vessel operators will reduce vessel speed to 10 knots (5.1 m/s) or less when mother/calf pairs, pods, or larger assemblages of marine mammals are observed near an underway vessel. ▪ All vessel operators will comply with 10 knots (5.1 m/s) speed restrictions in any DMA. ▪ NMFS NARW reporting systems will be monitored from November 1st through July 31th and whenever a DMA is established within any areas vessels operate. ▪ When marine mammals are sighted while a vessel is underway, the vessel shall take action to avoid violating the relevant separation distance (e.g., attempt to remain parallel to the animal's course, avoid excessive speed or abrupt changes in direction until the animal has left the area, reduce speed and shift the engine to neutral). This does not apply to any vessel towing gear or any vessel that is navigationally constrained. North Atlantic right whales and ESA-listed marine mammals: ▪ All vessels will maintain a separation distance of 500 m (1,640 ft) or greater from any sighted NARW and other ESA-listed marine mammals. ▪ The following avoidance measures will be are taken if a vessel comes within 500 m (1,640 ft) of any NARW. - If underway, any vessel will steer a course away from any NARW at 10 knots (5.1 m/s) or less until the 500 m (1,640 ft) minimum separation distance has been established, unless: - If a NARW is sighted within 100 m (328 ft) to an underway vessel, the vessel operator must immediately reduce speed and promptly shift the engine to neutral. The vessel operator must not engage the engines until the NARW has moved beyond 100 m (328 ft), at which point the vessel will steer a course away from any NARW at 10 knots (5.1 m/s) or less until the 500 m (1,640 ft) minimum separation distance has been established. - If a vessel is stationary, the vessel will not engage engines until the NARW has moved beyond 100 m (328 ft), at which point the vessel will steer a course away from any NARW at 10 knots (5.1 m/s) or less until the 500 m (1,640 ft) minimum separation distance has been established. ▪ If a whale is observed that cannot be confirmed to species, the vessel operator must assume that it is an ESA-listed species and take appropriate action. ▪ The requirements listed in this section do not apply if compliance would create imminent and serious threat to a person or vessel.
Reporting	▪ Sightings of injured or dead marine mammals will be reported to NMFS, including the NMFS Northeast Region's Stranding Hotline (866-755-6622 or current), within 24 hours of sighting, regardless of whether the injury/death was caused by the vessel. As requested by NMFS, if the survey vessel was responsible for the injury or death, Vineyard Mid-Atlantic will ensure that the vessel assists with any salvage effort.

Every attempt is made to utilize the most experienced personnel to meet the appropriate compliance for all the surveys. For all Protected Species Observers that will participate in the site characterization campaign, their resumes and company information will be submitted to BOEM at least seven days before the start of the field program.

IX. Archaeology Review and QMA Participation

In accordance with Lease 544 stipulations 2.2 and 5.3, the QMA and any additional Subject Matter Experts identified by BOEM will be present at the BOEM pre-survey meeting, if held, and will attend all pre-survey tribal meetings. The QMA will assume all applicable duties as required for Lease 544 as well as Guidelines for Providing Archaeological and Historic Property Information (May 2021). The QMA will interface with appropriate state historical agencies within the 3-nautical mile limit to ensure their guidelines and requirements are met by the OECC survey.

Prior to geotechnical operations, the QMA will review and assess the geophysical data acquired in the vicinity of each proposed borehole/vibracore and/or CPT location (per Lease 544 stipulation 5.3.4). Unless otherwise allowed by BOEM, potential archeological resources will be avoided by a minimum of 50 m from their maximum discernable extent. Preliminary data processing and results will be generated in the field to support this near real-time review, and will consist of the following products for each proposed geotechnical sample site, a minimum 120 x 120 m square box centered on the location:

- survey vessel/sensor tracklines
- bathymetric color shaded relief/topographic rendering
- SSS mosaic imagery
- magnetic intensity contours/colorized residual gradient
- SSS targets and magnetic anomalies picked, listed, and mapped
- interpreted subbottom profiles along all primary lines
- Excel spreadsheet tracking data, results, and clearance

In accordance with Lease 544 stipulation 5.3.5, Vineyard Mid-Atlantic will afford the QMA the opportunity to be present during HRG surveys and bottom disturbing activities. If the QMA elects to monitor the activities, s/he will be given the opportunity to inspect the data quality.

The QMA will document the archaeological review in writing prior to conducting geotechnical work. Archaeological documentation of geophysical clearance of geotechnical locations will be included in the Marine Archaeological Resource Assessment (MARA) report with the COP. The QMA will certify in the MARA that geotechnical exploration activities did not impact potential historic properties. In the unlikely event that geotechnical exploration activities do impact potential historic properties without BOEM's approval, Vineyard Mid-Atlantic and the QMA will provide a statement documenting the extent of the impacts.

In the event of an unanticipated discovery of a potential archeological resource, Vineyard Mid-Atlantic will adhere to the requirements of Lease 544 stipulation 5.3.7. These include:

- Immediately halting seafloor/bottom disturbing activities
- Notifying BOEM within 24 hours of the discovery;
- Notifying BOEM in writing via report within 72 hours of the discover;
- Maintaining the confidentiality of the discovery;
- Not taking any action that may adversely impact the archeological resource until BOEM has evaluated it and instructed Vineyard Mid-Atlantic on how to proceed; and
- If Vineyard Mid-Atlantic impacts the site, conducting additional investigations as directed by BOEM to determine if the site is eligible for listing on the National Register of Historic Places and implementing any additional mitigation measures proposed by BOEM.

X. Native American Tribes Communication Plan

In accordance with Vineyard Mid-Atlantic's Native American Tribes Communication Plan (Lease 544 stipulation 3.1.2.2), a discussion draft of which is included in Appendix C, open communication and consultation between Vineyard Mid-Atlantic and the Tribes (Absentee-Shawnee Tribe of Indians of Oklahoma, Delaware Tribe of Indians, Eastern Shawnee Tribe of Oklahoma, Mashantucket Pequot Tribal Nation, Mashpee Wampanoag Tribe, Mohegan Tribe of Connecticut, Shawnee Tribe, Stockbridge-Munsee Community Band of Mohican Indians, The Delaware Nation, The Narragansett Indian Tribe, The Shinnecock Indian Nation, and The Wampanoag Tribe of Gay Head [Aquinnah]; herein known as "the Tribes") is a vital and required component to the pre-survey permitting process due to potential historical and pre-contact concerns regarding the proposed offshore activities. Table 13 lists the primary contacts for each federally recognized Tribe in the vicinity of the project survey areas.

Table 13 Tribal Historic Preservation Officer (THPO) Contact Information

Tribe	THPO	Address	Email	Phone
Absentee-Shawnee Tribe of Indians of Oklahoma	Ms. Devon Frazier, Tribal Historic Preservation Officer	Office of the Governor Building 2025 S Gordon Cooper Dr. Shawnee, OK 74801	dfrazier@astribe.com	405-275-4030 ext.6243 405-432-9078
Delaware Tribe of Indians	Susan Bachor	PO Box 64, Pocono Lake, PA 18347	sbachor@delawaretribe.org	610-761-7452
Eastern Shawnee Tribe of Oklahoma	Paul Barton	70500 E, 128 Wyandotte, OK 74370	pbarton@estoo.net	918-238-5151 ext.1833
Mashantucket Pequot Tribal Nation	Michael Kickingbear Johnson	2 Matts Path/ POB 3060 Mashantucket, CT 06338-3202	mejohnson@mptn-nsn.gov	860-396-7575

Stockbridge-Munsee Community Band of Mohican Indians	Nathan Allison	65 1st St. Troy, NY 12180	nathan.allison@mohican-nsn.gov	
The Delaware Nation	Erin Paden	PHYSICAL ADDRESS: Delaware Nation 31064 US Highway 281 Building 100 Anadarko, OK 73005 MAILING ADDRESS: Delaware Nation P.O. Box 825 Anadarko, OK 73005	epaden@delawarenation-nsn.go	405-247-2448 ext.1403
Narragansett Indian Tribe	John Brown	4425 S. Country Trail, Charleston, RI 02813	Brwnjbb123@aol.com	401-491-9459
Shinnecock Indian Nation	Deputy THPO Jeremy Dennis	POB 5006 Southampton, NY 11969	jeremynative@gmail.com	631-283-6143
Wampanoag Tribe of Gay Head (Aquinnah)	Bettina Washington	20 Black Brook Road, Aquinnah, MA 02535	Bettina@wampanoagtribe.net	508-645-9265 ext.175

In accordance with Lease 544 stipulation 5.3.3., at least 30 calendar days prior to commencing any survey activities, pre-survey meetings with the above-listed tribes will be held. The purpose of the meetings is for the Lessee and QMA to discuss this Plan and to consider requests by tribal members to monitor portions of the survey activities. Invitations by certified mail (formal request) will be sent to the Tribes at least 15 calendar days prior to the proposed meeting dates. Meetings will be held virtually or at a location and time that affords the participants a reasonable opportunity to participate. The anticipated dates for the invitation mailing and pre-survey meeting are identified in Table 11.

Vineyard Mid-Atlantic will communicate directly with designated Tribal Historic Preservation Officers (THPO). Hard copies of invitation letters will be mailed per the lease and emails will be delivered to the THPOs as well. The QMA will be present at all tribal meetings. Minutes of each meeting held will be recorded. Vineyard Mid-Atlantic will provide BOEM with documentation of compliance with Lease 544 stipulation 5.3.3 prior to commencing surveys.

XI. Fisheries Communication Plan

In accordance with Lease 544 stipulation 3.1.2.1, Vineyard Mid-Atlantic has developed a robust Fisheries Communication Plan (FCP) based on its extensive experience through the Vineyard Wind 1 project conducting outreach to numerous fishery organizations and fishermen to identify potentially affected fisheries and lay out communication methods and tools. Crista Bank, Fisheries Liaison, is a fisheries biologist with a master's degree in fisheries oceanography. A discussion draft of the FCP is attached as Appendix D, which will be updated and refined based on feedback from fishermen and the Tribes.

Vineyard Mid-Atlantic will reach out to fishing organizations and fishermen before surveys commence. Updates on survey activities will be provided via email, text alerts, direct communication, advertising, and list-serve notification. Day-to-day fisheries information will be communicated via the onboard fisheries liaisons (OFLs) who in turn update the project team (email, calls), as well as directly interact with fishermen working in the vicinity of the survey vessels (very high-frequency [VHF] radio, emails). The FCP will be made available to all stakeholders with a website link distributed to area fishermen. "Offshore Wind Mariner Update Bulletins" that contain relevant information for the survey including OFL and Fisheries Representative contact details and survey vessel information will be distributed to fishermen. The company website will be updated as needed to help spread information to the fishermen regarding the survey schedules and progress.

Current key company personnel for contact regarding fisheries:

Fisheries Representative: Crista Bank Mobile: 508-525-0421 cbank@vineyardwind.com

XII. Pre-Survey Meeting

In accordance with Lease 544 stipulation 2.2, at BOEM's request, Vineyard Mid-Atlantic will hold a pre-survey meeting with BOEM to discuss this Plan prior to commencement of survey activities.

XIII. Reporting

Regarding the geotechnical clearance, preliminary data processing and results will be expedited to support near real-time review of geophysical data and coverage of proposed geotechnical sample stations (vibracores, borings, and CPTs). Plots of processed data and results will be delivered to the QMA for review and progress will be tracked as the field work and clearance is conducted. A final clearance tracking spreadsheet documenting the conditions at each geotechnical sampling location, and whether the site is clear of cultural resources, will be issued to Vineyard Mid-Atlantic and the survey contractor prior to any seafloor and subsurface disturbance activity. Final memos will be included with the MARA in the COP submission.

The full COP site characterization campaign data package will be analyzed, mapped, and reported to provide information on the seafloor structures, bathymetry, subsurface features, and any natural and man-made hazards that may affect the WTG foundation design, cable routing, design, or installation operations. A final site characterization report will be generated in accordance with BOEM guidelines and submitted as part of the COP. Similarly, a detailed SAP report will be submitted in support of any planned floating LiDAR buoy deployments in Lease 544.

In addition, pursuant to Lease 544 stipulation 3.1.3, progress in executing the survey activities will be included in the progress reports submitted in accordance with Lease 544 stipulation 3.1. Any modifications to the survey schedules will be included in the reports.

Separately, Vineyard Mid-Atlantic will comply with all reporting requirements in any applicable IHA.

Finally, in accordance with Lease 544 stipulation 5.4.4, Vineyard Mid-Atlantic will report any dead or injured birds or bats found during conduct of its activities under this plan. The first report will be submitted within 6 months of the start of the first survey, e.g., around January 2023, and thereafter submitted annually.

XIV. Communication

In compliance with Lease 544 stipulation 4.2.4, which states that the Lessee must inform the Lessor of persons/officers to be contacted in order to implement Lease 544 stipulations 4.2.2 and 4.2.3 requiring suspension of activities due to national security reasons, we provide the following contact information:

Rachel Pachter	**Jeff Gardner**
Chief Development Officer	Field Program Manager
Vineyard Mid-Atlantic LLC	Geo SubSea LLC
Mobile: 508-680-6455	Mobile: 860-682-7093
Email: rpachter@vineyardoffshore.com	Email: jeff@geosubseaconsulting.com

In accordance with Lease 544 stipulation 4.2.5, the contractor will contact U.S. Navy Fleet Forces, Command Headquarters in order to avoid or minimize the potential to conflict with any military operations being conducted in or near Lease 544. The contractor will submit all required information to the U.S. Navy, including but not limited to, the schedule of field activities and contact information in case of an emergency or short notice of U.S. Navy operations.

Open communication is maintained with the USCG and other personnel who are frequently out on coastal waterways so that these organizations are aware of Lease 544 activities. Vineyard Mid-Atlantic will coordinate with the USCG to prepare a Notice to Mariners for the offshore activities anticipated during the site characterization campaign. Survey contractors will assist with USCG coordination to provide vessel-specific information, employee contact information for key personnel, and communication protocols.

SIMOPS will be closely monitored by all vessels and masters, as well as program managers onshore, to maintain appropriate marine safety zones and coordinate activities in all project areas. All shore-based field management personnel and key vessel crew members and staff (Master, Party Chief, Client Rep) will be connected on multiple communications platforms for reporting survey progress, plans for the next 24 hours, and specific vessel movements and activities so the entire fleet is up to date. Direct communications via marine VHF radio will be used when vessels are working in the same area.

Appendix A

Geophysical, Geotechnical, and Environmental

Survey Equipment Specification Sheets

EdgeTech

4200 SERIES
SIDE SCAN SONAR SYSTEM

FEATURES
- Optional Multi-Pulse (MP) technology for high speed surveys
- Crisp, high resolution CHIRP images
- Multiple dual simultaneous frequency sets to choose from
- Stainless steel towfish
- Easily integrates to other 3rd party sensors
- Meets IHO & NOAA Survey Specifications

APPLICATIONS
- Cable & Pipeline Surveys
- Geological/Geophysical Surveys
- Mine Countermeasures (MCM)
- Geohazard Surveys
- Channel Clearance
- Search and Recovery
- Archeological Surveys

The 4200 Series is a versatile side scan sonar system that can be configured for almost any survey application from shallow to deep water operations. The 4200 utilizes EdgeTech's Full Spectrum® CHIRP technology to provide crisp, high resolution imagery at ranges up to 50% greater than non-CHIRP systems; thus allowing customers to cover larger areas and save money spent on costly surveys.

One of the unique features of the 4200 is the optional Multi-Pulse (MP) technology, which places two sound pulses in the water rather than one pulse like conventional side scan sonar systems. This allows the 4200 to be towed at speeds of up to 10 knots while still maintaining 100% bottom coverage. In addition, the MP technology will provide twice the resolution when operating at normal tow speeds, thus allowing for better target detection and classification ability. The addition of the optional MP technology provides the operator with two modes of operation; either High Definition Mode (HDM) or High Speed Mode (HSM). This software-selectable mode of operation provides the operator the ability to select the best configuration for the specific job type.

All EdgeTech 4200 systems are comprised of a topside system and a reliable stainless steel towfish. A choice of dual simultaneous frequency sets are available to the user and topside processors come in a choice of configurations from portable to rack mounted units. In addition, an easy-to-use GUI software is supplied with every unit.

EdgeTech

4200 SERIES

SIDE SCAN SONAR SYSTEM

KEY SPECIFICATIONS

SONAR SPECIFICATIONS	STANDARD	WITH OPTIONAL MP TECHNOLOGY
Frequency	Choice of either 100/400, 300/600 or 300/900 kHz dual simultaneous	
Operating Range (meters/side)	100 kHz: 500m, 300 kHz: 230m, 400 kHz: 150m, 600 kHz: 120m, 900 kHz: 75m	
Horizontal Beam Width:	100 kHz: 1.5°, 300 kHz: 0.5°, 400 kHz: 0.4°, 600 kHz: 0.26°, 900 kHz: 0.2°	In High Speed Mode: 100 kHz: 1.26°, 300 kHz: 0.54°, 400 kHz: 0.4°, 600 kHz: 0.34°, 900 kHz: 0.3° In High Definition Mode: 100 kHz: 0.64°, 300 kHz: 0.28°, 400 kHz: 0.3°, 600 kHz: 0.26°, 900 kHz: 0.2°
Resolution Along Track	100 kHz: 5 m @ 200 m 300 kHz: 1.3 m @ 150 m 400 kHz: 0.6 m @ 100 m 600 kHz: 0.45 m @ 100 m 900 kHz: 18 cm @ 50 m	High Definition Mode: 100 kHz: 2.5m @ 200m 300 kHz: 1.0m @ 200m 400 kHz: 0.5m @ 100m 600 kHz: 0.45m @ 100m 900 kHz: 18 cm @ 50m HIgh Speed Mode: 100 kHz: 4.4m @ 200m 300 kHz: 1.9m @ 200m 400 kHz: 0.7m @ 100m 600 kHz: 0.6m @ 100m 900 kHz: 26 cm @ 50m
Resolution Across Track	100 kHz: 8 cm, 300 kHz: 3 cm, 400 kHz: 2 cm, 600 kHz: 1.5 cm, 900 kHz: 1 cm	
Vertical Beam Width	50°	
Depression Angle	Tilted down 20°	

TOWFISH	STAINLESS STEEL
Diameter	11.4 cm (4.5 inches)
Length	125.6 cm (49.5 inches)
Weight in Air/Saltwater	48 / 36 kg (105 / 80 pounds)
Depth Rating (Max)	2,000m
Standard Sensors	Heading, pitch & roll
Optional Sensor Port	(1) Serial – RS 232C, 9600 Baud, Bi-directional & 27 VDC
Options	Pressure Sensor, Magnetometer, Integrated USBL Acoustic Tracking System, Built-in Responder Nose, Depressor, Power Loss Pinger and Custom Sensors

TOPSIDE PROCESSOR	4200-P	4200	701-DL INTERFACE
Hardware	Portable splash-proof case	19" rack mount computer	19" rack mount interface
Display & Interface	Splash-proof laptop	21" flat panel monitor, keyboard & trackball	Customer-supplied

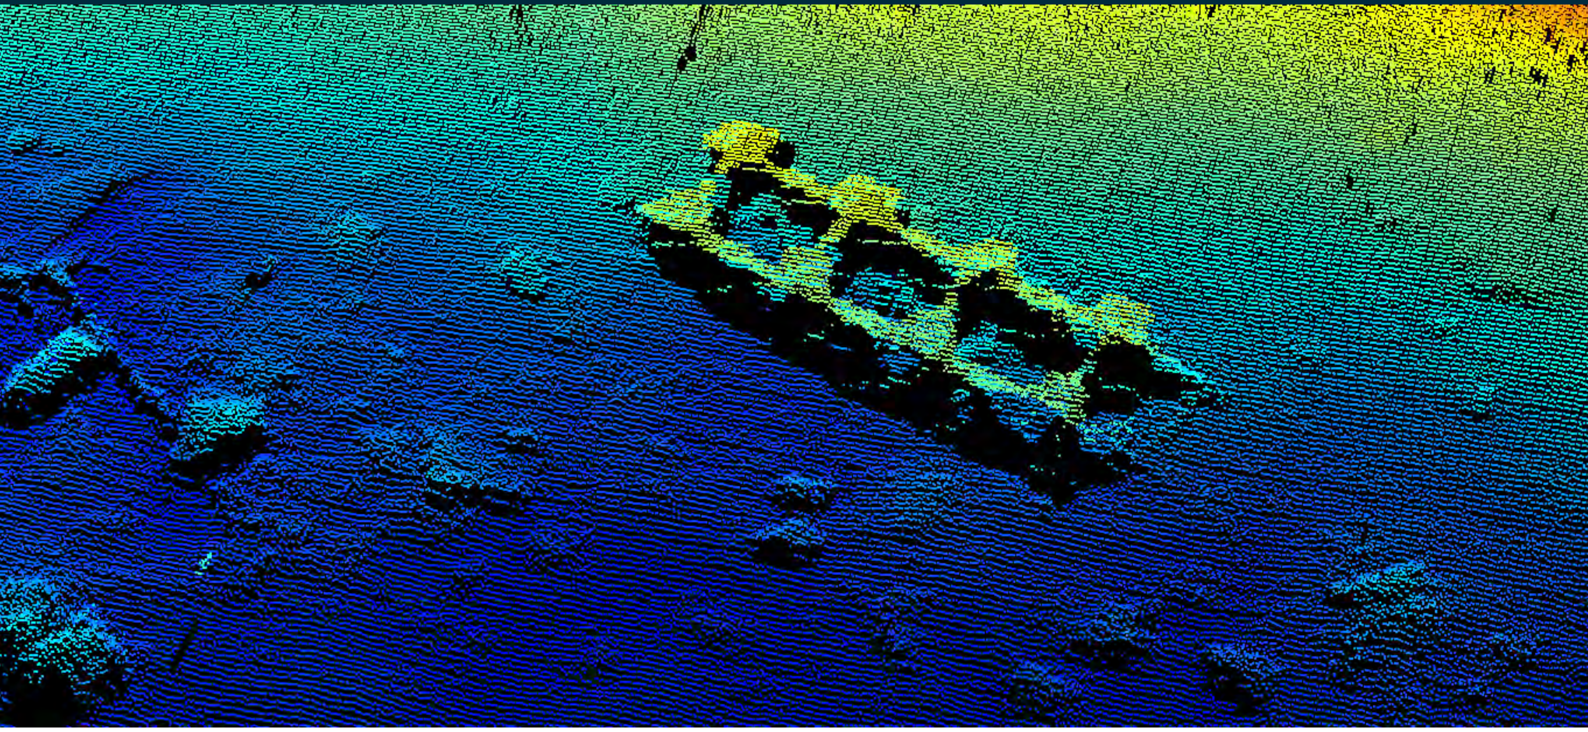
EM® 2040

KONGSBERG



MULTIBEAM ECHO SOUNDER

The EM2040 is a true wide band high resolution shallow water mutibeam echosounder, an ideal tool for any high resolution mapping and inspection application. It has a modular design, allowing the user to tailor the beamwidths and coverage to the operational requirements. The system fulfils and even surpasses the IHO-S44 special order and the more stringent LINZ specification.

Key facts
The EM 2040 receiver is 0.7 degrees, two transmitters are available: 0.4 and 0.7 degrees. The transmit fan is divided into three sectors pinging simultaneously at separate frequencies. This ensures a very strong and beneficial dampening of multibounce interference. The EM 2040 has dual swath capability, allowing a sufficient sounding density alongtrack at a reasonable vessel speed.

The operating bandwidth available on the EM 2040 is 200 to 400 kHz. Due to the very large operating bandwidth available, the system will have an output sample rate up to 60 kHz. The system can effectively operate with very short pulse lengths. The shortest pulse is 14 microseconds, which gives a raw range resolution (cт/2) of 10.5 mm. For maximum range and high resolution FM chirp is used.

The standard depth rating of the EM 2040 subsea parts is 6000 m. The system is ideal for operation on subsea vehicles such as ROVs or AUVs.

Components
The basic EM 2040 has four units, a transmit transducer, a receive transducer, a processing unit, and a workstation.

The EM 2040 is a modular system, fully prepared for upgrading to cater for more demanding applications. The transmit transducer has an angular coverage of 200º (±100º) as standard, allowing a coverage of 5.5 times water depth when matched with a single receive transducer. Adding a second receive transducer allows surveying to the water surface or up to 10 times water depth on flat bottoms. With two sets of transmit and receive transducers it is possible to avoid having a transducer at the keel. Also for pipeline inspections a dual TX and RX configuration gives the possibility to inspect the pipe from two different angles. The transducers are separate units with titanium housings.

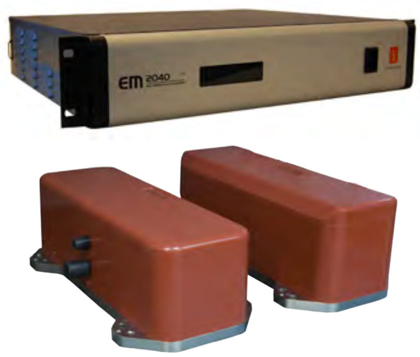
Operational modes
The EM 2040 has a frequency range of 200-400 kHz. The single transmitter configuration with either one or two receivers has three standard modes. 300 kHz is used for normal operation, giving an optimum balance between high resolution, depth capability and tolerance of detrimental factors such as water column sediments. 200 kHz is available for meeting requirements to operate at the standard hydrographic single beam frequency, but also to achieve the best depth capability. 400 kHz is provided for inspection work with the utmost resolution.

The specialised dual transmitter and receiver configuration has a mapping mode with two frequency coded sectors and user selectable frequency in steps of 10 kHz from 200 to 400 kHz.

FEATURES

- High resolution
- Wide frequency range
- FM chirp
- Roll, pitch and yaw stabilisation
- Nearfield focusing - both on transmit and receive
- Short pulse lengths, large bandwidth
- Water column display
- Seabed image
- Depth rated to 6000 m
- Easy to install

Options:
- Water column logging
- Extra detections
- Dual swath
- Dual RX
- Dual TX



TECHNICAL SPECIFICATIONS

SERVICE FLYER

FUGRO
BACK2BASE™

Back2Base™ is a set of technologies and processes which enable survey data to be reliably and economically transferred between work locations including survey vessels to the terrestrial reporting office, via an internet link such as satellite or mobile broadband and Wi-Fi.

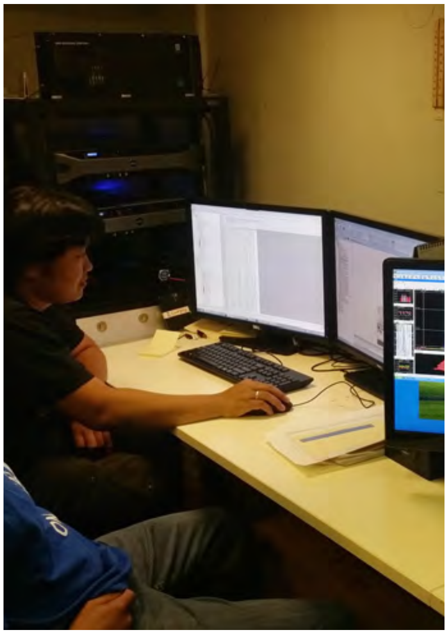
Getting information back from the field and onto the client's desk in a timely manner has always been one of the most challenging aspects of survey work. With internet and communication costs reducing as rapidly as bandwidth increases, Fugro have developed a service to deliver survey data to the client in a swift and cost-effective manner.

This data transmission technique enables close liaison with shore-based client personnel and Fugro experts in any location, not only in the field. Peer reviewed decisions can be taken in near real time that may modify the survey on the basis of observed conditions onsite or to investigate areas of particular interest. Experts can review data from multiple projects. Full processing and reporting can be started earlier resulting in faster information delivery.

THE PROCESS

The key to the Back2Base operation is in the packaging – data compression on its own is simply not enough …

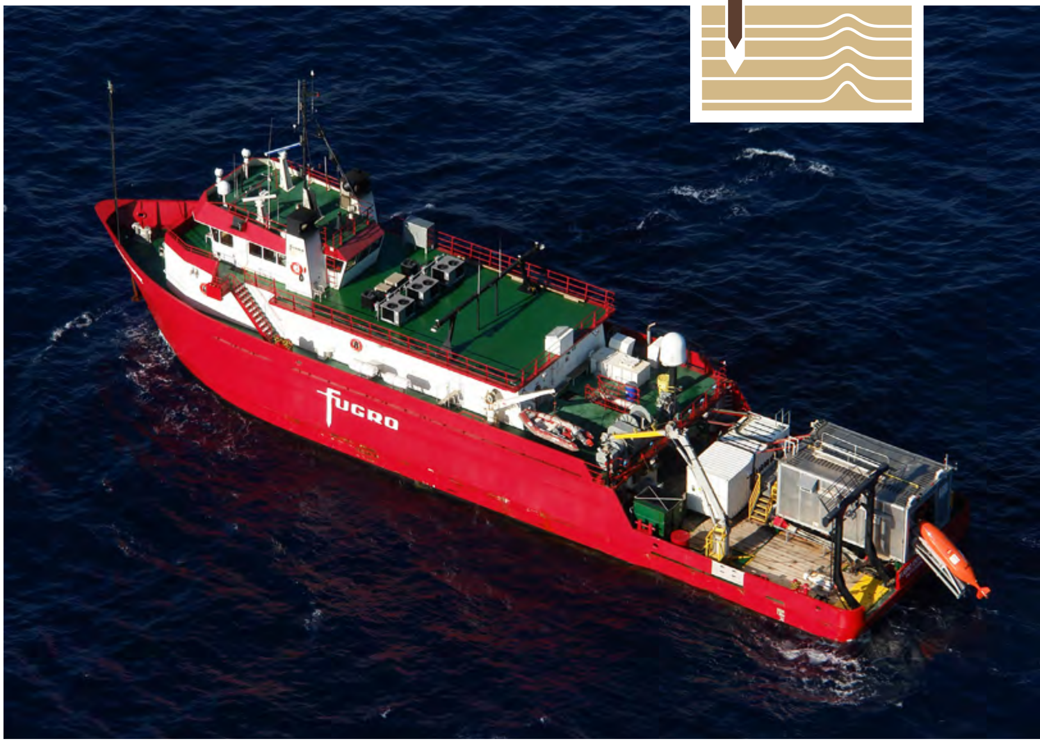
For example, a typical MBES survey will need to transfer the MBES, attitude and position data back to the office for processing



Survey data processed in the field.

SERVICE FLYER

- MBES @ 20Hz, 512 beams/ping
- Single beam echo sounding
- Attitude @100 Hz (pitch, roll, heave, heading)
- Position @1 Hz
- Raw RINEX on mobile + base for PPK processing
- Auxiliary files (SVP, tides, logs etc.)
- Side scan sonar .xtf files
- SEGY seismic files



Survey vessel.

PACKAGING EXAMPLES

The example below shows the reduction in file size typically obtained from the Back2Base procedure for MBES survey data:

Example Dataset	Size
Raw Data (5 mins MBES Calibration line)	680 MB
Packaging	49.4 MB
Compression	4.8 MB

TRANSFER PROCESS

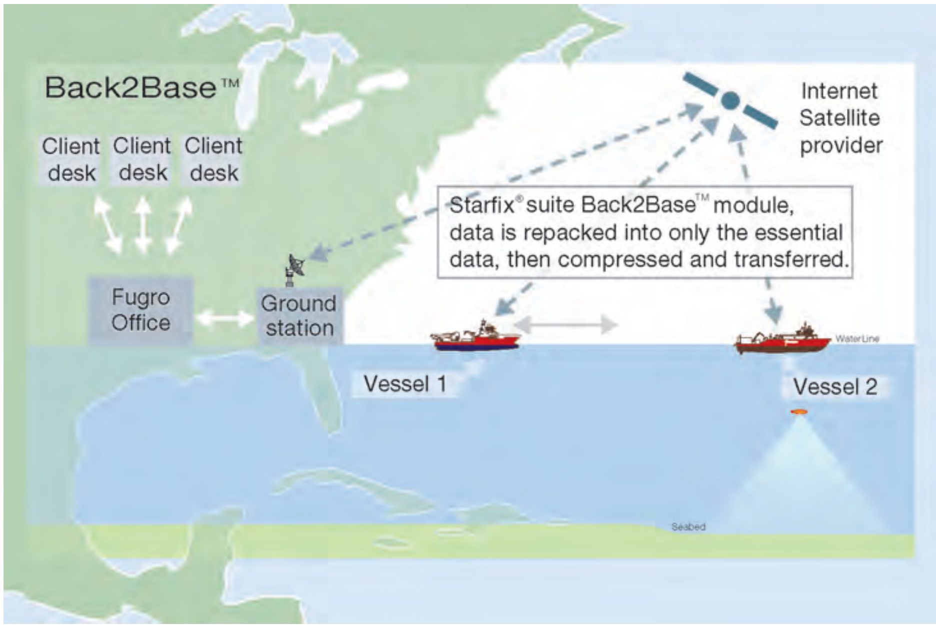
- The data to be sent is organised into a directory structure.
- Using the Starfix Suite Back2Base module, SBES/MBES, XTF and SEGY data is repackaged into only the essential data and then compressed.
- Transmission then takes place by the most efficient means – VSAT (C-band, Ku-band or Ka-band), 4G, 3G or Wi-Fi as available.
- Uploading of data does not compromise other internal or external tasks on the vessel network, such as email traffic; Back2Base transmission is prioritized to only use bandwidth when it is available.
- In the destination location, the data is decompressed and made available for processing using industry standard products.

SECURITY

Back2Base uses open SSL communications for data transfer. All data is protected using AES-128 encryption. The Back2Base security model uses session encryption, secure authentication and on-the-fly data encryption with integrity verification for each transmitted data block. Back2Base server access is through secure username and password. The Back2Base client can operate on a HTTPS certificate URL, essentially a secured web browser.

REAL WORLD EXAMPLES

Back2Base has been used for various survey types including special order nearshore surveys, AUV surveys, deep water pipeline route geophysical / geotechnical surveys, the search for MH370 and high-resolution site survey work.



SEAPATH® 380 SERIES

KONGSBERG

THE ULTIMATE HEADING, ATTITUDE AND POSITIONING SENSOR

The Seapath 380 series uses a state-of-the-art dual frequency GNSS receiver, inertial technology and processing algorithms to provide surveyors with the best possible accuracy in position, attitude and timing. All available GPS, GLONASS, Galileo, Beidou and QZSS satellites are used in the position solution.

Function
The advanced Seapath navigation algorithms integrate RTK GNSS data with the inertial sensor data from the MRU. This gives the Seapath 380 unique advantages compared to stand- alone RTK products. The Seapath product's accurate roll, pitch and heading measurements allow the RTK antenna position to be referenced to any point on the vessel where accurate position and velocity are required. All data from Seapath have the same time stamp and the output is in real-time. Subdecimetre position accuracy can be achieved through download of satellite orbit and clock data from the internet and by post processing of satellite and IMU data.

Product range
The Seapath 380 series is delivered in the following product range:

	Roll/Pitch [RMS]	Heading [RMS]	
		2.5m baseline	4m baseline
Seapath 380-3	0.08°	0.07°	0.05°
Seapath 380-H	0.03°	0.07°	0.04°
Seapath 380-5	0.02°	0.04°	0.03°
Seapath 380-5+	0.008°	0.04°	0.02°

Note: The MRU 3 model part of Seapath 380-3 has to be mounted in a fixed direction relative to the vessel and with the connector pointing up or down. Otherwise the performance of the Seapath 380-3 will be degraded.

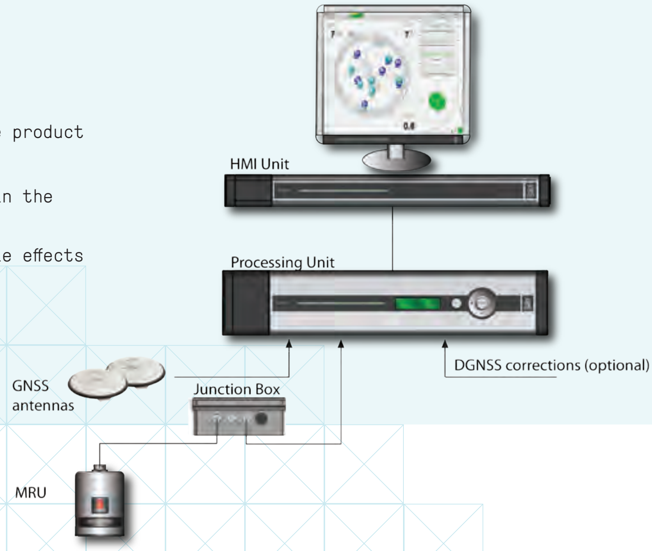
System configuration
This Seapath series is a two-module solution with a processing unit and a HMI unit connected via Ethernet. The processing unit run all critical computations independent from user interface on the HMI unit to ensure continuous and reliable operation. Multiple HMI units can be connected to the same processing unit in a networked architecture. The HMI units present the vessel motion in a clear and easy-to-understand format. The Seapath is operated through the operator software installed on one or several HMI units. This software is used for performance monitoring, configuration and troubleshooting of the system.

Interfaces
The processing unit has eight RS-232/422 serial lines, four Ethernet LANs and three analog output channels. This makes distribution of Seapath data to various users onboard almost endless. DGNSS corrections of various quality and sources are input on a configurable RS-232/422 serial line or Ethernet.

Applications
By using standard DGNSS, Fugro XP2/G2/G4/G4+ and RTK corrections, the Seapath 380 is a unique solution for hydrographic surveying and dredging work demanding the most comprehensive and accurate surveying data available.

FEATURES

- 0.008° to 0.08° roll and pitch accuracy depending on model
- 2 cm heave accuracy by use of the PFreeHeave® algorithms
- Meets IHO special order requirements
- Robust against GNSS dropouts due to the inertial sensor part of the product
- 555-channel dual frequency GPS/GLONASS/Galileo/Beidou receiver
- All available GPS/GLONASS/Galileo/Beidou/QZSS satellites are used in the positioning solution
- Includes ionospheric compensation methods to reduce Sunspot 24 cycle effects
- Fugro XP2/G2/G4/G4+ corrections and RTK supported
- RTK corrections format RTCM and CMR supported
- Includes SBAS corrections (WAAS, EGNOS, MSAS, GAGAN)
- All data have the same time stamp and to an accuracy of 0.001 s to the actual measurement time
- Logging of raw satellite and IMU data possible



TECHNICAL SPECIFICATIONS

SEAPATH 380 SERIES

PERFORMANCE

Heave accuracy (real-time)	5 cm or 5 % whichever is highest
Heave accuracy (delayed signal)	2 cm or 2 % whichever is highest
Heave periods (real-time), except Seapath 380-3	1 to 25 seconds
Heave periods (real-time), Seapath 380-3	0 to 18 seconds
Heave periods (delayed signal)	1 to 50 seconds
Position accuracy DGNSS/GLONASS	0.5 m RMS or 1 m 95% CEP
Position accuracy SBAS	0.5 m RMS or 1 m 95% CEP
Position accuracy Fugro XP2/G2/G4/G4+	0.1 m RMS or 0.2 m 95% CEP
Position accuracy RTK (X and Y)	1 cm + 1 ppm RMS
Position accuracy RTK (Z)	2 cm + 1 ppm RMS
Velocity accuracy	0.03 m/s (RMS)
Range to RTK reference station	10 km
UHF radio frequencies (radio not included in standard package)	430 to 470 MHz 390 to 430 MHz (optional)

DATA OUTPUTS

Communication ports	8 serial RS-232/RS-422 lines and 16 Ethernet UPD/IP ports
Data output interval	Programmable in 0.005-se steps and 1PPS pulse
Data update rate	Up to 200 Hz
Analog output	3 user configurable channels, +/- 10 Volt
1PPS signal accuracy	220 nsec

POWER SPECIFICATIONS

Processing Unit	100 to 240 V AC, 75 W (max)
HMI Unit	100 to 240 V AC, 40 W (max)
Monitor	100 to 240 V AC, 23 W (max)
IMU	24 V DC from Processing Unit
GNSS antenna	5 V DC from Processing Unit

WEIGHTS AND DIMENSIONS

Processing Unit	5.4 kg, 89 x 485 x 357 mm
HMI Unit	3.8 kg, 44 x 485 x 330 mm
Monitor	3.8 kg, 383 x 380 x 170 mm
IMU	2.2 kg, 140 x Ø105 mm
GNSS ante nna	0.5 kg, 69 x 185 mm

ENVIRONMENTAL SPECIFICATIONS

Operational temperature range

Processing and HMI Unit	-15 to +55 °C
Monitor	+5 to +40 °C
IMU	-5 to +55 °C
GNSS antenna	-40 to +85 °C

Storage temperature range

Processing and HMI Unit	-20 to +70 °C
Monitor	-20 to +60 °C
IMU	-25 to +70 °C
GNSS antenna	-55 to +85 °C

Enclosure protection

Processing and HMI Unit	IP 21 (rear)
Monitor	IP 21 (rear)
IMU	IP 66
GNSS antenna	IP 66
Cables	IP 67
Connectors	IP 67

Mechanical

Vibration	IEC 60945/EN 60945

Electromagnetic compatibility

Compliance to EMCD, immunity/emission	IEC 60945/EN 60945

PRODUCT SAFETY

Compliance to LVD, standard used	IEC 60950-1/EN 60950-1

Specifications are valid without multipath, without shadowing of antennas and with vessel in motion.

Specifications subject to change without any further notice.

G-882TVG CESIUM MAGNETOMETER & TRANSVERSE GRADIOMETER

- **Marine Search Applications for UXO, pipelines, lost objects with Multi-Sensor Array Capability**
- **High Sensitivity — 0.004 nT/sq-rt-Hz RMS with dual CM−221 Larmor Counters**
- **Very Low Heading Error — ±0.25nT over 360° equatorial and polar spins**
- **Versatility — CM-221 counter includes 8 channel 12 bit A to D converters for real time internal diagnostics, digital data stream concatenation, and short, long or telemetry over coax options**
- **Reliability and Ruggedness – Cesium magnetometers never need be returned to factory for calibration or tuning. Designed for tough environmental conditions and high "G" loads**
- **Gradiometer arrays offering simultaneous operation of up to 8 separate sensors using the designed-in multi-sensor data concatenation of the CM-221 internal counter**
- **Geometrics offers complete turnkey systems including tow cables, gradiometer wing, digital data acquisition systems with real time anomaly detection, GPS navigation and post acquisition data processing software and training.**

The Geometrics Model G-882TVG Transverse Gradiometer system mates the well- proven high-performance cesium sensor with dual high sensitivity and high speed CM-221 Larmor Counters. This advanced integrated magnetometer system provides unmatched versatility in performance, with a wide sensor separation for maximum target detection efficiency and survey cost effectiveness.

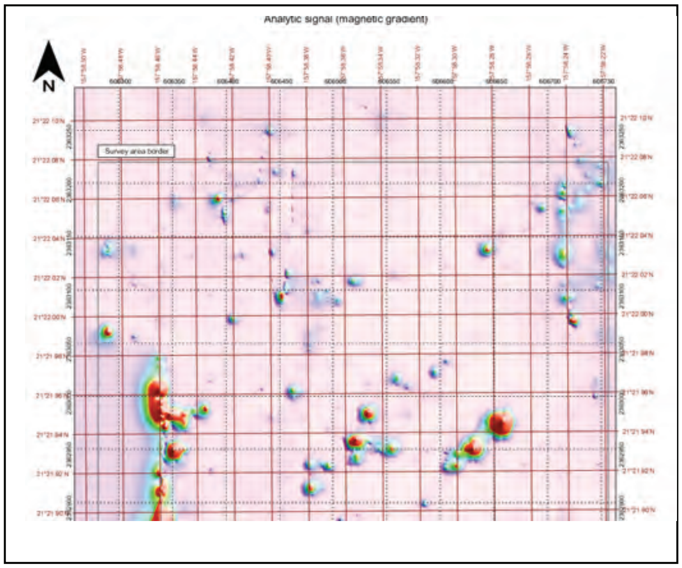
The system comprises a transverse wing and two G-882 Cesium Vapor magnetometer fish with stabilizer weights and fins. Tow cables may be up to 150m in length with standard power supply or up to 700m with a high capacity voltage sense supply. Depth sensors provide gradiometer attitude and depth information to the operator depth and an echo-sounder altimeter provides height above sea floor for proper system flight control.

Dual sensors are synchronized to 1ms sampling and data is transmitted via RS-232 for recording by any standard PC computer using our industry standard MagLogLite software. High sample and data transmission rates (up to 40 samples per second) are standard.

The G-882G provides sensitivities of 0.004 nT/√Hz RMS or approximately 0.01 nT P−P at 10 Hz, selectable via software command for detection of the smallest anomalies. MagLog software computes the transverse difference for display and analysis in real time, using the customer supplied GPS for interpolation and target positioning.

The system's high performance is excellent for the detection and delineation of cables, pipelines, environmental, archaeological or military UXO and EOD targets.

Software
Geometrics supplies MagMap2000 and MagPick with each system for analysis and interpretation of total field and gradient data. Analytical signal is computed from the transverse gradient, longitudinal time gradient and computed vertical gradient to give a time-variation free data set for contouring and plotting of anomaly targets. Simultaneous dual inversion routines in MagPick produce a located target worksheet with models including object latitude-longitude position and depth of burial. Download ftp://geom.geometrics.com/pub/mag/Software/Posters.zip for more information



MODEL G-882TVG MARINE CESIUM GRADIOMETER SPECIFICATIONS

OPERATING PRINCIPLE:	Self-oscillating split-beam cesium vapor (non-radioactive)
OPERATING RANGE:	20,000 to 100,000 nT
OPERATING ZONES:	The earth's field vector should be at an angle greater than 10° from the sensor's equator and greater than 10° from the sensor's long axis. Automatic hemisphere switching.
SENSITIVITY WITH CM-221 COUNTER:	<0.004 nT/sq-rt-Hz RMS. Typically 0.01 nT P-P at a 0.1 second (10 Hz) sample rate (90% of all readings falling within the P-P envelope)
SAMPLE RATE:	Up to 40Hz in 100ms increments
HEADING ERROR:	<0.25 nT over entire 360° equatorial and polar spins
ABSOLUTE ACCURACY:	<3 nT throughout range
OUTPUT:	Cycle of Larmor frequency = 3.498572 Hz/nT, RS-232 data at 115K baud, concatenated data streams from 2 to 8 sensors depending on sample rate
MECHANICAL:	Total weight including 70kg (155 lbs) including two fish, wing and tow cable. Sensor separation is 1. 5m for maximum gradient
CABLES:	Vectran Reinforced multi-conductor tow cable. Breaking strength 3,600 lbs, 0.48 in OD, 500 ft standard maximum. Up to 2100 ft with variable voltage supply. 200 ft (60m) weighs 17 lbs (7.7 kg).
OPERATING TEMPERATURE:	-30°F to +122°F (-35°C to +50°C)
STORAGE TEMPERATURE:	-48°F to +158°F (-45°C to +70°C)
ALTITUDE:	Up to 30,000 ft (9,000 m)
DEPTH RATING:	Depth rated to 4,000 psi (2,700m)
POWER:	115/220 VAC, 60 watts at turn-on and 40 watts thereafter
ACCESSORIES:	
Standard:	Power/RS-232 multiconductor cable (electronics to power/data junction box with 9 pin RS-232 connector and power lugs), lengths to be specified, operation manual and reusable shipping and storage containers
Optional:	
Logging Software	MagLog (Logs GPS and Mag, shows trackplot, mag profile, other data)
Processing software	MagMap2000, MagPick

Performance
- water depth range: 2 – 2,000 m
- penetration: up to 70 m, depending on sediments
- layer resolution: up to 5 cm
- motion compensation: heave, roll
- beam width @ 3 dB: ±1 ° / footprint < 3.5 % of water depth for all frequencies

System Components
- transceiver unit 19 inch / 12 U (WHD: 0.52 m x 0.58 m x 0.40 m; 56 kg)
- transducer incl. 30 m cable (WHD: 0.50 m x 0.12 m x 0.50 m; 60 kg)
- system control: internal PC
- KVM remote control

SES-2000 medium-100
Parametric Sub-bottom Profiler

Transmitter
- primary frequencies: approx. 100 kHz (band 85 – 115 kHz)
- secondary low frequencies: 4, 5, 6, 8, 10, 12, 15 kHz (band 2 – 22 kHz)
- primary source level: > 247 dB//µPa re 1 m
- pulse width: 0.07 – 2 ms
- pulse rate: up to 40/s
- multi-ping mode
- pulse type: CW, Ricker, LFM (chirp)

Software
- SESWIN data acquisition software
- SES Convert SEG-Y/XTF data export
- SES NetView remote display
- ISE post-processing software

Acquisition
- primary frequency (echo sounder, bottom track)
- secondary low frequency (sub-bottom data, multi-frequency mode)
- sample rate 96 kHz @ 24 bit

Power Supply Requirements
- 100 – 240 V AC / 50 – 60 Hz
- power consumption: < 700 W

GAPS

FOURTH-GENERATION USBL ACOUSTIC POSITIONING SYSTEM

The **iXBlue** fourth-generation pre-calibrated **GAPS** combines high performance ultra-short baseline (USBL) and a fiber-optic inertial navigation system (INS) in the same housing to provide accurate position of any subsea object, in diverse and challenging environments. Its performance ranges from extremely shallow water to deep sea. Its compact and all-in-one design allows both portable and permanent installations. One of **GAPS** key new features is support of dynamic positioning (DP).

FEATURES

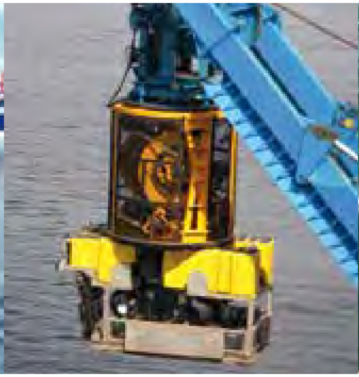
- Integrates USBL, high-grade INS, real-time positioning and GPS
- Position accuracy: 0.06% x slant range
- Advanced signal processing and 3D acoustic antenna for range and accuracy performance
- Powerful dynamic positioning (DP) mode (L/USBL/INS)

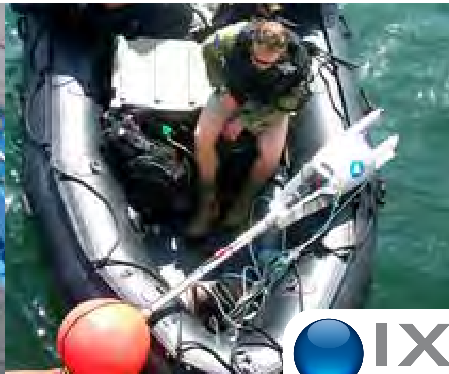
BENEFITS

- Cost- and time-saving deployment: flexible, portable, pre-calibrated, rapid, and simple
- Robust performance in very shallow water (10 m depth) to long range (> 4000 m depth)
- Deployment options, from surface buoy, side pole, moon pool or hull mounted
- Universal utilization

APPLICATIONS

• Offshore, AUV and ROV navigation • Underwater survey and inspection • Drilling • Dynamic positioning (DP) • Structure placement • Pipeline and cable deployment • Diver tracking • Seismic • Ocean science • Defense • Renewable energy industries





IXBLUE
DEEP INSIGHT. SHARPER SENSES.

GAPS
TECHNICAL SPECIFICATIONS

PERFORMANCE

Subsea positioning	
Position accuracy (CEP50)	0.06 % of the slant range [1]
Nominal range	4 000 m [2]
Antenna coverage	200 deg hemispherical
Surface positioning	
Heading accuracy	0.01 deg x secant latitude
Roll / pitch accuracy	0.01 deg

COMPATIBLE TRANSPONDERS AND SENSORS

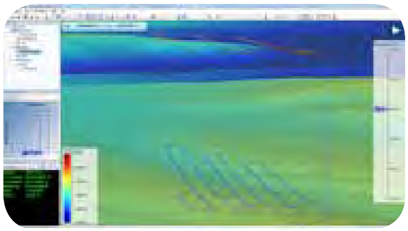
iXBlue mini transponders	OCEANO MT8 x 2, OCEANO MT9 x 2, OCEANO MTA x 2
iXBlue midi transponders	OCEANO ETA62 and releasable OCEANO RTA62
Third party wide band transponders	Optional
iXBlue inertial-acoustic solution integration	PHINS, ROVINS, RAMSES

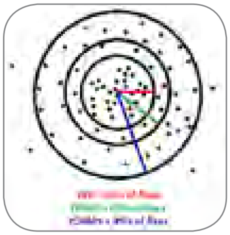
OPERATING / ENVIRONMENT / MECHANICAL

Power supply / consumption	24 – 36 VDC or 110 – 230 VAC / 50 W
Weight in air / water	15 kg / -7 kg (positive buoyancy)
Dimensions (Ø x H)	295 mm x 638 mm
Array depth rating	20 m (100 m survival)
Operating / storage temperature	-5°C to 35°C / -40°C to 70°C

INTERFACES

Control command	Standard iXBlue web-based user interface
Input / output	Quad RS232 / RS485 / Ethernet
	Trigger I/O pulse port and PPS / Sync ports
Protocols	Library of NMEA protocols (standard telegrams for all DPs)





1 signal to noise ratio > 40 dB, in vertical conditions
2 noise level < 65 dB / √Hz @ 1 m ref µPa

STARFIX. G2+
AN ULTRA HIGH ACCURACY SERVICE FOR OFFSHORE APPLICATIONS

Starfix.G2+ is a further advancement in the field of GNSS augmentation, which delivers ultra-high accuracy positioning to our customers.

The Starfix.G2+ is a further advancement in the field of GNSS augmentation, which delivers ultra-high accuracy positioning to our customers.

This new positioning service is based on advanced Integer Ambiguity Resolution (IAR) technology which is a further development of Precise Point Positioning (PPP). The basis of the IAR technique is the derivation an additional set of carrier-phase corrections from the Fugro reference station network (known as Uncalibrated Phase Delays or UPD).

The implementation of the UPD corrections in the Fugro StarPack software results in the carrier-phase ambiguities being resolved (fixed to integer values) resulting in a positioning accuracy at the centimetre level.

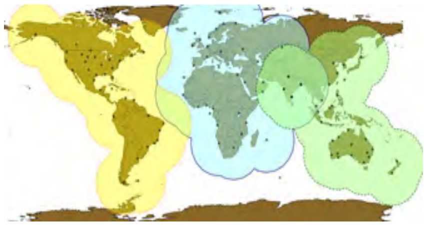
When the Starfix.G2+ service is enabled, the Fugro StarPack software will compute a centimetre Starfix.G2+ position. If for some reason the carrier-phase ambiguities cannot be resolved then the solution will fall back to a standard decimetre PPP solution.

The Starfix.G2+ corrections are supplied to our customers via L-Band satellite links to give global coverage.

The UPD Corrections are generated for 3 geographical regions as these provide significantly better results when compared to a single global set of corrections. These regions are:

1. North and South America
2. Europe, Africa and Middle East
3. Asia and Australia

Although the corrections are divided into regions, our customers do not need to be inside the region in order for the service to work, but should always choose the region closest to their work location.



FUGRO SATELLITE POSITIONING

Solution accuracy; the following table illustrates Starfix.G2+ accuracy over 24 hours over 2 days from four locations

	E (SD)	N (SD)	H (SD)
Bergen (14/03/2015)	0.014 m	0.010 m	0.032 m
Bergen (15/03/2015)	0.016 m	0.013 m	0.034 m
Brownsville (14/03/2015)	0.012 m	0.011 m	0.037 m
Brownsville (15/03/2015)	0.011 m	0.010 m	0.027 m
Houston (14/03/2015)	0.013 m	0.011 m	0.032 m
Houston (15/03/2015)	0.011 m	0.010 m	0.029 m
Leidschendam (14/03/2015)	0.013 m	0.010 m	0.028 m
Leidschendam (15/03/2015)	0.014 m	0.012 m	0.032 m

The Starfix.G2+ service is currently available to customers using Fugro's StarPack GNSS systems.

Starfix.G2+ performance plots for Bergen, on 14th March 2015.

StarPack - High precision GNSS positions, heading and time from a single platform

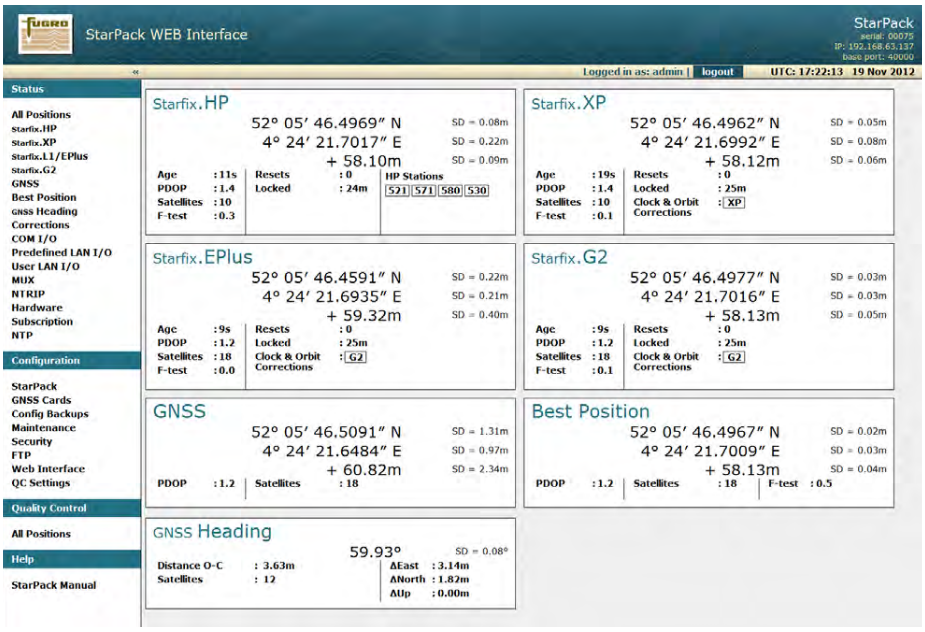
The StarPack is Fugro's answer to increasing market demand for precise, redundant GNSS positioning solutions, including extensive QC and accurate time, from a single, easy to use platform.

StarPack platform

The StarPack unit consists of a survey grade GNSS combined L-band receiver and powerful processor, running Linux multitasking operating system. The receiver is capable of tracking all current satellites (GPS, GLONASS) and is Galileo ready. StarPack can be extended with a second GNSS card (in the same unit), to provide accurate, GNSS derived heading. In addition to GNSS observations, the second card provides also L-band functionality, creating an independent source of corrections for backup.

The combination of receiver and processor provides robust multiple simultaneous precise position calculations and extensive QC. For maximum system reliability, the internal software is embedded on a flash memory. System can be controlled and configured via the front panel, web interface or a serial port.

The StarPack is equipped with four serial ports on the rear panel and LAN interface to provide a multitude of outputs to the user and to read multiple correction sources (in addition to those from the integrated receiver(s)). Raw GNSS data and corrections are continuously logged internally and can be exported to RINEX to enable high quality support and back-up. User can download this data and send it to Fugro's development centers for re-processing. Additional user defined output can be configured for automatic logging. Firmware can be upgraded using the web interface or using a USB stick at the front panel.



Positioning and Heading solutions

The embedded processing software of the StarPack GNSS receiver provides multiple configurable simultaneous precise positioning solutions, including G2.

- Four independent correction sources
  - o Starfix.G2
  - o Starfix.XP
  - o Starfix.HP
  - o Starfix.L1
- Five solutions: Starfix.G2, Starfix.XP, Starfix.HP, Starfix.EPlus and Starfix.L1
- New "Best Position" solution, combining all available solutions in to one, using proper weighting. "Best Position" provides increased availability and better accuracy.
- A Heading solution between two GNSS antennae, in combination with a second GNSS card (in the same or another receiver).

StarPack applications

- Accurate height for tidal corrections and heave compensation
- Accurate position for seabed mapping surveys
- Accurate vertical reference for out of straightness pipeline surveys
- Accurate (instantaneous) heading source (in combination with a second GNSS card)
- Stable position for station keeping on DP vessels
- Accurate relative positioning of structures
- Automated vessel guidance

NTP support

The StarPack contains an NTP (Network Time Protocol) server, providing a time accuracy of 500 µs or better with a convergence time after power-on within several minutes.

NTRIP client

The StarPack contains also NTRIP (Networked Transport of RTCM via Internet Protocol) client. When internet connection is available StarPack can be connected to Fugro's (or third-party) corrections servers providing additional, independent from L-Band, corrections backup.

Quality control

Extensive quality control is provided through StarPackQC, a stand alone PC based application, or on web interface, Quality control parameters indicating precision, reliability and availability can be visualized for estimated positions as well as for corrections and individual satellites.

Technical specifications

GNSS hardware engine

- Trimble BD982 with two antenna inputs: 220 channel GPS/GLONASS, Galileo/BeiDou available with software option upgrade
- Single or dual NovAtel OEMV- 3: 72 channel GPS/GLONASS board (no longer manufactured, but serviceable)
- Trimble BD960: 72 channel GPS/ GLONASS board (no longer manufactured, but serviceable)

Corrections	Integrated receiver for Starfix differential and orbit/clock corrections
Processor	Intel Pentium III, embedded Linux operating system
Data rate	1 Hz - 5Hz
Data storage	10 days, raw and correction data (1 Hz) on internal disk
Size	245 x 60 x 195 mm (W x H x D)
Weight	2 kg
Input voltage	80 – 250 VAC, 40 – 60 Hz
Input/output	4 RS232 ports, LAN with more than 30 configurable ports, 1 PPS
Operating temperature	-20°C – +50°C
Storage temperature	-40°C – +85°C
Humidity	95% non-condensing
Compliant	EMC 2004/108/EC (EN60945:2002) 2011/65/EU(RoHS 2)

Service/ solution	Accuracy (hor. 95%)	System	Correction data	Coverage
Starfix.G2	0.1m	GPS GLONASS	Clock and orbit corrections	Global
Starfix.XP	0.1m	GPS	Clock and orbit corrections	Global
Starfix.HP	0.1m	GPS	Ionosphere-free carrier phase corrections from multiple reference stations	Regional <1000km*
Starfix.EPlus	1m	GPS GLONASS	Clock and orbit corrections	Global
Starfix.L1	1.5m	GPS	L1 pseudo range corrections from multiple reference stations	Regional <500km*
Best Position	0.1m	GPS GLONASS	All available correction data	Global
Heading	Better than 0.1° for baselines longer than 3m	GPS GLONASS	-	Global

** distance to reference station*

SKYFIX-XP

SkyFix-XP (Decimetric Differential GPS)

SkyFix-XP is a GPS positioning system that is based on clock and orbit corrections supplied by NASA's Jet Propulsion Laboratory (JPL). SkyFix-XP is a Precise Point Positioning (PPP) technology, which distinguishes itself from the traditional differential approach as satellite errors are not lumped together but estimated per source, per satellite; it is also known as a *'State Space solution'*. The GPS clock and orbit corrections are computed independently, free of ionospheric and tropospheric effects.

Key Features:

- Capable of 10cm accuracy in horizontal and 20cm in vertical domain.
- Truly global coverage with no range restrictions from stations
- Dual delivery satellite beams – high power and low power
- Extensive QC monitoring in line with UKOOA standards
- Real-time system performance information available on-line
- Compatible with existing SkyFix hardware
- Truly independent of Starfix systems

SkyFix-XP Technology

Traditional Differential GPS services use the fixed location of a single reference station to measure the ranges to all GPS satellites in view. These measurements are then compared to the computed ranges at that location and the resulting differences in the observations are transmitted as pseudo-range corrections. This technique introduces some inaccuracies as the distance from the reference station grows.

SkyFix-XP removes this range limitation by using a completely new technique known as Satellite Differential GPS (SDGPS). Orbit and clock corrections are determined for each satellite continuously utilizing Fugro's global network of reference stations. These corrections are then broadcast to the user and can be used at any location, regardless if the distance to any reference station, making the system truly global.

The orbit and clock corrections are contained in a set of proprietary RTCM messages, which can be received using the existing SkyFix decoders. Users require dual-frequency DGPS receiver as well as the MultiFix 5 positioning and QC software. The high accuracy is obtained by new processing techniques within MultiFix 5 that correct, estimate and /or eliminate the common GPS error sources (orbits, clocks, troposphere, ionosphere, multi-path and noise).

Local tropospheric and ionospheric errors are corrected at the user end by using a dual GPS frequency receiver. Multipath and receiver noise are addressed by using carrier phase observations within the XP calculation.

Advantages of SkyFix XP

- A single set of corrections per satellite valid independent of the geographic location.
- Independence from the existing Fugro reference station network
- Simplicity for the user

Direct comparisons with competing providers' capabilities and performance show that Fugro continues to lead in accuracy and robustness of solution.

Quality Control and Verification

SkyFix-XP data is rigorously checked for accuracy, advanced statistical testing is performed using UKOOA recommendations. SkyFix-XP utilises MultiFix 5, Fugro's latest version of its GPS QC software. MultiFix 5 can also be configured with a number of back-up solutions for the primary SkyFix-XP calculation to provide optimum redundancy. This allows the system to switch automatically to an alternative DGPS solution such as SkyFix or SkyFix Premier. These back-up processes are performance (rather than availability) based, giving the operator maximum confidence in the system.

Standard DGPS vs. SkyFix-XP

To provide a confirmation of accuracy, Fugro has installed regional monitoring systems located at key oil and gas hot spots around the world. These provide real-time system performance information via the Starfix website (www.skyfix.com).

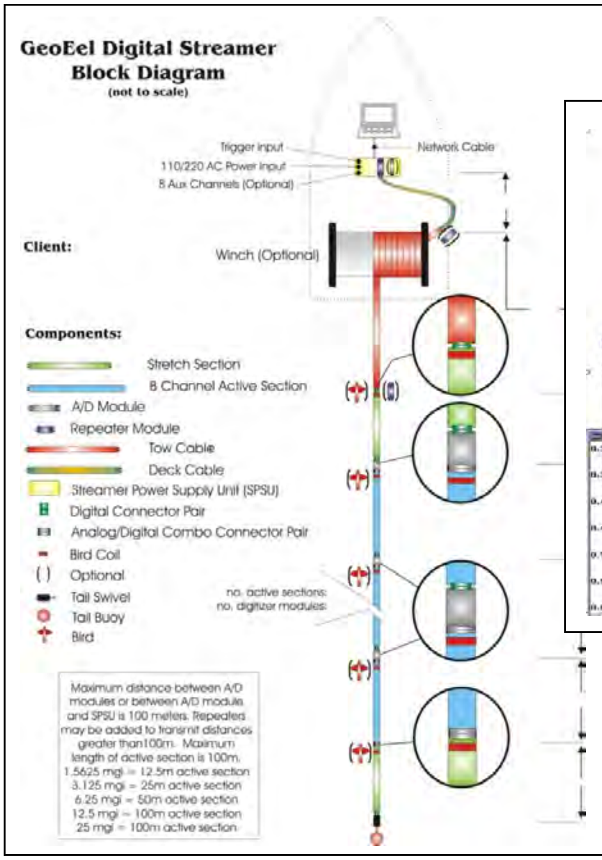
System Overview

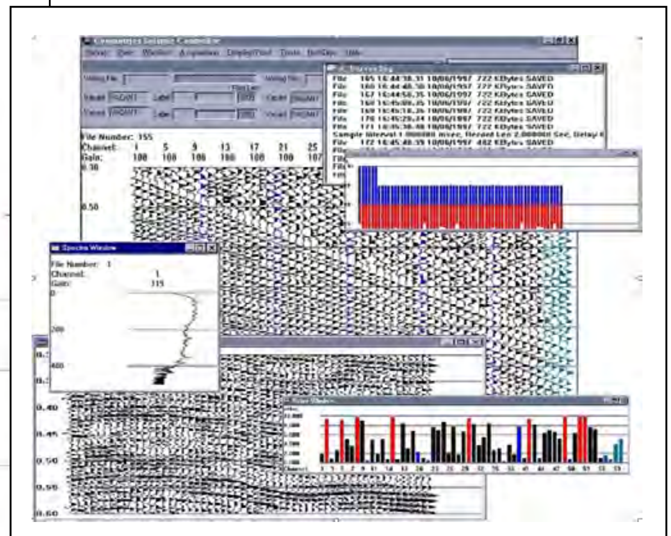
The hardware configuration for SkyFix-XP is similar is similar to that of the standard SkyFix system, it is possible to share hardware or upgrade an existing system with the addition of a dual frequency GPS receiver and the new MultiFix 5 software.

Typical SkyFix-XP system configuration:

The additional SkyFix-XP correction messages can be received with all existing SkyFix decoders. MultiFix 5 is compatible with most leading GPS receivers including units produced by Thales, Trimble and Novatel.

EQUIPMENT SHEET OFFSHORE SURVEY



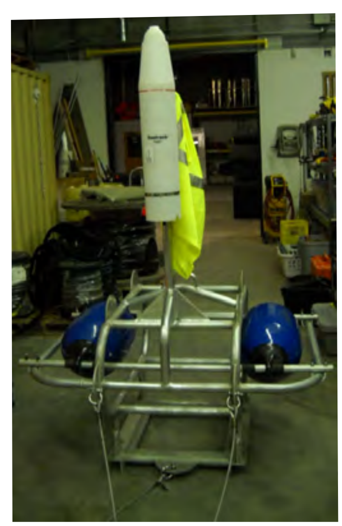


FUGRO
SEISMIC PROFILER - GEOMETRICS GeoEeL

The Geometrics GeoEel digital towed hydrophone streamer is the first narrow diameter array meeting the performance standards of larger systems. With a diameter of only 41 mm, the GeoEel is easy to deploy, easy to transport, and can be shipped by air. Separate 8 channel modules coupled with unique slim active-section design yield noise levels under 5 microbars and make the GeoEel immune from the electronic interference, leakage, and ground loops that plague the installation of analog streamers.

GeoEel active sections are filled with inert silicone oil, making them environmentally safe and non-flammable. A 1/8-inch thick abrasion resistant polyurethane makes the streamer extremely rugged but still flexible enough to deploy on small boats. Acquisition is controlled with PC-based Geometrics CNT-2 software.

Features include: multiple shot and gather windows, bar graph noise displays, windows for shot timing, gun energy, brute stack, tape status, spectral analysis; sure-save software that protects against data loss even with total storage device failure; sequentially-ordered file saving; auto-switching between storage device, dual tape writing; multiple printer support; parameter change logs; and integrated navigation, gun, and bird parameters into an SEG-D, SEG-Y or SEG-2 header.



GPS Tail Bouy

EQUIPMENT SHEET OFFSHORE SURVEY

SEISMIC PROFILER - GEOMETRICS GeoEel

A/D Converter Canister Specifications

Channels Per A/D Canister	8
Sample Rates	1/16, 1/8, 1/4, 1/2, 1, 2, 4 ms
Bandwidth	5 Hz to 8 kHz
Programmable Gain	0 dB, 6 dB, 18 dB, 30 dB, 42 dB
Anti-Alias Filter	set by sample interval, down 135 dB at stop band
Maximum Input Range	±2.25V
Resolution	24 bits including sign
Input Impedance	126.8 K Ohms, paralleled by 2.4 nF
Dynamic Range	120 dB Typical @ 1ms
Common Mode Rejection	>110 dB
Record Length	Up To 40 sec in shot synch mode
Dead Time	100 ms
Continuous Recording Mode	Enabled with GPS synchronization
Noise Floor	0.1 uV at 2 ms
QC Tests	Leakage and capacitance of hydrophone elements, noise, offset, harmonic distortion and gain similarity
Power Consumption	Approximately 100 mA at 48 VDC
Calibration Oscillator	10 Hz to 2 kHz, 1 ?V to 100 mV AC RMS
Dimensions	44 mm diameter x 33 cm long (1.75” by 11”)
Weight	900 grams (2.0 lbs)
Packaging Material	Titanium body
Connectors	Waterproof high density stainless steel, 41 pin

Stretch and Vibration Isolation Section Specifications

Length Construction	10, 25 or 50 meters standard
Outer Diameter	Similar to active section
Stretch Ratio	41 mm (1.6 inches)
Compass/Bird Coil	Approximately 15% for stretch section
Break Strength	I/O Model 587, isolation section Only
Depth Transducer	over 2200 kg (5000 lbs), Vectran strain members
	Available only on isolation section

Hydrophone Section Specifications

Number of Channels	8 per section
Hydrophones per group	16 typical at 12.5m
Hydrophone Type	Benthos RDA Geopoint, or AQ-1
Jacket Material	Clear polyurethane, 70 Duro, 3.18 mm (1/8 inch) wall thickness
Outer Diameter	41 mm (1.6 inches)
Ballast Fluid	Inert, non-polluting silicone oil, 100 cSt
Weight	~135 kg (300 lbs) / 8 channels @12.5 mg
Break Strength	over 2200 kg (5000 lbs), Vectran strain members
Maximum Tow Speed	~8 knots recording, ~10 knots steaming, depending on configuration and sea state
Minimum Bend Radius	75 cm (30 inches)
Compass/Bird Coil	IO Model 587
Depth Transducer	One per section (optional)

EQUIPMENT SHEET OFFSHORE SURVEY

SEISMIC PROFILER - GEOMETRICS GeoEel

Streamer Power Supply Unit Specifications

Power Requirements	115/230 VAC, 3/1.5 Amp max, 50/60 Hz
Voltage to Streamer	36- 72 VDC
I/O Communications	100 Base TX Fast Ethernet, IEEE 802.3 compliant
Trigger Requirements	Isolated Input, Positive or Negative TTL, software selectable
Testing	Cable leakage and resistance, Ethernet for faults and collisions
Optional Auxiliary Inputs	8 analog channels with 24-bit resolution
Ethernet Connection	RJ-45
Trigger Connection	BNC

Tow Cable Specifications

Electrical conductors Weight	10 twisted pair shielded
Strain member	~ 25 kg (55 lbs) for 50 meters
Break strength	Kevlar
Diameter	over 2200 kg (5000 lbs)
	20 mm

GeoEel Convertible Acquisition Channel Specifications

Maximum Channels	240 per chassis
Channel per card set	8
Sample Rates	1/16, 1/8, 1/4, 1/2, 1, 2, 4 ms
Bandwidth	5 Hz to 8 kHz
Programmable Gain	0 dB, 6 dB, 18 dB, 30 dB, 42 dB
Anti-Alias Filters	et by sample interval, down 135 dB at stop band
Maximum Input Range	±2.25V
Resolution	24 bits including sign
Input Impedance	126.8K Ohms, paralleled by 2.4 nF
Dynamic Range	120dB Typical @ 1ms
Common Mode Rejection	>110 dB
Record Length	Up to 40 sec

Charge Amplifier

Configurations	24 to 120 channels in groups of 24
Frequency response	5 Hz to > 300 Hz, by streamer capacitance
Output Impedance	1000 ohms
Dimensions	7U 12.5"hx19"Chassis wx14"d
Power Consumption	115/220 VAC, 50/60 Hz, 1 Amp
Weight	33.5 lbs
Operating Temperature	-10 to +40 degrees C
Relative Humidity	80% max, non-condensing
Input Impedance	virtual ground
Transducers	piezoelectric ceramic element
Channel Output D.C. Offset Channel	3mV (Differential) nominal
Maximum Output	4V P-P open circuit
Channel Dynamic Range	>100dB
Channel Output Distortion	< 0.005% THD
Channel Output Sensitivity Precision	+/- 2%
Channel Low Frequency Cutoff	4Hz
Common Mode Rejection	>40 dB (Balanced Input)
Communication Interface (Option)	10/100 Base T Ethernet

RANGER 2 USBL

TRACK EVERYTHING, IN ANY DEPTH, FROM ANY VESSEL.

TRACK A TOWFISH, POSITION AN ROV, DP YOUR VESSEL, SEARCH THE SEABED OR NAVIGATE AN AUV. WHEN YOU NEED TO INVEST IN ULTRA-SHORT BASELINE (USBL) ACOUSTIC TECHNOLOGY TO SUPPORT YOUR UNDERWATER OPERATIONS, RANGER 2 HAS THE PERFORMANCE YOU NEED, AT THE INVESTMENT LEVEL YOU CAN AFFORD TO GET THE PROJECT COMPLETED FASTER AND MORE EFFICIENTLY THAN ANY OTHER SYSTEM ON THE MARKET.

ENGINEERED LIKE NO OTHER

All USBL systems calculate position by measuring the range and bearing from a vessel-mounted transceiver to an acoustic transponder fitted to a moving target or placed on the seabed. But not all USBL systems do it with the accuracy and precision offered by Ranger 2.

We've taken everything that made our original Ranger system so effective and advanced it to the next level. That next level is our award-winning 6G (sixth generation) acoustic hardware platform and Sonardyne Wideband® 2 digital signal architecture which work seamlessly together to deliver the best possible USBL positioning performance and operator experience.

Vessel and vehicle hardware is easy to install and configure. It can track your equipment to beyond 7,000 metres and update its position every second. It's engineered for shallow water, deep water, high elevation and multi-user operating scenarios. And if your vessel's fitted with a DP system – regardless of what make it is – Ranger 2 can interface with it.

THE ONLY USBL YOU'LL NEED

Every survey, ocean science, DP and seismic exploration project is different; different water depths, different vessels and different targets to position. But that shouldn't mean you need a different USBL system for each one.

Ranger 2 comes with an impressive list of standard features. As your needs grow and become more complex, so too can the capabilities of Ranger 2 thanks to software feature packs available in three versions; Survey, Dynamic Positioning and Professional – all of which can be remotely activated* in the field.

*Subject to having the appropriate hardware available on board

WHY IT'S GOOD FOR YOUR OPERATIONS

- Simple, intuitive software
- Tracks an unlimited number of targets; ROVs, towfish, AUVs...
- Operating range beyond 7,000 metres
- Better than 0.1% system accuracy when optimised
- Up to 1 second position updates
- Compatible with all makes of DP system
- Automated setup reduces vessel delays
- Application packs available bringing extra features specific to your operations
- User training available worldwide
- Multi-user capable
- Track record of success on all types of vessel
- Support available globally 24/7

RANGER 2 USBL FOR

SURVEY

WHETHER YOU ARE CONDUCTING A HYDROGRAPHIC SURVEY WITH A TOWFISH, MONITORING THE TOUCHDOWN POSITION OF A PIPELINE OR LOWERING AND LANDING STRUCTURES ONTO THE SEABED, RANGER 2 HAS ALL THE CAPABILITY YOU NEED IN ONE APPLICATION. THE OPTIONAL SURVEY PACK UNLOCKS A HOST OF ADDITIONAL FEATURES TO FURTHER OPTIMISE THE PERFORMANCE OF YOUR RANGER 2 SYSTEM FOR THE MAJORITY OF OFFSHORE CONSTRUCTION AND SURVEY TASKS.

RANGER 2 SURVEY PACK

The Ranger 2 Survey pack uses the intuitive and simple layout as the standard software but allows access to more complex areas such as the setup and tracking of ROVs, AUVs and structures. These objects can be configured with multiple transponders attached to them and fixed offsets can then be computed to points such as a structure's CRP or an ROV's bumper bar which can be both displayed on-screen with their position output.

Being able to work in this manner directly in the USBL software benefits your surveys as any sensor latency induced errors are minimised, and the risk of systematic errors from the use of incorrect offsets is reduced. AutoCAD backdrops and configurable seabed geodesy allow Ranger 2 Survey to be used for tracking and guidance. Complex doesn't have to be complicated.

WHY IT'S GOOD FOR SURVEY

- Up to 0.07% slat range tracking performance using GyroUSBL
- Supports complex tracking scenarios such as structures and vehicles with multiple transponders and multiple remote offsets
- Importable AutoCAD DXF field backdrops
- Built-in seabed geodesy package
- Configurable UI to suit multiple project tasks
- Tools to configure stinger-mounted GyroUSBL transceivers
- System can be shared with DP

WLL 15T

RANGER 2 USBL FOR

DYNAMIC POSITIONING

OUT OF THE BOX, RANGER 2 IS A HIGHLY CAPABLE ACOUSTIC POSITION REFERENCE SYSTEM THAT YOU CAN INTERFACE WITH ANY DP SYSTEM INCLUDING GE, KONGSBERG, MT, NAVIS, ROLLS-ROYCE AND WÄRTSILÄ. BUT IF YOUR VESSEL UNDERTAKES CRITICAL STATION KEEPING ACTIVITIES IN ULTRA-DEEP WATERS, THE RANGER 2 DP PACK OFFERS ENHANCED LEVELS OF POSITIONING INTEGRITY. DEVELOPED TO MEET THE REQUIREMENTS OF CLASS 2 AND 3 RULES, IT'S PERFECT FOR HEAVY CONSTRUCTION, WELL INTERVENTION, SALVAGE AND PRODUCTION VESSELS.

RANGER 2 DP PACK

The DP pack's stand-out feature is its ability to support Long and Ultra-Short BaseLine (LUSBL) and inertial navigation (DP-INS) configurations.

LUSBL exploits the greater precision and acoustic range redundancy offered by Long BaseLine (LBL) seabed transponder arrays where accuracy is virtually independent of water depth. And because Ranger 2 is built around our exclusive Wideband 2 signal architecture, you have the freedom to deploy your own transponder array without interrupting others, or share one that is already deployed in the field, saving vessel time and lowering your costs.

Tightly integrated acoustic and inertial positioning benefits your DP system by improving the accuracy, update rate and reliability of the position. The inertial navigation system can be aided by a single USBL transponder or multiple transponders – but far fewer than a conventional LBL array. Transponders can also be set to a slower update rate, extending their battery life saving deployment and calibration time and extending service intervals.

DPO FRIENDLY

DPOs quickly feel comfortable using Ranger 2's easy and intuitive software. Automatic discovery of Sonardyne transponders and array planning tools are included as standard whilst real-time quality indicators, noise analysis and signal travel time displays are just some of the extra tools available to help them optimise performance.

WHY IT'S GOOD FOR DP

- High integrity positioning for critical deep water operations
- Fully compatible with all makes of DP system
- Cost effective for owners and shipyards
- Less wiring, fewer components and smaller gate-valve than comparable systems
- Easy to learn, easy to use
- DP-INS for added reliability and operational savings
- Dual transceivers for added accuracy

CCC PIONEER

CCC

RANGER 2 USBL FOR

EXPLORATION

WITH ITS ABILITY TO SIMULTANEOUSLY TRACK MULTIPLE SUBSEA TARGETS, RANGER 2 IS IDEAL FOR MARINE SEISMIC OPERATIONS WHERE VERY LARGE AREAS OF THE SEABED ARE COVERED WITH NODES AND THEIR PRECISE LOCATIONS CONFIRMED BEFORE ACQUISITION CAN BEGIN. BUT RANGER 2 DOES MORE THAN SIMPLY POSITIONING. THE HIGH-SPEED ACOUSTIC COMMUNICATIONS BUILT INTO EACH NODE-MOUNTED 6G TRANSPONDER MEANS THAT DURING A SURVEY, DATA CAN BE UPLOADED TO THE SURFACE TO LET YOU KNOW EACH NODE'S STATUS.

FROM SHALLOW TO DEEP

Seismic surveys using Ocean Bottom Nodes (OBNs) are a popular method of acquiring high resolution reservoir imagery. Ranger 2 USBL is used to determine the locations of thousands of marine seismic nodes – or the ROVs that deploy them – when operating in the transition zone all the way to very deep water.

When ROVs are used, Ranger 2 integrates seamlessly with our SPRINT INS and Syrinx DVL products to maximise ROV positioning performance. This minimises the number of observations required to achieve your project's specification.

THIRD PARTY SOFTWARE INTERFACES

Node deployment operations are typically conducted under the control of third party navigation packages such as HydroPos and Gator II so Ranger 2 comes with a remote control interface provided as standard.

Once your survey is complete, the precision offered by Ranger 2 allows an ROV pilot to navigate directly to each node to recover it. This saves time and ensures no hardware is left behind on the seabed. Alternatively, the transponders attached to each node can be acoustically commanded to release anchor weights so that the entire instrument floats up to the surface.

WHY IT'S GOOD FOR EXPLORATION

- Thousands of unique transponder addresses permit large node arrays without identity repetition.
- Compatible with Sonardyne ROV based INS and DVL products for seamless operation.
- High update rate maximises deployment speed.
- Quick to install on vessels of opportunity using pre-calibrated transceivers
- Remote control interface to standard seismic navigation systems such as HydroPos and Gator II.

RANGER 2 USBL FOR

OCEAN SCIENCE

CHOSEN FOR ITS ABILITY TO TRACK A WIDE VARIETY OF SCIENTIFIC PACKAGES AT RANGES UP TO 10,000 METRES, RANGER 2 IS THE PREFERRED USBL SOLUTION FOR MANY OF THE WORLD'S LEADING OCEAN RESEARCH INSTITUTES. IT IS A KEY ENABLER FOR THEIR VESSELS AND HAS THE FLEXIBILITY TO MEET THE PRECISE IN-WATER AND NEAR-BOTTOM SUSTAINED OBSERVATION NEEDS OF SCIENCE USERS WORKING NEARSHORE, COASTAL AND DEEP OCEAN.

MAXIMISING SCIENCE TIME, MINIMISING DOWNTIME

Science users rarely have the luxury of remaining on site for long, so Ranger 2's ability to position instruments such as corers, camera platforms and geological drills without having to first deploy a seabed array of transponders, helps you maximise precious ship time. It can even be used to activate compatible acoustic release transponders, allowing you to release and track your moorings all the way to the surface for immediate recovery on board.

If your research involves using a vessel of opportunity, then the benefits of using Ranger 2 begin before you've left port. Our pre-calibrated, all-in-one GyroUSBL transceiver is perfect for installation on a temporary over-the-side mounting arrangement yet delivers the same precision as a permanent installation.

ULTRA-DEEP TOW

Ranger 2's unique Inverted USBL (iUSBL) mode, a feature of the Survey pack, is perfect for deep tow, extreme layback towfish tracking. Rather than mounting the USBL transceiver on the vessel in the traditional manner, with iUSBL, the transceiver is installed on the towed body itself. Because towfish are typically quiet, the signal-to-noise ratio is significantly improved which provides longer ranges and greater precision.

AUV OPERATIONS

When paired with Av-Trak 6, Ranger 2 enhances AUV operations, combining telemetry and positioning. The 6G Sonardyne Messaging Service supports the transfer of vehicle mission updates and USBL reference positions to the AUV, as well as status messages from it, and AUV-to-AUV telemetry.

SEABED GEODESY

Ranger 2's flexibility allows you to recover data from our Autonomous Monitoring Transponders, which are increasingly being used for the long term measurement (up to 10 years) of seabed tectonic deformation. With both MF and LMF options available to support this capability, Ranger 2 HPTs can also be supplied as stand-alone modems for over-the-side wire deployment on ships not fitted with a Ranger 2 system.

WHY IT'S GOOD FOR OCEAN SCIENCE

- Tracks AUVs, ROVs and other equipment to full ocean depth
- Maintains performance in noisy, shallow water environments
- Built-in fast data telemetry capability
- Supports MF and long range LMF operating bands
- Easy to install on vessels of opportunity
- Inverted USBL mode for tracking over long laybacks
- Software is simple and intuitive
- Compatible with all DP systems

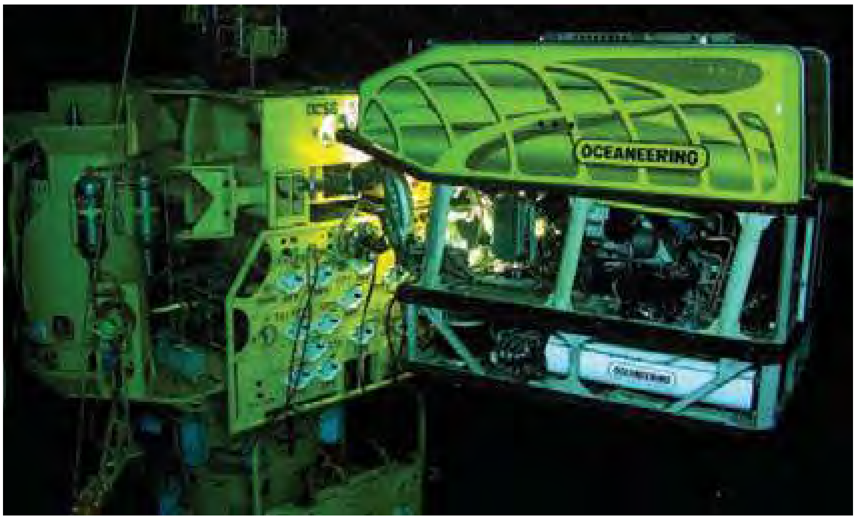
RANGER 2 USBL FOR

UNRIVALLED CAPABILITY

BE PREPARED FOR ANY VESSEL AND SUBSEA POSITIONING SCENARIO BY CHOOSING THE HIGHEST SPECIFICATION RANGER 2 PACK AVAILABLE – PROFESSIONAL. WITH THIS FEATURE PACK INSTALLED, YOU AND YOUR VESSEL HAVE GOT THE UNRIVALLED ABILITY TO SELECT WHICHEVER FEATURE YOU WANT, WHEN YOU WANT IT



RANGER 2 PROFESSIONAL PACK

Whether it's to provide an acoustically aided reference telegram to a DP desk whilst simultaneously tracking a complex structure with multiple transponders attached, or tracking an ROV overlaid on a geodetic backdrop whilst outputting an LUSBL DP telegram, Ranger 2 USBL Professional can do all this and more.

SURVEY AND DP

Ranger 2 Professional directly benefits multi-purpose vessels by enabling you to take advantage of the powerful position reference features found within the DP pack along with all the tracking features found within the Survey pack. This enables vessels to operate using a single USBL system for both DP and construction survey tasks which makes ownership and operation much simpler.

Professional retains the same easy to use UI of the standard version enabling you to make the switch with the minimum of extra training required. And, like the Survey pack, the UI can display exactly what you want to see.

WHY I'TS GOOD FOR ANY OPERATION

- Up to 0.07% slant range tracking performance
- Full support for aided INS and LUSBL vessel DP references
- Capability to track structures and vehicles with multiple transponders and multiple remote offsets
- Can operate in Standard and Optimised tracking modes
- Easy to install on vessels of opportunity
- Support for all Sonardyne 6G USBL transceivers, transponders and responders
- Configurable UI to suit multiple project tasks

EMAS CHIYODA

SHIP FIT EQUIPMENT

BRIDGE & INSTRUMENT ROOM

EASIER, FASTER AND NOW MORE CONFIGURABLE. THE LATEST VERSION OF RANGER 2 OPERATING SOFTWARE IS UNLIKE ANY OTHER ACOUSTIC POSITIONING SOFTWARE PACKAGE AND BRINGS TOGETHER ALL THE FEATURES SURVEYORS, SCIENTISTS AND DPOS TOLD US THEY WANTED TO SEE. IF YOU'VE NEVER USED A USBL SYSTEM, YOU'LL QUICKLY FEEL COMFORTABLE USING RANGER 2 AND IN NO TIME, BE READY TO CONFIGURE YOUR FIRST UNDERWATER TRACKING OPERATION. IT'S ALSO DESIGNED SPECIFICALLY TO TAKE ADVANTAGE OF THE POWERFUL FEATURES CONTAINED WITHIN EVERY 6G TRANSPONDER AND TRANSCEIVER.

ALL THE TOOLS YOU NEED

Ranger 2 benefits from a completely revised main UI, a centralised transponder management table, an array planning tool for DP operations, configurable displays, and integrated support for iWand, our go-anywhere back deck test and configuration device for 6G transponders. And when you need them, remote infield upgrades unlock extra features – ensuring you only pay for what you need.

- **Highly configurable navigation chart with layers**
- **Importable DXF backdrops**
- **Remote control and output telegrams**
- **Built-in performance verification and optimisation tools**
- **Automatic detection of previously deployed transponders including configured address**

NAVIGATION PC (NAVPC)

The NavPC and NSH are designed to meet the complete on-board requirements of any Ranger 2 positioning operation. Featuring an Intel® Core i7 processor, the NavPC is purpose built to run the family of Ranger 2 software applications and is proven to withstand the rugged environmental conditions associated with marine operations. It measures just 2U high so is ideally suited for mounting in an instrument rack, portable case for temporary installations or within a DP desk.

- **Designed to industrial PC standards**
- **Internal security dongle**
- **Shock-mounted hard drive**
- **Dual screen (VGA, DVI or HDMI)**
- **Ethernet or Serial interface to NSH**

NAVIGATION SENSOR HUB (NSH)

The NSH is the interface between the in-water acoustic instruments, sensors and the NavPC which runs the Ranger 2 positioning software. In addition to accurately time-stamping incoming data from external devices such as gyros, VRUs and GNSS, the NSH also provides power and communications for ship-borne acoustic transceivers.

- **Configurable for stand-alone or dual independent modes**
- **Up to 16 Ethernet or serial interfaces**
- **6 transceiver serial ports providing 24/48 V DC power**
- **Sub-microsecond time-stamping on all Tx/Rx data**

SHIP FIT EQUIPMENT

TRANSCEIVERS

WHEN IT COMES TO USBL TRANSCEIVERS, ONE MODEL DOES NOT FIT ALL SITUATIONS AND VESSELS. THAT'S WHY OUR HIGH PERFORMANCE TRANSCEIVER (HPT) IS AVAILABLE WITH DIFFERENT ARRAY DESIGNS RANGING FROM FULL HEMISPHERICAL COVERAGE TO DIRECTIONAL DESIGNS FOR ULTRA-DEEP WATER AND HIGH VESSEL NOISE OPERATING ENVIRONMENTS. HPT TRANSCEIVERS CAN ALSO BE USED AS WIRELESS MODEMS FOR AUTONOMOUS MONITORING TRANSPONDER SETUP AND DATA RETRIEVAL AS WELL AS SUPPORTING LBL OPERATIONS.

TOWFISH MOUNTED

iUSBL/GYROiUSBL

A subsea vehicle based transceiver that turns conventional USBL tracking on its head. Designed for projects using deep tow, long layback survey platforms requiring high precision.

HPT 13000

A specialist USBL transceiver available to support tracking projects in the deepest water. The large array and advanced multi-element signal processing enables transponders to be tracked with ultimate precision.

LMF HPT

A Low Medium Frequency (14-18kHz) transceiver to ensure maximum data telemetry rate and positioning range whilst providing simultaneous multi-user operation with systems in other bands of operation. Identical functionality to that of Medium Frequency band HPT instruments.

GYROUSBL 5000/7000

Lodestar subsea AHRS sensor and HPT transceiver in one unit. GyroUSBL can be pre-calibrated for rapid and cost-effective deployment on vessels of opportunity. Available with standard and deep water optimised arrays.

HPT 7000

A USBL and LUSBL transceiver optimised for noisy dynamically positioned drilling and construction vessels operating in deep water. Vessel and thruster noise is rejected.

HPT 5000

Enables subsea targets to be tracked with precision and repeatability over a wide range of water depths and elevations. Supports high speed 6G data telemetry mode.

SHIP FIT EQUIPMENT

OPTIONS

OPTIMISED USBL

The positioning accuracy obtainable from Ranger 2 can be further improved by co-locating Lodestar, our premium quality Attitude and Heading Reference system (AHRS), with your vessel's 6G acoustic transceiver.

Known as Optimised USBL, the advantage of this configuration is that raw USBL range and bearing data is simultaneously processed with the Lodestar's attitude data. This achieves a tightly compensated solution that enables a system accuracy of 0.1% of slant range to be achieved. Available with standard Ranger 2 systems, or those enabled with Survey, DP and Professional feature packs.

TIP If you don't need the extra performance offered by Optimised USBL, the bridge-installed version of Lodestar is a cost effective replacement for your ship's gyro and VRU.

DP-INS

For tightly integrated acoustically-aided inertial DP operations ,you will need to install our DP-INS sensor to work alongside your Ranger 2 system.

GyroUSBL transceivers have this sensor built-in, its capability simply needs to be enabled. Alternatively, we offer a stand-alone unit for installing on your bridge or deployment machine. Both units incorporate three Ring Laser Gyroscopes and three accelerometers selected for use for their performance, high mean time between failure (MTBF) and ease of export (non ITAR). These sensors have highly stable error characteristics and are compensated for temperature variation.

TIP Did you know we use RLGs and inertial sensors with a 400,000hrs MTBF, proven over 15 years of use in almost every commercial airliner?

VIEWPOINT REMOTE WORKSTATION

If you want to share and visualise positioning data from your Ranger 2 system with other teams on board, then you will need a Viewpoint remote display workstation.

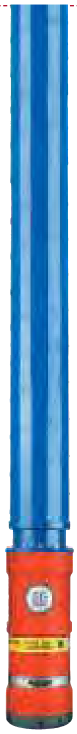
It enables you to transform co-ordinates of surface vessels, subsea vehicles and structures into geographical information overlaid on easy-to-use guidance displays. When changes to Ranger 2 are made, such as adding a new tracked target, they automatically appear on ViewPoint workstations. And because it is serially interfaced with Ranger 2, Viewpoint is totally secure; there is no way to affect live survey and DP operations.

TRANSCEIVER DEPLOYMENT – PERMANENT

USBL system performance is seriously degraded by poor transceiver mounting and deployment so we've developed a family of highly engineered deployment machines suitable for any situation. Validated on hundreds of vessels, our through-hull hydraulic deployment machine is ideal for permanent installations and features a stiff, corrosion-resistant pole, high integrity bearing and sealing design and reliable hydraulic actuation with safety interlocks, sea chest for access, and remote control options.

Where through-hull deployment via a gate valve is not available or practical, a through-tube machine is available. Modular, easy to transport sections accommodate any pole length and once deployed, the pole is held rigidly in place using a self-contained hydraulic clamping mechanisms.

TRANSCEIVER DEPLOYMENT – TEMPORARY



For short term projects using a vessel of opportunity, our modular over-the-side deployment pole provides a cost-effective and practical solution. Pole lengths can be adjusted by adding or removing sections and once the assembled pole is lowered and locked into position, a high degree of stability is assured.

- **High performance, high integrity survey grade deployment system**
- **Drag and vortex reducing strakes**
- **Deck and hull mount options**
- **Sectional pole allows length to be configured for each vessel**
- **Good corrosion resistance**
- **Custom design available for other manufacturers instrumentation**
- **Easy to transport and assemble**

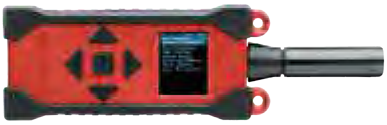
VEHICLE FIT / SEABED EQUIPMENT

TRANSPONDERS

WIDEBAND SUB-MINI 6+ (WSM 6+)

Included with any purchase of our Ranger 2 USBL system, WSM 6+ is the ideal choice of transponder for tracking mobile underwater targets such as a towfish, crane wire, ROV and manned submersible. 2-way wideband signals ensure reliable acoustic performance in all conditions.

- Small and rugged
- 1,000 metre and 4,000 metre depth ratings
- Omni-directional or directional transducers
- Inbuilt depth sensor aids USBL performance
- Responder mode for fast position updates
- Rechargeable battery



TIP iWand – use it to test and configure any 6G transponder on the back deck. You can even import their settings straight into Ranger 2.

WIDEBAND MINI TRANSPONDER 6 (WMT 6)

If size and weight are important considerations, but you need the capability to track equipment in water depths up to 7,000 metres, look no further than the WMT 6. Its high power acoustic output means it's perfect for noisy operating environments.

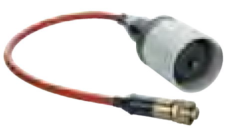
- 3,000 metre, 5,000 metre and 7,000 metre depth ratings
- Available with remote transducer (3,000 metre version)
- Mini size – small and lightweight
- Full 2-way Sonardyne Wideband communications
- Responder mode for fast position updates
- Long life Li-ion battery

TIP If you're not using your WMT for a while, the unit's external On/Off switch helps to ensure it is always ready for your next operation.

AV-TRAK 6

Av-Trak 6 combines the functions of a USBL transponder, LBL transceiver and wireless communications link in one low power instrument that's perfect for missions involving AUVs. Available with electronics-only for customer integration and a custom I/O for mission abort and ballast jettison.

- Combined transponder, transceiver and telemetry instrument
- Track it, navigate it and command it
- Depth ratings to 7,000 metres
- Can aid vehicle's INS system
- Remote transducer option for easy vehicle installation
- Rechargeable battery



TIP If space on your vehicle is limited, Av-Trak 6 can be supplied with a remote transducer allowing you to install the main electronics housing wherever you want.

WIDEBAND RELEASE TRANSPONDER 6 (WRT 6)

WRT 6 is a dedicated acoustic release transponder which you can use with Ranger 2 to deploy, track and detach seafloor equipment and instrument moorings. It uses field-proven mechanics combined with 6G electronics to ensure interference-free operation in multi-user scenarios.

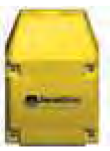
- **1,275 kg Working Load Limit (WLL)**
- **Higher WLL available with load maximisation frames**
- **Highly reliable release mechanism**
- **External On/Off switch to maximise battery life when not in use**
- **Depth rated to 3,000 metres**
- **Can be positioned using Kongsberg HiPAP® systems**

TIP Load amplification frames extend the WLL of WRT 6s – perfect for structure installation projects.

DYNAMIC POSITIONING TRANSPONDER 6 (DPT 6)

If you need an ultra-dependable, cost effective seabed DP reference transponder, DPT 6 is the answer. It's quick to set up on the back deck, easy to deploy and can be recovered without the need to send down an ROV.

- **Highly reliable acoustic release mechanism**
- **3,000 metre, 5,000 metre and 7,000 metre depth ratings**
- **Robust acoustic performance in all conditions**
- **Hundreds of operating channels**
- **Choice of sensors including depth, temperature and inclinometer**



TIP If you're deploying a Compatt or DPT on the seabed, you'll need a floatation collar. We have designs to suit every application.

COMPATT 6 (C6)

From Mini to Mega, C6 is the industry standard transponder used for high precision subsea survey and construction in all water depths. Available in a wide range of sizes, materials, sensor and battery configurations, ask us which one is right for your project.

- **Multi-functional transponder; supports USBL, LBL, modem and gyro applications**
- **Mini, Midi, Standard, Mega and Maxi sizes**
- **Can be used by multiple users simultaneously**
- **Extensive choice of sensors, depths and batteries**
- **Global track record of success**

SUPPORT

WE INSTALL, WE TRAIN, WE MAINTAIN.

WITH SEVERAL THOUSAND USBL INSTALLATIONS SUCCESSFULLY UNDERTAKEN, WE HAVE THE EXPERIENCE TO WORK SIDE-BY-SIDE WITH YOUR NAVAL ARCHITECT, SHIPYARD, DP SUPPLIER AND CREW TO MAKE THE PROCESS OF INVESTING IN RANGER 2 PROBLEM-FREE AND LOW-RISK. IT'S ALL PART OF THE SERVICE THAT HELPS LOWER YOUR OPERATIONAL RISK, SPEED UP YOUR SUBSEA OPERATIONS AND KEEP VESSEL DOWNTIME TO A MINIMUM.

EXPERT ADVICE

Our long-term partnership with clients has enabled us to develop a unique and extensive insight into the diverse nature of underwater operations and the associated commercial and operational pressures. We understand that the technology investment decisions you take today, will affect your operational capability for years to come so they need to be right.

That's why you can trust our global commercial and technical teams to give you expert advice on which Ranger 2 system is best for you, how to finance it (now including lease rental), where and how it should be installed, what transponders you need and the typical performance you can expect to see based on how and where you'll be using it.

OPERATOR TRAINING

Making sure that you get the very best out of your Ranger 2 system once it is installed and commissioned is the goal of our operator training programme. From standard courses run at our worldwide centres to bespoke courses held on your vessel, Sonardyne's training is comprehensive and flexible.

HELP WHEN YOU NEED IT

Once you become a Sonardyne Ranger 2 customer, you gain unrivalled access to our customer care programme. A dedicated email helpline connects you to product engineers ready to answer your questions but if it's more urgent, our 24 hour worldwide telephone help-line is standing by ready to resolve any operational issues you're facing.

ANNUAL SERVICE VISITS

Of course, the best way to ensure your equipment always performs as it should, is to service it regularly. Book an annual service visit, and one of our field engineers will inspect the health of your vessel's system including updating software and firmware and inspecting your deployment machine to make sure regular checks are being carried out. Transponder sensors can be re-calibrated at any one of our international service centres.

4200 SERIES
SIDE SCAN SONAR SYSTEM

EdgeTech
An Affiliate of ORE Offshore

FEATURES

- Optional Multi-Pulse (MP) technology for high speed surveys
- Crisp, high resolution CHIRP images
- Multiple dual simultaneous frequency sets to choose from
- Choice of stainless steel or lightweight aluminum towfish
- Easily integrates to other 3rd party sensors
- Meets IHO & NOAA Survey Specifications

APPLICATIONS

- Cable & Pipeline Surveys
- Geological/Geophysical Surveys
- Mine Countermeasures (MCM)
- Geohazard Surveys
- Channel Clearance
- Search and Recovery
- Archeological Surveys

The 4200 Series is a versatile side scan sonar system that can be configured for almost any survey application from shallow to deep water operations. The 4200 utilizes EdgeTech's Full Spectrum® CHIRP technology to provide crisp, high resolution imagery at ranges up to 50% greater than non-CHIRP systems; thus allowing customers to cover larger areas and save money spent on costly surveys.

One of the unique features of the 4200 is the optional Multi-Pulse (MP) technology, which places two sound pulses in the water rather than one pulse like conventional side scan sonar systems. This allows the 4200 to be towed at speeds of up to 10 knots while still maintaining 100% bottom coverage. In addition, the MP technology will provide twice the resolution when operating at normal tow speeds, thus allowing for better target detection and classification ability. The addition of the optional MP technology provides the operator with two modes of operation; either High Definition Mode (HDM) or High Speed Mode (HSM). This software-selectable mode of operation provides the operator the ability to select the best configuration for the specific job type.

A 4200 system comes with a choice of a dual simultaneous frequency towfish available in either a stainless steel or lightweight aluminum housing depending on operational requirements. Customers can also choose between a rack mount or portable topside processor or a digital link to interface to 3rd party topsides and software.

4200 SERIES

SIDE SCAN SONAR SYSTEM

KEY SPECIFICATIONS

SONAR SPECIFICATIONS	STANDARD	WITH OPTIONAL MP TECHNOLOGY
Frequency	Choice of either 100/400, 300/600 or 300/900 kHz dual simultaneous	
Operating Range (meters/side)	100 kHz: 500m, 300 kHz: 230m, 400 kHz: 150m, 600 kHz: 120m, 900 kHz: 75m	
Horizontal Beam Width:	100 kHz: 1.5°, 300 kHz: 0.5°, 400 kHz: 0.4°, 600 kHz: 0.26°, 900 kHz: 0.2°	In High Speed Mode: 100 kHz: 1.26°, 300 kHz: 0.54°, 400 kHz: 0.4°, 600 kHz: 0.34°, 900 kHz: 0.3° In High Definition Mode: 100 kHz: 0.64°, 300 kHz: 0.28°, 400 kHz: 0.3°, 600 kHz: 0.26°, 900 kHz: 0.2°
Resolution Along Track	100 kHz: 5 m @ 200 m 300 kHz: 1.3 m @ 150 m 400 kHz: 0.6 m @ 100 m 600 kHz: 0.45 m @ 100 m 900 kHz: 18 cm @ 50 m	High Definition Mode: 100 kHz: 2.5m @ 200m 300 kHz: 1.0m @ 200m 400 kHz: 0.5m @ 100m 600 kHz: 0.45m @ 100m 900 kHz: 18 cm @ 50m HIgh Speed Mode: 100 kHz: 4.4m @ 200m 300 kHz: 1.9m @ 200m 400 kHz: 0.7m @ 100m 600 kHz: 0.6m @ 100m 900 kHz: 26 cm @ 50m
Resolution Across Track	100 kHz: 8 cm, 300 kHz: 3 cm, 400 kHz: 2 cm, 600 kHz: 1.5 cm, 900 kHz: 1 cm	
Vertical Beam Width	50°	
Depression Angle	Tilted down 20°	

TOWFISH	STAINLESS STEEL	ALUMINUM
Diameter	11.4 cm (4.5 inches)	
Length	125.6 cm (49.5 inches)	
Weight in Air/Saltwater	48 / 36 kg (105 / 80 pounds)	30 / 18 kg (66 / 40 pounds)
Depth Rating (Max)	2,000m	500m
Standard Sensors	Heading, pitch & roll	
Optional Sensor Port	(1) Serial – RS 232C, 9600 Baud, Bi-directional & 27 VDC	
Options	Pressure Sensor, Magnetometer, Integrated USBL Acoustic Tracking System, Built-in Responder Nose, Depressor, Power Loss Pinger and Custom Sensors	

TOPSIDE PROCESSOR	4200-P	4200	701-DL INTERFACE
Hardware	Portable splash-proof case	19” rack mount computer	19” rack mount interface
Display & Interface	Splash-proof laptop	21” flat panel monitor, keyboard & trackball	Customer-supplied
Power Input	20-36 VDC or 115/230 VAC	115/230 VAC	115/230 VAC
Operating System	Windows© XP Pro		
File Format	Native JSF or XTF		
Output	Ethernet		

TOW CABLE	
	Coaxial Kevlar or double-armored up to 6,000m, winches available

EdgeTech

4205

TRI-FREQUENCY / MOTION TOLERANT SIDE SCAN SONAR SYSTEM

FEATURES

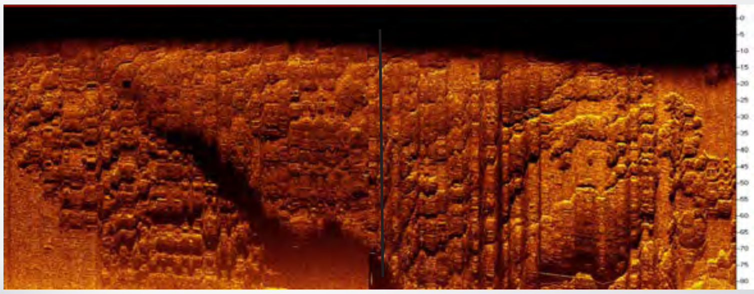
- Tri frequency side scan sonar
- Motion tolerant mode
- Improved target positioning
- Crisp, high resolution CHIRP imagery
- Increased towfish power to support wider range of 3rd party sensors
- Single pulse high resolution mode

APPLICATIONS

- Cable & pipeline surveys
- Geological/geophysical surveys
- Mine countermeasures (MCM)
- Geohazard surveys
- Channel clearance
- Search and recovery
- Archeological surveys

The next generation 4205 is a versatile side scan sonar system that can be configured for almost any survey application from shallow to deep water operations. The 4205 utilizes EdgeTech's Full Spectrum® CHIRP technology to provide crisp, high resolution imagery at ranges up to 50% greater than non-CHIRP systems; thus allowing customers to cover larger areas and save money spent on costly surveys. In addition to the high-resolution imagery that EdgeTech is known for, the 4205 comes with a number of new features which makes the system even more flexible and powerful in offshore operations. The 4205 is available in either a tri-frequency side scan sonar configuration or motion tolerant and multi-pulse configuration. The tri-frequency version allows surveyors the option to operate any two frequencies simultaneously from the tri-frequency system. Long range operations for example can be achieved with a selection of 230/540 kHz combination. Then, on-demand the system can be changed to a 540/850kHz system for an even higher resolution survey. The 4205 motion tolerant configuration with multi-pulse provides surveyors the ability to operate either at faster survey speeds or in more adverse weather conditions while still obtaining high quality underwater imagery. Additionally, this configuration can be operated in a single pulse high-resolution mode for those operations that require an even more finite view of the seafloor.

In both the tri-frequency and motion tolerant/ multi-pulse configurations, towfish and target positioning has been improved with the integration of a more accurate heading sensor that can be coupled with an optional USBL beacon. Additionally, all systems now come with increased towfish power to support a wider range of additional 3rd party sensors. All EdgeTech 4205 systems are comprised of a topside system and a reliable stainless steel towfish. Topside processors are rack mountable and come with easy-to-use GUI software that can be installed on the optional industrial workstation, laptop or customer provided PC.



Motion Tolerant Mode Sonar example: During turbulent conditions, the data on the left of side of this image was recorded using the EdgeTech 4205 Motion Tolerant mode. The right side of the image, depicting motion induced striping was captured without the Motion Tolerant mode for comparison.

Trimble R8 GNSS Receiver

KEY FEATURES

Advanced Trimble R-Track technology

Unmatched GNSS tracking performance

Includes Trimble Maxwell 6 chip with 220 channels

Remote configuration and access

Base and rover communications options to suit any application

The Trimble® R8 GNSS Receiver sets the new standard for full-featured GNSS (Global Navigation Satellite System) receiver technology. This integrated system delivers unmatched power, accuracy and performance in a rugged, compact unit.

ADVANCED TRIMBLE R-TRACK TECHNOLOGY
The Trimble R8 GNSS delivers the latest advancements in R-Track™ technology, designed to deliver reliable, precise positioning performance. In challenging areas for GNSS surveying, such as tree cover or limited sky view, Trimble R-Track provides unmatched tracking performance of GNSS satellite signals.

Trimble R-Track with Signal Prediction™ compensates for intermittent or marginal RTK correction signals, enabling extended precision operation after an RTK signal is interrupted.

The new CMRx communications protocol provides unprecedented correction compression for optimized bandwidth and full utilization all of the satellites in view, giving you the most reliable positioning performance.

Featuring the Trimble Maxwell™ 6 chip, the Trimble R8 GNSS advances the industry with more memory and more GNSS channels. Trimble delivers business confidence with a sound GNSS investment for today and into the future.

Broad GNSS Support
The Trimble R8 GNSS supports a wide range of satellite signals, including GPS L2C and L5 and GLONASS L1/L2 signals. In addition, Trimble is committed to the next generation of modernized GNSS configurations by providing Galileo-compatible products available for customers well in advance of Galileo system availability[1,2]. In support of this plan, the new Trimble R8 GNSS is capable of tracking the experimental GIOVE-A and GIOVE-B test satellites for signal evaluation and test purposes.

FLEXIBLE SYSTEM DESIGN
The Trimble R8 GNSS receiver combines the most comprehensive feature set into an integrated and flexible system for demanding surveying applications. The Trimble R8 GNSS includes a built-in transmit/receive UHF radio, enabling ultimate flexibility for rover or base operation. As a base station, the internal NTRIP caster provides you with customized access[3] to base station corrections via the internet.

Trimble's exclusive, Web UI™ eliminates travel requirements for routine monitoring of base station receivers. Now you can assess the health and status of base receivers and perform remote configurations from the office. Likewise, you can download post-processing data through Web UI and save additional trips out to the field.

ENABLING THE CONNECTED SITE
Pair the speed and accuracy of the Trimble R8 GNSS receiver with flexibility and collaboration tools of Trimble Access™ software. Trimble Access brings field and office teams closer by enabling data sharing and collaboration in a secure, web-based environment. With optional streamlined workflows, Trimble Access further empowers surveyors and survey teams for success. Now it is easier than ever to realize the potential of the Trimble Connected Site. Connecting the right tools, techniques, services and relationships enables surveying businesses to achieve more every day.

1 ***Galileo Commercial Authorization***
Receiver technology having Galileo capability to operate in the Galileo frequency bands and using information from the Galileo system for future operational satellites is restricted in the publicly available Galileo Open Service Signal-In-Space Interface Control Document (GAL OS SIS ICD) and is not currently authorized for commercial use.
Receiver technology that tracks the GIOVE-A and GIOVE-B test satellites uses information that is unrestricted in the public domain in the GIOVE A + B Navigation Signals-In-Space Interface Control Document. Receiver technology having developmental GIOVE-A and B capability is intended for signal evaluation and test purposes.

Trimble R8 GNSS Receiver

TRIMBLE R8 GNSS RECEIVER

PERFORMANCE SPECIFICATIONS

Measurements

- Trimble R-Track technology
- Advanced Trimble Maxwell 6 Custom Survey GNSS chip with 220 channels
- High precision multiple correlator for GNSS pseudorange measurements
- Unfiltered, unsmoothed pseudorange measurements data for low noise, low multipath error, low time domain correlation and high dynamic response
- Very low noise GNSS carrier phase measurements with <1 mm precision in a 1 Hz bandwidth
- Signal-to-Noise ratios reported in dB-Hz
- Proven Trimble low elevation tracking technology
- Satellite signals tracked simultaneously:
  - GPS: L1C/A, L2C, L2E (Trimble method for tracking L2P), L5
  - GLONASS: L1C/A, L1P, L2C/A (GLONASS M only), L2P
  - SBAS: L1C/A, L5
  - Galileo GIOVE-A and GIOVE-B

Code differential GNSS positioning[1]

Horizontal . . . . . 0.25 m + 1 ppm RMS
Vertical . . . . . 0.50 m + 1 ppm RMS
WAAS differential positioning accuracy[2] . . . . . typically <5 m 3DRMS

Static and FastStatic GNSS surveying[1]

Horizontal . . . . . 3 mm + 0.1 ppm RMS
Vertical . . . . . 3.5 mm + 0.4 ppm RMS

Kinematic surveying[1]

Horizontal . . . . . 10 mm + 1 ppm RMS
Vertical . . . . . 20 mm + 1 ppm RMS
Initialization time[3] . . . . . typically <10 seconds
Initialization reliability[4] . . . . . typically >99.9%

HARDWARE

Physical

Dimensions (W×H) . . . . . 19 cm × 11.2 cm (7.5 in x 4.4 in), including connectors
Weight . . . . . 1.34 kg (2.95 lb) with internal battery, internal radio, standard UHF antenna.
3.70 kg (8.16 lb) entire RTK rover including batteries, range pole, controller and bracket

Temperature[5]
Operating . . . . . –40 °C to +65 °C (–40 °F to +149 °F)
Storage . . . . . –40 °C to +75 °C (–40 °F to +167 °F)
Humidity . . . . . 100%, condensing
Water/dustproof . . . . . IP67 dustproof, protected from temporary immersion to depth of 1 m (3.28 ft)

Shock and vibration . . . . . Tested and meets the following environmental standards:
Shock . . . . . Non-operating: Designed to survive a 2 m (6.6 ft) pole drop onto concrete. Operating: to 40 G, 10 msec, sawtooth
Vibration MIL-STD-810F, FIG.514.5C-1

Electrical

- Power 11 to 28 V DC external power input with over-voltage protection on Port 1 (7-pin Lemo)
- Rechargeable, removable 7.4 V, 2.4 Ah Lithium-Ion battery in internal battery compartment. Power consumption is 3.2 W, in RTK rover mode with internal radio. Operating times on internal battery:
  - 450 MHz receive only option . . . . . 5.8 hours[7]
  - 450 MHz receive/transmit option . . . . . 3.7 hours[8]
  - GSM/GPRS . . . . . 4.1 hours[7]
- Certification Class B Part 15, 22, 24 FCC certification, 850/1900 MHz. Class 10 GSM/GPRS module. CE Mark approval, and C-tick approval

Communications and Data Storage

- 3-wire serial (7-pin Lemo) on Port 1. Full RS-232 serial on Port 2 (Dsub 9 pin)
- Fully Integrated, fully sealed internal 450 MHz receiver/transmitter option:
  - Transmit power: 0.5 W
  - Range[6]: 3–5 km typical / 10 km optimal
- Fully integrated, fully sealed internal GSM/GPRS option[7]
- Fully integrated, fully sealed 2.4 GHz communications port (Bluetooth®)[9]
- External cellphone support for GSM/GPRS/CDPD modems for RTK and VRS operations
- Data storage on 57 MB internal memory: 40.7 days of raw observables (approx. 1.4 MB /Day), based on recording every 15 seconds from an average of 14 satellites
- 1 Hz, 2 Hz, 5 Hz, 10 Hz, and 20 Hz positioning
- CMR+, CMRx, RTCM 2.1, RTCM 2.3, RTCM 3.0, RTCM 3.1 Input and Output
- 16 NMEA outputs, GSOF, RT17 and RT27 outputs. Supports BINEX and smoothed carrier

1 Accuracy and reliability may be subject to anomalies due to multipath, obstructions, satellite geometry, and atmospheric conditions. Always follow recommended survey practices.
2 Depends on WAAS/EGNOS system performance.
3 May be affected by atmospheric conditions, signal multipath, obstructions and satellite geometry.
4 May be affected by atmospheric conditions, signal multipath, and satellite geometry. Initialization reliability is continuously monitored to ensure highest quality.
5 Receiver will operate normally to –40 °C, internal batteries are rated to –20 °C.
6 Varies with terrain and operating conditions.
7 Varies with temperature.
8 Varies with temperature and wireless data rate.
9 Bluetooth type approvals are country specific.
Contact your local Trimble Authorized Distribution Partner for more information.

Specifications subject to change without notice.

Teledyne Oceanscience

rapidCAST™

Underway Profiling System

Teledyne Oceanscience's new rapidCAST™ underway profiling system allows surveyors and scientists to collect precise sound velocity (SV) profile on the fly. This unique technology eliminates costly survey down time and greatly increases survey efficiency by removing the need to stop the vessel to collect critical SV measurements. The new rapidCAST seamlessly delivers near real-time data, which is critical to ensuring the quality and integrity of bathymetric survey data.

The highly robust and nimble rapidCAST allows for SV casts to over 500 m depth while traveling at speeds of up to 5 kts, without the need for an operator on deck. (Deeper casts or higher speeds are possible - see chart on reverse side.) Using an advanced active line payout system with precise tension control, the effects of vessel speed and heave are eliminated, allowing the freefall SV probe to maintain a ±5% depth accuracy versus target even with no conducting cable tether. Integrated Bluetooth data transfer capability eliminates the need to fully recover the probe between casts, allowing the surveyor to conduct SV profile from their survey position, eliminating the need for an added deckhand.

The system's light weight combined with its small footprint allow for fast and easy installation onboard virtually any survey vessel of opportunity, allowing surveyors greater flexibility.

PRODUCT FEATURES

- Rapid underway sound velocity profiles at up to 12 kts
- Repeatable automated profiling to >500 m at 5 kts or deeper at slower speeds
- ±5% depth accuracy versus target
- Automatic Bluetooth data download after every profile
- Lightweight portable system
- Fast single-person mobilization
- Small footprint allows installation on practically any vessel
- Only seven-minute cycle time to 200 m @ 8 kts
- High quality Valeport rapidSV direct reading probe
- Optional temperature sensor
- Future Valeport Rapid CTD/Fluorescence probe option

TECHNICAL SPCIFICATIONS

Winch	Length	48 cm (18.89")
	Length with Davit	200 cm (78.74")
	Width	71 cm (27.95")
	Height	46 cm (18.11")
	Weight	36 kg (79.36 lbs.)
	Input Voltage	48 VDC/ 2.0 kW
	Line Capacity	1500 m standard (up to 3000 m)
	Construction	Aluminum/Delrin/Titanium/Stainless Steel
	Probe Recovery Speed	0.5-2 m/s (1.5-6.6 fps)
	Mount	Swivel base (12 cm diameter)
	Hardware	Stainless Steel
Control Module	Weight	14 kg (30.86 lbs.)
	Length	52 cm (20.47")
	Width	34 cm (13.34")
	Height	29 cm (11.42")
	Input Power	90-264 VAC (47-63 Hz)
	Output Power	48 VDC
Davit	Length	160 cm (63")
	Diameter	5 cm (2")
	Weight	1.18 kg (2.6 lbs.)
Valeport rapidSV Probe	Length (with tail spool)	111 cm (43.70")
	Diameter	5 cm (1.96")
	Weight (in air) (without tail spool)	4.48 kg (9.87 lbs.)
	Internal Memory	1000 casts
	Depth Rating	2000 m
	Pressure	Resolution ±0.001% range / Accuracy ±0.01% range / Range 0-200 dBar
	Temperature (if fitted)	Resolution 0.001C / Accuracy ±0.01C / Range -5 to 35C
	Sound Velocity	Resolution 0.001 m/s Accuracy ±0.02 m/s Range 1375 – 1900 m/s

Profiling Capability >500 m at 5 kts or deeper at slower speeds

EQUIPMENT SHEET OFFSHORE SURVEY

FUGRO
SBE SEACAT 19 PLUS

The SBE Seacat 19 Plus velocimeter measures conductivity, temperature, and pressure (CTD) with high accuracy, resolution, and reliability for a wide range of survey applications.

The pump-controlled T-C ducted flow configuration minimizes salinity spiking caused by ship heave and allows for gradual decent rates without slowing sensor responses, improving dynamic accuracy and resolving small-scale structure in the water column.

APPLICATION
The SBE 19 Plus samples continuously up to four scans per second (4 Hz), is battery operated and self-recording, and is commonly used in the field without a computer, recording up to 100 individual profiles. Nine D-size alkaline batteries provide up to 60 hours of operation.

OPERATION
The 19 Plus is commonly used autonomously, recording data internally. It can also provide real-time acquisition and display over short cables via the RS-232 interface. A load-bearing cable for hand-hauled, real-time profiling is available.

The SBE 19 Plus is supplied with a powerful Windows-based software package (SEASOFT-Win 32), which includes programs for communication and data retrieval, real-time acquisition, display, and plotting, as well as data processing (filtering, aligning, and averaging). Firmware upgrades can be downloaded through the communications port by the user without opening the instrument.

System capabilities include the following:

- 64 MB FLASH RAM memory
- 6 Auxiliary A/D input channels
- Supplies power to seven external sensors
- Samples continuously up to 4 Hz
- Data can be output in XML or ASCII format
- Battery operation for up to 60 continuous hours

Appendix B

PSO Equipment Specification Sheets

Night Monitoring Equipment Specifications

Night monitoring watches will be conducted with night vision goggles with head mounts and thermal clip-ons. Regular night vision binoculars work by enhancing the disponible light to allow a brighter image with the use of phosphor screen. The PVS-7D night vision goggles (Figure 1) withstand water immersion and runs on two AA batteries for more than 40 hours. Also provided were three pairs of batteries and a batteries charger with the equipment.

Figure 1: Night vision goggles with thermal clip.

The thermal clip on the night vision binocular enabled the capture of infrared light, which provided thermal imaging. The handheld forward-looking infrared (FLIR) system may also be provided (Figure 2). This allows a bit more flexibility with the IR detached from the headpiece.

Figure 2: Handheld thermal FLIR

Night Monitoring Equipment Specifications

Night Vision Goggle Technical Specifications

- Generation: 3 U.S.
- Resolution: 64 lp/mm (Min)
- Film: Thin-filmed
- Magnification: 1x
- Field of View: 40º
- Objective Lens: 25mm f/1.2
- Eyepiece Lens EFL: 26 mm
- Diopter Adjustment: +2 to -6
- Interpupillary Adjustment: 55 to 71 mm
- Range of Focus: 20cm to infinity
- Battery Type: Two (2) AA batteries
- Weight w/batteries: 24 oz / 680 grams
- Dimensions: 6 3/8”(L) x 6”(W) x 3”(H)
- Operating Temperature: -51°C to +52° C
- Weather Resistant: Yes
- IR Illuminator: Yes (built in)

Thermal Acquisition Clip-On Technical Specifications

- Field of View: 20° circular (centered)
- Magnification: 1X, optical unity
- Sensor: 320 x 240 Vox uncooled LWIR microbolometer
- Display Brightness: Adjustable
- Polarity: White hot/black hot
- Calibration: Manual
- Range: Detection – 300m, Recognition – 260m
- Compatibility: PVS-7
- Interface: Standard quick connect
- Battery Type: CR123, 3V lithium
- Battery Life: >3.0 hours (23°C), 2.5 hours (0°C)
- Dimensions: 38 x 64 x 89 mm (W x H x L)
- Weight: 166g with battery

Forward–looking Infrared (FLIR) Monocular Technical Specifications

- Dimensions: 5.5”(L) x 2.7”(W) x 1.9”(H)
- Weight: 0.46 pounds
- Detector Type: 320 x 256 V0x Microbolometer
- FOV: 24° x 19° (NTSC)
- Refresh Rate: 60 Hz
- Video Output: Digital Video
- Optical Magnification: 1x
- Display: Quad-VGA (1280 x 960) FLCOS
- Battery Type: One CR123A 3V Lithium Battery
- USB Power: 5 VDC

Appendix C

Discussion Draft – Native American Tribes Communication Plan

Vineyard Mid-Atlantic/Lease Area OCS-A 0544

Native American Tribes Communication Plan

DISCUSSION DRAFT

I. Overview

Vineyard Offshore is an offshore wind development company established by the same team that developed Vineyard Wind 1 (Lease Area OCS-0501), the nation's first commercial-scale offshore wind project. Vineyard Offshore leads the development of two lease areas along the US East Coast – Lease Area OCS-A 0544 (also known as Vineyard Mid-Atlantic) and Lease Area OCS-A 0522 (also known as Vineyard Northeast).

Section 3.1.2.2. of the Commercial Lease of Submerged Lands for Renewable Energy Development on the Outer Continental Shelf (the "Lease Agreement") for Lease Area OCS-A 0544 requires Vineyard Mid-Atlantic to develop a publicly available Native American Tribes Communication Plan (NATCP) that describes the strategies that we intend to use for communicating with federally recognized tribal communities and outlines specific methods for engaging with and disseminating information to federally recognized tribal communities with cultural and/or historical ties to the lease area. This document serves as the NATCP for Vineyard Mid-Atlantic in satisfaction of the above-cited Lease Agreement provision and will be implemented by Vineyard Offshore as the developer.

Vineyard Offshore understands and respects that the areas where it intends to develop its projects are part of tribes' cultural heritage and their traditional bonds to the past and importance to their cultural identity, sense of self, and future well-being. Open communication and consultation are therefore essential, given the potential for offshore wind development in Lease Area OCS-A 0544 to affect tribal communities' historical and cultural properties. This NATCP is based on our experience working with federally recognized tribes in conjunction with Vineyard Wind 1 and reflects the best practice recommendations outlined in the handbook published by the Advisory Council on Historic Preservation in 2019.[2] This document

[2] See https://www.achp.gov/sites/default/files/documents/2019-10/EarlyCoordinationHandbook_102819_highRes.pdf.

will be updated as needed to reflect feedback from tribal communities and federal agencies and ensure communication and information sharing protocols remain relevant and effective.

II. NATCP Approach

Vineyard Offshore has gained experience engaging and communicating with tribal communities both informally and through the National Historic Preservation Act's Section 106 consultation process. We fully understand that effective communication, early coordination, and information sharing are key to building productive working relationships with tribal communities and addressing tribal concerns.

Through the implementation of this NATCP, Vineyard Offshore aims to:

- develop and maintain positive, long-term working relationships with tribal communities in support of tribal efforts to preserve and maintain cultural heritage and histories.
- ensure that tribal communities are aware of Vineyard Mid-Atlantic's development milestones, provided with up-to-date information, and informed of and invited to local project-related outreach events and public meetings.
- give timely notice ahead of geological surveys and afford ample opportunities for tribal representatives to review and discuss survey results with Vineyard Offshore and contracted experts.
- understand tribal concerns about potential impacts to historical and cultural properties from offshore wind development in Vineyard Mid-Atlantic.
- where appropriate develop collaborative mitigation strategies for potentially unavoidable impacts.
- solicit input from tribal communities on offshore wind survey plans as well as project siting and design elements.
- identify opportunities to recruit, mentor, and train tribal community members for careers in the offshore wind industry.

Vineyard Offshore will work with tribal communities to develop mutually acceptable protocols for effective communication and information-sharing. As much as possible, these protocols will account for how tribal communities prefer to engage with offshore wind developers and receive information.

III. Federally Recognized Tribes

The Lease requires the lessee to disseminate information to "federally recognized Tribes with cultural and/or historical ties to the lease area." It also requires coordination of tribal pre-survey meetings with the following tribal communities (herein the "Tribes"):

- Abesentee-Shawnee Tribe of Indians of Oklahoma

- Delaware Tribe of Indians
- Eastern Shawnee Tribe of Oklahoma
- Mashantucket Pequot Tribal Nation
- Mashpee Wampanoag Tribe
- Mohegan Tribe of Connecticut
- Shawnee Tribe
- Stockbridge-Munsee Community Band of Mohican Indians
- The Delaware Nation
- The Narragansett Indian Tribe
- The Shinnecock Indian Nation
- Wampanoag Tribe of Gay Head (Aquinnah)

Vineyard Offshore will conduct outreach to the Tribes to discuss their cultural and/or historical ties to Lease Area OCS-A 0544 and invite them to participate in the development of the NATCP. If a Tribe confirms its desire to participate in the development of the NATCP, we will request that the Tribe designate a Tribal Representative to serve as the primary point of contact for communicating with Vineyard Offshore.

We have existing relationships with or have previously been in contact with the Mashantucket Pequot Tribal Nation, Mashpee Wampanoag Tribe, Mohegan Tribe of Connecticut, Narragansett Indian Tribe, Wampanoag Tribe of Gay Head (Aquinnah), and Shinnecock Indian Nation. We look forward to establishing relationships with the remaining tribal communities. Finally, we will conduct additional outreach with federal agencies and other stakeholders will confirm the completeness of this list with respect to Tribes that have cultural and/or historical ties to the lease area.

IV. Tribal Liaison

Vineyard Offshore intends to designate a Tribal Liaison who will be the primary point of contact for tribal communities for Vineyard Mid-Atlantic and other lease areas. The Tribal Liaison will have experience and training on how to coordinate and work with Native American tribes. Until a Tribal Liaison is formally retained, Nate Mayo, Director of External Affairs will serve in this role.

The name and contact details for the Tribal Liaison are provided below.

Name: Nate Mayo
Email: nmayo@vineyardoffshore.com
Phone: 617-840-4045

The Tribal Liaison will work with individual tribal representatives to ensure open lines of communication between tribal communities and Vineyard Offshore and to identify opportunities for engagement on the job training, work opportunities, energy savings projects, and sponsorship opportunities through which Vineyard Offshore and the tribes engage with one another and build and maintain long-term mutually beneficial relationships.

The Tribal Liaison will also be responsible for coordinating pre-survey meetings as well as regular check-ins with the Tribes either by text, email, phone calls, or meetings (in-person or virtual). The Tribal Liaison will also provide timely notice to tribal communities on critical development milestones and public comment opportunities in both the federal, state, and local permitting processes.

To ensure timely feedback, the Tribal Liaison will schedule listening sessions with interested tribal communities before decisions are made on items such as onshore and offshore cable routing and other potentially sensitive items. The Tribal Liaison will also proactively identify opportunities for Tribes to participate in open houses or set up tribal-specific events for tribal members including, but not limited to, workforce opportunities, project updates, or Tribal Council meetings.

V. Tribal Communication and Collaboration Strategies

Vineyard Offshore's tribal communication and collaboration strategies will utilize a number of methods and tools to engage and consult with Tribes, disseminate information, and keep tribal stakeholders informed. Based on our experience with Vineyard Wind 1, we expect that a combination of in-person, virtual, and digital communication approaches will be essential to build relationships, ensure effective two-way communication, and share information. These approaches will include, but not be limited to, one-on-one and group meetings, conference calls, text messages, listening sessions, e-mail updates, certified letters, virtual and in-person vessel tours and site visits, and social media updates. Vineyard Offshore will also explore with the Tribes opportunities to attend, present at, and support tribal meetings and events.

To ensure that Tribes and other tribal communities have ready and timely access to data and information, Vineyard Offshore will host a dedicated tribal page on our website. This "For Tribes" page will be a public resource that hosts information and documents on topics relevant to tribal communities, such as the Section 106 process, survey activities, fisheries science, and, eventually, construction updates. This page will serve as a one-stop shop for tribal communities interested in learning about Vineyard Mid-Atlantic and opportunities to engage with Vineyard Offshore. Vineyard Offshore will also create a separate non-public, log-in-only page for Tribal Historic Preservation Officers from the Tribes. This log-in-only page will host sensitive and confidential information that will not be available to the public, such as archaeology reports.

a. Communication and Information Sharing Protocols

Vineyard Offshore will work with the Tribes individually to develop communication and information sharing protocols that reflect each Tribe's preferred method(s) and frequency of communication. Effective communication is not one size fits all endeavor, and we will attempt to tailor our approach to the needs of each Tribe. These protocols will be outlined in future iterations of this NATCP.

We will also collaborate with offshore wind developers, as well as federal agencies where appropriate, to identify opportunities to streamline communication and information sharing efforts to reduce the demand for limited tribal resources to participate in the offshore wind project development process.

b. Tribal Pre-Survey Meetings

Vineyard Offshore will hold tribal pre-survey meetings as required in Section 5.3.3 of the Lease Agreement, which stipulates that the Lessee must coordinate a tribal pre-survey meeting by sending a letter through certified mail and following up with email and phone calls as necessary.

The purpose of these meetings will be for Vineyard Offshore and a Qualified Marine Archaeologist to discuss Vineyard Mid-Atlantic's Survey Plan with the Tribes and consider requests to monitor portions of the survey, including the visual logging and analysis of geotechnical sampling. The Tribes will also be given an opportunity to tour the survey vessel(s) prior to the campaign.

Tribal pre-survey meeting notifications will be sent at least 15 calendar days prior to the date of the proposed tribal pre-survey meeting, and the meeting will be scheduled at least 30 calendar days prior to the commencement of survey activity. Meetings will be either remote or in-person and will afford the Tribes a reasonable opportunity to participate. Meetings will be held with individual tribes, and if any of the Tribes do not attend the meeting, the Tribal Liaison will follow up with an email and phone call to offer alternative meeting dates and times. Any meeting materials and presentations from tribal pre-survey meetings will be provided to the Tribes upon request.

Once survey data has been collected and reviewed, Vineyard Offshore will offer the Tribes opportunities to discuss and review the findings.

c. Section 106 Pre-application Meetings

Vineyard Offshore will consult with the Tribes during Vineyard Mid-Atlantic's site assessment phase to discuss ways to ensure tribal historic preservation interests and concerns are understood and can be accommodated through early coordination. Aside from relationship and trust-building, these early meetings will allow the Tribes' indigenous knowledge to inform and influence Vineyard Mid-Atlantic's development while providing all parties the opportunity to consider mechanisms and opportunities for tribal involvement in the historic and cultural resources work.

Vineyard Offshore will also seek to use these pre-application meetings to obtain tribal input on the siting of offshore wind project components and export cable corridors. This will facilitate efforts to minimize, to the greatest extent practicable, potential visual and other impacts to historical and cultural properties as well as paleolandforms.

We will also use these meetings to understand how decision-making processes within each Tribe need to be considered when planning site assessment, permitting, and development activities for Vineyard Mid-Atlantic to facilitate tribal community participation.

d. Workforce Development

Vineyard Offshore will work proactively with the Tribes to identify opportunities to recruit, mentor, and train interested tribal community members for careers in the offshore wind industry. As a first step, we will discuss with the Tribes their interest in a tribal workforce assessment to identify individuals and tribe-affiliated businesses who are interested in working in the offshore wind industry during construction or operations, within the supply chain, or in support of development work such as surveys and permitting. A similar assessment was conducted for Vineyard Wind 1 to classify skills gaps and associated needs and map out pathways forward with existing training programs and barrier-reduction tools.

Appendix D

Discussion Draft - Fisheries Communication Plan

Vineyard Mid-Atlantic/Lease Area OCS-A 0544

Fisheries Communication Plan

DISCUSSION DRAFT

I. Introduction

Vineyard Offshore is an offshore wind development company established by the same team that developed Vineyard Wind 1 (Lease Area OCS-0501), the nation's first commercial-scale offshore wind project. Vineyard Offshore leads the development of two lease areas along the US East Coast – Lease Area OCS-A 0544 (also known as Vineyard Mid-Atlantic) and Lease Area OCS-A 0522 (also known as Vineyard Northeast).

Section 3.1.2.2. of the Commercial Lease of Submerged Lands for Renewable Energy Development on the Outer Continental Shelf (the "Lease Agreement") for Lease Area OCS-A 0544 requires Vineyard Mid-Atlantic to develop a publicly available Fisheries Communication Plan (FCP). This document serves as the FCP for Vineyard Mid-Atlantic in satisfaction of the above-cited Lease Agreement provision and will be implemented by Vineyard Offshore as the developer.

The FCP is a living document based on best practice guidance and input from fishermen and fisheries stakeholders. It outlines our proactive approach to fisheries communication to ensure effective and regular engagement with a wide range of fishermen and fisheries stakeholders. This FCP aligns with the Vineyard Wind 1 FCP, which was first drafted in 2011 to improve communication with fishermen potentially affected by the development of that offshore wind project. Since then, our communications plan and approach has evolved and grown with over ten years of input from fisheries stakeholders. This document will be updated regularly, in response to stakeholder feedback and to incorporate lessons learned, to ensure communication protocols and tools remain relevant and effective.

Vineyard Offshore strongly believes that the offshore wind and fishing industries can successfully co-exist in the marine environment, and we will continue the work started with Vineyard Wind 1 to build bridges between the two sectors. We will also continue to fund research, share data, participate in regional science initiatives, and expand our prior efforts to use fishermen and/or fishing vessels to support offshore site assessment and data gathering activities.

Visit https://www.vineyardoffshore.com/fishermen to sign-up for updates, Notices to Mariners, and information requests as well as to access charts, frequently asked questions (FAQs), and our fisheries science reports.

II. Vineyard Mid-Atlantic

Vineyard Offshore is developing Lease Area OCS-A 0544, as Vineyard Mid-Atlantic, for wind energy production on the Outer Continental Shelf (OCS). The lease area is approximately 43,056 acres in size and is located approximately 21 and 36 nautical miles from the nearest shorelines in New York and New Jersey, respectively. The lease area abuts Empire Wind's Lease Area OCS-A 0512 along its western edge and has water depths between 134.5 – 148 feet (22.4 – 24.6 fathoms).

III. Potentially Affected Fisheries

An analysis published by the National Oceanic and Atmospheric Administration (NOAA) in 2021 indicates that the commercial fisheries most likely to be most affected[3] by offshore wind site assessment, development, construction, and operations activities in Vineyard Mid-Atlantic are: Sea Scallop; Mackerel, Squid, and Butterfish; Monkfish; Surfclam, Ocean Quahog; and Summer Flounder, Scup, Black Sea Bass.[4] Other FMPs and fisheries may also be affected. Vineyard Offshore will conduct fisheries outreach and engagement to verify and refine NOAA's assessment of potential impacted commercial and recreational fisheries in Vineyard Mid-Atlantic as well along any potential offshore export cable corridors.

IV. Fisheries Team

Our fisheries communication efforts are led by Fisheries Manager (FM) Crista Bank, a fisheries biologist with deep knowledge of fishing practices as well as an extensive network of personal relationships with fishermen and fishery organizations in the region (see Figure 2). Crista oversees Vineyard Offshore's efforts to build and maintain relations with the fishing industry and surrounding communities. This includes directing outreach, developing fisheries research programs, and identifying potential workforce opportunities for fishing industry involvement. She has spent the last four years laying the groundwork for these strategies as a Fisheries Liaison on the Vineyard Wind 1 project.

[3] NOAA defines "most impacted" as the Fisheries Management Plans (FMPs) deriving the most revenue from an area over the 12-year analysis period of 2008 to 2019, indicating the highest potential for impact to the industry from a reduction in fishing area.

[4] See https://www.greateratlantic.fisheries.noaa.gov/ro/fso/reports/WIND/WIND_AREA_REPORTS/OCS_A_0544.html.

Crista is readily available by phone, email, and text for ongoing communication (see Figure 2 for contact information). Fishermen can also sign up for general updates and news, offshore wind mariner updates, and information requests by filling out a contact form on our website.

Vineyard Offshore also employs a Marine Operations Officer (MOO), also known as the Marine Operations Liaison Officer, who is responsible for safe marine operations and ensuring that Vineyard Offshore is a good neighbor while on the water. As such, there will be frequent interaction, information exchange, and coordination between the fisheries team and the MOO.

Vineyard Offshore will expand the fisheries team before the start of survey activities to include a Fisheries Liaison (FL), Fisheries Representatives (FRs), and Onboard Fisheries Liaisons (OFLs). Information about the role of FLs, FRs, and OFLs on offshore wind projects is provided below.

Figure 1. Vineyard Offshore's Fisheries Manager

Crista Bank, Fisheries Manager
cbank@vineyardoffshore.com
508-525-0421

Crista is a fisheries biologist who spent 12 years working at the School for Marine Science and Technology where she spent considerable time offshore on commercial fishing vessels working on collaborative research projects. Prior to that, she sailed on traditional sailing vessels crossing the Indian and South Atlantic Oceans and earned her 100-ton Captain's license while sailing on the Schooner Ernestina, the only surviving 19th-century Gloucester-built fishing schooner. Crista started her career teaching marine science at outdoor experiential education programs in New England, Southern California, and the Florida Keys.

She holds a bachelor's degree in Marine Biology and a master's degree in Fisheries Oceanography from the University of Massachusetts at Dartmouth. She resides in New Bedford, Massachusetts with her husband and three children and enjoys being out on the water as much as she can.

a. Fisheries Liaisons

FLs are employed by offshore wind developers to implement FCPs and serve as a communication conduit between offshore wind developers and the fishing industry. At Vineyard Offshore, FLs serve as a readily accessible and knowledgeable point of contact within the company that fishermen and FRs can efficiently and effectively communicate with. FLs are also tasked with:

- developing relationships and direct lines of communication with individuals that are representative of potentially impacted fishing regions, industries, and communities;
- understanding and conveying current fishing industry concerns and feedback to the fisheries team to identify and work towards solutions;

- maintaining existing working relationships with FRs, and identifying and onboarding new FRs;
- identifying potentially affected fisheries and developing communication protocols and tools that create two-way communication channels;
- coordinating with the FLs employed by other offshore wind developers to streamline fisheries communication, collaborate on fisheries research and support, and standardize programs as appropriate;
- working with scientists, federal and state agencies, fishermen, and fisheries stakeholders to develop monitoring plans for fish species and habitats of concern; and
- identifying and expanding training and work opportunities for fishermen and fishing vessels.

b. Fisheries Representatives

FRs do not work on behalf of offshore wind developers but represent a particular fishing community, organization, gear type, port, region, state, or sector(s). FRs are responsible for communicating fisheries concerns, issues, and other input to offshore wind developers. Typically, an FR is an active fisherman or group representing active fishermen within the region, fishery, state, or sector they represent. While FRs are compensated for their time and expenses by offshore wind developers, their duty is to the fishing region, industry, organization, gear type, or sector they represent.

Vineyard Offshore is committed to maintaining an effective network of FRs and is currently seeking FRs for Vineyard Mid-Atlantic. If you are interested or have suggestions, please contact our FM.

c. Onboard Fisheries Liaisons

OFLs are experienced fishermen employed to assist survey vessel captains with communication and to document fishing gear in the area to help avoid interactions. OFLs continue the role of the FL offshore so that there is effective communication on-site and in real-time. OFLs report to the FLs, and serve as the FLs' "eyes, ears, and voice" during offshore operations.

Among other things, the OFL records observed fisheries activities, ensures survey vessel operations are compliant with the FCP and other fisheries-related policies, and seeks to avoid negative fisheries interactions by looking out for fixed gear and establishing communications (usually by very high-frequency [VHF] radio) with fishing vessels when appropriate. In the event of a negative fisheries interaction, the OFL works with the FLs and relevant FRs to resolve the matter safely, fairly, and efficiently.

IV. Fisheries Engagement

Starting with the Vineyard Wind 1 project, Vineyard Offshore's team has over a decade of experience engaging with commercial and recreational fishermen, vessel owners, fishing advocacy organizations, shore support services, and fisheries research institutions on offshore wind. Our FM and other members of our staff have met with hundreds of fisheries stakeholders in recent years, including fishermen from various gear types and sectors, fishing advocacy organizations, and local fisheries groups who are most likely to be affected by offshore wind development on the OCS. Aside from building relationships with the region's fishermen and fisheries stakeholders, a key objective of our engagement efforts is to build trust and look for mutually beneficial opportunities to work with the fishing industry.

Vineyard Offshore has and will continue to employ a variety of outreach methods and tools to communicate and maintain relationships with fishermen and fisheries stakeholders. These outreach methods and tools include, but are not limited to, the following:

- organizing bi-weekly meetings with FRs to share project information and discuss concerns and current issues facing the fishing industry;
- working with FRs to distribute flyers, charts, FAQs, and other relevant information through their networks and communication channels;
- creating outreach materials for fishing communities to distribute at different events as well as local bait and tackle shops in the region;
- holding "port hours" with FLs from other offshore wind developers at ports in Montauk, New York, New Bedford, Massachusetts, Narragansett, Rhode Island, and Stonington, Connecticut to provide information to fishing vessel crews who fish in or transit through the New York Bight;
- maintaining a website with information specifically for fishermen, including fisheries science information, charts, mariner updates of offshore vessel activity, and vessel Requests for Information (RFIs);
- maintaining a database of fishing vessels interested in offshore wind, survey vessel, and guard vessel work as identified through our vessel RFI;
- reaching out to local recreational fishing organizations and clubs;
- presenting project information and updates on fisheries science at recreational organization meetings;
- hosting tables at commercial marine expos and recreational fishing shows;
- engaging with recreational fishing tournaments and derby organizers, including sponsoring events;
- engaging with local recreational fishing experts and influencers with a high social media presence to increase project awareness; and
- relying on word of mouth (i.e., reaching out to a fisherman at the request of another fisherman).

Vineyard Offshore is in regular contact with the relevant federal and state agencies on fisheries-related matters. In addition, we are or will become a member of and/or active participants in the following technical working groups, advisory boards, councils, and commissions:

- Atlantic States Marine Fisheries Commission
- International Council for the Exploration of the Seas (member of Working Group on Offshore Wind Development and Fisheries)
- Massachusetts Fisheries Working Group on Offshore Wind Energy
- Massachusetts Habitat Working Group on Offshore Wind Energy
- Mid-Atlantic Fishery Management Council
- New England Fishery Management Council
- New York State Energy Research and Development's (NYSERDA's) Environmental Technical Working Group
- NYSERDA's Fisheries Technical Working Group
- Regional Wildlife Science Entity
- Responsible Offshore Science Alliance

Finally, we understand that some fishermen do not feel adequately represented by fishing organizations or FRs, and therefore prefer to share information and concerns individually and through different channels of communication. We recognize that individuals' concerns are just as important as group concerns and will continue to reach out to individual fishermen and respect requests for anonymity.

VI. Offshore Communication Protocols

a. Overview

The offshore communications protocols outlined below will be adjusted and adapted over time to reflect best practices and lessons learned. Similar protocols will be standardized and implemented for construction activities at the appropriate time.

E-mail alerts are a critical communication tool to keep fishermen apprised of offshore activities, and we will actively encourage all fishermen and fisheries stakeholders to sign up for these alerts on our website.

b. Fishing Industry Communication Protocol Before and During Offshore Survey Work

Our offshore survey work communication protocol, which incorporates recommendations from fishermen and state agency protocols, is as follows:

- coordinate with the US Coast Guard to issue Notices to Mariners.
- create Offshore Wind Mariner Update Bulletins (OWMUs) that provide survey vessel(s) picture(s) and contact information, a chart showing the location and approximate

duration of vessel activity, OFL contact information, and scout vessel picture(s) and contact information.
- post OWMUs on our website, send them to our fisheries e-mail alert list, and share them on our main social media channels –LinkedIn, Facebook, Twitter, and Instagram.
- work with FRs to share information through their email lists and other media channels.
- announce and publicize survey activities through state agencies, fishing organization websites, fish houses, and newsletters.
- send out regular email and/or text updates detailing progress, both for work completed and upcoming work areas, to various parties during offshore work.

c. Geological Survey Vessel Communication and Fishing Gear Protocols

Vineyard Offshore will contract with local fishermen to serve as OFLs onboard survey vessels to assist vessel captains with communication and document fishing gear in the area to help avoid interactions, as noted above. OFLs with local fishing experience and knowledge of the area will typically be contracted for the duration of a survey vessel's operations.

Before a survey trip begins, FLs and OFLs will attend pre-trip meetings with the survey vessel captain and crew to review the specifics of the fisheries active in the area. If an FL has known coordinates of fixed gear in the area, the information will be shared with the survey vessel captain and OFL. The survey vessel captain and crew will be instructed to communicate respectfully with fishermen and work around fishing gear to the greatest extent practicable.

The captain, crew chief, Vineyard Offshore's client representative, and OFL will review and sign off on the communication and gear interaction protocols, which are outlined below, at the start of a survey campaign and whenever there is a new captain or party chief.

Communication Protocol for Survey Vessel Captains

Survey vessel captains and crew will implement the following communication protocol during offshore surveys:

- Provide the OFL with a VHF unit to monitor radio communications and will be able to communicate directly with fishermen if agreed upon with the vessel captain.
- Attempt to establish radio contact with any fishing vessels that are encountered. If a fishing vessel is not responding to radio calls, the OFL will try to communicate with the fishing vessel. If the OFL is off watch, the crew will wake up the OFL if asleep to engage in communication if necessary.
- Report all communication between fishing vessels and the OFL to Vineyard Offshore.
- Immediately alert the OFL about fishing gear interactions, including waking up the OFL if necessary.
- Work around fishing gear to the greatest extent practicable.
- Plot fixed gear locations while the OFL is off watch and relay that information to the OFL when s/he is back on watch.
- Establish agreed-upon safety zones and relay that information to fishing vessels in the area.

- Provide the OFL with access to the wheelhouse to set up equipment, if practicable, along with a reliable internet connection.

Fixed Gear Interaction Protocols for Survey Vessels

The following protocol will be implemented in the event of an incident between a survey vessel and static fishing gear:

- Immediately notify the OFL (wake up if off watch).
- Log the fishing gear interaction in both the daily vessel report spreadsheet and the Interaction Log, including the time, location, photos, details of events, etc.
- If the fishing gear is entangled around survey equipment and is brought on board, the OFL will determine if the fishing gear is active or if it is abandoned (i.e., ghost gear).
- For active fishing gear where the line needs to be severed, keep any severed fishing gear on board.
- For active fishing gear where the line does not need to be severed, return the fishing gear to the water. Take photos of the gear and record the time and vessel position where the fishing gear was returned.
- If the OFL determines that the fishing gear is not actively engaged in fishing, keep the abandoned fishing gear on board and record the position where it was retrieved.
- Bring all active severed fishing gear and ghost gear back to shore. If the owner can be identified, they will be notified, and the gear will be returned.
- For every incident, record vessel location and the time of any incident; log the buoy permit number and color, as available; and take pictures of the gear.
- Notify the FL in charge onshore as soon as possible.

Safety Management System/Emergency Communication Protocols

An important objective of this FCP is to enhance the safety of all ocean users in and around a project area during development, construction, operations, and decommissioning. Our Safety Management System will outline clear communication protocols and procedures for emergency events such as collision or allision of a vessel with a wind turbine structure, gear entanglement, damage to cables by fishing activity, catastrophic failure of a wind turbine, or another event. Safety planning will be further elaborated on in future updates of the FCP.

VII. Fishing Gear Loss and Compensation

Vineyard Offshore is currently developing a fishing gear loss and compensation protocol but anticipates adopting the same or a substantially standard gear loss/damage claims form that was previously developed through coordination with FRs, FLs, and other developers for the Vineyard Wind 1 project. This form, which was also adopted by other developers including Equinor and Mayflower, will be posted on our website before the start of any offshore activities.

OCS-A 0522 LLC[1] ("522 LLC") is pleased to submit this Survey Plan (Plan) in accordance with Lease OCS-A 0522 (Lease, Lease 0522) Addendum C, stipulation 2.1.1, which states that the Lessee must submit to the Lessor a Survey Plan for site characterization. The Survey Plan includes geophysical, geotechnical, and environmental investigations that are expected to begin in 2022 and extend into subsequent years as necessary (refer to the survey timeline in Section 5 for details). The site characterization campaign will be conducted in support of the submission of a proposed construction and operations plan (COP) for the development of Lease 0522 and potential offshore export cable corridors (OECCs) to shore (Figures 1 and 2). The scope of work covered under this Survey Plan includes geophysical surveying and geotechnical sampling, as well as environmental sampling and remote sensing, which collectively serve the following purposes:

1. Inform cable routing to select the most suitable path(s) between the wind farm and a mainland landfall position,
2. Inform cable design and assessment of burial techniques for the given site conditions,
3. Inform foundation design and wind turbine generator (WTG) siting in the WDA,
4. Inform of site conditions, particularly sensitive environmental areas and potential cultural resources, and the avoidance and mitigation of impact to those areas,
5. Provision of scientific information in support of COP submittals, and
6. Provision of scientific information for engineering and design efforts associated with project and installation planning.

A highly qualified team of experts will support this campaign from start to finish including professional marine geophysical, geotechnical, and environmental consultants, qualified marine archaeologists (QMAs), federal and state permitting specialists, and other senior level experts who have participated in previous Vineyard Wind projects and have extensive experience in the offshore renewables industry.

[1] On August 9, 2021, BOEM approved the assignment of lease OCS-A 0522 from Vineyard Wind LLC to OCS-A 0522 LLC. 522 LLC is currently within the Vineyard Wind corporate structure.

This Lease 0522 Survey Plan includes:

1. Government Guidelines
2. Project Background
3. Survey Plan Details
4. Equipment to Be Deployed
5. Survey Timeline
6. Protected Species Impact Mitigation Plan
7. Archaeology and Tribal Outreach
8. Fisheries Communications Plan
9. Pre-Survey Meeting
10. Reporting
11. Communication

Appendix A Geophysical, Geotechnical, and Environmental Survey Equipment Specification Sheets
Appendix B Relevant NMFS / NOAA / BOEM Correspondence
Appendix C PSO Equipment Specification Sheets

Survey acronyms used in this Plan:

G&G = geological and geophysical
HRG = high resolution geophysical
MBES = multibeam echosounder
SSS = side scan sonar
MAG/GRAD = magnetometer/gradiometer
SBP = subbottom profiler
SCS = single channel seismic
MCS = multi-channel seismic
CPT = cone penetration testing
CPTU = cone penetration testing with pore pressure
DH = down hole
DTH = down the hole
BH = bore hole

1. Government Guidelines

The following guidelines are applicable to coastal and offshore surveys conducted under this Survey Plan and the development of the COP (Table 1). Relevant state agencies will be consulted for portions of the site characterization campaign that occur in state waters.

Table 1. Agency Guidelines and Publications

Bureau of Ocean Energy Management (BOEM) Guidelines
Guidelines for Information Requirements for a Renewable Energy Construction and Operations Plan (COP)
Guidelines for Information Requirements for a Renewable Energy Site Assessment Plan (SAP)
Guidelines for Providing Geophysical, Geotechnical, and Geohazard Information Pursuant to 30 CFR Part 585 (BOEM G&G)
BOEM Publication No. 2018-054, Data Gathering Process: Geotechnical Departures for Offshore Wind Energy, DNV GL Doc No. 10071328-HOU-01, September 2018
Guidelines for Providing Archaeological and Historic Property Information Pursuant to 30 CFR Part 585 (Section 106 of NHPA and NEPA)
Guidelines for Providing Benthic Habitat Survey Information for Renewable Energy Development on the Atlantic Outer Continental Shelf Pursuant to 30 CFR Part 585
Guidelines for Providing Information on Fisheries Social and Economic Conditions for Renewable Energy Development on the Atlantic OCS Pursuant to 30 CFR Part 585

2. Project Background

Lease OCS-A 0522 is a 207 miles^2 area located approximately 28-50 miles south of Nantucket, MA in water depths of 98-213 ft on the continental shelf (Figure 1). Geophysical, geotechnical, and environmental surveys are planned to be conducted throughout the entire Lease Area.

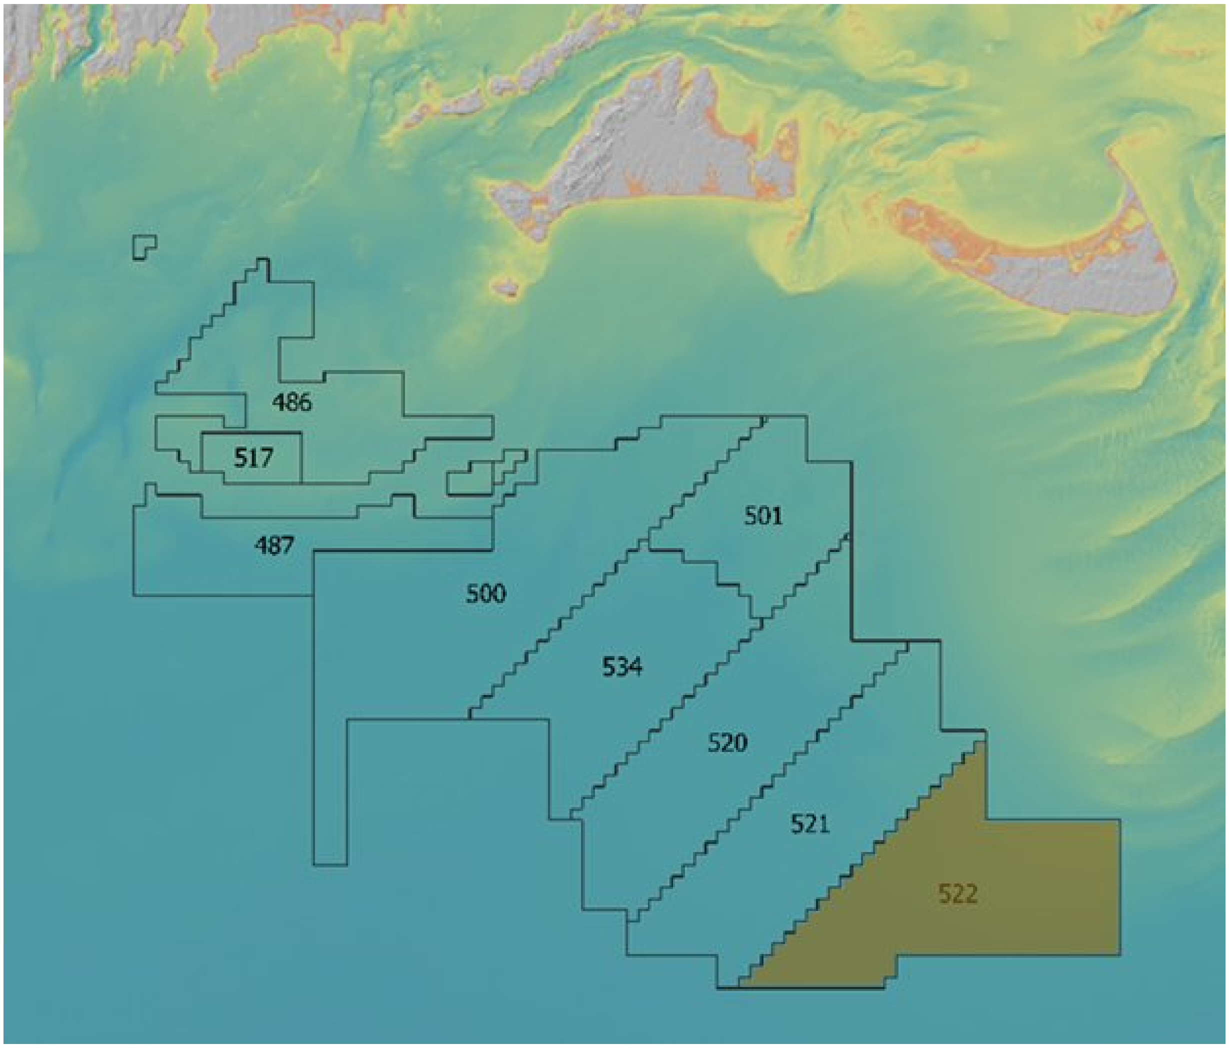

Figure 1: Location of Lease OCS-A 0522 (brown shaded area) offshore Massachusetts, due south of Nantucket. Other OCS lease areas in the Massachusetts Wind Energy Area (MA WEA) are included for location reference.

Several potential offshore export cable corridors (OECCs), ranging from approximately 50-200+ miles long, have been identified that could connect Lease 0522 to landfall locations along the north Atlantic coast. A selection of these potential routes may be surveyed during the field program covered by this Plan under individual mobilizations.

Due to the sensitive and proprietary nature of this information, the regions of the OCS and coastal waters where OECC routes may occur, and over which surveys described in this Plan will be conducted are broadly depicted (Figure 2).

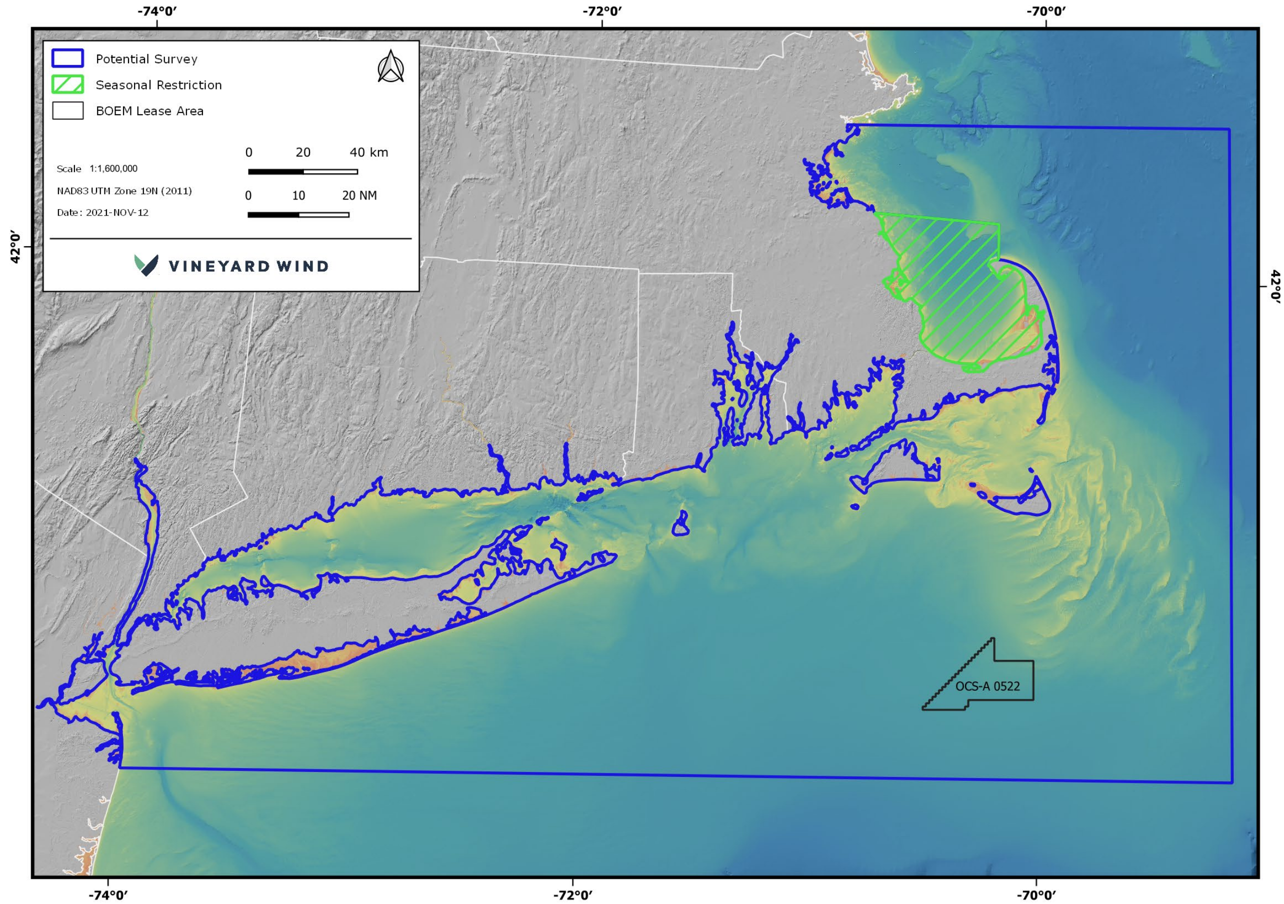

Figure 2: Proposed geophysical, geotechnical, and environmental site characterization campaign area including the Lease Area, and potential export cable corridors to bring power ashore from Lease 0522.

Previous Surveys

From 2016 to 2020, through the team's work as part of Vineyard Wind, the geophysical, geotechnical, and environmental data required to fulfill agency information requirements (Table 1) in Leases OCS-A 0501 (Lease 0501) and OCS-A 0534 (Lease 0534) was acquired. The team also acquired data along the OECC from Lease 0501 that runs from that lease areas to the south shore of Cape Cod. The data and results are described in detail in Volume II of the COP for Vineyard Wind 1 (previously 501 North) submitted in October 2018 (revised March 2019) and in Volume II of the COP for New England Wind (Lease 0534) soon to be submitted. Reconnaissance level geophysical and geotechnical data was also acquired in 2019 in the OCS-A 0522 Lease area. Data and results in Lease 0501 identify and describe the site-specific geology that can be extrapolated to the regional geology and identified stratigraphy underlying the southeast portion of the MA WEA that includes Lease 0522. A description of the surveys completed in 2019 is provided in the section below.

The MCS (multi-channel seismic; mini-air gun) data acquired in 2009 aboard the RV Endeavor (Cruise EN465[2]) and available through the Academic Seismic Portal at Lamont Doherty Earth Observatory, Columbia University[3], allows correlation of the deeper stratigraphic units described in the "Geotechnical Interpretative Report" of the Vineyard Wind 1 COP for Lease OCS-A 0501 into Lease 0522 (Figure 3). Through this correlation between the layers observed in OCS-A 0501 and 0534, a basic understanding of the expected ground conditions within the OCS-A 0522 Lease area can be deduced.

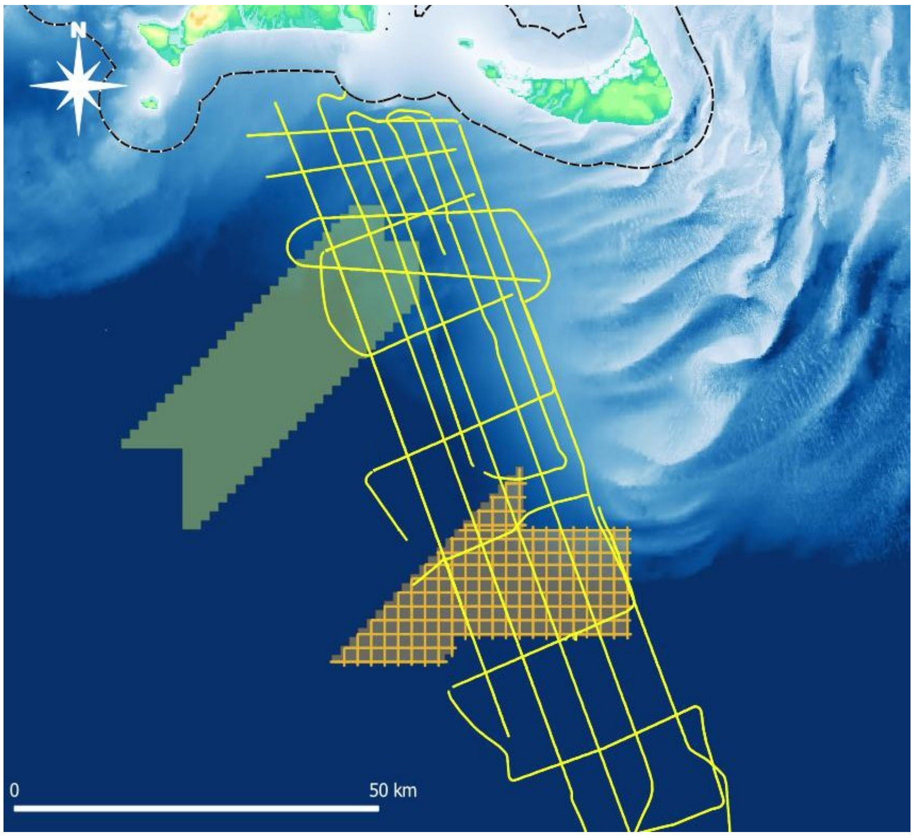

Figure 3. Map showing the 2019 MCS tracks surveyed in the Lease 0522 area (orange) and MCS profile lines acquired aboard the RV Endeavor in 2009 as part of Cruise EN465 (yellow).

Geophysical evidence of a late Pleistocene glaciation and paleo-ice stream on the Atlantic continental shelf offshore Massachusetts, USA, Marine Geology, vol. 303-306, p. 63-74, DOI: 10.1016/j.margeo.2012.01.007.

[3] Lamont Doherty Geological Observatory, Columbia University, Academic Seismic Portal
[Marine Geoscience Data System | Collections (marine-geo.org)]

Other studies conducted in the vicinity of Lease 0522 include the Collaborative Archaeological Investigations and Sound Source Verifications within the Massachusetts Wind Energy Area (BOEM 2013), an Inventory and Analysis of Archaeological Site Occurrence on the Atlantic Continental Shelf (TRC 2012), and SMAST drop video camera surveys of the benthos in the Massachusetts Wind Energy Area (Stokesbury, 2012 & 2014).

The amount of marine scientific information from available public research increases significantly adjacent to the southern shoreline of Massachusetts and Long Island, NY. Much of these data have been summarized and examined as part of general desktop and cable route feasibility studies previously developed for the Vineyard Wind lease areas, including OCS-A 0522.

2019 Surveys Conducted in Lease Area 0522

The 2019 field campaign in Lease 0522 included the initial surveys on surficial and subsurface site conditions. These data support the special mapping and assessments that are associated with the COP, including benthic habitats, archaeological/cultural resources, geology ground modeling, and cable burial to name a few. A total of six different vessels were utilized to complete the 2019 scope of work that included the following surveys in Lease 0522 (Figure 4):

High Resolution Geophysical (HRG) Survey:

Location	Lease Area
Systems	Full geophysical suite of instruments including multibeam, side scan sonar, magnetometer, shallow (chirp) and medium (sparker) penetration single channel subbottom profilers, and all support systems (positioning, motion sensor, sound velocity profiler, etc.)
Line Layout	Three 90 m (196.8 ft) spaced lines along primary E-W corridors, corridor centerlines spaced 900 m (2,952.7 ft) apart; grid/tie-line spacing 1,800 m (3,280.8 ft), perpendicular to primary corridors (N-S)
Purpose	Data for design of the wind farm and in support of the COP; archaeological reconnaissance

Multi-channel Seismic (MCS) Survey:

Location	Lease Area
Systems	Multi-channel seismic profiling system including sparker sound source, 48 channel hydrophone array (24x1m and 24x2m groups), multi-trace recording computer/software, and all support systems (vessel and streamer positioning, etc.).
Line Layout	Grid centerlines, 1,800 m spacing N-S direction, 1,800 m spacing E-W direction
Purpose	To assist with development of the subsurface geology ground model to support WTG/ESP foundation engineering and design

Site Assessment Plan (SAP) Survey:

Location	Two 300 m (984.2 ft) square areas in the Lease Area
Systems	Full geophysical suite of instruments including multibeam, side scan sonar, magnetometer, shallow (chirp) and medium (sparker) penetration, single channel subbottom profilers, and all support systems (positioning, motion sensor, sound velocity profiler, etc.)
Line Layout	11 lines at 30 m (98.4 ft) primary line spacing (N-S), 1 perpendicular tie-line (W-E) through the center point
Purpose	Site surveys for a potential met-ocean buoy installation

Geotechnical Site Clearance Surveys (geophysics):

Location	38 locations in the Lease Area, each 150x150 m (393.7x393.7 ft) area
Systems	Full geophysical suite of instruments including multibeam, side scan sonar, magnetometer, shallow (chirp) and medium (sparker) penetration, single channel subbottom profilers, and all support systems (positioning, motion sensor, sound velocity profiler, etc.)
Line Layout	5 primary lines at 30 m (98.4 ft) spacing (SW-NE), plus at least one tieline across the primary tracks
Purpose	Data for archaeological review for clearance of geotechnical stations prior to conducting geotechnical investigations; assessment made by the project qualified marine archaeologist (QMA)

Geotechnical Investigations:

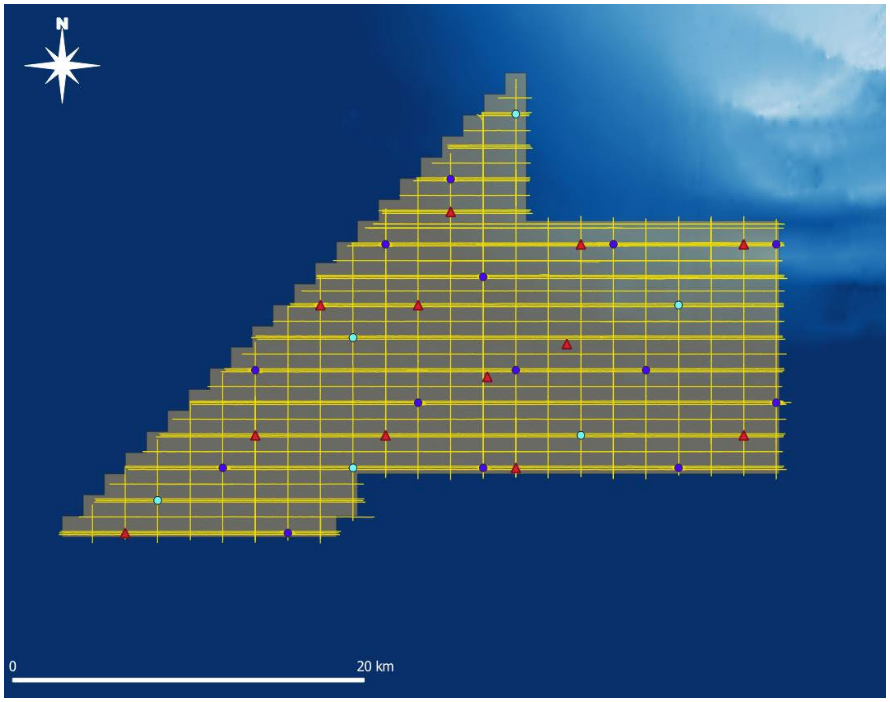
Location	38 locations in the Lease Area
Systems	Top drive power swivel boring rig with split spoon, wireline push sampler or up to 100 MPa downhole piezocone penetration testing tool, and 20 ton Seabed CPT for seabed piezocone penetration testing Vibratory corer with 6 m (19.7 ft) long, 10.2 cm (4 inch) OD core barrel and all support systems.
Sample Layout	6 borings up to 70 m (229.6 ft) deep; stations positioned strategically based on seismic profile data and site coverage. Alternating sampling and CPT. 20 seabed CPTs up to 23 m (75.4 ft) deep spread out to cover the area 12 vibracores 3-4 m deep to sample nearsurface sediments at the SAP sites and around the lease area
Purpose	Direct physical sampling of materials deep below the seabed, shallow subsurface and beyond foundation limits, for ground truthing and correlation with seismic data to support the geology ground model

Benthic Grab Sampling & Still Photos:

Location	40 locations in the Lease Area
Systems	Grab sampler with video/still photo camera; sampler with approx. 0.1 m^2 (1.07 ft^2) surface area, approx. 15 liter (3.96 gallon) volume
Sample Layout	~2 km (~1.1 nm) spacing along corridors, plus extras
Purpose	Analysis of surficial sediment for (a) ground truthing sonar data and (b) to identify benthic organisms and habitats

Underwater Video Transects:

Location	25 transects in the Lease Area
Systems	High resolution underwater video system, either towed camera or Remotely Operated Vehicle
Sample Layout	~2 km (~1.1 nm) spacing along corridors, plus additional in areas of suspected SSUs (special, sensitive, or unique habitats)
Purpose	Visual inspection of the seafloor and possible sensitive benthic habitats



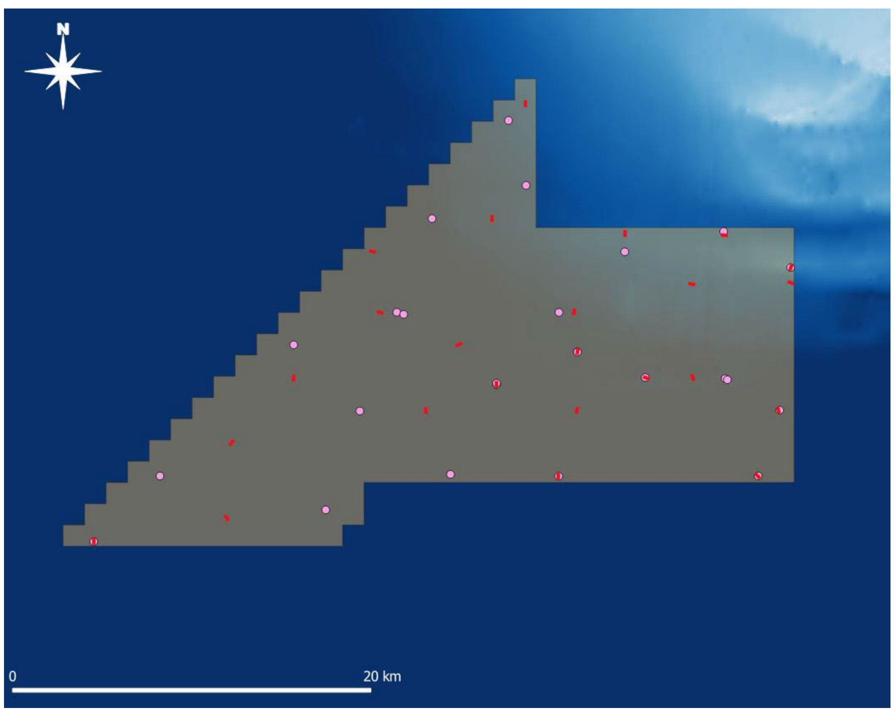


Figure 4: Maps showing the 2019 site investigations in Lease 0522. TOP = geophysical tracklines and geotechnical locations (vibracores in red, deep borings in cyan, CPTs in blue and cyan). BOT = benthic grab samples (pink dots) and underwater video transects (red lines).

3. COP Survey Plan Details

Surveys will be conducted in accordance with the BOEM Guidelines for Providing Geophysical, Geotechnical, and Geohazard Information Pursuant to 30 CFR Part 585 (May 27, 2020), Guidelines for Providing Archaeological and Historic Property Information Pursuant to 30 CFR Part 585 (May 27, 2020), and other relevant guidelines listed previously (Table 1). The Survey Plan includes geophysical, geotechnical, and environmental surveys in Lease 0522 and along potential OECCs.

The data acquired in 2022 and beyond will be used to support the preparation of one or more COP and Facilities Design Reports (FDR). A full suite of geophysical instrumentation including multi-channel seismic (MCS), shallow and medium penetration subbottom profilers, multibeam echosounder (MBES), side scan sonar (SSS) and gradiometer as well as geotechnical and benthic sampling equipment (deep boreholes, CPTs, vibratory corer and grab sampler), and other support systems may be utilized in the site characterization campaign.

Note that the surveys described in this plan will begin in 2022, and will extend as necessary into subsequent years to complete site characterization in support of a COP. The proposed surveys in Lease Area OCS-A 0522 and potential OECCs have been subdivided as follows:

- Lease Area geophysical surveys
- Lease Area deep geotechnical investigations
- Geophysical surveys along potential export cable corridors
- Shallow geotechnical investigations
- Environmental surveys

The following sub-sections detail the aim/objective and scope for each survey type. The site characterization campaign for Lease 0522 will include multiple vessel mobilizations as required to accommodate the timing of critical tasks (e.g., geotechnical investigations only after QMA has reviewed geophysical data and cleared) and to complete the full scope of services envisioned for 2022 and beyond.

Geophysical Surveys Within the Lease Area

<u>Aim and Objectives</u>

The planned geophysical scope in Lease 0522 includes full seafloor coverage and data density (line and point spacings) to meet BOEM requirements. The detailed geophysical surveys build upon the survey grids covered in the Lease Area in 2019 (see Section 2 “Site Surveys To-Date”) with detailed data acquisition in areas of potential seabed disturbance to meet federal and state guidelines and requirements.

<u>General Survey Scope</u>

- Geophysical Surveys—Lease Area
    - Full geophysical suite coverage of the Lease Area
    - 30 m line spacing acquiring all systems on all lines throughout the lease
- Geotechnical site clearance surveys
    - 30 m line spacing centered on proposed sample locations

    - Minimum 120 m square box for seabed coverage around geotechnical locations
    - Performed early in the campaign to expedite QMA assessment
- Hydrographic MBES
    - Minimum 60 m swath each side of survey line (dependent upon system)
    - Minimum 120 m box covered around geotechnical locations
- Side Scan Sonar
    - 50 m swath each side of centerline
    - Minimum 120 m box covered around geotechnical locations
- Gradiometer survey to identify possible ferrous objects along the export cable corridors
    - Maximum altitude of 6 m
    - Noise <3 nT to allow picking targets ≥5 nT peak-to-trough
- Subbottom / Seismic Profiling
    - High frequency, shallow penetration system (e.g., pinger- or chirp-type instrument)
    - Lower frequency, medium penetration system (e.g., sparker or boomer-type instrument)
    - Suitable for mapping geological horizons and archaeological items of potential interest along cable routes to a minimum depth of 10 m below the seafloor
- Multi-Channel Seismic (MCS)(sparker source; OPTIONAL)
    - Suitable for mapping of deep geological horizons to >70 m below the seafloor
    - Ability to resolve beds ~2 m-thick at the greatest depth of interest
    - Additional lines infilling the 2019 grid may be completed to supplement the SCS data

Deep Geotechnical Survey Within the Lease Area

Aim and Objectives

The proposed deep geotechnical investigations will be comprised of boreholes, downhole CPTs and optional seabed CPTs positioned at the WTG locations. The geotechnical data will be used to support ground model refinement and provide specific engineering properties critical for the WTG foundation design.

General Survey Scope

- Boreholes
    - Up to 50 stations up to 100 m depth with P-S logging, shallower depth at some
    - ASTM soil classification standards (or similar recognized standard) will be used
    - Minimum soil disturbance
    - Minimum sample diameter of 70 mm
    - Maximum vertical data gap of 0.2 m
    - Only seawater can be used as drilling fluid unless alternatives are approved
    - Potential sampling and oversampling methods, listed in order of preference
        - Piston thin wall sampler
        - Push thin wall sampler
        - Push thick wall
        - Hammer sampler
        - Rotary coring

    - Storage and transport of soil and rock samples must be in accordance with ASTM D 4220-95(2000) and ASTM D 5079-02
    - Optional near continuous CPTU
        - 0-40 m below sea floor: Maximum data gap = 0.20 m
        - 40+ m below sea floor: Next CPTU started from nearest 0.50 m mark from refusal depth of previous push/test (maximum data gap = 0.50 m)
- Continuous piezocone penetration testing (DTH CPTU)
    - Up to 160 tests up to 100 m depth, shallower depth at some
    - Measures tip resistance, sleeve friction, and pore pressure
    - Minimum penetration of 15 m
    - If 10 m requirement is not met in the first attempt, a second (and possibly a third) re-test will be performed to try to meet the requirements
    - 10 and 15 cm^2 cones will be used
    - Tests carried out in accordance with ISO 22476-1:2012
    - Only class 2 or higher will be assessed in-class and accepted
    - Filter stones will be fully saturated
    - Test stopped if:
        - Capacity of cone is reached
        - Inclination of 10 degrees
        - Sudden jump in inclination or tip resistance is observed
- Optional continuous seabed CPTU
    - Up to 160 tests up to 40 m depth
    - Measures tip resistance, sleeve friction, and pore pressure
    - Minimum penetration of 10 m
    - If 10 m requirement is not met in the first attempt, a second (and possibly a third) re-test will be performed to try to meet the requirements
    - 10 or 15 cm^2 cones will be used
    - Tests carried out in accordance with ISO 22476-1:2012
    - Only class 2 or higher will be assessed in-class and accepted
    - Filter stones will be fully saturated
    - Test stopped if:
        - Capacity of cone is reached
        - Inclination exceeds 10 degrees
        - Sudden jump in inclination or tip resistance is observed

Geophysical Survey Along Offshore Export Cable Corridors (OECCs)

<u>Aim and Objectives</u>

OECC options for linking the offshore wind farm to shore are being considered based on desktop studies (existing research and data publicly available) to assess expected conditions. Figure 2 shows the continental shelf region where export cable routes may be investigated.

A single geophysical reconnaissance line will be surveyed along multiple potential OECCs. Data will be reviewed in near real-time to assess each route and compare advantages and disadvantages of the various alignments. Additional offset lines may be acquired in areas where adverse seabed conditions are identified. In areas where unique subsurface conditions are present and/or sensitive habitats have been interpreted, additional data will also be acquired. A preferred route will be chosen based on the data collected and existing background information. A full corridor geophysical survey along with shallow geotechnical and environmental sampling will then be conducted primarily along the preferred route.

General Survey Scope

- Single line, reconnaissance survey with local optional routing along two or more potential OECCs
    - OECC link connecting a corner of Lease OCS-A 0522 with Lease OCS-A 0501 and/or Lease OCS-A 0534 (locations TBD)
    - OECCs connecting the Lease to potential landfall locations in NY, CT, RI, or MA
- Full export cable corridor COP detailed HRG surveys (chosen alignment)
    - 30 m line spacing federal waters, 15 m line spacing state waters
    - All systems run on every survey line
- Geotechnical site clearance surveys
    - 7 primary lines at 30 m spacing, and 1 tie line through the center
    - Covers a minimum 120 m square box at each geotechnical location
- Hydrographic MBES
    - Minimum beam width of 120° (60 degrees each side, system dependent)
    - Minimum 120 m box covered around geotechnical locations
- Side Scan Sonar
    - Reconnaissance = 75 m sweep range (each side of centerline)
    - Detail surveys = 50 m sweep range
    - Minimum 120 m box covered around geotechnical locations
- Magnetometer survey to identify possible ferrous objects along the export cable routes
    - Single magnetometer used for route reconnaissance surveys only
    - Maximum altitude of 6 m
    - Noise <3 nT to allow picking targets ≥5 nT peak-to-trough
- Gradiometer survey to identify possible ferrous objects along the export cable corridors
    - Multiple magnetometers used for the preferred OECC detailed COP survey
    - Maximum altitude of 6 m
    - Noise <3 nT to allow picking targets ≥5 nT peak-to-trough
- Single-Channel Seismic
    - High frequency, shallow penetration system (e.g., subbottom profiler (SBP) type, pinger- or chirp-type instrument)
    - Lower frequency, medium penetration system (e.g., single channel seismic (SCS) type, boomer or sparker source instrument)
    - Suitable for mapping geological horizons and archaeological items of potential interest beneath the export cable routes to a minimum depth of 10 m below the seafloor

- Suitable for mapping deeper horizons in support of stratigraphic mapping WTG foundation design and engineering, 70+m below the seafloor

Shallow Geotechnical Surveys

<u>Aim and Objectives</u>

Along with the geophysical and benthic habitat survey, the shallow geotechnical data is being used to assess cable corridor feasibility. The geotechnical data will also be used to ground-truth the geophysical data collected for mapping subsurface geological horizons important for archaeological resource evaluation and cable design and burial assessment.

<u>General Survey Scope</u>

- Geotechnical sampling performed after geophysical data has been analyzed and reviewed by the project geologist and Qualified Marine Archaeologist (QMA)
- Up to 200 co-located or alternating seabed CPTs and vibracores spaced approximately every 1-2 km along one or more export cable routes
- Additional vibracores and/or CPTs will be collected if advisable by the QMA and project geologists following preliminary geophysical data review
- Up to 200 co-located vibracores/CPTs along potential IACCs in the Lease Area
- Vibracores
  - Minimum requirements for first attempt
    - Penetration of at least 3 m
    - Recovery of >67% required
  - If minimum requirements are not met in the first attempt, a second (and possibly a third) attempt will be performed to try to meet the requirements
  - Vibracores will be cut in 1 m sections, photographed, logged, and torvane and pocket penetrometer testing will be carried out at section ends. The liner will be sealed, capped, taped securely shut, labeled and carefully stored for further archaeological and geotechnical testing
- Piezocone penetration testing (CPT)
  - Measures tip resistance, sleeve friction, and pore pressure
  - Minimum penetration of 3 m
  - If 3 m requirement is not met in the first attempt, a second (and possibly a third) re-test will be performed to try to meet the requirements
  - Only class 2 or higher will be assessed in-class and accepted

Environmental Surveys

<u>Aim and Objectives</u>

Grab samples and underwater video will be used to perform benthic habitat mapping along the potential OECCs and in the Lease Area. General characterization studies detailed in the BOEM Guidelines for Providing Benthic Habitat Survey Information for Renewable Energy Development on the Atlantic OCS Pursuant to 30 CFR 585 (June 2019) are planned. Benthic habitats and organisms will be identified from the grab samples and underwater imagery. The sediment recovered from the grabs will also be described and subjected to grain size analysis. The grab samples will be used to ground truth the side scan sonar imagery to help determine the nature of the surficial material and distribution of benthic habitats in the survey area. The latest National Marine Fisheries Service (NMFS) guidelines will be followed (Mar 2021) for habitat mapping with all benthic classifications based on the Coastal and Marine Ecological Classification Standard (CMECS).

General Survey Scope

- Up to 200 grab samples and 200 underwater video transects throughout the OECCs and Lease 0522
- Sampling and video transects will be conducted in the vicinity of sensitive habitats
- Grab sampling methodology
    - Attached underwater camera
    - Replicates as needed
    - Photographed, described, and subsampled on deck
    - Benthic analysis (2 subsamples)
        - 500 micron mesh sieve used for enumerating benthic infauna
    - Grain size analysis (1 subsample)
- Underwater video
    - Video speed < 1 kt
    - USBL in water depths > 9 m

4. Survey Equipment

A combination of the following equipment (or equivalent) may be utilized for the geophysical, geotechnical, and environmental site characterization campaign based on prior years' experience and knowledge of the industry standard systems being offered by the survey contractors.

Industry standard geophysical systems, including but not limited to:

Systems	Full geophysical suite of instruments including multibeam, side scan sonar, magnetometer, shallow (chirp) and medium (sparker) penetration single channel subbottom profilers, and all support systems (positioning, motion sensor, sound velocity profiler, etc.) • Applanix POS MV with Trimble Nav-Beacon/USCG differential receiver • Sonardyne Scout Pro USBL • Reson 7125 multibeam echosounder • Odom HydroTrac single beam echosounder • Klein 3900 side scan sonar • Geometrics Transverse Gradiometer (TVG) with dual G882 magnetometers • Teledyne-Benthos CHIRP III shallow subbottom profiler • GeoMarine Geospark 1000J medium penetration subbottom profiler with 200 tip sparker source and 8 element single channel GeoEel streamer • Teledyne-Oceanscience RapidCAST sound velocity profiler • Generation 3 NVG and Gardline PAMS system for PSO mitigation • Atlas H10 Offshore Corrections DGPS • SBG Ekinox 2-U Motion Sensor

	• Applanix POSMV M5 • Hemisphere VS330 GPS Receiver • R2Sonic 2024 MBES system • Knudsen 3212 200 kHz SBES system • Oceanscience Underway CTD system • AML Base-X SVP sensor • Valeport Mini SVP sensor • Applied Acoustics Easytrak Nexus 2 USBL System with AA 1019 mini beacons • Edgetech 4200/4205 dual frequency SSS (300/600/900 kHz) with Edgetech topside processor • Knudsen 3260 2x2 SBP Array (3.5kHz) Pinger • Applied Acoustic Dura-spark 200/400 seismic system with AA CSP-N (2400J) power supply • Geometrics G-882 Cesium Marine Magnetometer • Sonardyne Mini-Ranger 2 USBL system for underwater positioning

Industry standard geotechnical equipment used, including but not limited to:

Systems	• Top drive power swivel boring rig with split spoon or wireline push sampler • Wireline CPT tool for downhole piezocone penetration testing • 20 ton Seabed CPT for piezocone penetration testing Twin-derrick GMTR120 geotechnical drill rig, a fully heave-compensated rotary flush marine drill with a 5.5-inch API drill string driven by an EDECO Hydraulic power swivel (or equivalent) Downhole tools: • Hydraulic piston/push sampler, percussion/hammer sampler • WISON-APB Piezocone Penetration Test (PCPT) with 5 cm^2 or 10 cm^2 cones • Rock Coring bit / barrel combination • Seismic Cone Penetration Test (SCPT) with 10 cm^2 cones Manta-200kn seabed piezocone penetration test (PCPT) with 10 cm^2 or 15 cm^2 cones Drilling performed with standard 5-inch API drill pipe, fitted with a 5 wing drag bit. Bottom Hole Assembly (BHA), comprised of standard drill collars plus a specially adapted collar containing a series of landing and latching rings designed to accommodate and allow the use of the various sampling, in situ testing and non-coring tools. “WISON-APB” push sampler system with a minimal 70 mm inner diameter “Shelby” sampling tube mounted on a sample latching tool. “WISON-APB” downhole PCPT system with 10 cm^2 or 5 cm^2 electrical cones. PS logger probe Vibratory corer, pneumatic and electric systems; 3.5-4 inch diameter, 3-4 m long barrels with cutter heads and core/sediment catcher. Designed for shallow subsurface sampling of unconsolidated materials up to gravel and cobble size. Specifically applicable for cable burial assessment and sediment property suitability for housing power cables. Seabed CPT system, shallow penetration (3-10 m), e.g., Neptune 3000-5000; CPTU systems mounted on seabed frames with varying thrust capacity, smaller cone sizes (2-10 cm^2). Measure axial load, sleeve friction, pore pressure, tip resistance, and axial tilt, hydrostatic pressure. Complimentary system to the vibracore for obtaining information on more sediment properties to help define the variations in material layering.

Industry standard environmental survey equipment, including but not limited to:

Systems	Modified Day grab sampler, Van Veen power grab, or Smith McIntyre grab sampler, each with attached camera; samplers have 0.1 m^2 (1.07 ft^2) surface area and retain approximately 15 liter (3.96 gallon) volume of material Gravity BM500 Video Sled with DOER Marine HP Lasers, a DeepSea Power and Light W-Eye Camera and DeepSea Power and Light LED wide lights. SeaRover/DSSI SeaMax MK2 Survey Class ROV with Sony UMC S3CA 4K HD video camera, scaling lasers, powerful thrusters and LED lighting. Kongsberg/Simrad OE Model Cameras with low light sensitive lens, LED lighting, auto focus, and software overlay tool. Additional support systems (or equivalent) include: • Applanix POSMV OceanMaster with USCG Differential Corrections and PPK capability • Sonardyne Scout Plus/MiniRanger 2 USBL (35-55 kHz) • YSI CastAway CTD, AML SVP

High Resolution Geophysical (HRG)

Nearshore bodies of water found along the southern shores of the Northeast Atlantic (e.g. Vineyard Sound, Rhode Island Sound, Nantucket Sound, Great South Bay, Buzzards Bay) are dynamic areas with strong and variable tides and currents. Survey operations will be performed to make optimal use of the tidal conditions and when applicable, tracklines will be run along preferred orientations with respect to the prevailing currents with tight control of vessel speed. This will help maintain towed sensor positions and help keep the vessel on line when surveying the potential export cable corridors. In the open waters of the Atlantic Ocean found within Lease OCS-A 0522, currents are less severe than some constricted waterways nearshore, but still ever-present and variable, therefore towed sensor position is tracked accurately with a USBL system and vessel steering and line keeping monitored constantly.

Sediment transport is common in the area and is observed in the seafloor geomorphology as bedforms that migrate along the bottom. If there are larger, longer period sand waves present along any routes, towed sensors can be raised and lowered to maintain recommended heights for the side scan sonar and gradiometer given appropriate vessel speed. If the wavelength of the bedforms decreases, typically the sensors stay within the 6 m guideline over the troughs and may be much closer to the seafloor over the crests. Careful planning of preferred survey direction for the given tidal conditions assists in meeting these requirements.

Specific attributes of the geophysical systems and methods are discussed below.

Navigation and Sensor Positioning

Vessel positioning will be accomplished using industry standard GPS techniques to achieve a total horizontal uncertainty at the 95% confidence level of 2 m (IHO special order survey requirement, worst case accuracy). It expected more accurate positioning can be achieved offshore. Differential GPS solutions (e.g., U.S. Coast Guard or private reference stations) will be utilized to obtain this accuracy interfaced to a sophisticated GNSS aided inertial navigation system. These systems are the most widely used positioning solution for multibeam data acquisition as they provide integrated DGPS, inertial navigation, motion, and heading to obtain highly accurate position and orientation measurements. Additional post-survey applications afford further position processing to increase horizontal and vertical accuracies even more.

All GPS and associated data strings are imported to the navigation software (e.g., QINSy, Hypack, etc.) for positioning other ancillary devices that are a part of the geophysical instrument suite. These software programs allow full control over positioning and recording external system digital data and provide useful post-survey data review and processing tools for offline work onboard the larger vessels.

For towed sensors, a USBL underwater acoustic positioning system will be used in water depths greater than 9 m. This system is interfaced to the navigation software such that range, azimuth, depth, motion, and supporting USBL data are used to calculate the true x,y position of the USBL beacon attached to the towed sensor. Those coordinates are then exported out of the navigation software to external geophysical towed system's computers (side scan sonar, magnetometer). In this manner, offset and layback corrected positions are recorded in the towed system digital files in real time.

Multibeam Echosounder and Data

A multibeam bathymetry system will be used to record water depth measurements and backscatter ('snippets') in a swath covering the seafloor. These systems typically utilize 200-400 kHz frequencies over 120-200º angles to cover usable swath widths of 3-5 times the water depth. Depth values will be adjusted for sound velocity (SV) using CTD or SV profiler measurements. The systems have a SV probe at the transducer for continuous surface measurements and frequent CTD/SV casts for the entire water column supplement these surface data. Moving vessel profilers (MVPs) are preferred so the vessel does not have to stop to obtain a sound velocity cast. Precision motion data (heave, pitch, roll, yaw) are also recorded to position the soundings accurately on the bottom. During the survey, vessel speed, ping rate, beam width, and other parameters are closely monitored and controlled to ensure that a suitable quantity of soundings per square meter on the seafloor is achieved.

For vertical control and referencing of the water depths to the MLLW datum, POS data logged during the survey contains GPS altitudes that can be post-processed to achieve a tightly coupled PPK (post-processed kinematic) solution. The resulting NAD83 ellipsoid referenced points can be converted to MLLW using NOAA's VDatum software by applying the smoothed best estimate of trajectory (SBET) file from the POSPac software. The final processed water depth data will meet IHO S-44 Order 1a requirements.

Side Scan Sonar and Imagery

Dual frequency side scan sonar imagery (e.g., 300/600 kHz, 445/900 kHz) will be acquired to record the acoustic reflectivity of the seafloor. The combination of lower and higher frequency transmissions was designed to satisfy range and resolution desires of operators. A sonar sweep range of 50-75 m will be employed to obtain high resolution imagery in all survey areas. A 50 m sweep range is used for detailed survey work and the 75 m range is utilized for the reconnaissance lines to cover more area. The towfish is "flown" at a height of 10-20% of this range above the bottom to obtain optimal image results. During sea trials, sweep range, pulse length, ping rate, and frequency will be optimized to meet a target size detection criterion of 0.5 m.

In deeper water (i.e., > 9 m), the sonar towfish will be positioned using the USBL system with a beacon either integrated into the towfish or attached just above on the tow cable. Properly corrected towfish geo-referenced positions will be input to the digital sonar files in real time via the navigation software interface. A position accuracy of 3-5 m is estimated for the deeper water depths expected for this survey. For shallow water areas where water column noise can affect the USBL, a cable counter is planned for use to provide towfish layback corrections. Overall, position accuracy increases as water depth decreases.

Magnetic Intensity Measurements

A gradiometer system such as a dual Geometrics G882/Transverse gradiometer (TVG) will be utilized to detect ferrous materials on and below the seafloor. The systems will include an altimeter to measure and record height of the sensor above the seafloor, which will be maintained at less than 6 m if possible. Each gradiometer sensor will have a counter sensitivity of <0.004 nT/√Hz rms and an absolute accuracy across the range (20,000-100,000 nT) of <2 nT. The data sampling rate will be greater than 4.0 Hz to ensure sufficient data point density and is typically up to 10 Hz. Data is constantly monitored to ensure background noise remains below 3 nT. The magnetic data may be recorded by the navigation software or separate stand-alone computer package.

The gradiometer will be towed at a distance from the survey vessel and to minimize magnetic interference from the vessel. This distance is normally expected to be at least three times the length of the vessel, but shorter distances are acceptable if interference levels can be demonstrated to be acceptably low. If the gradiometer is piggy-backed to other equipment such as a Side-Scan Sonar towfish, sufficient distance to prevent interference from the towfish will be ensured. The gradiometer will be positioned using USBL tracking in water depths <10 m and cable layback in shallower waters. In very shallow waters, the magnetic sensor may be floated on the surface and towed separately to optimize data quality and vessel maneuverability without the use of a USBL.

Subbottom Profiling

To gather information on the shallow subsurface, two different seismic reflection-type systems will be utilized; a high frequency, shallow penetration subbottom profiling-type (SBP) system (e.g. pinger or chirp source instruments) and a lower frequency, medium penetration, single-channel seismic (SCS) system (e.g., boomer/sparker source instrument). Chirp and pinger SBPs are optimized to investigate the top 10 m below the seabed but in areas such as Rhode Island Sound, Nantucket Sound and elsewhere along the OCS, penetration is often limited to the upper few meters due to the presence of compact sands and coarser deposits. In these geologic settings, a lower frequency system is needed to penetrate and resolve sediment layers up to 10 m below the potential depth of disturbance for cable installation and geotechnical sampling. Boomer/sparker and chirp/pinger systems complement each by providing the resolution and penetration needed to assess the shallow subsurface geology. Chirp/pinger systems, due to their higher frequency content, are capable of resolving 30 cm-thick layers in the upper 3 m while the boomer/sparker's lower frequency can achieve resolution of 2 m or less in the upper 10-20 m.

Chirp/pinger SBPs are commonly hull mounted or towed on a short cable off the side, or in a moon pool, of the vessel. Boomer/sparker systems consist of a towed catamaran that houses the sound source (an electro-mechanical plate or sparker electrodes) and a towed, 8-10 element hydrophone single-channel streamer, which records the signal. A boomer system will emit a short duration outgoing pulse and the tow configuration will be optimized to minimize ghosting, which masks real subsurface reflectors. Additionally, the boomer system will be configured so that both the source and streamer are positioned outside the vessel wake and prop wash to minimize unwanted noise on the recording.

Multi-Channel Seismic

Multi-Channel Seismic (MCS) data may be acquired in Lease OCS-A 0522 to provide additional information needed to supplement the subsurface ground model to a depth 10 m greater than the maximum depth of disturbance from a potential wind turbine foundation. The MCS survey will make use of a sparker-type seismic source (~500-1000 joules) that can generate a repeatable, broadband (~0.5-4 kHz) signal to penetrate nearly 100 m below the seabed and resolve layers as thin as 2 m. The sparker system will be fired approximately every meter and a calibrated hydrophone will monitor the source signature as well as the tow depths of the source and streamer.

The multi-channel streamer used for the survey will have front end and tail buoys with GPS of radio transponders to monitor streamer feathering. The streamer will be towed at a depth of around 0.5 m to ensure the surface ghost does not degrade the frequency spectrum and reduce the vertical resolution. The group interval will be less than 3.125 m to allow for high horizontal resolution and the length of the streamer will be greater than the maximum target depth to improve velocity analysis and multiple suppression.

Shallow Geotechnical

Shallow geotechnical information will be obtained in the Lease Area and approximately every 1-2 km along the proposed export cable routes using co-located as well as alternating vibracores and CPTs. The total number of locations and type of sampling will be finalized after geophysical data has been analyzed and reviewed by the project geologist and Qualified Marine Archaeologist (QMA). The number of samples may also be driven by the results of initial geotechnical information as the field program progresses. Sampling may be reduced in areas that present consistent ground conditions.

This approach is consistent with Guidelines for Providing Geophysical, Geotechnical, and Geohazard Information Pursuant to 30 CFR Part 585 (May 27, 2020). Where possible, geotechnical sample stations will be strategically positioned to sample subsurface features interpreted from the subbottom profile data. This could include potential pre-Holocene intact strata (ravinement surface, possible archaeological significance), possible buried paleofeatures or submerged ancient landforms, or coarse deposits suggesting difficult burial conditions.

The vibratory coring method will recover samples of at least 70 mm diameter with a minimum penetration of 3 m and a minimum recovery of 67%. If either the penetration or recovery criteria is not achieved, at least one re-test shall be carried out. If the required penetration is not achieved on the re-attempt the Offshore Client Representative may instruct a third attempt. Core catchers and drill bits shall be available to maximize the penetration and recovery in the expected soils. Upon recovery to deck, the vibracores will be cut in 1m sections, photographed, geologically logged, and the section ends will be subjected to torvane and pocket penetrometer testing. The liner will be sealed, capped, taped securely shut, labeled and carefully stored for further testing.

Piezocone penetration testing (CPTU) will measure soil properties (tip resistance, sleeve friction, and pore pressure) at the same locations and over the same vertical zone (~3-4 m) as the vibracores. The size and capacity of the cones will be agreed upon prior to mobilization to produce the best results given the site conditions along the cable routes. A minimum penetration of 3 m is required. Like the vibracore sampling program, if 3 m penetration is not achieved in the first attempt, a second (and possibly a third) re-test will be performed.

The tests will be carried out in accordance with ISO 22476-1:2012 Geotechnical investigation and testing – Field testing – Part 1: Electrical cone and piezocone penetration test. Zero readings of all sensors shall be recorded before and after each test. The drift readings shall be calculated, and the class of each data reading calculated in accordance with ISO 22476-1:2012. Only class 2 or higher will be assessed as in-class and accepted. Class 3 or lower will be considered out of class. Continuous deck-to-deck readings will be taken and recorded for all tests and filter stones shall be fully saturated before each test. The test will be stopped if the capacity of the cone is reached, an inclination of 10 degrees is reached or a sudden jump in inclination or tip resistance is observed.

Deep Geotechnical

A deep geotechnical campaign may be undertaken initially using a large floating drillship that will most likely hold position using a dynamic positioning system – although there is a possibility that anchors may also be used. A heave compensated drill frame will be used that shall have the option to either undertake downhole CPTs or undertake wireline core drilling. Some basic sample testing will be undertaken on board the vessel, however more extensive and advanced testing shall be undertaken at onshore laboratories. P-S logging is planned at all boring locations after continuous sampling has been performed. Continuous CPTs may be acquired using a similar vessel with a seabed mounted CPT rig.

The deep geotechnical campaign will consist of multiple continuous sampling boreholes (up to 100 m depth below seafloor) with P-S logging and multiple downhole near-continuous CPTs (up to 100 m depth). Downhole near-continuous CPT boreholes will require that the maximum data gap allowed between a push/test that met refusal and a subsequent CPT push/test be less than 0.2 m up to 40 m below the seafloor and 0.5 m at depths greater than 40 m. For soil sampling, several methods are being considered. These methods in order of preference are:

- Piston thin wall sampler
- Push thin wall sampler
- Push thick wall
- Hammer sampler
- Rotary coring

Soil borings, sampling and handling shall be carried out in such a way that there is a minimum disturbance to the soil to be sampled or tested. The minimum sample diameter acceptable is 70 mm and the maximum vertical data gap between samples will be 0.2-0.5 m depending upon depth below the seafloor. Only seawater can be used as a drilling fluid unless alternatives are approved. The storage and transport of soil and rock samples must be in accordance with ASTM D 4220-95(2000) and ASTM D 5079–02.

Continuous seabed CPT data will be performed in the 0522 Lease Area with the same requirements as the shallow geotechnical CPTs except that the minimum penetration accepted is 10 m. The seabed CPT program will consist of multiple tests up to 40 m below the seafloor.

Benthic Sampling and Mapping

Grab samples are collected for benthic analysis and provide ground-truthing of the side scan sonar imagery and other geophysical data needed to perform surficial sediment mapping. The samples will be strategically located to provide material and data to support as many analyses and project tasks as possible. The grab sampler will have an underwater camera attached to the frame or downline to record images of the seafloor at the sample locations. Once on deck the grab sample will be photographed, and three subsamples will be retained (1 for grain size analysis and 2 for benthic analysis). Replicates will be obtained to meet NMFS guidelines when appropriate.

An underwater video system will also be used to aid benthic habitat mapping. The video survey speed will be maintained at less than 1 knot to assure the acquired video footage can be used for organism identification on the seafloor. In water depths greater than 9 m, a USBL will be used to position the video sled. Synchronized time on the video camera and navigation systems will allow time tags to be generated post-survey along the USBL tracklines that will show the camera position correlated directly to the time display on the video recording. The imagery will be used to ground truth surficial sediment types, delineate benthic habitat areas, and identify benthic communities on the seafloor.

Sampling methodology outlined in the NMFS guidelines (March 2021) will generally be followed, with fewer samples considered over large areas of homogenous seabed and habitat conditions. CMECS will be adhered to for defining sediments from the grabs and estimating visual seabed types from the video analysis.

Survey Vessels

Multiple vessels may be performing survey duties simultaneously in different sections of the cable corridors and within Lease 0522. Simultaneous operations (SIMOPS) between vessels will be coordinated to ensure that any separation distances required to avoid overlapping sound signatures are maintained.

Furthermore, to increase survey efficiency and production while reducing project costs, and effectively meet the timing required of the geophysical and geotechnical efforts, the vessels, survey equipment, and scientific crews will be mobilized to the site to conduct work for multiple tasks simultaneously. This will be a highly coordinated effort for program logistics with the intention of minimizing the survey time onsite.

More details on survey resources (quantity of vessels, equipment specification sheets, companies involved) will be provided to BOEM toward the end of the procurement when contractor(s) are selected.

5. Survey Timeline

Field investigations are expected to begin in the spring of 2022 with the duration of the work ultimately dependent on the final scope of the investigations performed. The survey tasks will likely be completed by four to six vessels simultaneously (nearshore and offshore), subject to any restrictions imposed by the final IHA from NMFS. Survey operational scenarios of 12- and 24-hour days are both being considered. Depending on contractor and vessel availability, the field operations may also not be performed sequentially. The current proposed survey timeline is outlined in Table 2 below.

Table 2. Proposed schedule for the OCS-A 0522 (and OECCs) site characterization campaign and pre-survey requirements

Work	Approx. Start Date
Survey Plan submittal to BOEM	November 17, 2021
BOEM pre-survey meeting	January 18, 2022
Tribal pre-survey meeting invitations sent out via certified mail	February 2, 2022
Tribal pre-survey meetings	February 17, 2022
Estimated submittal of PSO resumes to BOEM for NMFS approval[4]	March 1, 2022
Survey Start Date	March 19, 2022
Survey End Date *	31 December 2023

Notes:
*Survey dates above are only estimated and may change subsequent to receipt of updated information from BOEM and availability of survey resources. Due to the possibility of poor weather in the fall, unforeseeable project variations, and commercial constraints, the field program that begins in 2022 would extend into 2023 and possibly 2024 if necessary.

6. <u>Protected Species Impact Mitigation Plan</u>

During the site characterization campaign, monitoring and mitigation measures and the most appropriate equipment will be used to avoid and minimize potential effects to marine mammals and sea turtles from geophysical sound sources or vessels. These measures include, but are not necessarily limited to, monitoring and exclusion zones, ramp-up and shut down procedures, and vessel strike avoidance.

Currently, an Incidental Harassment Authorization (IHA) is in place that covers activities under this survey plan through June 20, 2022.[5] 522 LLC is also submitting a new IHA application to NMFS for work conducted under this survey plan that extends beyond June 2022. That IHA will either be renewed or a new IHA would be sought for work extending beyond June 2023.

The terms and conditions of the current IHA prescribe monitoring and mitigation measures specific to geophysical activities, including requirements for marine mammal monitoring and exclusion zones,

[4] PSOs approved for the previous surveys in 2016-2018 are understood to already be approved by BOEM and NMFS for surveys related to Lease OCS-A 0522. All names of PSOs with current NMFS approval scheduled for participation in 2019 will be submitted along with documentation of the PSOs' successful training or coursework to the agencies seven days before the scheduled start of the survey activities.

[5] The IHA was issued to Vineyard Wind LLC, which is the sole member of OCS-A 0522 LLC. See *https://www.federalregister.gov/documents/2021/07/20/2021-15383/takes-of-marine-mammals-incidental-to-specified-activities-taking-marine-mammals-incidental-to*.

ramp-up of survey equipment, shutdown procedures, vessel strike avoidance, seasonal operating requirements, and reporting. Activities under this Survey Plan will adhere to all provisions applicable to marine mammals as set forth by NMFS in the current IHA, as well as those included in the new IHA that is expected to be finalized in Spring 2022. For monitoring and mitigation measures of species not included in IHAs (e.g., sea turtles), surveys will comply with lease stipulations set forth in Addendum C of OCS-A 0522. A waiver request accompanies this Survey Plan for any lease stipulations that are inconsistent with the IHA, industry standards, and recent correspondence with NMFS.

Additional information related to potential effects of high resolution geophysical survey sound sources and monitoring and mitigation planned for the site characterization campaign are summarized below.

Sound Field Verification

Sound field verification (SFV) of HRG sources is not planned for the site characterization campaign. The same, or similar model geophysical equipment operating below 180 kHz that was used in surveys from 2016-2021 are proposed for this campaign (e.g., shallow penetration subbottom profilers and medium penetration single channel seismic systems). Prior field verifications in the vicinity of the Lease Area (Table 3) and assessment of sources by BOEM[6] and NMFS[7] indicate that sound fields produced by HRG equipment operating below 180 kHz are transient and temporary, and limited in radial distance to regulatory thresholds.

Table 3. Results from the 2016 SFV including measured sound levels from geophysical equipment operating at <200 kHz in the vicinity of the Lease Area[8].

System	Frequency (kHz)	Measured Source Level (SPL peak, db re 1 uPa m)	Measured Source Level (SPL, db re 1 uPa m)	Measured Distance to Level B Harassment Threshold (SPL 160 dB re 1 uPa)
Shallow Penetration Chirp/Pinger Subbottom Profiler	1.5-10	207.5	178.9	9 m
Medium Penetration 800J Sparker Subbottom Profiler	0.75-2.5	210.0	185.5	19 m

[7] NMFS. 2021. Data Collection and Site Survey Activities Programmatic Informal Consultation. Issued June 29, 2021. Revision 1. September 2021.

[8] Gardline Survey Report submitted 9-28-16. *Field Verification and Vessel Signature Report*, Vineyard Wind HRG Survey, Project No. 10878, 89 pp.

Additional acoustic assessment of HRG sources can be found in: (a) SFV performed in shallow water for the Cape Wind project[9], (b) SFV completed for geophysical surveys on adjacent OCS lease blocks, (c) geophysical systems testing by the Naval Undersea Warfare Center[10], (d) modeling of sound source parameters by JASCO for the Vineyard Wind IHA[11], and (e) the BOEM Data Collection and Site Survey Activities for Renewable Energy on the Atlantic Outer Continental Shelf Biological Assessment[6]. These measures and model estimates of sound source parameters all confirm that the limited acoustic impact from these systems is well within the planned monitoring and exclusion zones.

Geotechnical equipment acoustic field testing has limited documentation from previous research studies[12,13] but is not considered to have the potential impact that impulsive, low frequency geophysical sources might have. In the recently released Programmatic Consultation[7] NMFS stated that noise associated with geotechnical surveys is below the level that is expected to result in physiological or behavioral responses by any ESA-listed species considered in the assessment, and as such, effects to listed whales, sea turtles, or fish from exposure to this noise source is extremely unlikely to occur.

This survey plan serves as the submittal of existing SFV for geophysical and geotechnical instruments to document why this data is expected to be representative of the equipment and conditions described by the present Survey Plan. The equipment planned for use during the site characterization is the same as, or similar to, the equipment assessed in previous Vineyard Wind IHA applications and the above-referenced documents. Therefore, no additional sound field verification is necessary.

[11] Vineyard Wind and JASCO Applied Sciences. 2020. Draft Request for an Incidental Harassment Authorization to Allow the Non-Lethal Take of Marine Mammals Incidental to High-resolution Geophysical Surveys. Document 01923, Version 2.0. Technical report by JASCO Applied Sciences for Vineyard Wind, LLC. Draft Request for an Incidental Harassment Authorization to Allow the Non-Lethal Take of Marine Mammals Incidental to High-resolution Geophysical Surveys (noaa.gov)

[12] For vibratory coring, there is a publicly available document from the National Marine Fisheries Service (http://www.nmfs.noaa.gov/pr/pdfs/permits/shell_90day_report2010.pdf) titled "Marine Mammal Monitoring and Mitigation During Marine Geophysical Surveys by Shell Offshore, Inc. in the Alaskan Chukchi and Beaufort Seas, July-October 2010: 90 day Report" which provides some insight into the sound level produced by an Alpine Pneumatic Vibracore System. Based on this report, an Alpine Vibracore has a source level of 187.4 dB re 1µPa @ 1 m (Page 3-33 Chapter 3: Underwater Sound Measurements).

[13] Willis, MR, Broudic M, Bhurosah M, Mster I. 2010. Noise Associated with Small Scale Drilling Operations. 3rd International Conference on Ocean Energy, 6 October, Bilbao.

Personnel

A long list of protected species observers (PSOs) were approved for the previous 2016-2021 surveys in the Vineyard Wind lease areas. Every attempt is made to utilize the most experienced personnel to meet the appropriate compliance for all the surveys. For all PSOs that will participate in the site characterization campaign, their resumes and company information will be submitted to BOEM prior to seven days before the start of the field program (see Table 2 for project schedule).

7. Archaeology and Tribal Outreach

The project QMA and any additional Subject Matter Experts (SMEs) identified by BOEM will be present at the BOEM pre-survey meeting and will attend the pre-survey tribal meetings (Lease 4.2.3). The QMA will assume all applicable duties required in the Lease as well as Guidelines for Providing Archaeological and Historic Property Information (May 2021). The QMA will interface with appropriate state historical agencies within the 3 nm limit to ensure their guidelines and requirements are met by the cable route survey.

Prior to geotechnical operations, the QMA will review and assess the geophysical data acquired in the vicinity of each proposed borehole/vibracore and/or CPT location (per Lease Section 4.2.4). Preliminary data processing and results will be generated in the field to support this near real-time review, and will consist of the following products for each proposed geotechnical sample site, a minimum 120 x 120 m square box centered on the location:

- Survey vessel/sensor tracklines
- bathymetric color shaded relief/topographic rendering
- side scan sonar mosaic imagery
- magnetic intensity contours/colorized residual gradient
- side scan sonar targets and magnetic anomalies picked, listed, and mapped
- interpreted subbottom profiles along all primary lines
- Excel spreadsheet tracking data, results, and clearance

The QMA will document the archaeological review in writing prior to conducting geotechnical work (see Section 10 for further details). Archaeological documentation of geophysical clearance of geotechnical locations will be included in the Marine Archaeological Resource Assessment (MARA) report with the COP.

Cooperative Tribal Meeting/Communication Plan

Open communication and consultation between 522 LLC and the local Tribes (Narragansett, Mashpee Wampanoag, Aquinnah Wampanoag, Mashantucket Pequot, Mohegan, Shinnecock, and Delaware; herein known as “the Tribes”) is a vital and required component to the pre-survey permitting process due to potential historical and pre-contact concerns regarding the proposed offshore activities. The location of the export cable corridor chosen will dictate which of the Tribes listed below need to be involved. Table 5 below lists the primary contacts for each federally recognized Tribe in the vicinity of the project survey areas. A detailed listing of correspondence with tribal representatives and other tribal personnel is available upon request.

Table 5. Tribal Historic Preservation Officers

Tribe	THPO	Address	Email	Phone
Aquinnah Wampanoag Tribe of Gay Head	Bettina Washington	20 Black Brook Road, Aquinnah, MA 02535	Bettina@wampanoagtribe.net	508-645-9265 x 175
Mashpee Wampanoag	David Weeden	483 Great Neck Road South, Mashpee, MA 02649	dweeden@mwtribe.com	508-477-0208 x 102
Narragansett Indian Tribe	John Brown	4425 S. Country Trail, Charleston, RI 02813	Brwnjbb123@aol.com	401-491-9459
Mashantucket Pequot Tribal Nation	Marissa Turnbull	2 Matts Path/ POB 3060 Mashantucket, CT 06338-3202	mturnbull@mptn-nsn.gov	860-396-7575
Mohegan Tribe of Indians of Connecticut	James Quinn	13 CrowHill Road Uncasville, CT 06382	jquinn@monheganmail.com	860 -862-6893
Shinnecock Indian Nation	Josephine Smith	POB 5006 Southampton, NY 11969	JosephineSmith@shinnecock.org	631-283-6143
Delaware Tribe of Indians	Susan Bachor	PO Box 64, Pocono Lake, PA 18347	sbachor@delawaretribe.org	610-761-7452

According to the Lease, Section 4.2.3, and subsequent to any pre-survey meeting with BOEM and at least 45 calendar days prior to commencing any survey activities, invitations by certified mail (formal request) will be sent to the Tribes for a tribal pre-survey meeting with a Qualified Marine Archaeologist (QMA). The meeting will be scheduled for a date at least 30 calendar days prior to commencing the survey work and at a location and time that affords the participants a reasonable opportunity to participate. The anticipated dates for the invitation mailing and pre-survey meeting are identified in Table 2.

522 LLC will communicate directly with designated Tribal Historic Preservation Officers (THPO). Hard copies of invitation letters will be mailed per the lease and emails will be delivered to the THPOs as well. The QMA will be present at all tribal meetings. Minutes of each meeting held will be recorded.

8. Fisheries Communication Plan

Through the efforts on the Vineyard Wind portfolio of projects, the team is continuing outreach to numerous fishery organizations and fishermen to identify potentially affected fisheries and lay out communication methods and tools. Crista Bank, Fisheries Liaison, is a fisheries biologist with a Master's degree in fisheries oceanography.

522 LLC has and will continue to meet with a long list of people/organizations to openly communicate the project plans to the fishing community. A detailed listing of correspondence with fishermen and associated groups is available upon request.

In addition to these organizations, we will be reaching out to and meeting with additional fishermen before our surveys and continuing our dialogue. We will also be submitting updates on our surveys via email, text alerts, direct communication, advertising, and list-serve notification. Day-to-day fisheries information will be communicated via the onboard fisheries liaisons (OFLs) who in turn update the project team (email, calls), as well as directly interact with fishermen working in the vicinity of the survey vessels (VHF radio, emails). The Company fisheries communications plan is available at the following web link: Fisheries+Communication+Plan (squarespace.com).

We will also create single page handouts – "Mariner Updates" – that will contain relevant information for the survey including OFL & FR contact details, survey vessel information, and a chart of the primary survey area to be handed out to fishermen on the docks. The company website will be updated as needed to help spread information to the fishermen regarding the survey schedules and progress.

Current key company personnel for contact regarding fisheries:

Fisheries Representative: Crista Banks Mobile: 508-525-0421 cbank@vineyardwind.com

9. Pre-Survey Meeting

Lease 0522 states that at least 60 days prior to the initiation of survey activities in support of the submission of a plan, the Lessee must hold a pre-survey meeting with BOEM to discuss the enclosed survey plan and timeline (Lease Section 2.1.2). An approximate date for the pre-survey meeting is provided in Table 2.

10. Reporting

Regarding the geotechnical clearance, preliminary data processing and results will be expedited to support near real-time review of geophysical data and coverage of proposed geotechnical sample stations (vibracores, borings, and CPTs). Plots of processed data and results (see Section 7) will be delivered to the QMA for review and progress tracked as the field work and clearance is conducted. A final clearance tracking spreadsheet documenting the conditions at each geotechnical sampling location, and whether the site is clear of cultural resources, will be issued to 522 LLC and the survey contractor prior to any seafloor and subsurface disturbance activity. Final memos will be included with the MARA in the COP submission.

The full COP site characterization campaign data package will be analyzed, mapped, and reported to provide information on the seafloor structures, bathymetry, subsurface features, and any natural and man-made hazards that may affect the foundation design, cable routing, design, or installation operations. A final site characterization report will be generated in accordance with BOEM guidelines and submitted as part of the COP.

Furthermore, in accordance with Section 4.4 of Addendum C of Lease 0522 and all other governing documents (e.g., IHA), all reporting measures will be followed pertaining to protected species monitoring and mitigation.

11. Communication

In compliance with Lease provision 3.2.4, which states that the lessee must inform the lessor of persons/officers to be contacted in order to implement Lease provisions 3.2.2 and 3.2.3 requiring suspension of activities due to national security reasons, we provide the following contact information:

Rachel Pachter Chief Development Officer OCS-A 0522 LLC Mobile: 508-680-6455 Email: rpachter@vineyardwind.com	**Jeff Gardner** Field Program Manager Geo SubSea LLC Mobile: 860-682-7093 Email: jeff@geosubseaconsulting.com

In accordance with Lease provision 3.2.5, the contractor will contact U.S. Navy Fleet Forces, Command Headquarters in order to avoid or minimize the potential to conflict with any military operations being conducted in or near Lease 0522. The contractor will submit all required information to the Navy including but not limited to, the schedule of field activities and contact information in case of an emergency or short notice of Navy operations.

Open communication is maintained with the U.S. Coast Guard (USCG) and other personnel who are frequently out on coastal waterways so that these organizations are aware of the project and its activities. 522 LLC will coordinate with the USCG to prepare a Notice to Mariners for the offshore activities anticipated during the site characterization campaign. Survey contractors will assist with USCG coordination to provide vessel specific information, employee contact information for key personnel, and communication protocols.

SIMOPS will be closely monitored by all vessels and masters, as well as program managers onshore, to maintain appropriate marine safety zones and coordinate activities in all project areas. All shore-based field management personnel and key vessel crew members and staff (Master, Party Chief, Client Rep) will be connected on multiple communications platforms for reporting survey progress, plans for the next 24 hours, and specific vessel movements and activities so the entire fleet is up-to-date. Direct communications via marine VHF radio will be used when vessels are working in the same area.

Geophysical, Geotechnical, and Environmental

Survey Equipment Specification Sheets

(to be provided after contractor selection)

Geo-Spark 2000X - 7 kJ Spread

Ultra Hi-Res Seismic Profiling System

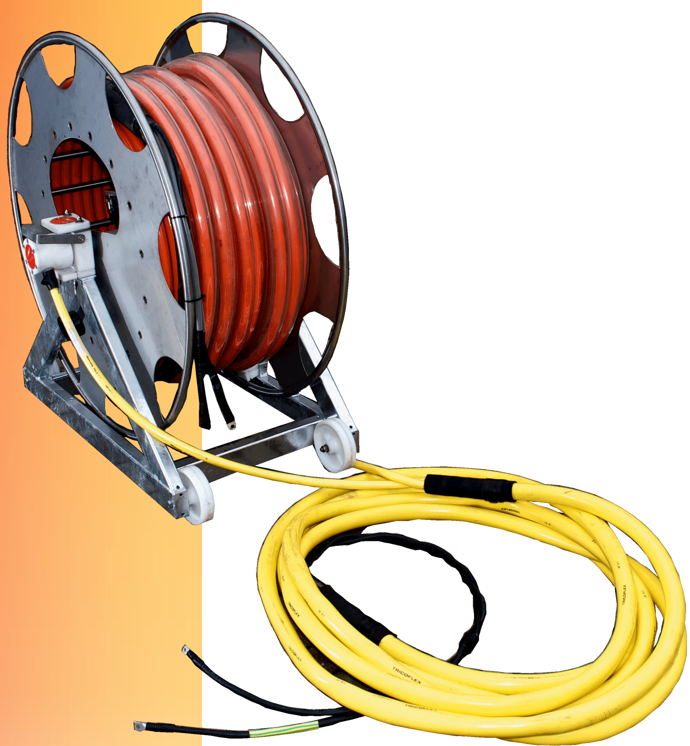
SPARK UP YOUR HI-RES SEISMIC SURVEY WITH INNOVATING NEGATIVE DISCHARGE TECHNOLOGY

The new **Geo-Spark 7000 spread** is based on the ideal combination of:

- the new **portable**, fast charging, **Geo-Spark 2000 X** Power Supply plus a switchable **5 kJ** capacitor unit
- the **400 or 800-tip** Geo-Source Sparker with **maintenance-free** electrodes
- the new, **floating, 2 x 40 mm^2 coaxial** HV cable designed for minimum power loss
- the **compact**, mobile HV cable reel with axial rotating HV contacts plus armored deck lead
- the **24-bit** Mini-Trace II recording system with powerful 64 bit **Geo-Suite Acquisition software**

THE GEO-SPARK CONCEPT, what makes the difference?

The difference is made by the unique concept of the Geo-Spark power supply, which is designed for a very fast, extremely powerful, **NEGATIVE,** High Voltage discharge of 5.6 kV up to 20 kA. It is this electric ***"punch"*** which makes the difference in the **powerful** acoustic pulse, that is providing the resolution and the penetration

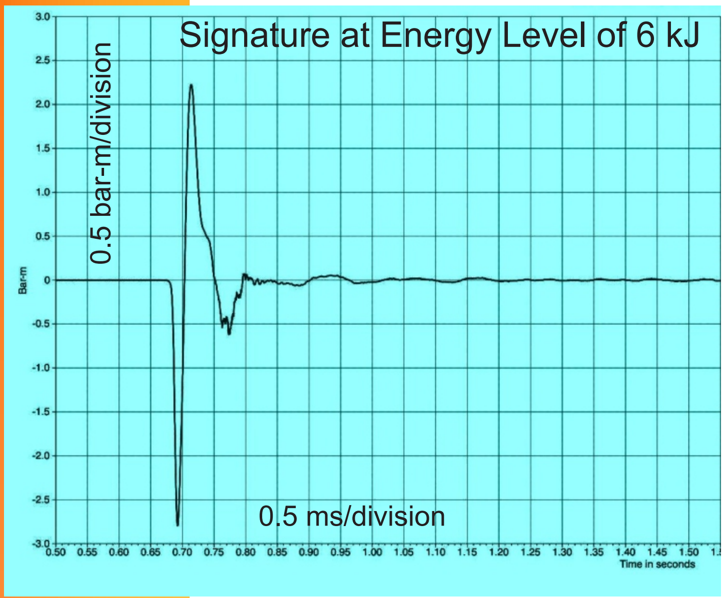


Maintenance free electrodes, with 5 year !! operational guarantee ….

By using the Geo-Spark power supplies, **the electrode tip-wear is reduced to practically zero**. Finally, the acoustic signature does not degrade anymore, which still happens as the old-fashioned electrodes are quickly burning away. With the Geo-Spark, there is no more need for tedious electrode trimming, there are **no more electrode consumables** and **no more interruptions** in the survey work. This means that you are saving a lot of time and money. Our so-called **PRESERVING ELECTRODE MODE** will give you continuously good quality data, day after day, month after month, year after year…. It is almost boring…

Portable Geo-Spark 7 kJ Spread

Ultra Hi-Res Seismic Profiling System



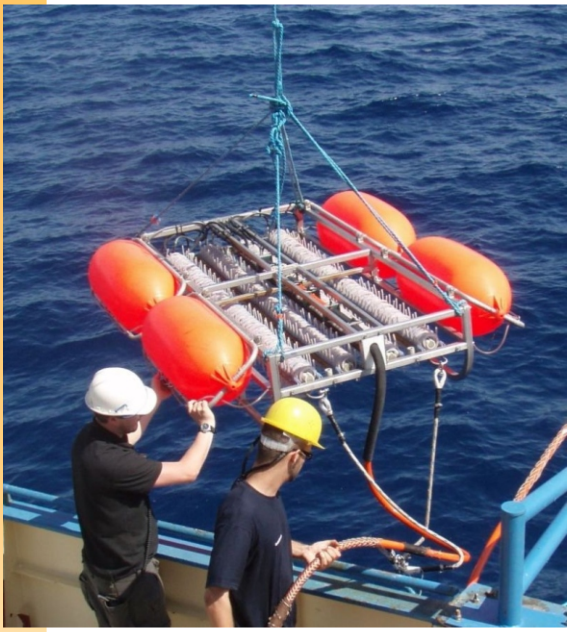
Resolution and Penetration

The Geo-Spark signature consists typically of the very strong **explosive pulse** (CF>1000 Hz), which provides the very high resolution, followed by the **implosive pulse** (CF<750 Hz), which achieves the penetration.

The High Power Geo-Spark Systems have a **proven track record** of successful use in prestigious Oceanographic Research Programs.

< Example Integrating Sparker - Airgun data in Risk Evaluation Study of Transcurrent fault in deep water > 1500 m, location Southern Spain

(Courtesy SEA TECHNOLOGY Feb 2009)



Wide Range of Applications

- For offshore surveys with a **large research vessel** in deep water down to **5000 m** depth.
- For near-shore studies in shallow water depths from **2 m** to **100 m** with a small survey vessel.
- The **Geo-Spark 2000 X power supply** can also be used as **stand-alone** with Geo-Source 400-tip sparkers (marine and fresh water)..... and even with a 300-500 Joule Geo-Boomer .

GEO-SPARK 7000 Power System Main Specifications

- Mains Power: 220- 240 V AC, 50-60 Hz, 16 A
- 95 kg for PS, 95 kg for Capacitor Bank
- Dimensions: H x W x D = 109 x 55 x 71cm
- High Voltage - 5600 V for real acoustic punch
- Energy Output selectable from 100 to 7000 J
- HV charging capability : 2 kJ / sec
- 1 shot every 4 sec at energy of 7000 J
- Indestructible 25 kA -5.6 kV discharge Thyristor
- Very high dI/dT, **NO** electrical oscillations
- 5 year guarantee for discharge capacitors
- Fully ground-referenced, 100 % safe
- Humidity and Temperature protection
- State-of-the-art micro-processor based control and monitoring system
- **maintenance-free** electrodes, 5 year guarantee
- Proven system **Reliability** and **Quality**

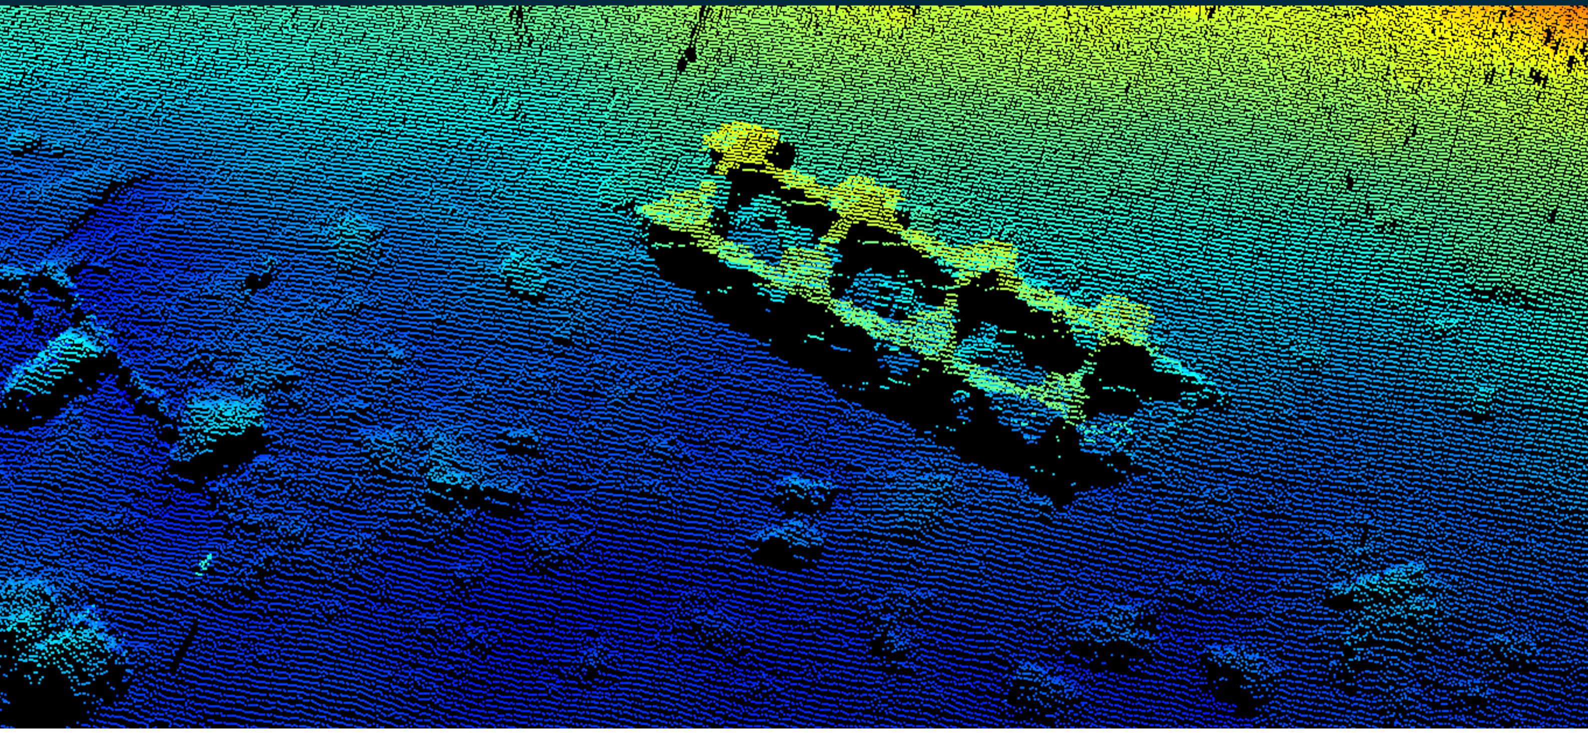
EM® 2040

KONGSBERG



MULTIBEAM ECHO SOUNDER

The EM2040 is a true wide band high resolution shallow water mutibeam echosounder, an ideal tool for any high resolution mapping and inspection application. It has a modular design, allowing the user to tailor the beamwidths and coverage to the operational requirements. The system fulfils and even surpasses the IHO-S44 special order and the more stringent LINZ specification.

Key facts
The EM 2040 receiver is 0.7 degrees, two transmitters are available: 0.4 and 0.7 degrees. The transmit fan is divided into three sectors pinging simultaneously at separate frequencies. This ensures a very strong and beneficial dampening of multibounce interference. The EM 2040 has dual swath capability, allowing a sufficient sounding density alongtrack at a reasonable vessel speed.

The operating bandwidth available on the EM 2040 is 200 to 400 kHz. Due to the very large operating bandwidth available, the system will have an output sample rate up to 60 kHz. The system can effectively operate with very short pulse lengths. The shortest pulse is 14 microseconds, which gives a raw range resolution (cτ/2) of 10.5 mm. For maximum range and high resolution FM chirp is used.

The standard depth rating of the EM 2040 subsea parts is 6000 m. The system is ideal for operation on subsea vehicles such as ROVs or AUVs.

Components
The basic EM 2040 has four units, a transmit transducer, a receive transducer, a processing unit, and a workstation.

The EM 2040 is a modular system, fully prepared for upgrading to cater for more demanding applications. The transmit transducer has an angular coverage of 200º (±100º) as standard, allowing a coverage of 5.5 times water depth when matched with a single receive transducer. Adding a second receive transducer allows surveying to the water surface or up to 10 times water depth on flat bottoms. With two sets of transmit and receive transducers it is possible to avoid having a transducer at the keel. Also for pipeline inspections a dual TX and RX configuration gives the possibility to inspect the pipe from two different angles. The transducers are separate units with titanium housings.

Operational modes
The EM 2040 has a frequency range of 200-400 kHz. The single transmitter configuration with either one or two receivers has three standard modes. 300 kHz is used for normal operation, giving an optimum balance between high resolution, depth capability and tolerance of detrimental factors such as water column sediments. 200 kHz is available for meeting requirements to operate at the standard hydrographic single beam frequency, but also to achieve the best depth capability. 400 kHz is provided for inspection work with the utmost resolution.

The specialised dual transmitter and receiver configuration has a mapping mode with two frequency coded sectors and user selectable frequency in steps of 10 kHz from 200 to 400 kHz.

FEATURES

- High resolution
- Wide frequency range
- FM chirp
- Roll, pitch and yaw stabilisation
- Nearfield focusing - both on transmit and receive
- Short pulse lengths, large bandwidth
- Water column display
- Seabed image
- Depth rated to 6000 m
- Easy to install

Options:

- Water column logging
- Extra detections
- Dual swath
- Dual RX
- Dual TX

EdgeTech

4200 SERIES

SIDE SCAN SONAR SYSTEM

FEATURES

- Optional Multi-Pulse (MP) technology for high speed surveys
- Crisp, high resolution CHIRP images
- Multiple dual simultaneous frequency sets to choose from
- Stainless steel towfish
- Easily integrates to other 3rd party sensors
- Meets IHO & NOAA Survey Specifications

APPLICATIONS

- Cable & Pipeline Surveys
- Geological/Geophysical Surveys
- Mine Countermeasures (MCM)
- Geohazard Surveys
- Channel Clearance
- Search and Recovery
- Archeological Surveys

The 4200 Series is a versatile side scan sonar system that can be configured for almost any survey application from shallow to deep water operations. The 4200 utilizes EdgeTech's Full Spectrum® CHIRP technology to provide crisp, high resolution imagery at ranges up to 50% greater than non-CHIRP systems; thus allowing customers to cover larger areas and save money spent on costly surveys.

One of the unique features of the 4200 is the optional Multi-Pulse (MP) technology, which places two sound pulses in the water rather than one pulse like conventional side scan sonar systems. This allows the 4200 to be towed at speeds of up to 10 knots while still maintaining 100% bottom coverage. In addition, the MP technology will provide twice the resolution when operating at normal tow speeds, thus allowing for better target detection and classification ability. The addition of the optional MP technology provides the operator with two modes of operation; either High Definition Mode (HDM) or High Speed Mode (HSM). This software-selectable mode of operation provides the operator the ability to select the best configuration for the specific job type.

All EdgeTech 4200 systems are comprised of a topside system and a reliable stainless steel towfish. A choice of dual simultaneous frequency sets are available to the user and topside processors come in a choice of configurations from portable to rack mounted units. In addition, an easy-to-use GUI software is supplied with every unit.

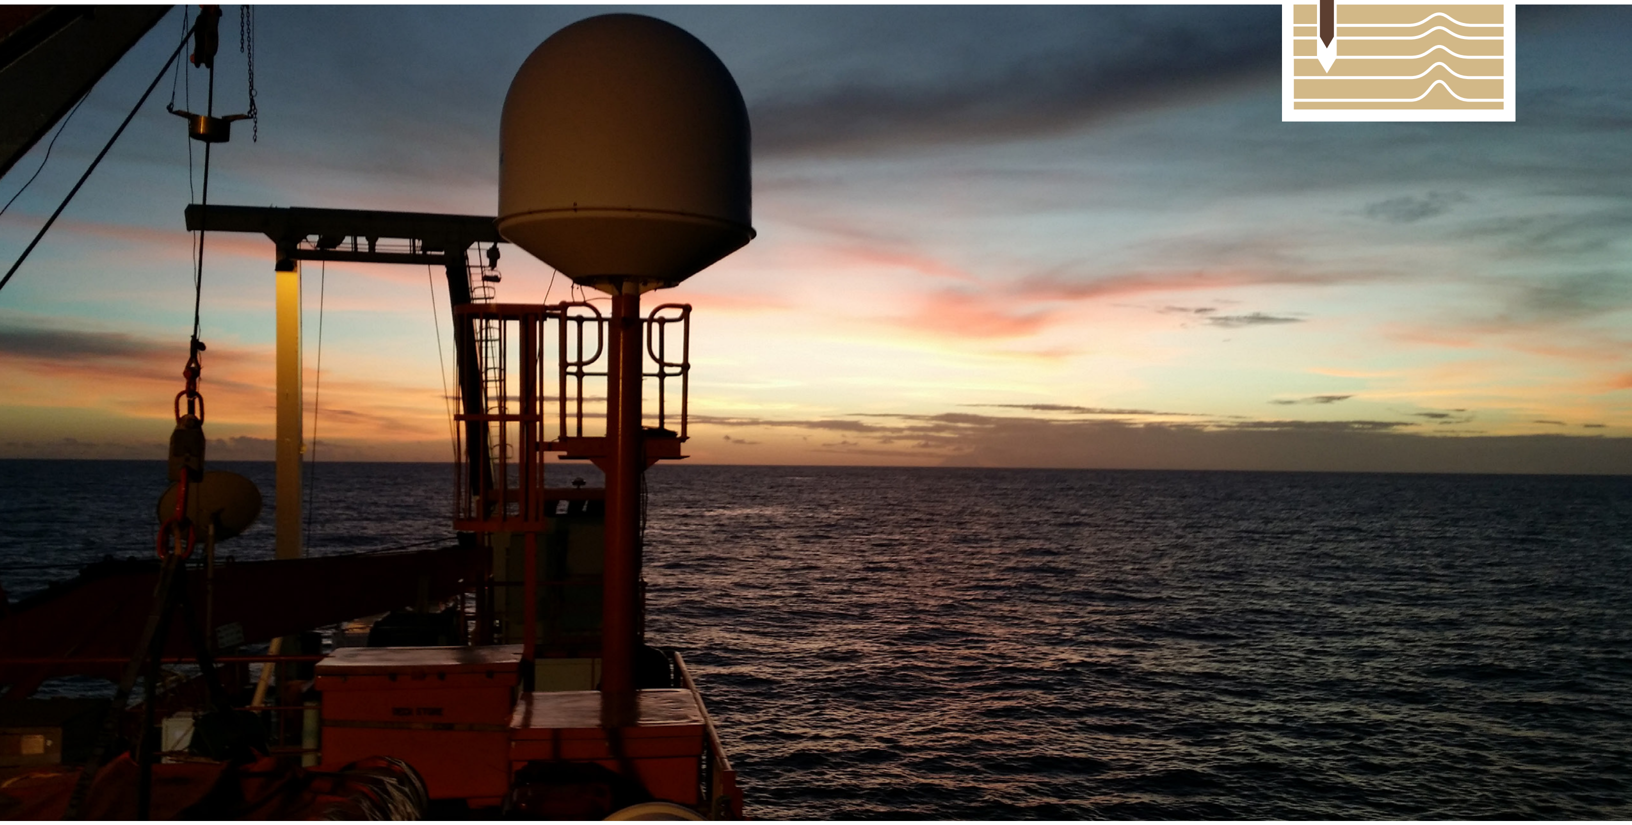
SERVICE FLYER



FUGRO
BACK2BASE™

Back2Base™ is a set of technologies and processes which enable survey data to be reliably and economically transferred between work locations including survey vessels to the terrestrial reporting office, via an internet link such as satellite or mobile broadband and Wi-Fi.

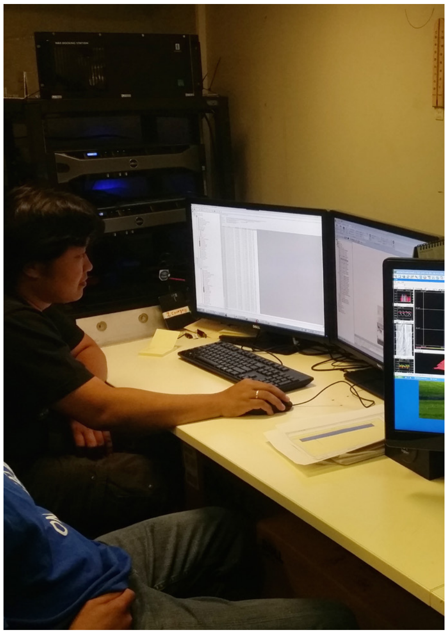
Getting information back from the field and onto the client's desk in a timely manner has always been one of the most challenging aspects of survey work. With internet and communication costs reducing as rapidly as bandwidth increases, Fugro have developed a service to deliver survey data to the client in a swift and cost-effective manner.

This data transmission technique enables close liaison with shore-based client personnel and Fugro experts in any location, not only in the field. Peer reviewed decisions can be taken in near real time that may modify the survey on the basis of observed conditions onsite or to investigate areas of particular interest. Experts can review data from multiple projects. Full processing and reporting can be started earlier resulting in faster information delivery.

THE PROCESS

The key to the Back2Base operation is in the packaging – data compression on its own is simply not enough …

For example, a typical MBES survey will need to transfer the MBES, attitude and position data back to the office for processing



Survey data processed in the field.

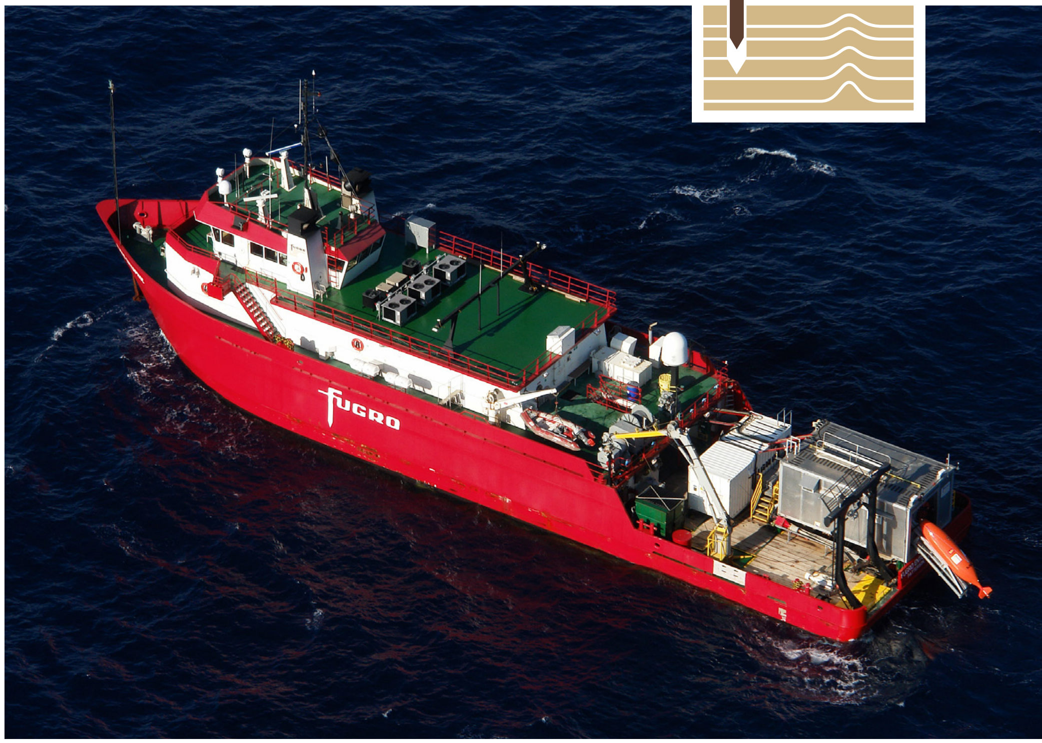
SERVICE FLYER

- MBES @ 20Hz, 512 beams/ping
- Single beam echo sounding
- Attitude @100 Hz (pitch, roll, heave, heading)
- Position @1 Hz
- Raw RINEX on mobile + base for PPK processing
- Auxiliary files (SVP, tides, logs etc.)
- Side scan sonar .xtf files
- SEGY seismic files

PACKAGING EXAMPLES

The example below shows the reduction in file size typically obtained from the Back2Base procedure for MBES survey data:

Example Dataset	Size
Raw Data (5 mins MBES Calibration line)	680 MB
Packaging	49.4 MB
Compression	4.8 MB



Survey vessel.

TRANSFER PROCESS

- The data to be sent is organised into a directory structure.
- Using the Starfix Suite Back2Base module, SBES/MBES, XTF and SEGY data is repackaged into only the essential data and then compressed.
- Transmission then takes place by the most efficient means – VSAT (C-band, Ku-band or Ka-band), 4G, 3G or Wi-Fi as available.
- Uploading of data does not compromise other internal or external tasks on the vessel network, such as email traffic; Back2Base transmission is prioritized to only use bandwidth when it is available.
- In the destination location, the data is decompressed and made available for processing using industry standard products.

SECURITY

Back2Base uses open SSL communications for data transfer. All data is protected using AES-128 encryption. The Back2Base security model uses session encryption, secure authentication and on-the-fly data encryption with integrity verification for each transmitted data block. Back2Base server access is through secure username and password. The Back2Base client can operate on a HTTPS certificate URL, essentially a secured web browser.

REAL WORLD EXAMPLES

Back2Base has been used for various survey types including special order nearshore surveys, AUV surveys, deep water pipeline route geophysical / geotechnical surveys, the search for MH370 and high-resolution site survey work.

SEAPATH® 380 SERIES

KONGSBERG

THE ULTIMATE HEADING, ATTITUDE AND POSITIONING SENSOR

The Seapath 380 series uses a state-of-the-art dual frequency GNSS receiver, inertial technology and processing algorithms to provide surveyors with the best possible accuracy in position, attitude and timing. All available GPS, GLONASS, Galileo, Beidou and QZSS satellites are used in the position solution.

Function

The advanced Seapath navigation algorithms integrate RTK GNSS data with the inertial sensor data from the MRU. This gives the Seapath 380 unique advantages compared to stand- alone RTK products. The Seapath product's accurate roll, pitch and heading measurements allow the RTK antenna position to be referenced to any point on the vessel where accurate position and velocity are required. All data from Seapath have the same time stamp and the output is in real-time. Subdecimetre position accuracy can be achieved through download of satellite orbit and clock data from the internet and by post processing of satellite and IMU data.

Product range

The Seapath 380 series is delivered in the following product range:

	Roll/Pitch [RMS]	Heading [RMS]	
		2.5m baseline	4m baseline
Seapath 380-3	0.08°	0.07°	0.05°
Seapath 380-H	0.03°	0.07°	0.04°
Seapath 380-5	0.02°	0.04°	0.03°
Seapath 380-5+	0.008°	0.04°	0.02°

Note: The MRU 3 model part of Seapath 380-3 has to be mounted in a fixed direction relative to the vessel and with the connector pointing up or down. Otherwise the performance of the Seapath 380-3 will be degraded.

System configuration

This Seapath series is a two-module solution with a processing unit and a HMI unit connected via Ethernet. The processing unit run all critical computations independent from user interface on the HMI unit to ensure continuous and reliable operation. Multiple HMI units can be connected to the same processing unit in a networked architecture. The HMI units present the vessel motion in a clear and easy-to-understand format. The Seapath is operated through the operator software installed on one or several HMI units. This software is used for performance monitoring, configuration and troubleshooting of the system.

Interfaces

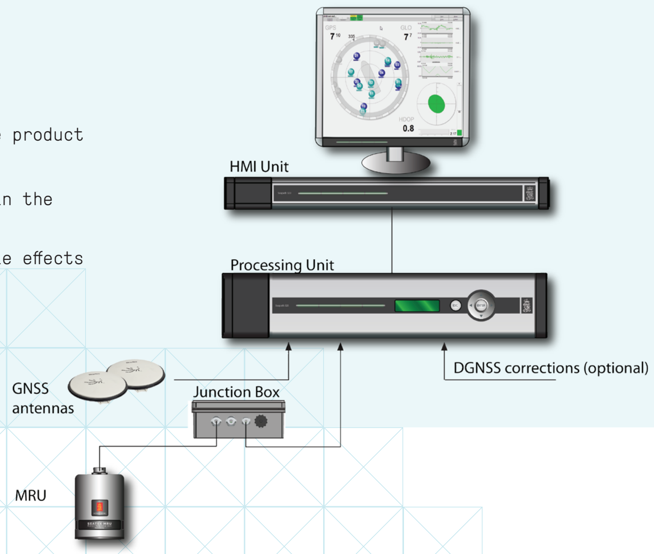
The processing unit has eight RS-232/422 serial lines, four Ethernet LANs and three analog output channels. This makes distribution of Seapath data to various users onboard almost endless. DGNSS corrections of various quality and sources are input on a configurable RS-232/422 serial line or Ethernet.

Applications

By using standard DGNSS, Fugro XP2/G2/G4/G4+ and RTK corrections, the Seapath 380 is a unique solution for hydrographic surveying and dredging work demanding the most comprehensive and accurate surveying data available.

FEATURES

- 0.008° to 0.08° roll and pitch accuracy depending on model
- 2 cm heave accuracy by use of the PFreeHeave® algorithms
- Meets IHO special order requirements
- Robust against GNSS dropouts due to the inertial sensor part of the product
- 555-channel dual frequency GPS/GLONASS/Galileo/Beidou receiver
- All available GPS/GLONASS/Galileo/Beidou/QZSS satellites are used in the positioning solution
- Includes ionospheric compensation methods to reduce Sunspot 24 cycle effects
- Fugro XP2/G2/G4/G4+ corrections and RTK supported
- RTK corrections format RTCM and CMR supported
- Includes SBAS corrections (WAAS, EGNOS, MSAS, GAGAN)
- All data have the same time stamp and to an accuracy of 0.001 s to the actual measurement time
- Logging of raw satellite and IMU data possible



TECHNICAL SPECIFICATIONS

SEAPATH 380 SERIES

PERFORMANCE	
Heave accuracy (real-time)	5 cm or 5 % whichever is highest
Heave accuracy (delayed signal)	2 cm or 2 % whichever is highest
Heave periods (real-time), except Seapath 380-3	1 to 25 seconds
Heave periods (real-time), Seapath 380-3	0 to 18 seconds
Heave periods (delayed signal)	1 to 50 seconds
Position accuracy DGNSS/GLONASS	0.5 m RMS or 1 m 95% CEP
Position accuracy SBAS	0.5 m RMS or 1 m 95% CEP
Position accuracy Fugro XP2/G2/G4/G4+	0.1 m RMS or 0.2 m 95% CEP
Position accuracy RTK (X and Y)	1 cm + 1 ppm RMS
Position accuracy RTK (Z)	2 cm + 1 ppm RMS
Velocity accuracy	0.03 m/s (RMS)
Range to RTK reference station	10 km
UHF radio frequencies (radio not included in standard package)	430 to 470 MHz 390 to 430 MHz (optional)

DATA OUTPUTS	
Communication ports	8 serial RS-232/RS-422 lines and 16 Ethernet UPD/IP ports
Data output interval	Programmable in 0.005-se steps and 1PPS pulse
Data update rate	Up to 200 Hz
Analog output	3 user configurable channels, +/- 10 Volt
1PPS signal accuracy	220 nsec

POWER SPECIFICATIONS	
Processing Unit	100 to 240 V AC, 75 W (max)
HMI Unit	100 to 240 V AC, 40 W (max)
Monitor	100 to 240 V AC, 23 W (max)
IMU	24 V DC from Processing Unit
GNSS antenna	5 V DC from Processing Unit

WEIGHTS AND DIMENSIONS	
Processing Unit	5.4 kg, 89 x 485 x 357 mm
HMI Unit	3.8 kg, 44 x 485 x 330 mm
Monitor	3.8 kg, 383 x 380 x 170 mm
IMU	2.2 kg, 140 x Ø105 mm
GNSS antenna	0.5 kg, 69 x 185 mm

ENVIRONMENTAL SPECIFICATIONS	
Operational temperature range	
Processing and HMI Unit	-15 to +55 °C
Monitor	+5 to +40 °C
IMU	-5 to +55 °C
GNSS antenna	-40 to +85 °C
Storage temperature range	
Processing and HMI Unit	-20 to +70 °C
Monitor	-20 to +60 °C
IMU	-25 to +70 °C
GNSS antenna	-55 to +85 °C
Enclosure protection	
Processing and HMI Unit	IP 21 (rear)
Monitor	IP 21 (rear)
IMU	IP 66
GNSS antenna	IP 66
Cables	IP 67
Connectors	IP 67
Mechanical	
Vibration	IEC 60945/EN 60945
Electromagnetic compatibility	
Compliance to EMCD, immunity/emission	IEC 60945/EN 60945

PRODUCT SAFETY	
Compliance to LVD, standard used	IEC 60950-1/EN 60950-1

Specifications are valid without multipath, without shadowing of antennas and with vessel in motion.

Specifications subject to change without any further notice.

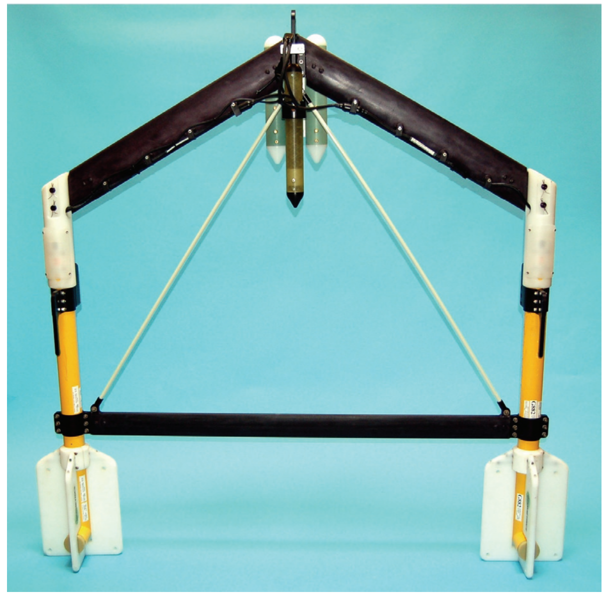
G-882TVG CESIUM MAGNETOMETER & TRANSVERSE GRADIOMETER



- **Marine Search Applications for UXO, pipelines, lost objects with Multi-Sensor Array Capability**
- **High Sensitivity — 0.004 nT/sq-rt-Hz RMS with dual CM−221 Larmor Counters**
- **Very Low Heading Error — ±0.25nT over 360° equatorial and polar spins**
- **Versatility — CM-221 counter includes 8 channel 12 bit A to D converters for real time internal diagnostics, digital data stream concatenation, and short, long or telemetry over coax options**
- **Reliability and Ruggedness – Cesium magnetometers never need be returned to factory for calibration or tuning. Designed for tough environmental conditions and high "G" loads**
- **Gradiometer arrays offering simultaneous operation of up to 8 separate sensors using the designed-in multi-sensor data concatenation of the CM-221 internal counter**
- **Geometrics offers complete turnkey systems including tow cables, gradiometer wing, digital data acquisition systems with real time anomaly detection, GPS navigation and post acquisition data processing software and training.**

The Geometrics Model G-882TVG Transverse Gradiometer system mates the well- proven high-performance cesium sensor with dual high sensitivity and high speed CM-221 Larmor Counters. This advanced integrated magnetometer system provides unmatched versatility in performance, with a wide sensor separation for maximum target detection efficiency and survey cost effectiveness.

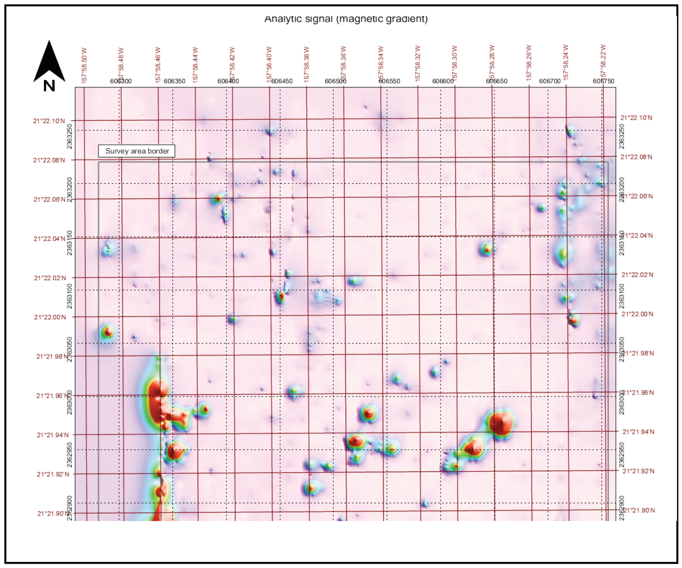
The system comprises a transverse wing and two G-882 Cesium Vapor magnetometer fish with stabilizer weights and fins. Tow cables may be up to 150m in length with standard power supply or up to 700m with a high capacity voltage sense supply. Depth sensors provide gradiometer attitude and depth information to the operator depth and an echo-sounder altimeter provides height above sea floor for proper system flight control.

Dual sensors are synchronized to 1ms sampling and data is transmitted via RS-232 for recording by any standard PC computer using our industry standard MagLogLite software. High sample and data transmission rates (up to 40 samples per second) are standard.

The G-882G provides sensitivities of 0.004 nT/√Hz RMS or approximately 0.01 nT P−P at 10 Hz, selectable via software command for detection of the smallest anomalies. MagLog software computes the transverse difference for display and analysis in real time, using the customer supplied GPS for interpolation and target positioning.

The system's high performance is excellent for the detection and delineation of cables, pipelines, environmental, archaeological or military UXO and EOD targets.

Software
Geometrics supplies MagMap2000 and MagPick with each system for analysis and interpretation of total field and gradient data. Analytical signal is computed from the transverse gradient, longitudinal time gradient and computed vertical gradient to give a time-variation free data set for contouring and plotting of anomaly targets. Simultaneous dual inversion routines in MagPick produce a located target worksheet with models including object latitude-longitude position and depth of burial. Download ftp://geom.geometrics.com/pub/mag/Software/Posters.zip for more information



MODEL G-882TVG MARINE CESIUM GRADIOMETER SPECIFICATIONS

OPERATING PRINCIPLE:	Self-oscillating split-beam cesium vapor (non-radioactive)
OPERATING RANGE:	20,000 to 100,000 nT
OPERATING ZONES:	The earth's field vector should be at an angle greater than 10° from the sensor's equator and greater than 10° from the sensor's long axis. Automatic hemisphere switching.
SENSITIVITY WITH CM-221 COUNTER:	<0.004 nT/sq-rt-Hz RMS. Typically 0.01 nT P-P at a 0.1 second (10 Hz) sample rate (90% of all readings falling within the P-P envelope)
SAMPLE RATE:	Up to 40Hz in 100ms increments
HEADING ERROR:	<0.25 nT over entire 360° equatorial and polar spins
ABSOLUTE ACCURACY:	<3 nT throughout range
OUTPUT:	Cycle of Larmor frequency = 3.498572 Hz/nT, RS-232 data at 115K baud, concatenated data streams from 2 to 8 sensors depending on sample rate
MECHANICAL:	Total weight including 70kg (155 lbs) including two fish, wing and tow cable. Sensor separation is 1. 5m for maximum gradient
CABLES:	Vectran Reinforced multi-conductor tow cable. Breaking strength 3,600 lbs, 0.48 in OD, 500 ft standard maximum. Up to 2100 ft with variable voltage supply. 200 ft (60m) weighs 17 lbs (7.7 kg).
OPERATING TEMPERATURE:	-30°F to +122°F (-35°C to +50°C)
STORAGE TEMPERATURE:	-48°F to +158°F (-45°C to +70°C)
ALTITUDE:	Up to 30,000 ft (9,000 m)
DEPTH RATING:	Depth rated to 4,000 psi (2,700m)
POWER:	115/220 VAC, 60 watts at turn-on and 40 watts thereafter
ACCESSORIES:	
Standard:	Power/RS-232 multiconductor cable (electronics to power/data junction box with 9 pin RS-232 connector and power lugs), lengths to be specified, operation manual and reusable shipping and storage containers
Optional:	
Logging Software	MagLog (Logs GPS and Mag, shows trackplot, mag profile, other data)
Processing software	MagMap2000, MagPick

Transducer

SES-2000 medium-100

Parametric Sub-bottom Profiler

▶ Performance

- water depth range: 2 – 2,000 m
- penetration: up to 70 m, depending on sediments
- layer resolution: up to 5 cm
- motion compensation: heave, roll
- beam width @ 3 dB: ±1 ° / footprint < 3.5 % of water depth for all frequencies

▶ Transmitter

- primary frequencies: approx. 100 kHz (band 85 – 115 kHz)
- secondary low frequencies: 4, 5, 6, 8, 10, 12, 15 kHz (band 2 – 22 kHz)
- primary source level: > 247 dB//μPa re 1 m
- pulse width: 0.07 – 2 ms
- pulse rate: up to 40/s
- multi-ping mode
- pulse type: CW, Ricker, LFM (chirp)

▶ Acquisition

- primary frequency (echo sounder, bottom track)
- secondary low frequency (sub-bottom data, multi-frequency mode)
- sample rate 96 kHz @ 24 bit

▶ System Components

- transceiver unit 19 inch / 12 U (WHD: 0.52 m x 0.58 m x 0.40 m; 56 kg)
- transducer incl. 30 m cable (WHD: 0.50 m x 0.12 m x 0.50 m; 60 kg)
- system control: internal PC
- KVM remote control

▶ Software

- SESWIN data acquisition software
- SES Convert SEG-Y/XTF data export
- SES NetView remote display
- ISE post-processing software

▶ Power Supply Requirements

- 100 – 240 V AC / 50 – 60 Hz
- power consumption: < 700 W

GAPS

FOURTH-GENERATION USBL ACOUSTIC POSITIONING SYSTEM

The **iXBlue** fourth-generation pre-calibrated **GAPS** combines high performance ultra-short baseline (USBL) and a fiber-optic inertial navigation system (INS) in the same housing to provide accurate position of any subsea object, in diverse and challenging environments. Its performance ranges from extremely shallow water to deep sea. Its compact and all-in-one design allows both portable and permanent installations. One of **GAPS** key new features is support of dynamic positioning (DP).

FEATURES

- Integrates USBL, high-grade INS, real-time positioning and GPS
- Position accuracy: 0.06% x slant range
- Advanced signal processing and 3D acoustic antenna for range and accuracy performance
- Powerful dynamic positioning (DP) mode (L/USBL/INS)

BENEFITS

- Cost- and time-saving deployment: flexible, portable, pre-calibrated, rapid, and simple
- Robust performance in very shallow water (10 m depth) to long range (> 4000 m depth)
- Deployment options, from surface buoy, side pole, moon pool or hull mounted
- Universal utilization

APPLICATIONS

• Offshore, AUV and ROV navigation • Underwater survey and inspection • Drilling • Dynamic positioning (DP) • Structure placement • Pipeline and cable deployment • Diver tracking • Seismic • Ocean science • Defense • Renewable energy industries

IXBLUE
DEEP INSIGHT. SHARPER SENSES.

GAPS
TECHNICAL SPECIFICATIONS

PERFORMANCE

Subsea positioning	
Position accuracy (CEP50)	0.06 % of the slant range [1]
Nominal range	4 000 m [2]
Antenna coverage	200 deg hemispherical
Surface positioning	
Heading accuracy	0.01 deg x secant latitude
Roll / pitch accuracy	0.01 deg

COMPATIBLE TRANSPONDERS AND SENSORS

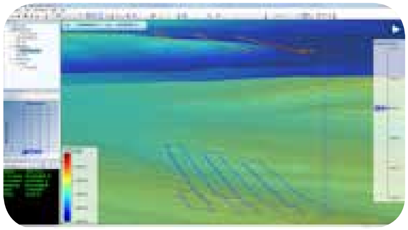
iXBlue mini transponders	OCEANO MT8 x 2, OCEANO MT9 x 2, OCEANO MTA x 2
iXBlue midi transponders	OCEANO ETA62 and releasable OCEANO RTA62
Third party wide band transponders	Optional
iXBlue inertial-acoustic solution integration	PHINS, ROVINS, RAMSES

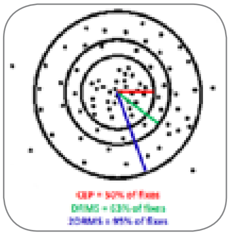
OPERATING / ENVIRONMENT / MECHANICAL

Power supply / consumption	24 – 36 VDC or 110 – 230 VAC / 50 W
Weight in air / water	15 kg / -7 kg (positive buoyancy)
Dimensions (Ø x H)	295 mm x 638 mm
Array depth rating	20 m (100 m survival)
Operating / storage temperature	-5°C to 35°C / -40°C to 70°C

INTERFACES

Control command	Standard iXBlue web-based user interface
Input / output	Quad RS232 / RS485 / Ethernet
	Trigger I/O pulse port and PPS / Sync ports
Protocols	Library of NMEA protocols (standard telegrams for all DPs)





1 signal to noise ratio > 40 dB, in vertical conditions
2 noise level < 65 dB / √Hz @ 1 m ref µPa

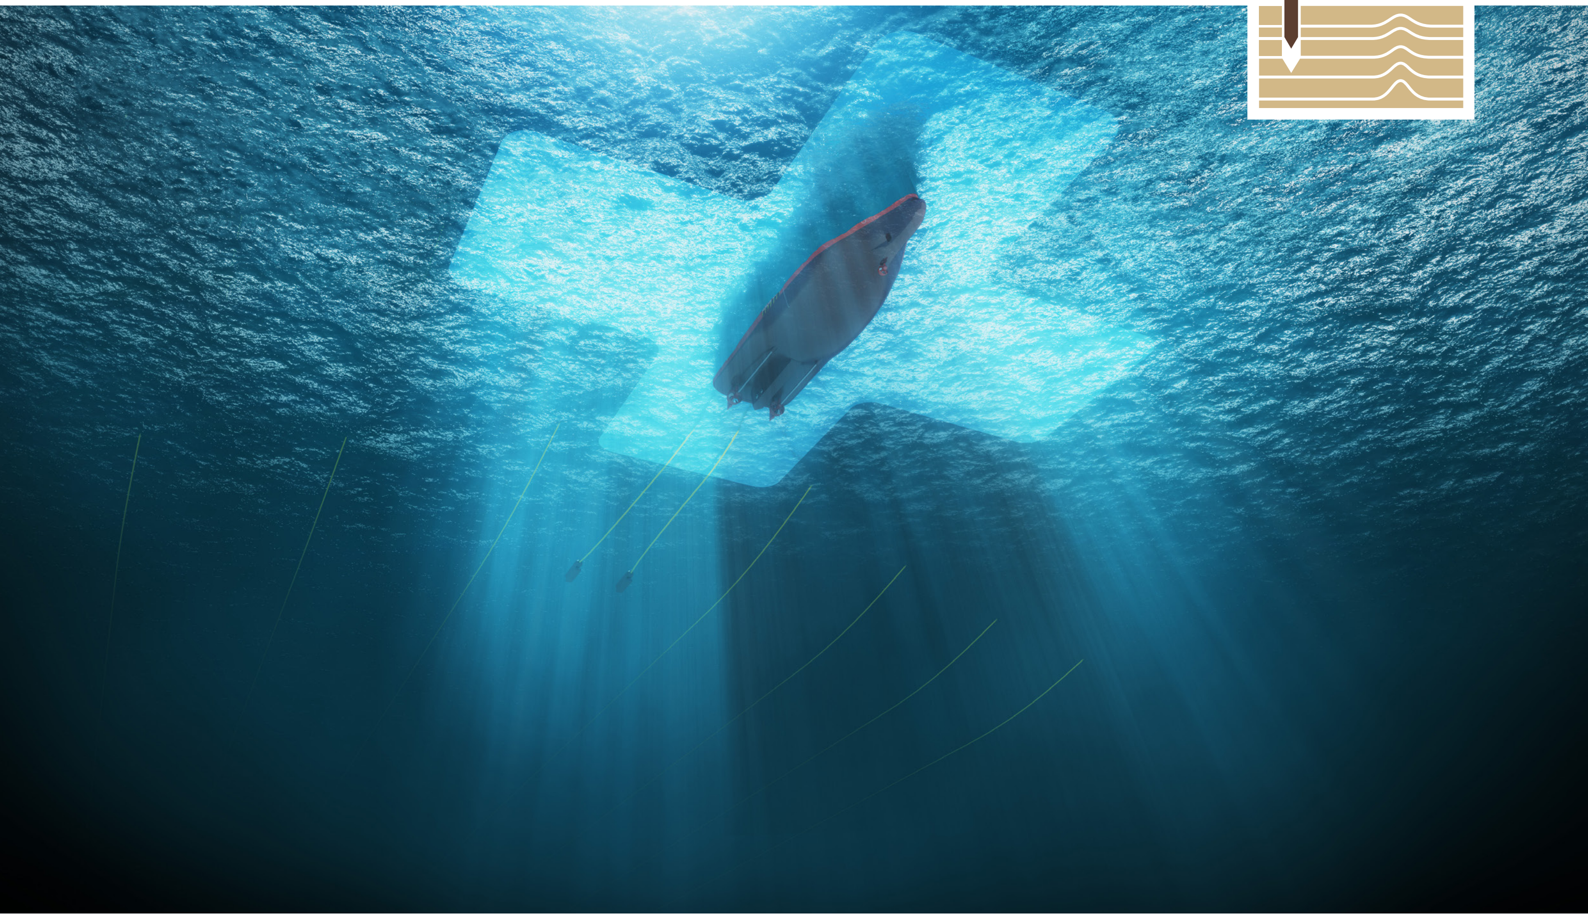
FUGRO SATELLITE POSITIONING



STARFIX. G2+
AN ULTRA HIGH ACCURACY SERVICE FOR OFFSHORE APPLICATIONS

Starfix.G2+ is a further advancement in the field of GNSS augmentation, which delivers ultra-high accuracy positioning to our customers.

The Starfix.G2+ is a further advancement in the field of GNSS augmentation, which delivers ultra-high accuracy positioning to our customers.

This new positioning service is based on advanced Integer Ambiguity Resolution (IAR) technology which is a further development of Precise Point Positioning (PPP). The basis of the IAR technique is the derivation an additional set of carrier-phase corrections from the Fugro reference station network (known as Uncalibrated Phase Delays or UPD).

The implementation of the UPD corrections in the Fugro StarPack software results in the carrier-phase ambiguities being resolved (fixed to integer values) resulting in a positioning accuracy at the centimetre level.

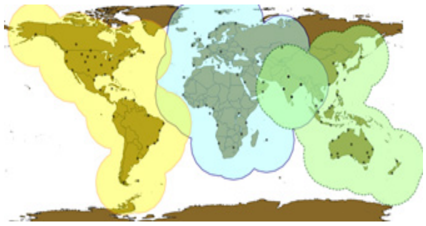
When the Starfix.G2+ service is enabled, the Fugro StarPack software will compute a centimetre Starfix.G2+ position. If for some reason the carrier-phase ambiguities cannot be resolved then the solution will fall back to a standard decimetre PPP solution.

The Starfix.G2+ corrections are supplied to our customers via L-Band satellite links to give global coverage.

The UPD Corrections are generated for 3 geographical regions as these provide significantly better results when compared to a single global set of corrections.
These regions are:

1. North and South America
2. Europe, Africa and Middle East
3. Asia and Australia

Although the corrections are divided into regions, our customers do not need to be inside the region in order for the service to work, but should always choose the region closest to their work location.



FUGRO SATELLITE POSITIONING

Solution accuracy; the following table illustrates Starfix.G2+ accuracy over 24 hours over 2 days from four locations

The Starfix.G2+ service is currently available to customers using Fugro's StarPack GNSS systems.

StarPack - High precision GNSS positions, heading and time from a single platform

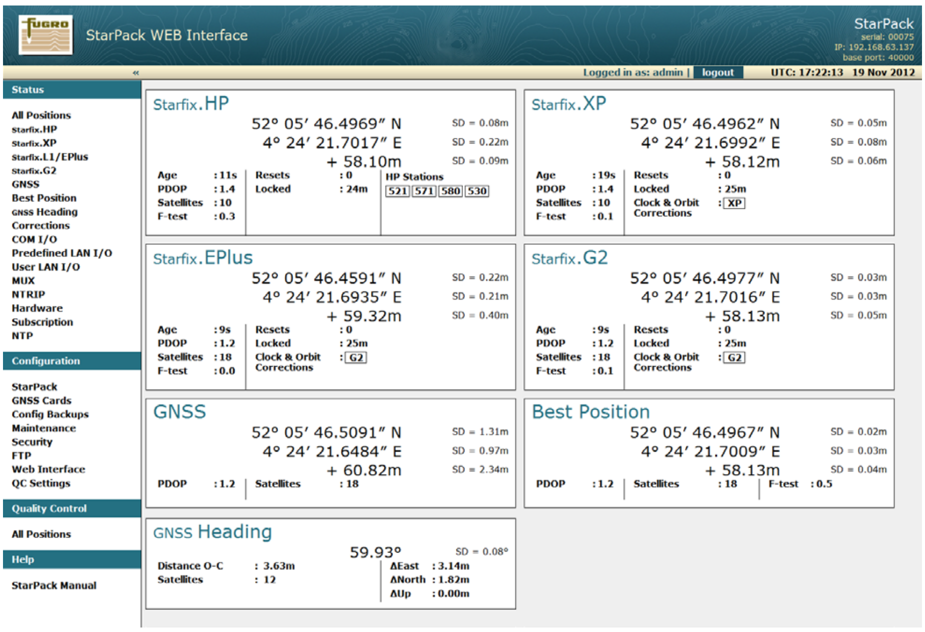
The StarPack is Fugro's answer to increasing market demand for precise, redundant GNSS positioning solutions, including extensive QC and accurate time, from a single, easy to use platform.

StarPack platform

The StarPack unit consists of a survey grade GNSS combined L-band receiver and powerful processor, running Linux multitasking operating system. The receiver is capable of tracking all current satellites (GPS, GLONASS) and is Galileo ready. StarPack can be extended with a second GNSS card (in the same unit), to provide accurate, GNSS derived heading. In addition to GNSS observations, the second card provides also L-band functionality, creating an independent source of corrections for backup.

The combination of receiver and processor provides robust multiple simultaneous precise position calculations and extensive QC. For maximum system reliability, the internal software is embedded on a flash memory. System can be controlled and configured via the front panel, web interface or a serial port.

The StarPack is equipped with four serial ports on the rear panel and LAN interface to provide a multitude of outputs to the user and to read multiple correction sources (in addition to those from the integrated receiver(s)). Raw GNSS data and corrections are continuously logged internally and can be exported to RINEX to enable high quality support and back-up. User can download this data and send it to Fugro's development centers for re-processing. Additional user defined output can be configured for automatic logging. Firmware can be upgraded using the web interface or using a USB stick at the front panel.



Positioning and Heading solutions

The embedded processing software of the StarPack GNSS receiver provides multiple configurable simultaneous precise positioning solutions, including G2.

- Four independent correction sources
  - o Starfix.G2
  - o Starfix.XP
  - o Starfix.HP
  - o Starfix.L1
- Five solutions: Starfix.G2, Starfix.XP, Starfix.HP, Starfix.EPlus and Starfix.L1
- New “Best Position” solution, combining all available solutions in to one, using proper weighting. “Best Position” provides increased availability and better accuracy.
- A Heading solution between two GNSS antennae, in combination with a second GNSS card (in the same or another receiver).

StarPack applications

- Accurate height for tidal corrections and heave compensation
- Accurate position for seabed mapping surveys
- Accurate vertical reference for out of straightness pipeline surveys
- Accurate (instantaneous) heading source (in combination with a second GNSS card)
- Stable position for station keeping on DP vessels
- Accurate relative positioning of structures
- Automated vessel guidance

NTP support

The StarPack contains an NTP (Network Time Protocol) server, providing a time accuracy of 500 µs or better with a convergence time after power-on within several minutes.

NTRIP client

The StarPack contains also NTRIP (Networked Transport of RTCM via Internet Protocol) client. When internet connection is available StarPack can be connected to Fugro’s (or third-party) corrections servers providing additional, independent from L-Band, corrections backup.

Quality control

Extensive quality control is provided through StarPackQC, a stand alone PC based application, or on web interface, Quality control parameters indicating precision, reliability and availability can be visualized for estimated positions as well as for corrections and individual satellites.

Technical specifications

GNSS hardware engine

- Trimble BD982 with two antenna inputs: 220 channel GPS/GLONASS, Galileo/BeiDou available with software option upgrade
- Single or dual NovAtel OEMV- 3: 72 channel GPS/GLONASS board (no longer manufactured, but serviceable)
- Trimble BD960: 72 channel GPS/ GLONASS board (no longer manufactured, but serviceable)

Corrections	Integrated receiver for Starfix differential and orbit/clock corrections
Processor	Intel Pentium III, embedded Linux operating system
Data rate	1 Hz - 5Hz
Data storage	10 days, raw and correction data (1 Hz) on internal disk
Size	245 x 60 x 195 mm (W x H x D)
Weight	2 kg
Input voltage	80 – 250 VAC, 40 – 60 Hz
Input/output	4 RS232 ports, LAN with more than 30 configurable ports, 1 PPS
Operating temperature	-20°C – +50°C
Storage temperature	-40°C – +85°C
Humidity	95% non-condensing
Compliant	EMC 2004/108/EC (EN60945:2002) 2011/65/EU(RoHS 2)

Service/ solution	Accuracy (hor. 95%)	System	Correction data	Coverage
Starfix.G2	0.1m	GPS GLONASS	Clock and orbit corrections	Global
Starfix.XP	0.1m	GPS	Clock and orbit corrections	Global
Starfix.HP	0.1m	GPS	Ionosphere-free carrier phase corrections from multiple reference stations	Regional <1000km*
Starfix.EPlus	1m	GPS GLONASS	Clock and orbit corrections	Global
Starfix.L1	1.5m	GPS	L1 pseudo range corrections from multiple reference stations	Regional <500km*
Best Position	0.1m	GPS GLONASS	All available correction data	Global
Heading	Better than 0.1° for baselines longer than 3m	GPS GLONASS	-	Global

** distance to reference station*

SKYFIX-XP

SkyFix-XP (Decimetric Differential GPS)

SkyFix-XP is a GPS positioning system that is based on clock and orbit corrections supplied by NASA's Jet Propulsion Laboratory (JPL). SkyFix-XP is a Precise Point Positioning (PPP) technology, which distinguishes itself from the traditional differential approach as satellite errors are not lumped together but estimated per source, per satellite; it is also known as a *'State Space solution'*. The GPS clock and orbit corrections are computed independently, free of ionospheric and tropospheric effects.

Key Features:

- Capable of 10cm accuracy in horizontal and 20cm in vertical domain.
- Truly global coverage with no range restrictions from stations
- Dual delivery satellite beams – high power and low power
- Extensive QC monitoring in line with UKOOA standards
- Real-time system performance information available on-line
- Compatible with existing SkyFix hardware
- Truly independent of Starfix systems

SkyFix-XP Technology

Traditional Differential GPS services use the fixed location of a single reference station to measure the ranges to all GPS satellites in view. These measurements are then compared to the computed ranges at that location and the resulting differences in the observations are transmitted as pseudo-range corrections. This technique introduces some inaccuracies as the distance from the reference station grows.

SkyFix-XP removes this range limitation by using a completely new technique known as Satellite Differential GPS (SDGPS). Orbit and clock corrections are determined for each satellite continuously utilizing Fugro's global network of reference stations. These corrections are then broadcast to the user and can be used at any location, regardless if the distance to any reference station, making the system truly global.

The orbit and clock corrections are contained in a set of proprietary RTCM messages, which can be received using the existing SkyFix decoders. Users require dual-frequency DGPS receiver as well as the MultiFix 5 positioning and QC software. The high accuracy is obtained by new processing techniques within MultiFix 5 that correct, estimate and /or eliminate the common GPS error sources (orbits, clocks, troposphere, ionosphere, multi-path and noise).

Local tropospheric and ionospheric errors are corrected at the user end by using a dual GPS frequency receiver. Multipath and receiver noise are addressed by using carrier phase observations within the XP calculation.

Advantages of SkyFix XP

- A single set of corrections per satellite valid independent of the geographic location.
- Independence from the existing Fugro reference station network
- Simplicity for the user

Direct comparisons with competing providers' capabilities and performance show that Fugro continues to lead in accuracy and robustness of solution.

Quality Control and Verification

SkyFix-XP data is rigorously checked for accuracy, advanced statistical testing is performed using UKOOA recommendations. SkyFix-XP utilises MultiFix 5, Fugro's latest version of its GPS QC software. MultiFix 5 can also be configured with a number of back-up solutions for the primary SkyFix-XP calculation to provide optimum redundancy. This allows the system to switch automatically to an alternative DGPS solution such as SkyFix or SkyFix Premier. These back-up processes are performance (rather than availability) based, giving the operator maximum confidence in the system.

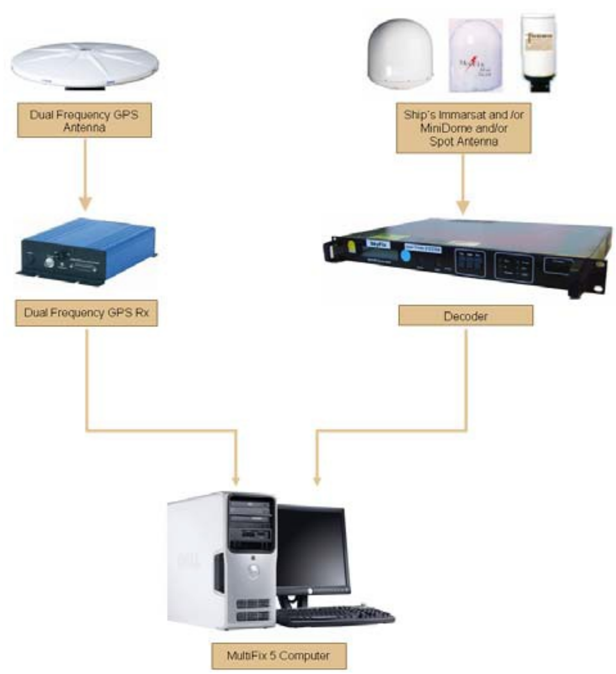
Standard DGPS vs. SkyFix-XP

To provide a confirmation of accuracy, Fugro has installed regional monitoring systems located at key oil and gas hot spots around the world. These provide real-time system performance information via the Starfix website (www.skyfix.com).

System Overview

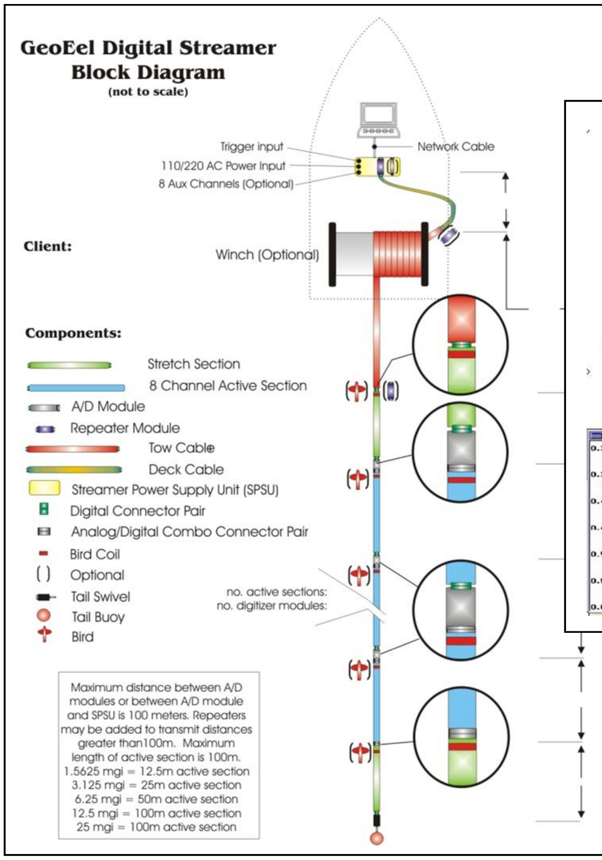
The hardware configuration for SkyFix-XP is similar is similar to that of the standard SkyFix system, it is possible to share hardware or upgrade an existing system with the addition of a dual frequency GPS receiver and the new MultiFix 5 software.

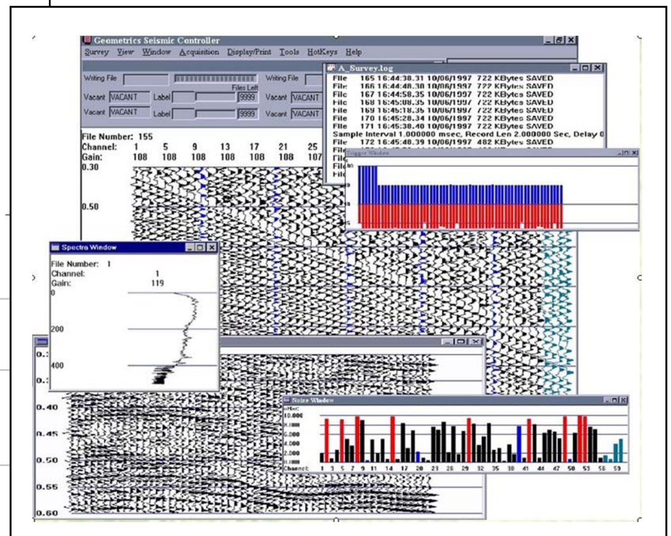
Typical SkyFix-XP system configuration:



The additional SkyFix-XP correction messages can be received with all existing SkyFix decoders. MultiFix 5 is compatible with most leading GPS receivers including units produced by Thales, Trimble and Novatel.

EQUIPMENT SHEET OFFSHORE SURVEY



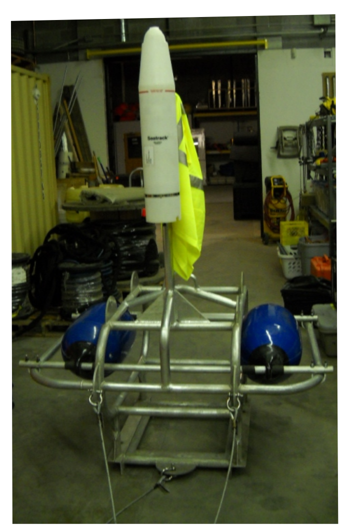


FUGRO
SEISMIC PROFILER - GEOMETRICS GeoEeL

The Geometrics GeoEel digital towed hydrophone streamer is the first narrow diameter array meeting the performance standards of larger systems. With a diameter of only 41 mm, the GeoEel is easy to deploy, easy to transport, and can be shipped by air. Separate 8 channel modules coupled with unique slim active-section design yield noise levels under 5 microbars and make the GeoEel immune from the electronic interference, leakage, and ground loops that plague the installation of analog streamers.

GeoEel active sections are filled with inert silicone oil, making them environmentally safe and non-flammable. A 1/8-inch thick abrasion resistant polyurethane makes the streamer extremely rugged but still flexible enough to deploy on small boats. Acquisition is controlled with PC-based Geometrics CNT-2 software.

Features include: multiple shot and gather windows, bar graph noise displays, windows for shot timing, gun energy, brute stack, tape status, spectral analysis; sure-save software that protects against data loss even with total storage device failure; sequentially-ordered file saving; auto-switching between storage device, dual tape writing; multiple printer support; parameter change logs; and integrated navigation, gun, and bird parameters into an SEG-D, SEG-Y or SEG-2 header.



GPS Tail Bouy

EQUIPMENT SHEET OFFSHORE SURVEY

SEISMIC PROFILER - GEOMETRICS GeoEel

A/D Converter Canister Specifications

Channels Per A/D Canister	8
Sample Rates	1/16, 1/8, 1/4, 1/2, 1, 2, 4 ms
Bandwidth	5 Hz to 8 kHz
Programmable Gain	0 dB, 6 dB, 18 dB, 30 dB, 42 dB
Anti-Alias Filter	set by sample interval, down 135 dB at stop band
Maximum Input Range	±2.25V
Resolution	24 bits including sign
Input Impedance	126.8 K Ohms, paralleled by 2.4 nF
Dynamic Range	120 dB Typical @ 1ms
Common Mode Rejection	>110 dB
Record Length	Up To 40 sec in shot synch mode
Dead Time	100 ms
Continuous Recording Mode	Enabled with GPS synchronization
Noise Floor	0.1 uV at 2 ms
QC Tests	Leakage and capacitance of hydrophone elements, noise, offset, harmonic distortion and gain similarity
Power Consumption	Approximately 100 mA at 48 VDC
Calibration Oscillator	10 Hz to 2 kHz, 1 ?V to 100 mV AC RMS
Dimensions	44 mm diameter x 33 cm long (1.75” by 11”)
Weight	900 grams (2.0 lbs)
Packaging Material	Titanium body
Connectors	Waterproof high density stainless steel, 41 pin

Stretch and Vibration Isolation Section Specifications

Length Construction	10, 25 or 50 meters standard
Outer Diameter	Similar to active section
Stretch Ratio	41 mm (1.6 inches)
Compass/Bird Coil	Approximately 15% for stretch section
Break Strength	I/O Model 587, isolation section Only
Depth Transducer	over 2200 kg (5000 lbs), Vectran strain members
	Available only on isolation section

Hydrophone Section Specifications

Number of Channels	8 per section
Hydrophones per group	16 typical at 12.5m
Hydrophone Type	Benthos RDA Geopoint, or AQ-1
Jacket Material	Clear polyurethane, 70 Duro, 3.18 mm (1/8 inch) wall thickness
Outer Diameter	41 mm (1.6 inches)
Ballast Fluid	Inert, non-polluting silicone oil, 100 cSt
Weight	~135 kg (300 lbs) / 8 channels @12.5 mg
Break Strength	over 2200 kg (5000 lbs), Vectran strain members
Maximum Tow Speed	~8 knots recording, ~10 knots steaming, depending on configuration and sea state
Minimum Bend Radius	75 cm (30 inches)
Compass/Bird Coil	IO Model 587
Depth Transducer	One per section (optional)

EQUIPMENT SHEET OFFSHORE SURVEY

SEISMIC PROFILER - GEOMETRICS GeoEel

Streamer Power Supply Unit Specifications

Power Requirements	115/230 VAC, 3/1.5 Amp max, 50/60 Hz
Voltage to Streamer	36- 72 VDC
I/O Communications	100 Base TX Fast Ethernet, IEEE 802.3 compliant
Trigger Requirements	Isolated Input, Positive or Negative TTL, software selectable
Testing	Cable leakage and resistance, Ethernet for faults and collisions
Optional Auxiliary Inputs	8 analog channels with 24-bit resolution
Ethernet Connection	RJ-45
Trigger Connection	BNC

Tow Cable Specifications

Electrical conductors Weight	10 twisted pair shielded
Strain member	~ 25 kg (55 lbs) for 50 meters
Break strength	Kevlar
Diameter	over 2200 kg (5000 lbs)
	20 mm

GeoEel Convertible Acquisition Channel Specifications

Maximum Channels	240 per chassis
Channel per card set	8
Sample Rates	1/16, 1/8, 1/4, 1/2, 1, 2, 4 ms
Bandwidth	5 Hz to 8 kHz
Programmable Gain	0 dB, 6 dB, 18 dB, 30 dB, 42 dB
Anti-Alias Filters	et by sample interval, down 135 dB at stop band
Maximum Input Range	±2.25V
Resolution	24 bits including sign
Input Impedance	126.8K Ohms, paralleled by 2.4 nF
Dynamic Range	120dB Typical @ 1ms
Common Mode Rejection	>110 dB
Record Length	Up to 40 sec

Charge Amplifier

Configurations	24 to 120 channels in groups of 24
Frequency response	5 Hz to > 300 Hz, by streamer capacitance
Output Impedance	1000 ohms
Dimensions	7U 12.5"hx19"Chassis wx14"d
Power Consumption	115/220 VAC, 50/60 Hz, 1 Amp
Weight	33.5 lbs
Operating Temperature	-10 to +40 degrees C
Relative Humidity	80% max, non-condensing
Input Impedance	virtual ground
Transducers	piezoelectric ceramic element
Channel Output D.C. Offset Channel	3mV (Differential) nominal
Maximum Output	4V P-P open circuit
Channel Dynamic Range	>100dB
Channel Output Distortion	< 0.005% THD
Channel Output Sensitivity Precision	+/- 2%
Channel Low Frequency Cutoff	4Hz
Common Mode Rejection	>40 dB (Balanced Input)
Communication Interface (Option)	10/100 Base T Ethernet

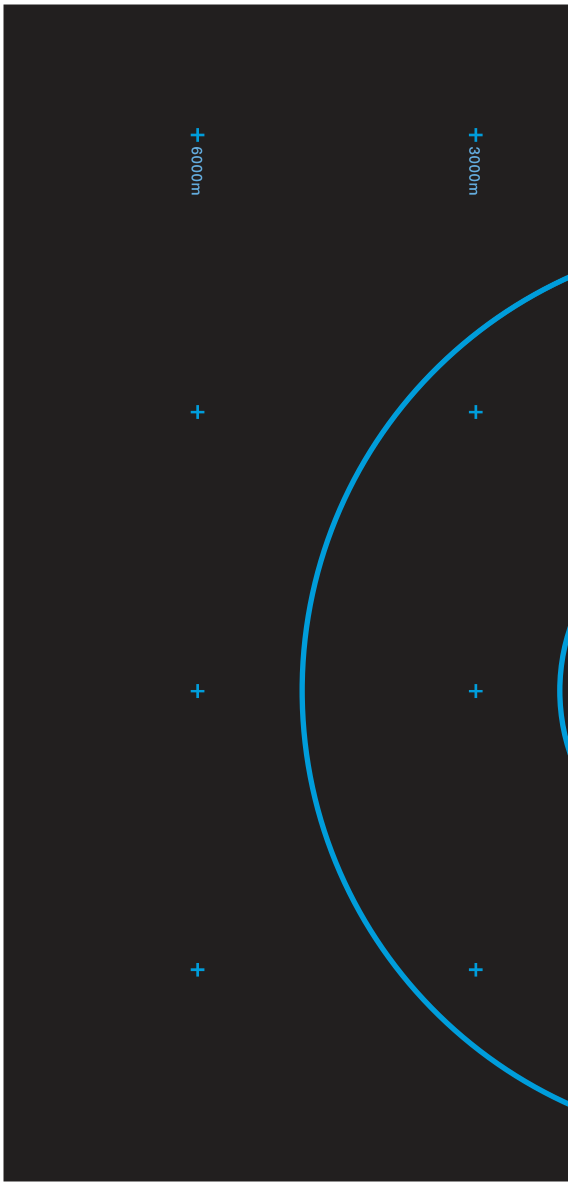
IMAGING



RANGER 2 USBL

TRACK EVERYTHING, IN ANY DEPTH, FROM ANY VESSEL.

TRACK A TOWFISH, POSITION AN ROV, DP YOUR VESSEL, SEARCH THE SEABED OR NAVIGATE AN AUV. WHEN YOU NEED TO INVEST IN ULTRA-SHORT BASELINE (USBL) ACOUSTIC TECHNOLOGY TO SUPPORT YOUR UNDERWATER OPERATIONS, RANGER 2 HAS THE PERFORMANCE YOU NEED, AT THE INVESTMENT LEVEL YOU CAN AFFORD TO GET THE PROJECT COMPLETED FASTER AND MORE EFFICIENTLY THAN ANY OTHER SYSTEM ON THE MARKET.

ENGINEERED LIKE NO OTHER

All USBL systems calculate position by measuring the range and bearing from a vessel-mounted transceiver to an acoustic transponder fitted to a moving target or placed on the seabed. But not all USBL systems do it with the accuracy and precision offered by Ranger 2.

We've taken everything that made our original Ranger system so effective and advanced it to the next level. That next level is our award-winning 6G (sixth generation) acoustic hardware platform and Sonardyne Wideband® 2 digital signal architecture which work seamlessly together to deliver the best possible USBL positioning performance and operator experience.

Vessel and vehicle hardware is easy to install and configure. It can track your equipment to beyond 7,000 metres and update its position every second. It's engineered for shallow water, deep water, high elevation and multi-user operating scenarios. And if your vessel's fitted with a DP system – regardless of what make it is – Ranger 2 can interface with it.

THE ONLY USBL YOU'LL NEED

Every survey, ocean science, DP and seismic exploration project is different; different water depths, different vessels and different targets to position. But that shouldn't mean you need a different USBL system for each one.

Ranger 2 comes with an impressive list of standard features. As your needs grow and become more complex, so too can the capabilities of Ranger 2 thanks to software feature packs available in three versions; Survey, Dynamic Positioning and Professional – all of which can be remotely activated* in the field.

*Subject to having the appropriate hardware available on board

WHY IT'S GOOD FOR YOUR OPERATIONS

- Simple, intuitive software
- Tracks an unlimited number of targets; ROVs, towfish, AUVs...
- Operating range beyond 7,000 metres
- Better than 0.1% system accuracy when optimised
- Up to 1 second position updates
- Compatible with all makes of DP system
- Automated setup reduces vessel delays
- Application packs available bringing extra features specific to your operations
- User training available worldwide
- Multi-user capable
- Track record of success on all types of vessel
- Support available globally 24/7

RANGER 2 USBL FOR

SURVEY

WHETHER YOU ARE CONDUCTING A HYDROGRAPHIC SURVEY WITH A TOWFISH, MONITORING THE TOUCHDOWN POSITION OF A PIPELINE OR LOWERING AND LANDING STRUCTURES ONTO THE SEABED, RANGER 2 HAS ALL THE CAPABILITY YOU NEED IN ONE APPLICATION. THE OPTIONAL SURVEY PACK UNLOCKS A HOST OF ADDITIONAL FEATURES TO FURTHER OPTIMISE THE PERFORMANCE OF YOUR RANGER 2 SYSTEM FOR THE MAJORITY OF OFFSHORE CONSTRUCTION AND SURVEY TASKS.

RANGER 2 SURVEY PACK

The Ranger 2 Survey pack uses the intuitive and simple layout as the standard software but allows access to more complex areas such as the setup and tracking of ROVs, AUVs and structures. These objects can be configured with multiple transponders attached to them and fixed offsets can then be computed to points such as a structure's CRP or an ROV's bumper bar which can be both displayed on-screen with their position output.

Being able to work in this manner directly in the USBL software benefits your surveys as any sensor latency induced errors are minimised, and the risk of systematic errors from the use of incorrect offsets is reduced. AutoCAD backdrops and configurable seabed geodesy allow Ranger 2 Survey to be used for tracking and guidance. Complex doesn't have to be complicated.

WHY IT'S GOOD FOR SURVEY

- Up to 0.07% slat range tracking performance using GyroUSBL
- Supports complex tracking scenarios such as structures and vehicles with multiple transponders and multiple remote offsets
- Importable AutoCAD DXF field backdrops
- Built-in seabed geodesy package
- Configurable UI to suit multiple project tasks
- Tools to configure stinger-mounted GyroUSBL transceivers
- System can be shared with DP

BSEA
WLL 15T

RANGER 2 USBL FOR

DYNAMIC POSITIONING

OUT OF THE BOX, RANGER 2 IS A HIGHLY CAPABLE ACOUSTIC POSITION REFERENCE SYSTEM THAT YOU CAN INTERFACE WITH ANY DP SYSTEM INCLUDING GE, KONGSBERG, MT, NAVIS, ROLLS-ROYCE AND WÄRTSILÄ. BUT IF YOUR VESSEL UNDERTAKES CRITICAL STATION KEEPING ACTIVITIES IN ULTRA-DEEP WATERS, THE RANGER 2 DP PACK OFFERS ENHANCED LEVELS OF POSITIONING INTEGRITY. DEVELOPED TO MEET THE REQUIREMENTS OF CLASS 2 AND 3 RULES, IT'S PERFECT FOR HEAVY CONSTRUCTION, WELL INTERVENTION, SALVAGE AND PRODUCTION VESSELS.

RANGER 2 DP PACK

The DP pack's stand-out feature is its ability to support Long and Ultra-Short BaseLine (LUSBL) and inertial navigation (DP-INS) configurations.

LUSBL exploits the greater precision and acoustic range redundancy offered by Long BaseLine (LBL) seabed transponder arrays where accuracy is virtually independent of water depth. And because Ranger 2 is built around our exclusive Wideband 2 signal architecture, you have the freedom to deploy your own transponder array without interrupting others, or share one that is already deployed in the field, saving vessel time and lowering your costs.

Tightly integrated acoustic and inertial positioning benefits your DP system by improving the accuracy, update rate and reliability of the position. The inertial navigation system can be aided by a single USBL transponder or multiple transponders – but far fewer than a conventional LBL array. Transponders can also be set to a slower update rate, extending their battery life saving deployment and calibration time and extending service intervals.

DPO FRIENDLY

DPOs quickly feel comfortable using Ranger 2's easy and intuitive software. Automatic discovery of Sonardyne transponders and array planning tools are included as standard whilst real-time quality indicators, noise analysis and signal travel time displays are just some of the extra tools available to help them optimise performance.

WHY IT'S GOOD FOR DP

- High integrity positioning for critical deep water operations
- Fully compatible with all makes of DP system
- Cost effective for owners and shipyards
- Less wiring, fewer components and smaller gate-valve than comparable systems
- Easy to learn, easy to use
- DP-INS for added reliability and operational savings
- Dual transceivers for added accuracy

CCC PIONEER

CCC

RANGER 2 USBL FOR

EXPLORATION

WITH ITS ABILITY TO SIMULTANEOUSLY TRACK MULTIPLE SUBSEA TARGETS, RANGER 2 IS IDEAL FOR MARINE SEISMIC OPERATIONS WHERE VERY LARGE AREAS OF THE SEABED ARE COVERED WITH NODES AND THEIR PRECISE LOCATIONS CONFIRMED BEFORE ACQUISITION CAN BEGIN. BUT RANGER 2 DOES MORE THAN SIMPLY POSITIONING. THE HIGH-SPEED ACOUSTIC COMMUNICATIONS BUILT INTO EACH NODE-MOUNTED 6G TRANSPONDER MEANS THAT DURING A SURVEY, DATA CAN BE UPLOADED TO THE SURFACE TO LET YOU KNOW EACH NODE'S STATUS.

FROM SHALLOW TO DEEP

Seismic surveys using Ocean Bottom Nodes (OBNs) are a popular method of acquiring high resolution reservoir imagery. Ranger 2 USBL is used to determine the locations of thousands of marine seismic nodes – or the ROVs that deploy them – when operating in the transition zone all the way to very deep water.

When ROVs are used, Ranger 2 integrates seamlessly with our SPRINT INS and Syrinx DVL products to maximise ROV positioning performance. This minimises the number of observations required to achieve your project's specification.

THIRD PARTY SOFTWARE INTERFACES

Node deployment operations are typically conducted under the control of third party navigation packages such as HydroPos and Gator II so Ranger 2 comes with a remote control interface provided as standard.

Once your survey is complete, the precision offered by Ranger 2 allows an ROV pilot to navigate directly to each node to recover it. This saves time and ensures no hardware is left behind on the seabed. Alternatively, the transponders attached to each node can be acoustically commanded to release anchor weights so that the entire instrument floats up to the surface.

WHY IT'S GOOD FOR EXPLORATION

- Thousands of unique transponder addresses permit large node arrays without identity repetition.
- Compatible with Sonardyne ROV based INS and DVL products for seamless operation.
- High update rate maximises deployment speed.
- Quick to install on vessels of opportunity using pre-calibrated transceivers
- Remote control interface to standard seismic navigation systems such as HydroPos and Gator II.

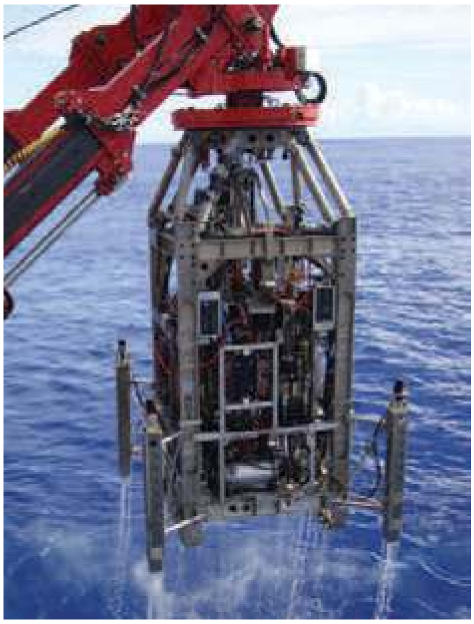
magseis



RANGER 2 USBL FOR

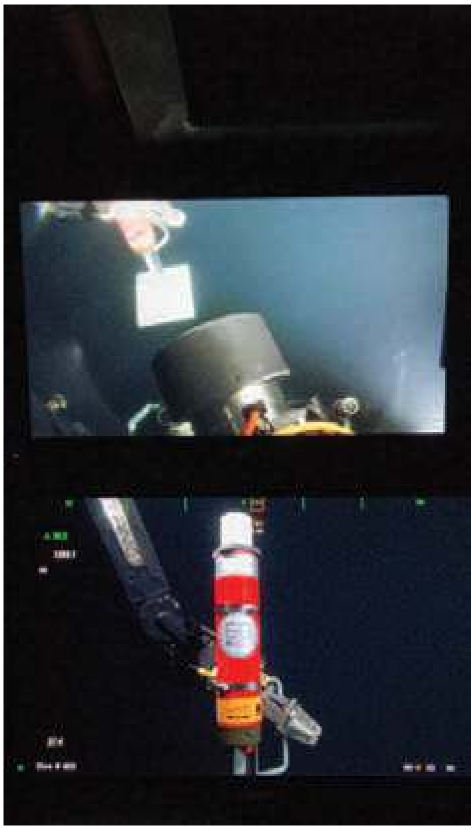
OCEAN SCIENCE

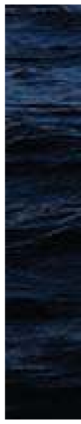
CHOSEN FOR ITS ABILITY TO TRACK A WIDE VARIETY OF SCIENTIFIC PACKAGES AT RANGES UP TO 10,000 METRES, RANGER 2 IS THE PREFERRED USBL SOLUTION FOR MANY OF THE WORLD'S LEADING OCEAN RESEARCH INSTITUTES. IT IS A KEY ENABLER FOR THEIR VESSELS AND HAS THE FLEXIBILITY TO MEET THE PRECISE IN-WATER AND NEAR-BOTTOM SUSTAINED OBSERVATION NEEDS OF SCIENCE USERS WORKING NEARSHORE, COASTAL AND DEEP OCEAN.

MAXIMISING SCIENCE TIME, MINIMISING DOWNTIME

Science users rarely have the luxury of remaining on site for long, so Ranger 2's ability to position instruments such as corers, camera platforms and geological drills without having to first deploy a seabed array of transponders, helps you maximise precious ship time. It can even be used to activate compatible acoustic release transponders, allowing you to release and track your moorings all the way to the surface for immediate recovery on board.

If your research involves using a vessel of opportunity, then the benefits of using Ranger 2 begin before you've left port. Our pre-calibrated, all-in-one GyroUSBL transceiver is perfect for installation on a temporary over-the-side mounting arrangement yet delivers the same precision as a permanent installation.





ULTRA-DEEP TOW

Ranger 2's unique Inverted USBL (iUSBL) mode, a feature of the Survey pack, is perfect for deep tow, extreme layback towfish tracking. Rather than mounting the USBL transceiver on the vessel in the traditional manner, with iUSBL, the transceiver is installed on the towed body itself. Because towfish are typically quiet, the signal-to-noise ratio is significantly improved which provides longer ranges and greater precision.

AUV OPERATIONS

When paired with Av-Trak 6, Ranger 2 enhances AUV operations, combining telemetry and positioning. The 6G Sonardyne Messaging Service supports the transfer of vehicle mission updates and USBL reference positions to the AUV, as well as status messages from it, and AUV-to-AUV telemetry.

SEABED GEODESY

Ranger 2's flexibility allows you to recover data from our Autonomous Monitoring Transponders, which are increasingly being used for the long term measurement (up to 10 years) of seabed tectonic deformation. With both MF and LMF options available to support this capability, Ranger 2 HPTs can also be supplied as stand-alone modems for over-the-side wire deployment on ships not fitted with a Ranger 2 system.

WHY IT'S GOOD FOR OCEAN SCIENCE

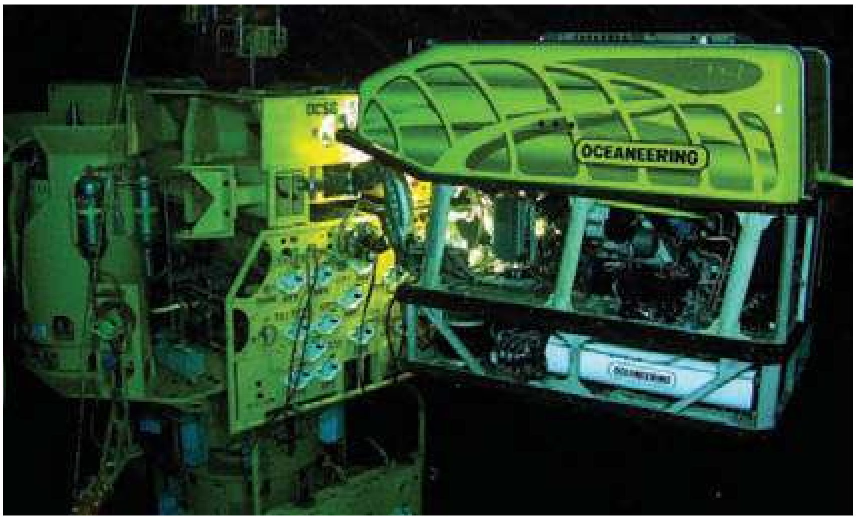
- Tracks AUVs, ROVs and other equipment to full ocean depth
- Maintains performance in noisy, shallow water environments
- Built-in fast data telemetry capability
- Supports MF and long range LMF operating bands
- Easy to install on vessels of opportunity
- Inverted USBL mode for tracking over long laybacks
- Software is simple and intuitive
- Compatible with all DP systems

Image: SOI

RANGER 2 USBL FOR

UNRIVALLED CAPABILITY

BE PREPARED FOR ANY VESSEL AND SUBSEA POSITIONING SCENARIO BY CHOOSING THE HIGHEST SPECIFICATION RANGER 2 PACK AVAILABLE – PROFESSIONAL. WITH THIS FEATURE PACK INSTALLED, YOU AND YOUR VESSEL HAVE GOT THE UNRIVALLED ABILITY TO SELECT WHICHEVER FEATURE YOU WANT, WHEN YOU WANT IT



RANGER 2 PROFESSIONAL PACK

Whether it's to provide an acoustically aided reference telegram to a DP desk whilst simultaneously tracking a complex structure with multiple transponders attached, or tracking an ROV overlaid on a geodetic backdrop whilst outputting an LUSBL DP telegram, Ranger 2 USBL Professional can do all this and more.

SURVEY AND DP

Ranger 2 Professional directly benefits multi-purpose vessels by enabling you to take advantage of the powerful position reference features found within the DP pack along with all the tracking features found within the Survey pack. This enables vessels to operate using a single USBL system for both DP and construction survey tasks which makes ownership and operation much simpler.

Professional retains the same easy to use UI of the standard version enabling you to make the switch with the minimum of extra training required. And, like the Survey pack, the UI can display exactly what you want to see.

WHY IT'S GOOD FOR ANY OPERATION

- Up to 0.07% slant range tracking performance
- Full support for aided INS and LUSBL vessel DP references
- Capability to track structures and vehicles with multiple transponders and multiple remote offsets
- Can operate in Standard and Optimised tracking modes
- Easy to install on vessels of opportunity
- Support for all Sonardyne 6G USBL transceivers, transponders and responders
- Configurable UI to suit multiple project tasks

EMAS CHIYODA

SHIP FIT EQUIPMENT

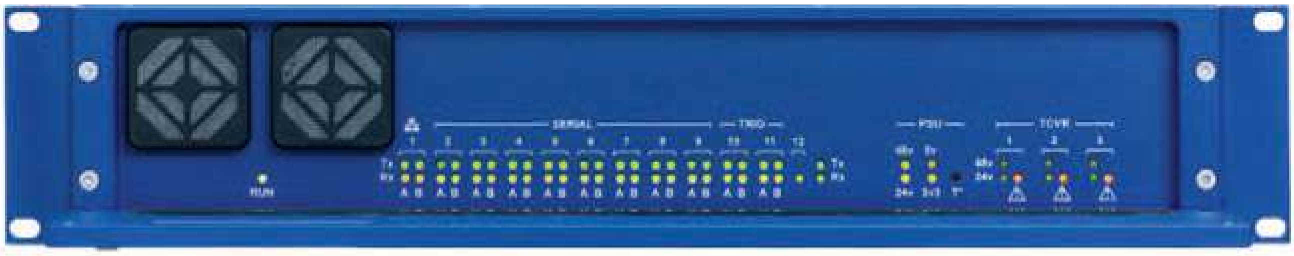
BRIDGE & INSTRUMENT ROOM

EASIER, FASTER AND NOW MORE CONFIGURABLE. THE LATEST VERSION OF RANGER 2 OPERATING SOFTWARE IS UNLIKE ANY OTHER ACOUSTIC POSITIONING SOFTWARE PACKAGE AND BRINGS TOGETHER ALL THE FEATURES SURVEYORS, SCIENTISTS AND DPOS TOLD US THEY WANTED TO SEE. IF YOU'VE NEVER USED A USBL SYSTEM, YOU'LL QUICKLY FEEL COMFORTABLE USING RANGER 2 AND IN NO TIME, BE READY TO CONFIGURE YOUR FIRST UNDERWATER TRACKING OPERATION. IT'S ALSO DESIGNED SPECIFICALLY TO TAKE ADVANTAGE OF THE POWERFUL FEATURES CONTAINED WITHIN EVERY 6G TRANSPONDER AND TRANSCEIVER.

ALL THE TOOLS YOU NEED

Ranger 2 benefits from a completely revised main UI, a centralised transponder management table, an array planning tool for DP operations, configurable displays, and integrated support for iWand, our go-anywhere back deck test and configuration device for 6G transponders. And when you need them, remote infield upgrades unlock extra features – ensuring you only pay for what you need.

- **Highly configurable navigation chart with layers**
- **Importable DXF backdrops**
- **Remote control and output telegrams**
- **Built-in performance verification and optimisation tools**
- **Automatic detection of previously deployed transponders including configured address**



NAVIGATION PC (NAVPC)

The NavPC and NSH are designed to meet the complete on-board requirements of any Ranger 2 positioning operation. Featuring an Intel® Core i7 processor, the NavPC is purpose built to run the family of Ranger 2 software applications and is proven to withstand the rugged environmental conditions associated with marine operations. It measures just 2U high so is ideally suited for mounting in an instrument rack, portable case for temporary installations or within a DP desk.

- **Designed to industrial PC standards**
- **Internal security dongle**
- **Shock-mounted hard drive**
- **Dual screen (VGA, DVI or HDMI)**
- **Ethernet or Serial interface to NSH**

NAVIGATION SENSOR HUB (NSH)

The NSH is the interface between the in-water acoustic instruments, sensors and the NavPC which runs the Ranger 2 positioning software. In addition to accurately time-stamping incoming data from external devices such as gyros, VRUs and GNSS, the NSH also provides power and communications for ship-borne acoustic transceivers.

- **Configurable for stand-alone or dual independent modes**
- **Up to 16 Ethernet or serial interfaces**
- **6 transceiver serial ports providing 24/48 V DC power**
- **Sub-microsecond time-stamping on all Tx/Rx data**

SHIP FIT EQUIPMENT

TRANSCEIVERS

WHEN IT COMES TO USBL TRANSCEIVERS, ONE MODEL DOES NOT FIT ALL SITUATIONS AND VESSELS. THAT'S WHY OUR HIGH PERFORMANCE TRANSCEIVER (HPT) IS AVAILABLE WITH DIFFERENT ARRAY DESIGNS RANGING FROM FULL HEMISPHERICAL COVERAGE TO DIRECTIONAL DESIGNS FOR ULTRA-DEEP WATER AND HIGH VESSEL NOISE OPERATING ENVIRONMENTS. HPT TRANSCEIVERS CAN ALSO BE USED AS WIRELESS MODEMS FOR AUTONOMOUS MONITORING TRANSPONDER SETUP AND DATA RETRIEVAL AS WELL AS SUPPORTING LBL OPERATIONS.

TOWFISH MOUNTED

iUSBL/GYROiUSBL

A subsea vehicle based transceiver that turns conventional USBL tracking on its head. Designed for projects using deep tow, long layback survey platforms requiring high precision.

HPT 13000

A specialist USBL transceiver available to support tracking projects in the deepest water. The large array and advanced multi-element signal processing enables transponders to be tracked with ultimate precision.

LMF HPT

A Low Medium Frequency (14-18kHz) transceiver to ensure maximum data telemetry rate and positioning range whilst providing simultaneous multi-user operation with systems in other bands of operation. Identical functionality to that of Medium Frequency band HPT instruments.

GYROUSBL 5000/7000

Lodestar subsea AHRS sensor and HPT transceiver in one unit. GyroUSBL can be pre-calibrated for rapid and cost-effective deployment on vessels of opportunity. Available with standard and deep water optimised arrays.

HPT 7000

A USBL and LUSBL transceiver optimised for noisy dynamically positioned drilling and construction vessels operating in deep water. Vessel and thruster noise is rejected.

HPT 5000

Enables subsea targets to be tracked with precision and repeatability over a wide range of water depths and elevations. Supports high speed 6G data telemetry mode.

SHIP FIT EQUIPMENT

OPTIONS

OPTIMISED USBL

The positioning accuracy obtainable from Ranger 2 can be further improved by co-locating Lodestar, our premium quality Attitude and Heading Reference system (AHRS), with your vessel's 6G acoustic transceiver.

Known as Optimised USBL, the advantage of this configuration is that raw USBL range and bearing data is simultaneously processed with the Lodestar's attitude data. This achieves a tightly compensated solution that enables a system accuracy of 0.1% of slant range to be achieved. Available with standard Ranger 2 systems, or those enabled with Survey, DP and Professional feature packs.

TIP If you don't need the extra performance offered by Optimised USBL, the bridge-installed version of Lodestar is a cost effective replacement for your ship's gyro and VRU.

DP-INS

For tightly integrated acoustically-aided inertial DP operations ,you will need to install our DP-INS sensor to work alongside your Ranger 2 system.

GyroUSBL transceivers have this sensor built-in, its capability simply needs to be enabled. Alternatively, we offer a stand-alone unit for installing on your bridge or deployment machine. Both units incorporate three Ring Laser Gyroscopes and three accelerometers selected for use for their performance, high mean time between failure (MTBF) and ease of export (non ITAR). These sensors have highly stable error characteristics and are compensated for temperature variation.

TIP Did you know we use RLGs and inertial sensors with a 400,000hrs MTBF, proven over 15 years of use in almost every commercial airliner?

VIEWPOINT REMOTE WORKSTATION

If you want to share and visualise positioning data from your Ranger 2 system with other teams on board, then you will need a Viewpoint remote display workstation.

It enables you to transform co-ordinates of surface vessels, subsea vehicles and structures into geographical information overlaid on easy-to-use guidance displays. When changes to Ranger 2 are made, such as adding a new tracked target, they automatically appear on ViewPoint workstations. And because it is serially interfaced with Ranger 2, Viewpoint is totally secure; there is no way to affect live survey and DP operations.

TRANSCEIVER DEPLOYMENT – PERMANENT

USBL system performance is seriously degraded by poor transceiver mounting and deployment so we've developed a family of highly engineered deployment machines suitable for any situation. Validated on hundreds of vessels, our through-hull hydraulic deployment machine is ideal for permanent installations and features a stiff, corrosion-resistant pole, high integrity bearing and sealing design and reliable hydraulic actuation with safety interlocks, sea chest for access, and remote control options.

Where through-hull deployment via a gate valve is not available or practical, a through-tube machine is available. Modular, easy to transport sections accommodate any pole length and once deployed, the pole is held rigidly in place using a self-contained hydraulic clamping mechanisms.

TRANSCEIVER DEPLOYMENT – TEMPORARY

For short term projects using a vessel of opportunity, our modular over-the-side deployment pole provides a cost-effective and practical solution. Pole lengths can be adjusted by adding or removing sections and once the assembled pole is lowered and locked into position, a high degree of stability is assured.

- **High performance, high integrity survey grade deployment system**
- **Drag and vortex reducing strakes**
- **Deck and hull mount options**
- **Sectional pole allows length to be configured for each vessel**
- **Good corrosion resistance**
- **Custom design available for other manufacturers instrumentation**
- **Easy to transport and assemble**

VEHICLE FIT / SEABED EQUIPMENT

TRANSPONDERS

WIDEBAND SUB-MINI 6+ (WSM 6+)

Included with any purchase of our Ranger 2 USBL system, WSM 6+ is the ideal choice of transponder for tracking mobile underwater targets such as a towfish, crane wire, ROV and manned submersible. 2-way wideband signals ensure reliable acoustic performance in all conditions.

- **Small and rugged**
- **1,000 metre and 4,000 metre depth ratings**
- **Omni-directional or directional transducers**
- **Inbuilt depth sensor aids USBL performance**
- **Responder mode for fast position updates**
- **Rechargeable battery**

TIP iWand – use it to test and configure any 6G transponder on the back deck. You can even import their settings straight into Ranger 2.

WIDEBAND MINI TRANSPONDER 6 (WMT 6)

If size and weight are important considerations, but you need the capability to track equipment in water depths up to 7,000 metres, look no further than the WMT 6. Its high power acoustic output means it's perfect for noisy operating environments.

- **3,000 metre, 5,000 metre and 7,000 metre depth ratings**
- **Available with remote transducer (3,000 metre version)**
- **Mini size – small and lightweight**
- **Full 2-way Sonardyne Wideband communications**
- **Responder mode for fast position updates**
- **Long life Li-ion battery**

TIP If you're not using your WMT for a while, the unit's external On/Off switch helps to ensure it is always ready for your next operation.

AV-TRAK 6

Av-Trak 6 combines the functions of a USBL transponder, LBL transceiver and wireless communications link in one low power instrument that's perfect for missions involving AUVs. Available with electronics-only for customer integration and a custom I/O for mission abort and ballast jettison.

- **Combined transponder, transceiver and telemetry instrument**
- **Track it, navigate it and command it**
- **Depth ratings to 7,000 metres**
- **Can aid vehicle's INS system**
- **Remote transducer option for easy vehicle installation**
- **Rechargeable battery**

TIP If space on your vehicle is limited, Av-Trak 6 can be supplied with a remote transducer allowing you to install the main electronics housing wherever you want.

WIDEBAND RELEASE TRANSPONDER 6 (WRT 6)

WRT 6 is a dedicated acoustic release transponder which you can use with Ranger 2 to deploy, track and detach seafloor equipment and instrument moorings. It uses field-proven mechanics combined with 6G electronics to ensure interference-free operation in multi-user scenarios.

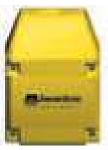
- **1,275 kg Working Load Limit (WLL)**
- **Higher WLL available with load maximisation frames**
- **Highly reliable release mechanism**
- **External On/Off switch to maximise battery life when not in use**
- **Depth rated to 3,000 metres**
- **Can be positioned using Kongsberg HiPAP® systems**

TIP Load amplification frames extend the WLL of WRT 6s – perfect for structure installation projects.

DYNAMIC POSITIONING TRANSPONDER 6 (DPT 6)

If you need an ultra-dependable, cost effective seabed DP reference transponder, DPT 6 is the answer. It's quick to set up on the back deck, easy to deploy and can be recovered without the need to send down an ROV.

- **Highly reliable acoustic release mechanism**
- **3,000 metre, 5,000 metre and 7,000 metre depth ratings**
- **Robust acoustic performance in all conditions**
- **Hundreds of operating channels**
- **Choice of sensors including depth, temperature and inclinometer**



TIP If you're deploying a Compatt or DPT on the seabed, you'll need a floatation collar. We have designs to suit every application.

COMPATT 6 (C6)

From Mini to Mega, C6 is the industry standard transponder used for high precision subsea survey and construction in all water depths. Available in a wide range of sizes, materials, sensor and battery configurations, ask us which one is right for your project.

- **Multi-functional transponder; supports USBL, LBL, modem and gyro applications**
- **Mini, Midi, Standard, Mega and Maxi sizes**
- **Can be used by multiple users simultaneously**
- **Extensive choice of sensors, depths and batteries**
- **Global track record of success**

SUPPORT

WE INSTALL, WE TRAIN, WE MAINTAIN.

WITH SEVERAL THOUSAND USBL INSTALLATIONS SUCCESSFULLY UNDERTAKEN, WE HAVE THE EXPERIENCE TO WORK SIDE-BY-SIDE WITH YOUR NAVAL ARCHITECT, SHIPYARD, DP SUPPLIER AND CREW TO MAKE THE PROCESS OF INVESTING IN RANGER 2 PROBLEM-FREE AND LOW-RISK. IT'S ALL PART OF THE SERVICE THAT HELPS LOWER YOUR OPERATIONAL RISK, SPEED UP YOUR SUBSEA OPERATIONS AND KEEP VESSEL DOWNTIME TO A MINIMUM.

EXPERT ADVICE

Our long-term partnership with clients has enabled us to develop a unique and extensive insight into the diverse nature of underwater operations and the associated commercial and operational pressures. We understand that the technology investment decisions you take today, will affect your operational capability for years to come so they need to be right.

That's why you can trust our global commercial and technical teams to give you expert advice on which Ranger 2 system is best for you, how to finance it (now including lease rental), where and how it should be installed, what transponders you need and the typical performance you can expect to see based on how and where you'll be using it.

OPERATOR TRAINING

Making sure that you get the very best out of your Ranger 2 system once it is installed and commissioned is the goal of our operator training programme. From standard courses run at our worldwide centres to bespoke courses held on your vessel, Sonardyne's training is comprehensive and flexible.

HELP WHEN YOU NEED IT

Once you become a Sonardyne Ranger 2 customer, you gain unrivalled access to our customer care programme. A dedicated email helpline connects you to product engineers ready to answer your questions but if it's more urgent, our 24 hour worldwide telephone help-line is standing by ready to resolve any operational issues you're facing.

ANNUAL SERVICE VISITS

Of course, the best way to ensure your equipment always performs as it should, is to service it regularly. Book an annual service visit, and one of our field engineers will inspect the health of your vessel's system including updating software and firmware and inspecting your deployment machine to make sure regular checks are being carried out. Transponder sensors can be re-calibrated at any one of our international service centres.

4200 SERIES

SIDE SCAN SONAR SYSTEM

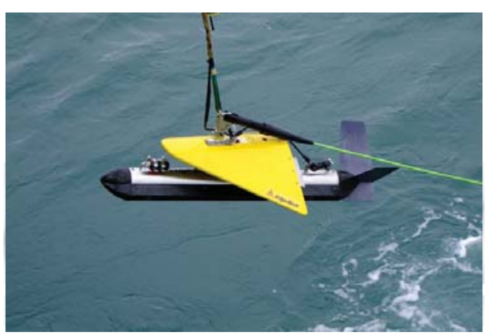
EdgeTech
An Affiliate of ORE Offshore

FEATURES

- Optional Multi-Pulse (MP) technology for high speed surveys
- Crisp, high resolution CHIRP images
- Multiple dual simultaneous frequency sets to choose from
- Choice of stainless steel or lightweight aluminum towfish
- Easily integrates to other 3rd party sensors
- Meets IHO & NOAA Survey Specifications

APPLICATIONS

- Cable & Pipeline Surveys
- Geological/Geophysical Surveys
- Mine Countermeasures (MCM)
- Geohazard Surveys
- Channel Clearance
- Search and Recovery
- Archeological Surveys



The 4200 Series is a versatile side scan sonar system that can be confi gured for almost any survey application from shallow to deep water operations. The 4200 utilizes EdgeTech's Full Spectrum® CHIRP technology to provide crisp, high resolution imagery at ranges up to 50% greater than non-CHIRP systems; thus allowing customers to cover larger areas and save money spent on costly surveys.

One of the unique features of the 4200 is the optional Multi-Pulse (MP) technology, which places two sound pulses in the water rather than one pulse like conventional side scan sonar systems. This allows the 4200 to be towed at speeds of up to 10 knots while still maintaining 100% bottom coverage. In addition, the MP technology will provide twice the resolution when operating at normal tow speeds, thus allowing for better target detection and classifi cation ability. The addition of the optional MP technology provides the operator with two modes of operation; either High Defi nition Mode (HDM) or High Speed Mode (HSM). This software-selectable mode of operation provides the operator the ability to select the best confi guration for the specific job type.

A 4200 system comes with a choice of a dual simultaneous frequency towfi sh available in either a stainless steel or lightweight aluminum housing depending on operational requirements. Customers can also choose between a rack mount or portable topside processor or a digital link to interface to 3rd party topsides and software.

4200 SERIES
SIDE SCAN SONAR SYSTEM

EdgeTech

KEY SPECIFICATIONS

SONAR SPECIFICATIONS	STANDARD	WITH OPTIONAL MP TECHNOLOGY	
Frequency	Choice of either 100/400, 300/600 or 300/900 kHz dual simultaneous		
Operating Range (meters/side)	100 kHz: 500m, 300 kHz: 230m, 400 kHz: 150m, 600 kHz: 120m, 900 kHz: 75m		
Horizontal Beam Width:	100 kHz: 1.5°, 300 kHz: 0.5°, 400 kHz: 0.4°, 600 kHz: 0.26°, 900 kHz: 0.2°	In High Speed Mode: 100 kHz: 1.26°, 300 kHz: 0.54°, 400 kHz: 0.4°, 600 kHz: 0.34°, 900 kHz: 0.3° In High Definition Mode: 100 kHz: 0.64°, 300 kHz: 0.28°, 400 kHz: 0.3°, 600 kHz: 0.26°, 900 kHz: 0.2°	
Resolution Along Track	100 kHz: 5 m @ 200 m 300 kHz: 1.3 m @ 150 m 400 kHz: 0.6 m @ 100 m 600 kHz: 0.45 m @ 100 m 900 kHz: 18 cm @ 50 m	High Definition Mode: 100 kHz: 2.5m @ 200m 300 kHz: 1.0m @ 200m 400 kHz: 0.5m @ 100m 600 kHz: 0.45m @ 100m 900 kHz: 18 cm @ 50m	HIgh Speed Mode: 100 kHz: 4.4m @ 200m 300 kHz: 1.9m @ 200m 400 kHz: 0.7m @ 100m 600 kHz: 0.6m @ 100m 900 kHz: 26 cm @ 50m
Resolution Across Track	100 kHz: 8 cm, 300 kHz: 3 cm, 400 kHz: 2 cm, 600 kHz: 1.5 cm, 900 kHz: 1 cm		
Vertical Beam Width	50°		
Depression Angle	Tilted down 20°		
TOWFISH	**STAINLESS STEEL**	**ALUMINUM**	
Diameter	11.4 cm (4.5 inches)		
Length	125.6 cm (49.5 inches)		
Weight in Air/Saltwater	48 / 36 kg (105 / 80 pounds)	30 / 18 kg (66 / 40 pounds)	
Depth Rating (Max)	2,000m	500m	
Standard Sensors	Heading, pitch & roll		
Optional Sensor Port	(1) Serial – RS 232C, 9600 Baud, Bi-directional & 27 VDC		
Options	Pressure Sensor, Magnetometer, Integrated USBL Acoustic Tracking System, Built-in Responder Nose, Depressor, Power Loss Pinger and Custom Sensors		
TOPSIDE PROCESSOR	**4200-P**	**4200**	**701-DL INTERFACE**
Hardware	Portable splash-proof case	19" rack mount computer	19" rack mount interface
Display & Interface	Splash-proof laptop	21" flat panel monitor, keyboard & trackball	Customer-supplied
Power Input	20-36 VDC or 115/230 VAC	115/230 VAC	115/230 VAC
Operating System	Windows© XP Pro		
File Format	Native JSF or XTF		
Output	Ethernet		
TOW CABLE			
	Coaxial Kevlar or double-armored up to 6,000m, winches available		

4205

TRI-FREQUENCY / MOTION TOLERANT SIDE SCAN SONAR SYSTEM

FEATURES

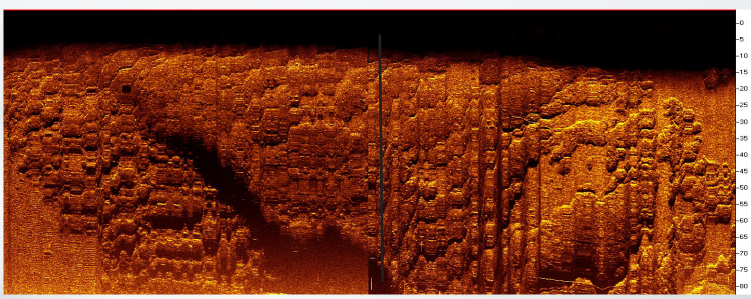
- Tri frequency side scan sonar
- Motion tolerant mode
- Improved target positioning
- Crisp, high resolution CHIRP imagery
- Increased towfish power to support wider range of 3rd party sensors
- Single pulse high resolution mode

APPLICATIONS

- Cable & pipeline surveys
- Geological/geophysical surveys
- Mine countermeasures (MCM)
- Geohazard surveys
- Channel clearance
- Search and recovery
- Archeological surveys

The next generation 4205 is a versatile side scan sonar system that can be configured for almost any survey application from shallow to deep water operations. The 4205 utilizes EdgeTech's Full Spectrum® CHIRP technology to provide crisp, high resolution imagery at ranges up to 50% greater than non-CHIRP systems; thus allowing customers to cover larger areas and save money spent on costly surveys. In addition to the high-resolution imagery that EdgeTech is known for, the 4205 comes with a number of new features which makes the system even more flexible and powerful in offshore operations. The 4205 is available in either a tri-frequency side scan sonar configuration or motion tolerant and multi-pulse configuration. The tri-frequency version allows surveyors the option to operate any two frequencies simultaneously from the tri-frequency system. Long range operations for example can be achieved with a selection of 230/540 kHz combination. Then, on-demand the system can be changed to a 540/850kHz system for an even higher resolution survey. The 4205 motion tolerant configuration with multi-pulse provides surveyors the ability to operate either at faster survey speeds or in more adverse weather conditions while still obtaining high quality underwater imagery. Additionally, this configuration can be operated in a single pulse high-resolution mode for those operations that require an even more finite view of the seafloor.

In both the tri-frequency and motion tolerant/ multi-pulse configurations, towfish and target positioning has been improved with the integration of a more accurate heading sensor that can be coupled with an optional USBL beacon. Additionally, all systems now come with increased towfish power to support a wider range of additional 3rd party sensors. All EdgeTech 4205 systems are comprised of a topside system and a reliable stainless steel towfish. Topside processors are rack mountable and come with easy-to-use GUI software that can be installed on the optional industrial workstation, laptop or customer provided PC.



Motion Tolerant Mode Sonar example: During turbulent conditions, the data on the left of side of this image was recorded using the EdgeTech 4205 Motion Tolerant mode. The right side of the image, depicting motion induced striping was captured without the Motion Tolerant mode for comparison.

Trimble R8 GNSS Receiver

KEY FEATURES

Advanced Trimble R-Track technology

Unmatched GNSS tracking performance

Includes Trimble Maxwell 6 chip with 220 channels

Remote configuration and access

Base and rover communications options to suit any application

The Trimble® R8 GNSS Receiver sets the new standard for full-featured GNSS (Global Navigation Satellite System) receiver technology. This integrated system delivers unmatched power, accuracy and performance in a rugged, compact unit.

ADVANCED TRIMBLE R-TRACK TECHNOLOGY

The Trimble R8 GNSS delivers the latest advancements in R-Track™ technology, designed to deliver reliable, precise positioning performance. In challenging areas for GNSS surveying, such as tree cover or limited sky view, Trimble R-Track provides unmatched tracking performance of GNSS satellite signals.

Trimble R-Track with Signal Prediction™ compensates for intermittent or marginal RTK correction signals, enabling extended precision operation after an RTK signal is interrupted.

The new CMRx communications protocol provides unprecedented correction compression for optimized bandwidth and full utilization all of the satellites in view, giving you the most reliable positioning performance.

Featuring the Trimble Maxwell™ 6 chip, the Trimble R8 GNSS advances the industry with more memory and more GNSS channels. Trimble delivers business confidence with a sound GNSS investment for today and into the future.

Broad GNSS Support

The Trimble R8 GNSS supports a wide range of satellite signals, including GPS L2C and L5 and GLONASS L1/L2 signals. In addition, Trimble is committed to the next generation of modernized GNSS configurations by providing Galileo-compatible products available for customers well in advance of Galileo system availability[1,2]. In support of this plan, the new Trimble R8 GNSS is capable of tracking the experimental GIOVE-A and GIOVE-B test satellites for signal evaluation and test purposes.

FLEXIBLE SYSTEM DESIGN

The Trimble R8 GNSS receiver combines the most comprehensive feature set into an integrated and flexible system for demanding surveying applications. The Trimble R8 GNSS includes a built-in transmit/receive UHF radio, enabling ultimate flexibility for rover or base operation. As a base station, the internal NTRIP caster provides you with customized access[3] to base station corrections via the internet.

Trimble's exclusive, Web UI™ eliminates travel requirements for routine monitoring of base station receivers. Now you can assess the health and status of base receivers and perform remote configurations from the office. Likewise, you can download post-processing data through Web UI and save additional trips out to the field.

ENABLING THE CONNECTED SITE

Pair the speed and accuracy of the Trimble R8 GNSS receiver with flexibility and collaboration tools of Trimble Access™ software. Trimble Access brings field and office teams closer by enabling data sharing and collaboration in a secure, web-based environment. With optional streamlined workflows, Trimble Access further empowers surveyors and survey teams for success. Now it is easier than ever to realize the potential of the Trimble Connected Site. Connecting the right tools, techniques, services and relationships enables surveying businesses to achieve more every day.

1 ***Galileo Commercial Authorization***
Receiver technology having Galileo capability to operate in the Galileo frequency bands and using information from the Galileo system for future operational satellites is restricted in the publicly available Galileo Open Service Signal-In-Space Interface Control Document (GAL OS SIS ICD) and is not currently authorized for commercial use.
Receiver technology that tracks the GIOVE-A and GIOVE-B test satellites uses information that is unrestricted in the public domain in the GIOVE A + B Navigation Signals-In-Space Interface Control Document. Receiver technology having developmental GIOVE-A and B capability is intended for signal evaluation and test purposes.

2 *For more information about Trimble and GNSS modernization, please visit* ***http://www.trimble.com/srv_new_era.shtml***.

3 *Cellular modem required.*

Trimble R8 GNSS Receiver

TRIMBLE R8 GNSS RECEIVER

PERFORMANCE SPECIFICATIONS

Measurements

- Trimble R-Track technology
- Advanced Trimble Maxwell 6 Custom Survey GNSS chip with 220 channels
- High precision multiple correlator for GNSS pseudorange measurements
- Unfiltered, unsmoothed pseudorange measurements data for low noise, low multipath error, low time domain correlation and high dynamic response
- Very low noise GNSS carrier phase measurements with <1 mm precision in a 1 Hz bandwidth
- Signal-to-Noise ratios reported in dB-Hz
- Proven Trimble low elevation tracking technology
- Satellite signals tracked simultaneously:
  - GPS: L1C/A, L2C, L2E (Trimble method for tracking L2P), L5
  - GLONASS: L1C/A, L1P, L2C/A (GLONASS M only), L2P
  - SBAS: L1C/A, L5
  - Galileo GIOVE-A and GIOVE-B

Code differential GNSS positioning[1]

Horizontal. . . . . 0.25 m + 1 ppm RMS
Vertical . . . . 0.50 m + 1 ppm RMS
WAAS differential positioning accuracy[2]. . . . . typically <5 m 3DRMS

Static and FastStatic GNSS surveying[1]

Horizontal. . . . . 3 mm + 0.1 ppm RMS
Vertical . . . . 3.5 mm + 0.4 ppm RMS

Kinematic surveying[1]

Horizontal. . . . . 10 mm + 1 ppm RMS
Vertical . . . . 20 mm + 1 ppm RMS
Initialization time[3] . . . . typically <10 seconds
Initialization reliability[4]. . . . . typically >99.9%

HARDWARE

Physical

Dimensions (W×H) . . . . 19 cm × 11.2 cm (7.5 in x 4.4 in), including connectors
Weight . . . . 1.34 kg (2.95 lb) with internal battery, internal radio, standard UHF antenna.
3.70 kg (8.16 lb) entire RTK rover including batteries, range pole, controller and bracket
Temperature[5]
Operating . . . . –40 °C to +65 °C (–40 °F to +149 °F)
Storage . . . . –40 °C to +75 °C (–40 °F to +167 °F)
Humidity. . . . . 100%, condensing
Water/dustproof. . . . . IP67 dustproof, protected from temporary immersion to depth of 1 m (3.28 ft)

Shock and vibration. . . . . Tested and meets the following environmental standards:
Shock . . . . Non-operating: Designed to survive a 2 m (6.6 ft) pole drop onto concrete. Operating: to 40 G, 10 msec, sawtooth
Vibration MIL-STD-810F, FIG.514.5C-1

Electrical

- Power 11 to 28 V DC external power input with over-voltage protection on Port 1 (7-pin Lemo)
- Rechargeable, removable 7.4 V, 2.4 Ah Lithium-Ion battery in internal battery compartment. Power consumption is 3.2 W, in RTK rover mode with internal radio. Operating times on internal battery:
  - 450 MHz receive only option. . . . . 5.8 hours[7]
  - 450 MHz receive/transmit option . . . . 3.7 hours[8]
  - GSM/GPRS . . . . 4.1 hours[7]
- Certification Class B Part 15, 22, 24 FCC certification, 850/1900 MHz. Class 10 GSM/GPRS module. CE Mark approval, and C-tick approval

Communications and Data Storage

- 3-wire serial (7-pin Lemo) on Port 1. Full RS-232 serial on Port 2 (Dsub 9 pin)
- Fully Integrated, fully sealed internal 450 MHz receiver/transmitter option:
  - Transmit power: 0.5 W
  - Range[6]: 3–5 km typical / 10 km optimal
- Fully integrated, fully sealed internal GSM/GPRS option[7]
- Fully integrated, fully sealed 2.4 GHz communications port (Bluetooth®)[9]
- External cellphone support for GSM/GPRS/CDPD modems for RTK and VRS operations
- Data storage on 57 MB internal memory: 40.7 days of raw observables (approx. 1.4 MB /Day), based on recording every 15 seconds from an average of 14 satellites
- 1 Hz, 2 Hz, 5 Hz, 10 Hz, and 20 Hz positioning
- CMR+, CMRx, RTCM 2.1, RTCM 2.3, RTCM 3.0, RTCM 3.1 Input and Output
- 16 NMEA outputs, GSOF, RT17 and RT27 outputs. Supports BINEX and smoothed carrier

1 Accuracy and reliability may be subject to anomalies due to multipath, obstructions, satellite geometry, and atmospheric conditions. Always follow recommended survey practices.
2 Depends on WAAS/EGNOS system performance.
3 May be affected by atmospheric conditions, signal multipath, obstructions and satellite geometry.
4 May be affected by atmospheric conditions, signal multipath, and satellite geometry. Initialization reliability is continuously monitored to ensure highest quality.
5 Receiver will operate normally to –40 °C, internal batteries are rated to –20 °C.
6 Varies with terrain and operating conditions.
7 Varies with temperature.
8 Varies with temperature and wireless data rate.
9 Bluetooth type approvals are country specific. Contact your local Trimble Authorized Distribution Partner for more information.

Specifications subject to change without notice.

EQUIPMENT SHEET OFFSHORE SURVEY

FUGRO
SBE SEACAT 19 PLUS

The SBE Seacat 19 Plus velocimeter measures conductivity, temperature, and pressure (CTD) with high accuracy, resolution, and reliability for a wide range of survey applications.

The pump-controlled T-C ducted flow configuration minimizes salinity spiking caused by ship heave and allows for gradual decent rates without slowing sensor responses, improving dynamic accuracy and resolving small-scale structure in the water column.

APPLICATION
The SBE 19 Plus samples continuously up to four scans per second (4 Hz), is battery operated and self-recording, and is commonly used in the field without a computer, recording up to 100 individual profiles. Nine D-size alkaline batteries provide up to 60 hours of operation.

OPERATION
The 19 Plus is commonly used autonomously, recording data internally. It can also provide real-time acquisition and display over short cables via the RS-232 interface. A load-bearing cable for hand-hauled, real-time profiling is available.

The SBE 19 Plus is supplied with a powerful Windows-based software package (SEASOFT-Win 32), which includes programs for communication and data retrieval, real-time acquisition, display, and plotting, as well as data processing (filtering, aligning, and averaging). Firmware upgrades can be downloaded through the communications port by the user without opening the instrument.

System capabilities include the following:

- 64 MB FLASH RAM memory
- 6 Auxiliary A/D input channels
- Supplies power to seven external sensors
- Samples continuously up to 4 Hz
- Data can be output in XML or ASCII format
- Battery operation for up to 60 continuous hours

1. May 2019 - BOEM Responses to VW's Limited Waiver and Modified Lease Stipulation Requests for Lease OCS-A 0522 G&G Surveys

2. 20 July 2021 NMFS Incidental Harassment Authorization Renewal

BOEM Responses to Vineyard Wind's Limited Waiver and Modified Lease Stipulation Requests for Lease OCS-A 0522 Geophysical and Geotechnical Surveys (Scheduled for May and June of 2019)

4.1.1.2 <u>Vessel Strike Avoidance Measures and Time-of-Year Speed Restrictions</u>. **Vineyard Wind LLC (the Lessee) requested a limited waiver of the seasonal speed restriction to 10 knots or less from November 1 to July 31, as required under lease stipulation 4.1.1.2.** This speed restriction is based on several Seasonal Management Area (SMA) time/area restrictions based on possible ports where vessels may operate. Because vessels associated with the survey plan will only operate within or near the Mid-Atlantic SMA (from November 1 to April 30) and Vineyard Wind proposed an extended protective speed restriction buffer (from April 30 to May 14), Vineyard Wind requested a limited waiver of the 10-knot speed restriction from May 15 to July 31. Upon reviewing the information provided, **BOEM approves this request** because the vessel operating area is consistent with the Federal time-of-year vessel speed requirements for the Mid-Atlantic SMA. Please note that this lease stipulation still applies to vessels transiting from ports and within the operating areas described in the survey plans.

4.1.1.4 <u>Vessel Strike Avoidance Measures and Speed Restrictions</u>. **Vineyard Wind requested a limited waiver of the 10-knot speed restriction designated at any time of year in Nantucket Sound, as required under lease stipulation 4.1.1.4. BOEM denies this request to waive the 10-knot speed restriction in Dynamic Management Areas (DMAs).** During consultation with the National Marine Fisheries Service (NMFS) on this request, BOEM confirmed that DMAs are designated in waterways where NMFS believes groups of North Atlantic right whales may occur; therefore, no vessel speed exemptions should apply in DMAs. Additionally, vessel speed restrictions based on SMAs are required in the biological opinion, and thus, changes to those restrictions will not be approved. However, as described in the preceding paragraph, BOEM approves the limited waiver of seasonal speed restrictions between May 15 and July 31 for vessels operating within the vicinity of the Mid-Atlantic SMA.

Vineyard Wind also requested a limited waiver of any speed restriction requirements if vessel speeds over 10 knots are needed during a time period when speed restrictions are in place. Vineyard Wind indicated that in such cases, observers will be stationed on vessels over 65 feet in length to watch for North Atlantic right whales (NARWs). Upon reviewing the information provided, **BOEM denies this request**. The vessel speed restriction set forth in stipulation 4.1.1.4 is intended to avoid mortal injury if whales are unintentionally struck, and not all whales can be seen and avoided. The vessel speed restriction also provides more adequate reaction time to avoid whales that are sighted in the path of a moving vessel.

4.3.6.1 <u>Establishment of Default High Resolution Geophysical Watch Zone and Exclusion Zone</u>. **Vineyard Wind requested to modify the size of the 200-meter default exclusion zone required under lease stipulation 4.3.6.1 for ESA-listed whales and sea turtles during high resolution geophysical (HRG) surveys with equipment operating below 200 kHz.** In the case of the North Atlantic right whale, the minimum separation distance of 500 meters (1,640 feet), as required under stipulation 4.1.1.6.1, must be observed. According to lease stipulation

4.3.6.1, exclusion zones for non-listed marine mammals will be determined through project-specific mitigation and monitoring requirements of Incidental Take Authorizations (ITAs) provided by NMFS. If an ITA is not required, default exclusion zones of 100 meters for harbor porpoises and humpback whales, and 50 meters for all other non-listed marine mammals must be established around each vessel conducting HRG survey activities.

Vineyard Wind requested an increase to 1,000 meters for NARWs, a decrease to 100 meters for non-delphinoid cetaceans other than right whales and harbor porpoises, and a decrease to 50 meters for delphinoid cetaceans, pinnipeds, and sea turtles. BOEM approves these requests based on new information showing that these exclusion zones are still effective at minimizing and avoiding effects to protected species. Please note that BOEM does not find that the information provided supports the increase from 500 to 1,000 meters. However, BOEM acknowledges Vineyard Wind's commitment to implementing the January 22, 2019 agreement with non-governmental organizations, and considers any additional distance beyond the minimum 500 meters to be voluntary on behalf of Vineyard Wind. Thus, a waiver is not required for this increase.

4.3.6.5 <u>Clearance of Exclusion Zone during HRG Surveys</u>. **Vineyard Wind requested to modify the pre-clearance time and active sound source wait period required under lease stipulation 4.3.6.5 during HRG surveys with equipment operating below 200 kHz.** This stipulation requires a pre-clearance and wait period of 60 minutes for all marine mammals and sea turtles. **Vineyard Wind requested a change from 60 minutes to 30 minutes for non-delphinoid cetaceans and sea turtles, and to 15 minutes for delphinoid cetaceans, pinnipeds, and other protected marine species. BOEM partially approves this request according to the following: Vineyard Wind must ensure that active acoustic sound sources are not activated until the protected species observer (PSO) has reported the exclusion zone clear of: NARWs and sea turtles for 60 minutes; non-delphinoid cetaceans other than NARWs for 30 minutes; and delphinoid cetaceans and pinnipeds for 15 minutes.**

BOEM denies the requested reduction from 60 minutes to 30 minutes for sea turtles because of the current biological opinion requirements. The 60-minute pre-clearance and wait period requirement is based on the longest dive time (about 60 minutes for sea turtles) of listed species in the survey area, and applies to all species. Given that Mysticete whale dive times in the area are less than 30 minutes, BOEM has allowed for the change to 30 minutes only for whales. However, as noted above, Vineyard Wind must still follow the 60-minute requirement for turtles, as required in the biological opinion.

4.3.7.1 <u>Establishment of Default Geotechnical Watch Zone and Exclusion Zone</u>. **Vineyard Wind requested to modify the size of the 200-meter default exclusion zone required under lease stipulation 4.3.7.1 for large whales other than NARWs and sea turtles during geotechnical surveys.** According to lease stipulation 4.3.7.1, a default exclusion zone distance of 500 meters for North Atlantic right whales and other listed species must be monitored around each vessel conducting geotechnical survey activities where North Atlantic right whales are expected to occur. If surveys are conducted in an area where North Atlantic right whales are not expected to occur, a default exclusion zone of 200 meters for other large whales and sea turtles must be established around each vessel conducting geotechnical survey activities. Exclusion zones for non-listed marine mammals will be determined through project-specific mitigation and monitoring requirements of ITAs provided by NMFS. If an ITA is not required, default exclusion zones of 100 meters for harbor porpoises and humpback whales, and 50 meters for all other non-listed marine mammals must be established around each vessel conducting geotechnical survey activities.

Vineyard Wind requested an increase to 1,000 meters for NARWs, a decrease to 100 meters for non-delphinoid cetaceans other than right whales and harbor porpoises, and a decrease to 50 meters for delphinoid cetaceans, pinnipeds, and sea turtles. BOEM approves these requests based on new information showing that these exclusion zones are still effective at minimizing and avoiding effects to protected species. Please note that BOEM does not find that the information provided supports the increase from 500 to 1,000 meters. However, BOEM acknowledges Vineyard Wind's commitment to implementing the January 22, 2019 agreement with non-governmental organizations, and considers any additional distance beyond the minimum 500 meters to be voluntary on behalf of Vineyard Wind. Thus, a waiver is not required for this increase.

4.3.7.3 **Clearance of Exclusion Zone during Geotechnical Surveys. Vineyard Wind requested to modify the pre-clearance time and sound source wait period required under lease stipulation 4.3.7.3 during geotechnical surveys.** This stipulation requires a pre-clearance and wait period of 60 minutes for all marine mammals and sea turtles. **Vineyard Wind requested a change from 60 minutes to 30 minutes for non-delphinoid cetaceans and sea turtles, and to 15 minutes for delphinoid cetaceans, pinnipeds, and other protected marine species. BOEM partially approves this request according to the following: Vineyard Wind must ensure that the geotechnical sound source is not activated until the PSO has reported the exclusion zone clear of: NARWs and sea turtles for 60 minutes; non-delphinoid cetaceans other than NARWs for 30 minutes; and delphinoid cetaceans and pinnipeds for 15 minutes. BOEM denies the requested reduction from 60 minutes to 30 minutes for sea turtles** because of the current biological opinion requirements.

BOEM's approval of the above-noted modifications and limited waivers apply solely for purposes of Vineyard Wind's HRG and geotechnical surveys scheduled for May and June of 2019. None of these modifications or limited waivers impacts compliance with any other lease stipulations.

UNITED STATES DEPARTMENT OF COMMERCE
National Oceanic and Atmospheric Administration
NATIONAL MARINE FISHERIES SERVICE
1315 East-West Highway
Silver Spring, Maryland 20910

INCIDENTAL HARASSMENT AUTHORIZATION

Vineyard Wind, LLC (Vineyard Wind) is hereby authorized under section 101(a)(5)(D) of the Marine Mammal Protection Act (MMPA; 16 U.S.C. 1371(a)(5)(D)) to harass marine mammals incidental to marine site characterization surveys off the coasts of Massachusetts, Rhode Island, Connecticut, and New York, when adhering to the following terms and conditions.

1. This incidental harassment authorization (IHA) is valid from the date of issuance through June 20, 2022.

2. This IHA is valid only for the marine site characterization survey specified in the IHA application, in the Atlantic Ocean.

3. General Conditions

   (a) A copy of this IHA must be in the possession of Vineyard Wind, the vessel operators, the lead protected species observers (PSO), and any other relevant designees of Vineyard Wind operating under the authority of this IHA.

   (b) The species authorized for taking are listed in Table 1. The taking, by Level B harassment only, is limited to the species and numbers listed in Table 1. Any taking of species not listed in Table 1, or exceeding the authorized amounts listed in Table 1, is prohibited and may result in the modification, suspension, or revocation of this IHA.

   (c) The taking by injury, serious injury, or death of any of the species listed in Table 1 of the Authorization or any taking of any other species of marine mammal is prohibited and may result in the modification, suspension, or revocation of this IHA.

   (d) Vineyard Wind must ensure that the vessel operator and other relevant vessel personnel are briefed on all responsibilities, communication procedures, marine mammal monitoring protocols, operational procedures, and IHA requirements prior to the start of survey activity, and when relevant new personnel join the survey operations.

4. Mitigation Requirements – The holder of this Authorization is required to implement the following mitigation measures:

(a) Vineyard Wind must employ a minimum of two (2) NMFS-approved PSOs on each survey vessel at all times when high-resolution geophysical (HRG) equipment is in use (*i.e.* daylight and night time operations). PSOs must be on duty 30 minutes prior to ramp-up of HRG equipment on each survey vessel. PSOs must have no tasks other than to conduct observational effort, record observational data, and communicate with and instruct relevant vessel crew with regard to the presence of marine mammals and mitigation requirements.

(b) Visual monitoring must begin no less than 30 minutes prior to initiation of survey equipment and must continue until 30 minutes after use of survey equipment ceases.

(c) Exclusion Zones – PSOs must establish and monitor marine mammal Exclusion Zones. Distances to Exclusion Zones must be from any survey equipment, not the distance from the vessel. Exclusion Zones must be as follows:

(i) 500-m Exclusion Zone for North Atlantic right whales;

(ii) 100-m Exclusion Zone for all other marine mammals.

(d) Marine Mammal Monitoring Zone – PSOs must establish and monitor a marine mammal Monitoring Zone that represents a distance of 500 meters from survey equipment.

(e) Marine Mammal Buffer Zone – PSOs must establish and monitor a 200-m Buffer Zone.

(i) During use of geophysical sources with the potential to result in marine mammal harassment (i.e., anytime the acoustic source is active, including ramp-up), occurrences of marine mammals within the Buffer Zone must be communicated to the vessel operator to prepare for potential shutdown of the acoustic source.

(ii) The Buffer Zone is not applicable when the EZ is greater than 100 meters.

(f) Shutdown requirements

(i) If a marine mammal is observed within or entering the relevant Exclusion Zones as described under 4(c) while geophysical survey equipment is operational, the geophysical survey equipment must be immediately shut down.

(ii) Any PSO on duty has the authority to call for shutdown of survey equipment. When there is certainty regarding the need for mitigation action on the basis of visual detection, the relevant PSO(s) must call for such action immediately.

(iii) When a shutdown is called for by a PSO, the shutdown must occur and any dispute resolved only following shutdown.

(iv) The vessel operator must establish and maintain clear lines of communication directly between PSOs on duty and crew controlling the geophysical source(s) to ensure that shutdown commands are conveyed swiftly while allowing PSOs to maintain watch.

(v) Upon implementation of a shutdown, survey equipment may be reactivated when all marine mammals that triggered the shutdown have been confirmed by visual observation to have exited the relevant Exclusion Zone or an additional time period has elapsed with no further sighting of the animal that triggered the shutdown (15 minutes for small odontocetes and seals and 30 minutes for all other marine mammals).

(vi) If geophysical survey equipment shuts down for less than 30 minutes for reasons other than marine mammal mitigation (*e.g.,* due to mechanical or electronic failure) the equipment may be re-activated as soon as is practicable at full operational level if PSOs have maintained constant visual observation during the shutdown and no visual detections of marine mammals occurred within the applicable Exclusion and Buffer Zones during that time. For a shutdown of 30 minutes or longer, or if visual observation was not continued diligently during the pause, pre-clearance observation is required, as described under 4(g).

(vii) If a delphinid(s) from the genera *Delphinus, Lagenorhynchus,* or *Tursiops* is visually detected approaching the vessel (*e.g*., to bow ride) or towed survey equipment, shutdown is not required. If there is uncertainty regarding identification of a marine mammal species (*i.e.,* whether the observed marine mammal(s) belongs to one of the delphinid genera for which shutdown is waived), PSOs must use best professional judgment in making the decision to call for a shutdown. If delphinids from the above genera are observed within or entering the relevant EZ but do not approach the vessel or towed survey equipment, shutdown is required.

(viii) Shutdown of geophysical survey equipment is required upon observation of a species for which authorization has not been granted, or, observation of a species for which authorization has been granted but the authorized number of takes has been met, approaching or observed within the Level B harassment zone (*i.e.,* within 195 meters of active geophysical survey equipment).

(g) Pre-clearance observation – PSOs must conduct 30 minutes of pre-clearance observation prior to initiation of geophysical survey equipment. If a marine mammal is observed within or approaching the pre-clearance zones described below during the pre-clearance period, geophysical survey equipment must not be initiated until the marine mammal(s) is confirmed by visual observation to have exited the relevant zone, or, until an additional time period has elapsed with no further sighting of the animal (15 minutes for small odontocetes and seals and 30 minutes for all other species). The pre-clearance requirement includes small delphinids (as described in 4(f)(vii) above) that approach the vessel (*e.g.*, bow ride). Geophysical surveys must not be initiated if:

(i) a North Atlantic right whale is observed within a 500-m radius of geophysical survey equipment during the pre-clearance period; or

(ii) any other marine mammals are observed within a 200-m radius of geophysical survey equipment during the pre-clearance period.

(h) Ramp-up – when technically feasible, survey equipment must be ramped up at the start or re-start of survey activities. Ramp-up must begin with the power of the smallest acoustic equipment at its lowest practical power output appropriate for the survey. When technically feasible the power must then be gradually turned up and other acoustic sources added in a way such that the source level would increase gradually.

(i) Seasonal Restrictions

(i) Survey activities in the Cape Cod Bay SMA and Off Race Point SMA are limited to the months of August and September.

(ii) Vineyard Wind must not operate more than three HRG survey vessels concurrently within a seasonal restriction area as shown in Figure 1 with HRG survey equipment operating at or below 180 kHz.

(A) December through February restriction area is delineated by latitudes and longitudes of 41.183 N; 40.366 N; 69.533 W; and 70.616 W. This area is marked by a solid line in Figure 1.

(B) March through June restriction area is delineated by a polygon with the following vertices: 40.746 N 70.748 W; 40.953 N 71.284 W; 41.188 N 71.284 W; 41.348 N 70.835 W; 41.35 N 70.455 W; 41.097 N 70.372 W; and 41.021 N 70.37 W. This area is marked by a dashed line in Figure 1.

(j) Vessel Strike Avoidance – Vessel operator and crew must maintain a vigilant watch for all marine mammals and slow down or stop the vessel or alter course, as appropriate, to avoid striking any marine mammal, unless such action represents a human safety concern. Survey vessel crew members responsible for navigation duties must receive site-specific training on marine mammal sighting/reporting and vessel strike avoidance measures. Vessel strike avoidance measures must include the following, except under circumstances when complying with these requirements would put the safety of the vessel or crew at risk:

(i) The vessel operator and crew must maintain vigilant watch for cetaceans and pinnipeds, and slow down or stop the vessel to avoid striking marine mammals;

(ii) The vessel operator must reduce vessel speed to 10 knots (18.5 km/hr) or less when any large whale, any mother/calf pairs, whale or dolphin pods, or larger assemblages of non-delphinoid cetaceans are observed near (within 100 m (330-ft)) an underway vessel;

(iii) The survey vessel must maintain a separation distance of 500 meters (1640 ft) or greater from any sighted North Atlantic right whale. If a whale is observed but cannot be confirmed as a species other than a right whale, the vessel operator must assume that it is a right whale and maintain a minimum separation distance of 500 meters.

(iv) If underway, the vessel must steer a course away from any sighted North Atlantic right whale at 10 knots (18.5 km/hr) or less until the 500-m (1640 ft) minimum separation distance has been established. If a North Atlantic right whale is sighted in a vessel’s path, or within 500 meters to an underway vessel, the underway vessel must reduce speed and shift the engine to neutral. Engines must not be engaged until the North Atlantic right whale has moved outside of the vessel’s path and beyond 500 meters. If stationary, the vessel must not engage engines until the North Atlantic right whale has moved beyond 500 m;

(v) The vessel must maintain a separation distance of 100 meters (330 ft) or greater from any sighted non-delphinoid cetacean. If sighted, the vessel underway must reduce speed and shift the engine to neutral, and must not engage the engines until the non-delphinoid cetacean has moved outside of the vessel’s path and beyond 100 meters. If a survey vessel is stationary, the vessel must not engage engines until the non-delphinoid cetacean has moved out of the vessel’s path and beyond 100 meters;

(vi) The vessel must maintain a separation distance of 50 meters (164 ft) or greater from any sighted delphinoid cetacean or pinniped. Any vessel underway must remain parallel to a sighted delphinoid cetacean's course whenever possible, and avoid excessive speed or abrupt changes in direction. Vessels may not adjust course and speed until the delphinoid cetaceans have moved beyond 50 meters and/or the abeam of the underway vessel;

(vii) All vessels underway must not divert or alter course in order to approach any whale, delphinoid cetacean, or pinniped. Any vessel underway must avoid excessive speed or abrupt changes in direction to avoid injury to the sighted cetacean or pinniped; and

(viii) All survey vessels, regardless of size, must observe a 10-knot speed restriction in specific areas designated by NMFS for the protection of North Atlantic right whales from vessel strikes: any DMAs or Slow Zones when in effect, and the Block Island Seasonal Management Area (SMA) (from November 1 through April 30), Cape Cod Bay SMA (from January 1 through May 15), Off Race Point SMA (from March 1 through April 30) and Great South Channel SMA (from April 1 through July 31).

5. Monitoring Requirements – Vineyard Wind is required to conduct marine mammal visual monitoring during geophysical survey activity. Monitoring must be conducted in accordance with the following requirements:

(a) A minimum of two (2) NMFS-approved PSOs must be on duty and conducting visual observations when HRG equipment is in use on all survey vessels during geophysical surveys (*i.e*. daylight and night time operations).

(b) PSO resumes must be provided to NMFS for approval prior to commencement of the survey. PSO qualifications must include completion of a PSO training course and direct field experience conducting similar surveys.

(c) PSOs must be employed by a third-party observer provider, must have no tasks other than to conduct observational effort, collect data, and communicate with and instruct relevant vessel crew with regard to the presence of marine mammals and mitigation requirements (including brief alerts regarding maritime hazards), and must have successfully completed an approved PSO training course appropriate for their designated task. Non-third-party observers may be approved by NMFS on a case-by-case basis for limited, specific duties in support of approved, independent PSOs.

(d) Visual monitoring must begin no less than 30 minutes prior to initiation of geophysical survey equipment and must continue until one hour after use of the acoustic source ceases or until 30 minutes past sunset.

(e) PSOs must coordinate to ensure 360° visual coverage around the vessel from the most appropriate observation posts.

(f) Visual observations must be conducted using binoculars and the naked eye while free from distractions and in a consistent, systematic, and diligent manner.

(g) PSOs may be on watch for a maximum of four consecutive hours followed by a break of at least two hours between watches and may conduct a maximum of 12 hours of observation per 24-hour period.

(h) In cases where multiple vessels are surveying concurrently, any observations of marine mammals must be communicated to PSOs on all active survey vessels.

(i) PSOs must be equipped with binoculars and have the ability to estimate distances to marine mammals located in proximity to the vessel and/or Exclusion Zones using range finders. Reticulated binoculars must also be available to PSOs for use as appropriate based on conditions and visibility to support the sighting and monitoring of marine species.

(j) Position data must be recorded using hand-held or vessel global positioning system (GPS) units for each sighting.

(k) Vineyard Wind must consult NMFS' North Atlantic right whale reporting systems for the presence of North Atlantic right whales throughout survey operations for the establishment of a Dynamic Management Area (DMA or Slow Zone).

(l) During good conditions (*e.g.*, daylight hours; Beaufort sea state (BSS) 3 or less), to the maximum extent practicable, visual PSOs must conduct observations when the acoustic source is not operating for comparison of sighting rates and behavior with and without use of the acoustic source and between acquisition periods.

(m) Night-vision equipment (*i.e.*, night-vision goggles and infrared technology) must be available for use during nighttime monitoring.

(n) Any observations of marine mammals by crew members aboard any vessel associated with the survey must be relayed to the PSO team.

(o) If Exclusion Zones, Buffer Zone and/or Monitoring Zone are not fully visible to PSOs due to darkness or inclement weather, survey activities may continue, unless a marine mammal is detected within or entering the Exclusion Zones as described under 4(c).

(p) Data on all PSO observations must be recorded based on standard PSO collection requirements. PSOs must use standardized data forms, whether hard copy or electronic. The following information must be reported:

(i) PSO names and affiliations

(ii) Dates of departures and returns to port with port name

(iii) Dates and times (Greenwich Mean Time) of survey effort and times corresponding with PSO effort

(iv) Vessel location (latitude/longitude) when survey effort begins and ends; vessel location at beginning and end of visual PSO duty shifts

(v) Vessel heading and speed at beginning and end of visual PSO duty shifts and upon any line change

(vi) Environmental conditions while on visual survey (at beginning and end of PSO shift and whenever conditions change significantly), including wind speed and direction, Beaufort sea state, Beaufort wind force, swell height, weather conditions, cloud cover, sun glare, and overall visibility to the horizon

(vii) Factors that may be contributing to impaired observations during each PSO shift change or as needed as environmental conditions change (*e.g.*, vessel traffic, equipment malfunctions)

(viii) Survey activity information, such as type of survey equipment in operation, acoustic source power output while in operation, and any other notes of significance (*i.e.*, pre-clearance survey, ramp-up, shutdown, end of operations, etc.)

(ix) If a marine mammal is sighted, the following information should be recorded:

(A) Watch status (sighting made by PSO on/off effort, opportunistic, crew, alternate vessel/platform);

(B) PSO who sighted the animal;

(C) Time of sighting;

(D) Vessel location at time of sighting;

(E) Water depth;

(F) Direction of vessel’s travel (compass direction);

(G) Direction of animal’s travel relative to the vessel;

(H) Pace of the animal;

(I) Estimated distance to the animal and its heading relative to vessel at initial sighting;

(J) Identification of the animal (*e.g.*, genus/species, lowest possible taxonomic level, or unidentified); also note the composition of the group if there is a mix of species;

(K) Estimated number of animals (high/low/best) ;

(L) Estimated number of animals by cohort (adults, yearlings, juveniles, calves, group composition, etc.);

(M) Description (as many distinguishing features as possible of each individual seen, including length, shape, color, pattern, scars or markings, shape and size of dorsal fin, shape of head, and blow characteristics);

(N) Detailed behavior observations (*e.g.*, number of blows, number of surfaces, breaching, spyhopping, diving, feeding, traveling; as explicit and detailed as possible; note any observed changes in behavior);

(O) Animal’s closest point of approach and/or closest distance from the center point of the acoustic source;

(P) Platform activity at time of sighting (*e.g.*, deploying, recovering, testing, data acquisition, other);

(Q) Description of any actions implemented in response to the sighting (*e.g.*, delays, shutdown, ramp-up, speed or course alteration, etc.) and time and location of the action: and

(R) Documentation of whether the marine mammal was estimated to have been within 195 meters of active survey equipment.

6. Reporting – a monitoring report must be provided to NMFS within 90 days after completion of survey activities that fully documents the methods and monitoring protocols, summarizes the data recorded during both visual and passive acoustic monitoring, estimates the number of marine mammals that may have been taken during survey activities, describes, assesses and compares the effectiveness of monitoring and mitigation measures. Any recommendations made by NMFS must be addressed in the final report prior to acceptance by NMFS. PSO datasheets or raw sightings data must also be provided with the draft and final monitoring report.

(a) Reporting sightings of North Atlantic right whales:

(i) If a North Atlantic right whale is observed at any time by any project vessels, during surveys or during vessel transit, Vineyard Wind must immediately report sighting information to the NMFS North Atlantic Right Whale Sighting Advisory System: (866) 755-6622. North Atlantic right whale sightings in any location may also be reported to the U.S. Coast Guard via channel 16.

(b) Reporting injured or dead marine mammals:

(i) Discovery of injured or dead marine mammal – In the event that personnel involved in the survey activities covered by the authorization discover an injured or dead marine mammal, the IHA-holder shall report the incident to the Office of Protected Resources (OPR) (301-427-8401), NMFS and to the New England/Mid-Atlantic Regional Stranding Coordinator (978-282-8478) as soon as feasible. The report must include the following information:

(A) Time, date, and location (latitude/longitude) of the first discovery (and updated location information if known and applicable);

(B) Species identification (if known) or description of the animal(s) involved;

(C) Condition of the animal(s) (including carcass condition if the animal is dead);

(D) Observed behaviors of the animal(s), if alive;

(E) If available, photographs or video footage of the animal(s); and

(F) General circumstances under which the animal was discovered.

(ii) Vessel Strike – In the event of a ship strike of a marine mammal by any vessel involved in the activities covered by the authorization, the IHA-holder shall report the incident to OPR, NMFS and to the New England/Mid-Atlantic Regional Stranding Coordinator as soon as feasible. The report must include the following information:

(A) Time, date, and location (latitude/longitude) of the incident;

(B) Species identification (if known) or description of the animal(s) involved;

(C) Vessel's speed during and leading up to the incident;

(D) Vessel's course/heading and what operations were being conducted (if applicable);

(E) Status of all sound sources in use;

(F) Description of avoidance measures/requirements that were in place at the time of the strike and what additional measures were taken, if any, to avoid strike;

(G) Environmental conditions (e.g., wind speed and direction, Beaufort sea state, cloud cover, visibility) immediately preceding the strike;

(H) Estimated size and length of animal that was struck;

(I) Description of the behavior of the marine mammal immediately preceding and following the strike;

(J) If available, description of the presence and behavior of any other marine mammals immediately preceding the strike;

(K) Estimated fate of the animal (e.g., dead, injured but alive, injured and moving, blood or tissue observed in the water, status unknown, disappeared); and

(L) To the extent practicable, photographs or video footage of the animal(s).

7. This Authorization may be modified, suspended or withdrawn if the holder fails to abide by the conditions prescribed herein, or if NMFS determines the authorized taking is

having more than a negligible impact on the species or stock of affected marine mammals.

PSO Equipment Specification Sheets

(to be provided after contractor selection)

Night Monitoring Equipment Specifications

Night monitoring watches will be conducted with night vision goggles with head mounts and thermal clip-ons. Regular night vision binoculars work by enhancing the disponible light to allow a brighter image with the use of phosphor screen. The PVS-7D night vision goggles (Figure 1) withstand water immersion and runs on two AA batteries for more than 40 hours. Also provided were three pairs of batteries and a batteries charger with the equipment.

Figure 1: Night vision goggles with thermal clip.

The thermal clip on the night vision binocular enabled the capture of infrared light, which provided thermal imaging. The handheld forward-looking infrared (FLIR) system may also be provided (Figure 2). This allows a bit more flexibility with the IR detached from the headpiece.

Figure 2: Handheld thermal FLIR

Night Monitoring Equipment Specifications

Night Vision Goggle Technical Specifications

- Generation: 3 U.S.
- Resolution: 64 lp/mm (Min)
- Film: Thin-filmed
- Magnification: 1x
- Field of View: 40º
- Objective Lens: 25mm f/1.2
- Eyepiece Lens EFL: 26 mm
- Diopter Adjustment: +2 to -6
- Interpupillary Adjustment: 55 to 71 mm
- Range of Focus: 20cm to infinity
- Battery Type: Two (2) AA batteries
- Weight w/batteries: 24 oz / 680 grams
- Dimensions: 6 3/8”(L) x 6”(W) x 3”(H)
- Operating Temperature: -51°C to +52° C
- Weather Resistant: Yes
- IR Illuminator: Yes (built in)

Thermal Acquisition Clip-On Technical Specifications

- Field of View: 20° circular (centered)
- Magnification: 1X, optical unity
- Sensor: 320 x 240 Vox uncooled LWIR microbolometer
- Display Brightness: Adjustable
- Polarity: White hot/black hot
- Calibration: Manual
- Range: Detection – 300m, Recognition – 260m
- Compatibility: PVS-7
- Interface: Standard quick connect
- Battery Type: CR123, 3V lithium
- Battery Life: >3.0 hours (23°C), 2.5 hours (0°C)
- Dimensions: 38 x 64 x 89 mm (W x H x L)
- Weight: 166g with battery

Forward–looking Infrared (FLIR) Monocular Technical Specifications

- Dimensions: 5.5”(L) x 2.7”(W) x 1.9”(H)
- Weight: 0.46 pounds
- Detector Type: 320 x 256 V0x Microbolometer
- FOV: 24° x 19° (NTSC)
- Refresh Rate: 60 Hz
- Video Output: Digital Video
- Optical Magnification: 1x
- Display: Quad-VGA (1280 x 960) FLCOS
- Battery Type: One CR123A 3V Lithium Battery
- USB Power: 5 VDC

Passive Acoustic Monitoring (PAM) Equipment

The PAM equipment comprises the following items:

- 250m Hydrophone Array Cable containing 2 Low Frequency hydrophones (10Hz to 24kHz), 2 Ultra Broadband hydrophones (200Hz to 200kHz), and 2 Broadband hydrophones (2kHz to 200kHz)
- 100m deck cable
- Electronic data capture and processing unit including:
  - Headphones RF transmitter
  - Fireface audio interface
  - Rackmount PC
  - Buffer interface unit
- Integral screen and keyboard
- Backup System

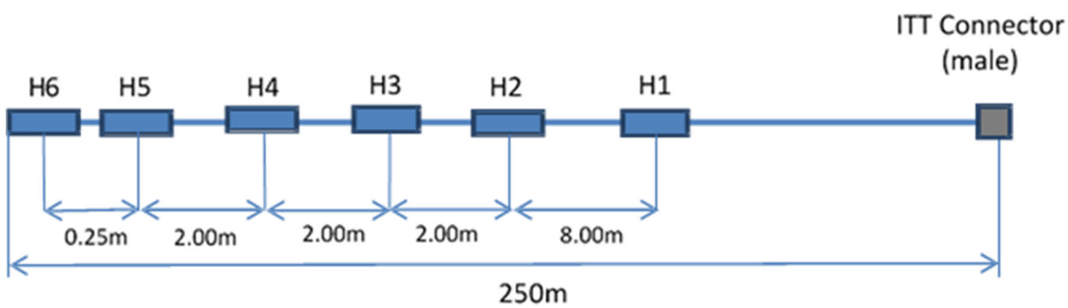
6-Channel Hydrophone Array

The array includes six hydrophones arranged in three pairs of identical specification with appropriate physical separation to provide direction0finding (bearings) to marine mammals and localization using Target Motion Analysis (TMA).

- The front pair (H1 and H2, 8m separation) consists of two “Low Frequency” hydrophones with a response of 10 Hz to 24 KHz.
- The middle pair (H3 and H4, 2m separation) consists of two “Broadband” hydrophones with a response of 200 Hz to 200 kHz.
- The rear pair (H5 and H6, 0.25m separation) consists of two “Standard” hydrophones with a response of 2 kHz to 200 kHz.

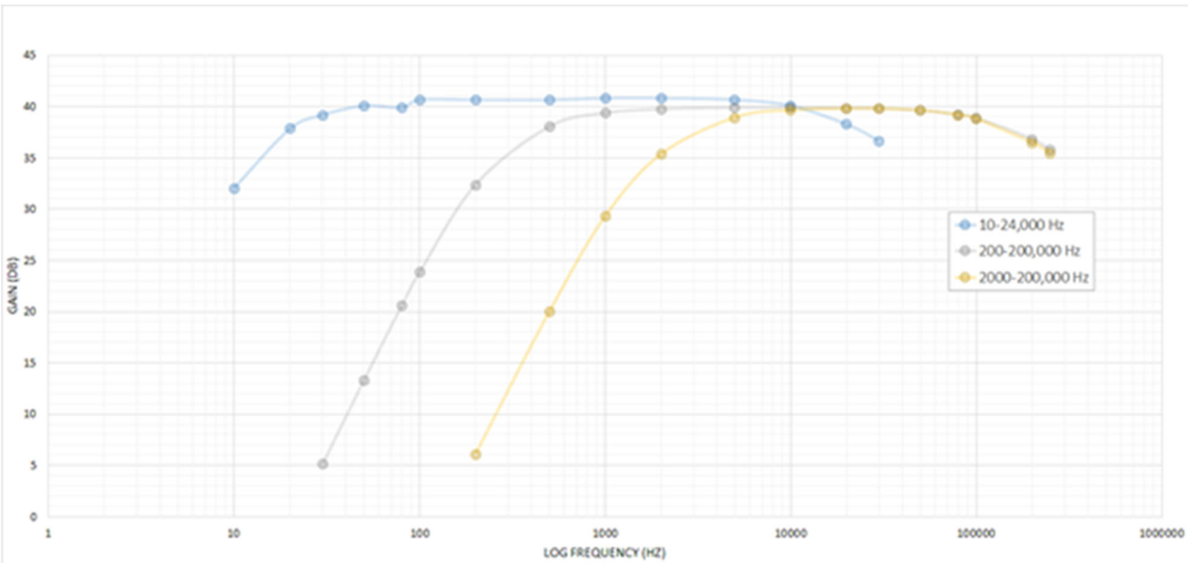
The “Low Frequency” hydrophones are configured to detect very low frequency vocalizations while the “Broadband” and “Standard” hydrophones are configured to detect low-mid frequency and mid-high vocalizations respectively. These three pairs of hydrophones provide the capability to detect the full range of marine mammal vocalizations anticipated to be encountered.

Simulation exercises have been completed using the PAMGuard software to verify that they within-pari separation provides consistently accurate bearings to a range of marine mammal vocalizations. Test signals used in these exercises simulated right whale up-calls, broadband sperm whale clicks, delphinid whistles, and narrow band high frequency harbor porpoise clicks. Anecdotal reports from surveys utilizing Seiche PAM systems with simultaneous visual and acoustic monitoring indicate that the acoustic range estimates have been sufficiently accurate for decision-making on whether vocal animals are within or beyond a 500m mitigation zone.



Frequency Response Curves

Frequency response curves provide a standard for demonstrating hydrophone sensitivity over a range of frequencies. A flat response between the frequencies of interest is desirable, indicating consistent sensitivity across the band of interest. The frequency response curves provided were generated from 10 Hz to 24 kHz, 200 Hz to 200 kHz, and 2 kHz to 200 kHz hydrophone elements (including pre-amps) of a Seiche towed array and are representative of the response curves for the 6 Hydrophone Array. The frequency response curves for each element within the arrays (main system and spare) used on the survey will be generated as part of the calibration process prior to their dispatch.



APPENDIX B

Required Documentation and Permits

UNITED STATES DEPARTMENT OF COMMERCE
National Oceanic and Atmospheric Administration
NATIONAL MARINE FISHERIES SERVICE
1315 East-West Highway
Silver Spring, Maryland 20910

INCIDENTAL HARASSMENT AUTHORIZATION

Vineyard Northeast, LLC (Vineyard Northeast) and their designees are hereby authorized under section 101(a)(5)(D) of the Marine Mammal Protection Act (MMPA; 16 U.S.C. 1371(a)(5)(D)) to incidentally harass marine mammals, under the following conditions:

1. This incidental harassment authorization (IHA) is valid for one year from the date of issuance.

2. This IHA authorizes take incidental to marine site characterization surveys in the Outer Continental Shelf Lease Area OCS-A 0522 and OCS-A 0544 and potential offshore export cable corridor (OECC) routes to landfall locations from Massachusetts to New Jersey.

3. General Conditions

   (a) A copy of this IHA must be in the possession of Vineyard Northeast, the vessel operators, the lead protected species observers (PSO), and any other relevant designees of Vineyard Northeast while conducting activities subject to this IHA.

   (b) The species and/or stocks authorized for taking are listed in Table 1. Taking is authorized take by Level B harassment only and is limited to the species and/or stocks and numbers listed in Table 1.

   (c) The taking by injury, serious injury, or death of any of the species/stocks listed in Table 1 or any taking of any species/stock of marine mammal not listed in Table 1 is prohibited and may result in the modification, suspension, or revocation of this IHA. Any taking exceeding the authorized amounts listed in Table 1 is prohibited and may result in the modification, suspension, or revocation of this IHA.

   (d) Vineyard Northeast must instruct relevant vessel personnel with regard to the authority of the protected species monitoring team, and must ensure that relevant vessel personnel and the protected species monitoring team participate in a joint onboard briefing (hereafter PSO briefing), led by the vessel operator and lead PSO, prior to beginning survey activities to ensure that responsibilities, communication procedures, monitoring protocols, safety and operational procedures, and IHA requirements are clearly understood. This PSO briefing must be repeated when relevant new personnel (*e.g.*, PSOs, acoustic source operator) join the survey operations before work commences.

   (e) The acoustic source must be deactivated when not acquiring data or preparing to acquire data, except as necessary for testing. Unnecessary use of the acoustic source must be avoided.

(f) Vineyard Northeast must abide by the relevant Project Design Criteria (PDC 4, 5 and 7) of the programmatic consultation completed by NMFS' Greater Atlantic Regional Fisheries Office on June 29, 2021 (revised September 2021), pursuant to section 7 of the Endangered Species Act (ESA).

4. <u>Mitigation Requirements</u>

(a) Vineyard Northeast must employ qualified, NMFS-approved visual PSOs (see Section 5 of this IHA). When specified acoustic sources (impulsive: sparkers and boomers; non-impulsive: non-parametric sub-bottom profilers) are operating, a minimum of one PSO must be on duty, per source vessel, during daylight hours (civil sunrise to civil sunset) and two PSOs must be on duty, per source vessel, during nighttime hours.

(b) Visual monitoring must begin no less than 30 minutes prior to initiation of specified acoustic sources (see condition 4(a) of this IHA) and must continue until 30 minutes after use of specified acoustic sources ceases.

(c) PSOs must establish and monitor applicable Shutdown Zones (see Table 3). These zones must be based upon the radial distance from the acoustic source (rather than being based around the vessel itself).

(d) Pre-start clearance and ramp-up – PSOs must establish and monitor applicable pre-start clearance zones (see Table 3) A ramp-up procedure, involving a gradual increase in source level output, is required at all times as part of the activation of the acoustic source, when technically feasible. Operators must ramp up sources to half power for 5 minutes and then proceed to full power. A 30-minute pre-start clearance observation period must occur prior to the start of ramp-up (or initiation of source use if ramp-up is not technically feasible). All operators must adhere to the following pre-start clearance and ramp-up requirements:

(i) The operator must notify a designated PSO of the planned start of ramp-up as agreed upon with the lead PSO; the notification time must not be less than 60 minutes prior to the planned ramp-up to allow the PSOs time to monitor the Shutdown Zones for 30 minutes prior to the initiation of ramp-up (pre-start clearance). During this 30-minute pre-start clearance period, the entire applicable Shutdown Zone must be visible, except as indicated in (viii) below.

(ii) Ramp-ups must be scheduled so as to minimize the time the source activated.

(iii) A PSO conducting pre-start clearance observations must be notified again immediately prior to initiating ramp-up procedures and the operator must receive confirmation from the PSO that the Shutdown Zone is clear prior to proceeding.

(iv) Any PSO on duty has the authority to delay the start of survey operations if a marine mammal is detected within the applicable pre-start clearance zone.

(v) The operator must establish and maintain clear lines of communication directly between PSO(s) on duty and crew controlling the acoustic source to ensure that mitigation commands are conveyed swiftly while allowing PSOs to maintain watch.

(vi) Ramp-up must not be initiated if any marine mammal is within the applicable Shutdown Zone. If a marine mammal is observed within the applicable Shutdown Zone during the 30-minute pre-start clearance period, ramp-up must not begin until the animal(s) has been observed exiting the zones or until an additional period has elapsed with no further sightings (15 minutes for small odontocetes and pinnipeds and 30 minutes for all other species).

(vii) PSOs must monitor the Shutdown Zone 30 minutes before and during ramp-up, and ramp-up must cease and the source must be shut down upon observation of a marine mammal within the applicable Shutdown Zone.

(viii) Ramp-up may occur at times of poor visibility, including nighttime, if appropriate visual monitoring has occurred with no detections of marine mammals in the 30 minutes prior to beginning ramp-up. Acoustic source activation may only occur at night where operational planning cannot reasonably avoid nighttime activation.

(ix) If the acoustic source is shut down for brief periods (*i.e.*, less than 30 minutes) for reasons other than implementation of prescribed mitigation (*e.g.*, mechanical difficulty), it may be activated again without ramp-up if PSOs have maintained constant visual observation and no detections of marine mammals have occurred within the applicable Shutdown Zone. For any longer shutdown, pre-start clearance observation and ramp-up are required.

(e) Shutdown requirements

(i) Any PSO on duty has the authority to call for shut down of the acoustic source if a marine mammal is detected within the applicable Shutdown Zone.

(ii) The operator must establish and maintain clear lines of communication directly between PSOs on duty and crew controlling the acoustic source to ensure that shutdown commands are conveyed and implemented swiftly while allowing PSOs to maintain watch.

(iii) When the acoustic source is active and a marine mammal appears within or enters the applicable Shutdown Zone, the acoustic source must be shut down (Table 3). When shutdown is instructed by a PSO, the acoustic source must be immediately deactivated and any dispute resolved only following deactivation.

(iv) The shutdown requirement is waived for small delphinids[1] and pinnipeds, as provided in paragraphs (A) and (B) below.

(A) If a delphinid (individual belonging to the genera of the Family *Delphinidae*) or pinniped included in Table 1 is visually detected within the Shutdown Zone, no shutdown is required.

(B) If there is uncertainty regarding identification of a marine mammal species (*i.e.*, whether the observed marine mammal(s) belongs to one of the delphinid genera for which shutdown is waived or one of the species with a larger Shutdown Zone), PSOs must use best professional judgment in making the decision to call for a shutdown.

(v) Upon implementation of shutdown, the source may be reactivated after the marine mammal has been observed exiting the applicable Shutdown Zone or following a clearance period (15 minutes for harbor porpoises and 30 minutes for all other species; Table 3) with no further detection of the marine mammal.

(vi) Shutdown of acoustic sources is required upon observation of either a species for which incidental take is not authorized or a species for which incidental take has been authorized but the authorized number of takes has been met entering or within the Level B harassment zone (Table 2).

(f) Vessel Strike Avoidance – Vessel operators must comply with the below measures except under extraordinary circumstances when the safety of the vessel or crew is in doubt or the safety of life at sea is in question. These requirements do not apply in any case where compliance would create an imminent and serious threat to a person or vessel or to the extent that a vessel is restricted in its ability to maneuver and, because of the restriction, cannot comply.

(i) Vessel operators and crews must maintain a vigilant watch for all marine mammals and slow down, stop their vessel, or alter course, as appropriate and regardless of vessel size, to avoid striking any marine mammal. A single marine mammal at the surface may indicate the presence of additional submerged animals in the vicinity of the vessel; therefore,

[1] Small delphinids include members of the following genera: *Delphinus*, *Lagenorhynchus*, *Stenella*, or *Tursiops*.

precautionary measures should always be exercised. A visual observer aboard the vessel must monitor a vessel strike avoidance zone around the vessel (species-specific distances detailed below). Visual observers monitoring the vessel strike avoidance zone may be third-party observers (*i.e.*, PSOs) or crew members, but crew members responsible for these duties must be provided sufficient training to 1) distinguish a marine mammal from other phenomena and 2) broadly to identify a marine mammal as a right whale, other whale (defined in this context as sperm whales or baleen whales other than right whales), or other marine mammals.

(ii) All vessels, regardless of size, must observe a 10-knot speed restriction in specific areas designated by NMFS for the protection of North Atlantic right whales from vessel strikes. These include all Seasonal Management Areas (SMA) (when in effect) and any Dynamic Management Areas (DMA) (when in effect). See *www.fisheries.noaa.gov/national/endangered-species-conservation/reducing-ship-strikes-north-atlantic-right-whales* for specific detail regarding these areas.

(iii) Vessel speeds must be reduced to 10 knots or less when mother/calf pairs, pods, or large assemblages cetaceans are observed near a vessel.

(iv) All vessels must maintain a minimum separation distance of 500-m from right whales and other ESA-listed species. If an ESA-listed species is sighted within the relevant separation distance, the vessel must steer a course away at 10-knots or less until the 500-m separation distance has been established (Table 3). If a whale is observed but cannot be confirmed as a species that is not ESA-listed, the vessel operator must assume that it is an ESA-listed species and take appropriate action.

(v) All vessels must maintain a minimum separation distance of 100-m from non-ESA-listed whales (Table 3).

(vi) All vessels must, to the maximum extent practicable, attempt to maintain a minimum separation distance of 50-m from all other marine mammals, with an understanding that at times this may not be possible (*e.g.*, for animals that approach the vessel; Table 3).

(vii) When a marine mammal is sighted while a vessel is underway, the vessel must take action as necessary to avoid violating the relevant separation distance (*e.g.*, attempt to remain parallel to the animal's course, avoid excessive speed or abrupt changes in direction until the animal has left the area, reduce speed and shift the engine to neutral). This does not apply to any vessel towing gear or any vessel that is navigationally constrained.

(g) Survey activities using HRG equipment operating at or below 180 kHz are prohibited from January 1 through May 15 within the North Atlantic right whale SMA in Cape Cod Bay.

5. Monitoring Requirements

(a) Vineyard Northeast must use independent, dedicated, trained PSOs, meaning that the PSOs must be employed by a third-party observer provider, must have no tasks other than to conduct observational effort, collect data, and communicate with and instruct relevant vessel crew with regard to the presence of marine mammal and mitigation requirements (including brief alerts regarding maritime hazards), and must have successfully completed an approved PSO training course for geophysical surveys. Except as provided under condition 4(f)(i) above and paragraph (b) below, visual monitoring must be performed by qualified, NMFS-approved PSOs. PSO resumes must be provided to NMFS for review and approval prior to the start of survey activities.

(b) On a case-by-case basis, non-independent observers (*e.g.*, crew members) may be approved by NMFS to act as PSOs for limited, specific duties (*i.e.*, conduct visual monitoring while the independent NMFS-approved PSO takes the required 2-hour break between 4-hour shifts) on smaller vessels with limited occupancy. Non-independent observers may be approved only for surveys operating in nearshore waters and only for daylight operations In order to be approved to act as PSOs, non-independent observers must have no duties other than marine mammal monitoring while on watch, and must be trained on protected species detection and identification, vessel strike minimization procedures, and reporting requirements in this IHA. If a whale is observed but cannot be confirmed as a species other than a right whale, the non-independent observer must assume that it is a right whale and take appropriate action (*i.e.*, call for a delay or shutdown).

(c) PSO names must be provided to NMFS by the operator for review and confirmation of their approval for specific roles prior to commencement of the survey[2]. For prospective PSOs not previously approved, or for PSOs whose approval is not current, NMFS must review and approve PSO qualifications. Resumes must include information related to relevant education, experience, and training, including dates, duration, location, and description of prior PSO experience. Resumes must be accompanied by relevant documentation of successful completion of necessary training.

(d) NMFS may approve PSOs as conditional or unconditional. A conditionally-approved PSO may be one who is trained but has not yet attained the requisite experience. An unconditionally-approved PSO is one who has attained the necessary experience. For unconditional approval, the PSO must have a minimum of 90 days at sea performing the role during a geophysical survey, with the

[2] PSO-related inquiries should be directed to *nmfs.psoreview@noaa.gov*.

conclusion of the most recent relevant experience not more than 18 months previous.

(e) At least one of the visual PSOs aboard the vessel must be unconditionally-approved. One unconditionally-approved visual PSO must be designated as the lead for the entire PSO team. This lead should typically be the PSO with the most experience, would coordinate duty schedules and roles for the PSO team[3], and serve as primary point of contact for the vessel operator. To the maximum extent practicable, the duty schedule must be planned such that unconditionally-approved PSOs are on duty with conditionally-approved PSOs.

(f) PSOs must have successfully attained a bachelor's degree from an accredited college or university with a major in one of the natural sciences, a minimum of 30 semester hours or equivalent in the biological sciences, and at least one undergraduate course in math or statistics. The educational requirements may be waived if the PSO has acquired the relevant skills through alternate experience. Requests for such a waiver must be submitted to NMFS and must include written justification. Alternate experience that may be considered includes, but is not limited to, (1) secondary education and/or experience comparable to PSO duties; (2) previous work experience conducting academic, commercial, or government-sponsored marine mammal surveys; and (3) previous work experience as a PSO (PSO must be in good standing and demonstrate good performance of PSO duties).

(g) PSOs must successfully complete relevant training, including completion of all required coursework and passing (80 percent or greater) a written and/or oral examination developed for the training program.

(h) PSOs must coordinate to ensure 360° visual coverage around the vessel from the most appropriate observation posts and must conduct visual observations using binoculars or night-vision equipment and the naked eye while free from distractions and in a consistent, systematic, and diligent manner.

(i) PSOs may be on watch for a maximum of four consecutive hours followed by a break of at least two hours between watches and may conduct a maximum of 12 hours of observation per 24-hour period.

(j) Any observations of marine mammal by crew members aboard any vessel associated with the survey must be relayed to the PSO team.

(k) Vineyard Northeast must work with the selected third-party PSO provider to ensure PSOs have all equipment (including backup equipment) needed to adequately perform necessary tasks, including accurate determination of distance and bearing to observed marine mammals, and to ensure that PSOs are capable of

[3] Responsibility for coordination of duty schedules and roles may be delegated, such as to a shore-based monitoring coordinator employed by the third-party observer provider.

calibrating equipment as necessary for accurate distance estimates and species identification. Such equipment, at a minimum, must include:

(i) At least one thermal (infrared) imaging device suited for the marine environment;

(ii) Reticle binoculars (*e.g.*, 7x50) of appropriate quality (at least one per PSO, plus backups);

(iii) Global Positioning Units (GPS) (at least one plus backups);

(iv) Digital cameras with a telephoto lens that is at least 300 mm or equivalent on a full-frame single lens reflex (SLR) (at least one plus backups). The camera or lens must also have an image stabilization system;

(v) Equipment necessary for accurate measurement of distances to marine mammals;

(vi) Compasses (at least one plus backups);

(vii) Means of communication among vessel crew and PSOs; and

(viii) Any other tools deemed necessary to adequately and effectively perform PSO tasks.

(l) Equipment specified in (i) through (viii) above may be provided by an individual PSO, the third-party PSO provider, or the operator, but Vineyard Northeast is responsible for ensuring PSOs have the proper equipment required to perform the duties specified within this IHA.

(m) During good conditions (*e.g.*, daylight hours; Beaufort sea state 3 or less), PSOs must conduct observations when the specified acoustic sources (see condition 4(a) of this IHA) are not operating for comparison of sighting rates and behavior with and without use of the specified acoustic sources and between acquisition periods, to the maximum extent practicable.

(n) Vineyard Northeast must consult the NMFS North Atlantic right whale reporting system and Whale Alert, daily and as able, for the presence of North Atlantic right whales before and throughout survey operations, and for the establishment of a DMA. If NMFS should establish a DMA in the Lease Areas during the survey, the vessels must abide by speed restrictions in the DMA.

6. <u>Reporting Requirements</u>

(a) Vineyard Northeast must submit a draft comprehensive report on all activities and monitoring results within 90 days of the completion of the survey or expiration of the IHA, whichever comes sooner. The report must describe all activities conducted and sightings of marine mammals, must provide full documentation of methods, results, and interpretation pertaining to all monitoring, and must summarize the dates and locations of survey operations and all marine mammal sightings (dates, times, locations, activities, associated survey activities). The draft report must also include geo-referenced, time-stamped vessel tracklines for all time periods during which acoustic sources were operating. Tracklines must include points recording any change in acoustic source status (*e.g.*, when the sources began operating, when they were turned off, or when they changed operational status such as from full array to single gun or vice versa). GIS files must be provided in ESRI shapefile format and include the UTC date and time, latitude in decimal degrees, and longitude in decimal degrees. All coordinates must be referenced to the WGS84 geographic coordinate system. In addition to the report, all raw observational data must be made available. A final report must be submitted within 30 days following resolution of any comments on the draft report. All draft and final marine mammal monitoring reports must be submitted to *PR.ITP.MonitoringReports@noaa.gov*, *nmfs.gar.incidental-take@noaa.gov* and *ITP.Esch@noaa.gov*.

(b) PSOs must use standardized electronic data forms to record data. PSOs must record detailed information about any implementation of mitigation requirements, including the distance of marine mammal to the acoustic source and description of specific actions that ensued, the behavior of the animal(s), any observed changes in behavior before and after implementation of mitigation, and if shutdown was implemented, the length of time before any subsequent ramp-up of the acoustic source. If required mitigation was not implemented, PSOs must record a description of the circumstances. At a minimum, the following information must be recorded:

(i) Vessel names (source vessel and other vessels associated with survey), vessel size and type, maximum speed capability of vessel;

(ii) Dates of departures and returns to port with port name;

(iii) The lease number;

(iv) PSO names and affiliations;

(v) Date and participants of PSO briefings;

(vi) Visual monitoring equipment used;

(vii) PSO location on vessel and height of observation location above water surface;

(viii) Dates and times (Greenwich Mean Time) of survey on/off effort and times corresponding with PSO on/off effort;

(ix) Vessel location (decimal degrees) when survey effort begins and ends and vessel location at beginning and end of visual PSO duty shifts;

(x) Vessel location at 30-second intervals if obtainable from data collection software, otherwise at practical regular interval;

(xi) Vessel heading and speed at beginning and end of visual PSO duty shifts and upon any change;

(xii) Water depth (if obtainable from data collection software);

(xiii) Environmental conditions while on visual survey (at beginning and end of PSO shift and whenever conditions change significantly), including BSS and any other relevant weather conditions including cloud cover, fog, sun glare, and overall visibility to the horizon;

(xiv) Factors that may contribute to impaired observations during each PSO shift change or as needed as environmental conditions change (*e.g.*, vessel traffic, equipment malfunctions); and

(xv) Survey activity information (and changes thereof), such as acoustic source power output while in operation, tow depth of an acoustic source, and any other notes of significance (*i.e.*, pre-start clearance, ramp-up, shutdown, end of operations, etc.).

(c) Upon visual observation of any marine mammal, the following information must be recorded:

1. Watch status (sighting made by PSO on/off effort, opportunistic, crew, alternate vessel/platform);

2. Vessel/survey activity at time of sighting (*e.g.*, deploying, recovering, testing, shooting, data acquisition, other);

3. PSO who sighted the animal;

4. Time of sighting;

5. Initial detection method;

6. Sightings cue;

7. Vessel location at time of sighting (decimal degrees);

8. Direction of vessel's travel (compass direction);

9. Speed of the vessel(s) from which the observation was made;

10. Identification of the animal (*e.g.*, genus/species, lowest possible taxonomic level or unidentified); also note the composition of the group if there is a mix of species;

11. Species reliability (an indicator of confidence in identification);

12. Estimated distance to the animal and method of estimating distance;

13. Estimated number of animals (high/low/best);

14. Estimated number of animals by cohort (adults, yearlings, juveniles, calves, group composition, etc.);

15. Description (as many distinguishing features as possible of each individual seen, including length, shape, color, pattern, scars, or markings, shape and size of dorsal fin, shape of head, and blow characteristics);

16. Detailed behavior observations (*e.g.*, number of blows/breaths, number of surfaces, breaching, spyhopping, diving, feeding, traveling; as explicit and detailed as possible; note any observed changes in behavior before and after point of closest approach);

17. Mitigation actions; description of any actions implemented in response to the sighting (*e.g.*, delays, shutdowns, ramp-up, speed or course alteration, etc.) and time and location of the action;

18. Equipment operating during sighting;

19. Animal's closest point of approach and/or closest distance from the center point of the acoustic source; and

20. Description of any actions implemented in response to the sighting (*e.g.*, delays, shutdown, ramp-up) and time and location of the action.

(d) Reporting sightings of North Atlantic right whales:

(i) If a North Atlantic right whale is observed at any time by PSOs or personnel on any project vessels, during surveys or during vessel transit, Vineyard Northeast must immediately report the sighting information to the NMFS North Atlantic Right Whale Sighting Advisory System (866-755-6622).

(ii) North Atlantic right whale sightings in any location may also be reported to the U.S. Coast Guard via Channel 16.

(e) Reporting injured or dead marine mammals:

(i) Sightings of any injured or dead marine mammal must be reported to NMFS, regardless of the cause of injury or death. In the event that personnel involved in the survey activities discover an injured or dead marine mammal, Vineyard Northeast must report the incident as soon as feasible to the NMFS Office of Protected Resources and the NMFS New England/Mid-Atlantic Stranding Network by phone (866-755-6622) and by email (*nmfs.gar.stranding@noaa.gov* and *PR.ITP.MonitoringReports@noaa.gov*). The report must include the following information:

1. Time, date, and location (latitude/longitude) of the first discovery (and updated location information if known and applicable);

2. Species identification (if known) or description of the animal(s) involved;

3. Condition of the animal(s) (including carcass condition if the animal is dead);

4. Observed behaviors of the animal(s), if alive;

5. If available, photographs or video footage of the animal(s); and

6. General circumstances under which the animal was discovered.

(ii) In the event of a ship strike of a marine mammal by any vessel involved in the survey activities, Vineyard Northeast must report the incident to NMFS OPR and the NMFS Office of Protected Resources and the NMFS New England/Mid-Atlantic Stranding Network by phone (866-755-6622) and by email (*nmfs.gar.stranding@noaa.gov* and *PR.ITP.MonitoringReports@noaa.gov*) as soon as feasible but within 24 hours. The report must include the following information:

1. Time, date, and location (latitude/longitude) of the incident;

2. Species identification (if known) or description of the animal(s) involved;

3. Vessel's speed during and leading up to the incident;

4. Vessel's course/heading and what operations were being conducted (if applicable);

5. Status of all sound sources in use;

6. Description of avoidance measures/requirements that were in place at the time of the strike and what additional measures were taken, if any, to avoid strike;

7. Environmental conditions (*e.g.*, wind speed and direction, Beaufort sea state, cloud cover, visibility) immediately preceding the strike;

8. Estimated size and length of animal that was struck;

9. Description of the behavior of the marine mammal immediately preceding and/or following the strike;

10. If available, description of the presence and behavior of any other marine mammals immediately preceding the strike;

11. Estimated fate of the animal (*e.g.*, dead, injured but alive, injured and moving, blood or tissue observed in the water, status unknown, disappeared); and

12. To the extent practicable, photographs or video footage of the animal(s).

7. This Authorization may be modified, suspended or revoked if the holder fails to abide by the conditions prescribed herein (including, but not limited to, failure to comply with monitoring or reporting requirements), or if NMFS determines: (1) the authorized taking is having more than a negligible impact on the species or stocks of affected marine mammals, or (2) the prescribed measures are likely not or are not effecting the least practicable adverse impact on the affected species or stocks and their habitat.

8. <u>Renewals</u> – On a case-by-case basis, NMFS may issue a one-time, one-year Renewal IHA following notice to the public providing an additional 15 days for public comments when (1) up to another year of identical, or nearly identical, activities are planned or (2) the specified activities would not be completed by the time this IHA expires and a Renewal would allow for completion of the activities, provided all of the following conditions are met:

(a) A request for Renewal is received no later than 60 days prior to the needed Renewal IHA effective date (the Renewal IHA expiration date cannot extend beyond one year from expiration of this IHA).

(b) The request for Renewal must include the following:

(i) An explanation that the activities to be conducted under the requested Renewal IHA are identical to the activities analyzed for this IHA, are a subset of the activities, or include changes so minor that the changes do not affect the previous analyses, mitigation and monitoring requirements, or take estimates (with the exception of reducing the type or amount of take).

(ii) A preliminary monitoring report showing the results of the required monitoring to date and an explanation showing that the monitoring results do not indicate impacts of a scale or nature not previously analyzed or authorized.

(c) Upon review of the request for Renewal, the status of the affected species or stocks, and any other pertinent information, NMFS determines that there are no more than minor changes in the activities, the mitigation and monitoring measures will remain the same and appropriate, and the findings made in support of this IHA remain valid.

7/27/2022

Kimberly Damon-Randall,
Director, Office of Protected Resources,
National Marine Fisheries Service.

United States Department of the Interior

BUREAU OF OCEAN ENERGY MANAGEMENT
WASHINGTON, DC 20240-0001

MAR 5 2019

Mr. Lars Thanning Pedersen
Vineyard Wind LLC
700 Pleasant Street
Suite 510
New Bedford, Massachusetts 02740

Dear Mr. Pedersen:

Please find enclosed one fully executed copy of Vineyard Wind LLC's (Company Number: 15010) commercial lease OCS-A 0522. The lease comprises 132,370 acres, more or less, lying within the Massachusetts Wind Energy Area, and will become effective April 1, 2019.

Please do not hesitate to contact me at our main office number, (703) 787-1300, if you have any further questions.

Sincerely,

James F. Bennett
Program Manager
Office of Renewable Energy Programs

Enclosure

UNITED STATES DEPARTMENT OF THE INTERIOR BUREAU OF OCEAN ENERGY MANAGEMENT **COMMERCIAL LEASE OF SUBMERGED LANDS FOR RENEWABLE ENERGY DEVELOPMENT ON THE OUTER CONTINENTAL SHELF** ***Paperwork Reduction Act of 1995 statement:*** *This form does not constitute an information collection as defined by 44 U.S.C. § 3501 et seq. and therefore does not require approval by the Office of Management and Budget.*	Office Sterling, VA	Renewable Energy Lease Number OCS-A 0522
	Cash Bonus and/or Acquisition Fee $135,100,000.00	Resource Type Wind
	Effective Date April 1, 2019	Block Number(s) See Addendum A

This lease, which includes any addenda hereto, is hereby entered into by and between the United States of America, ("Lessor"), acting through the Bureau of Ocean Energy Management ("BOEM"), its authorized officer, and

Lessee	Interest Held
Vineyard Wind LLC	100%

("Lessee"). This lease is effective on the date written above ("Effective Date") and will continue in effect until the lease terminates as set forth in Addendum "B." In consideration of any cash payment heretofore made by the Lessee to the Lessor and in consideration of the promises, terms, conditions, covenants, and stipulations contained herein and attached hereto, the Lessee and the Lessor agree as follows:

Section 1: Statutes and Regulations.

This lease is issued pursuant to subsection 8(p) of the Outer Continental Shelf Lands Act ("the Act"), 43 U.S.C. §§ 1331 *et seq.* This lease is subject to the Act and regulations promulgated pursuant to the Act, including but not limited to, offshore renewable energy and alternate use regulations at 30 CFR Part 585 as well as other applicable statutes and regulations in existence on the Effective Date of this lease. This lease is also subject to those statutes enacted (including amendments to the Act or other statutes) and regulations promulgated thereafter, except to the extent that they explicitly conflict with an express provision of this lease. It is expressly understood that amendments to existing statutes, including but not limited to the Act, and regulations may be made, and/or new statutes may be enacted or new regulations promulgated, which do not explicitly conflict with an express provision of this lease, and that the Lessee bears the risk that such amendments, regulations, and statutes may increase or decrease the Lessee's obligations under the lease.

Section 2: Rights of the Lessee.

(a) The Lessor hereby grants and leases to the Lessee the exclusive right and privilege, subject to the terms and conditions of this lease and applicable regulations, to: (1) submit to the Lessor for approval a Site Assessment Plan (SAP) and Construction and Operations Plan (COP) for the project identified in Addendum "A" of this lease; and (2) conduct activities in the area identified in Addendum "A" of this lease ("leased area") and/or Addendum "D" of this lease ("project easement(s)"), that are described in a SAP or COP that has been approved by the Lessor. This lease does not, by itself, authorize any activity within the leased area.

(b) The rights granted to the Lessee herein are limited to those activities described in any SAP or COP approved by the Lessor. The rights granted to the Lessee are limited by the lease-specific terms, conditions, and stipulations required by the Lessor per Addendum "C."

(c) This lease does not authorize the Lessee to conduct activities on the Outer Continental Shelf (OCS) relating to or associated with the exploration for, or development or production of, oil, gas, other seabed minerals, or renewable energy resources other than those renewable energy resources identified in Addendum "A."

Section 3: Reservations to the Lessor.

(a) All rights in the leased area and project easement(s) not expressly granted to the Lessee by the Act, applicable regulations, this lease, or any approved SAP or COP, are hereby reserved to the Lessor.

(b) The Lessor will decide whether to approve a SAP or COP in accordance with the applicable regulations in 30 CFR Part 585. The Lessor retains the right to disapprove a SAP or COP based on the Lessor's determination that the proposed activities would have unacceptable environmental consequences, would conflict with one or more of the requirements set forth in subsection 8(p)(4) of the Act (43 U.S.C. § 1337(p)(4)), or for other reasons provided by the Lessor pursuant to 30 CFR 585.613(e)(2) or 30 CFR 585.628(f)(2). Disapproval of plans will not subject the Lessor to liability under the lease. The Lessor also retains the right to approve with modifications a SAP or COP, as provided in applicable regulations.

(c) The Lessor reserves the right to suspend the Lessee's operations in accordance with the national security and defense provisions of Section 12 of the Act and applicable regulations.

(d) The Lessor reserves the right to authorize other uses within the leased area and project easements(s) that will not unreasonably interfere with activities described in an approved SAP and/or COP, pursuant to this lease.

Section 4: Payments.

(a) The Lessee must make all rent payments to the Lessor in accordance with applicable regulations in 30 CFR Part 585, unless otherwise specified in Addendum "B."

(b) The Lessee must make all operating fee payments to the Lessor in accordance with applicable regulations in 30 CFR Part 585, as specified in Addendum "B."

Section 5: Plans.

The Lessee may conduct those activities described in Addendum "A" only in accordance with a SAP or COP approved by the Lessor. The Lessee may not deviate from an approved SAP or COP except as provided in applicable regulations in 30 CFR Part 585.

Section 6: Associated Project Easement(s).

Pursuant to 30 CFR 585.200(b), the Lessee has the right to one or more project easement(s), without further competition, for the purpose of installing gathering, transmission, and distribution cables, pipelines, and appurtenances on the OCS, as necessary for the full enjoyment of the lease, and under applicable regulations in 30 CFR Part 585. As part of submitting a COP for approval, the Lessee may request that one or more easement(s) be granted by the Lessor. If the Lessee requests that one or more easement(s) be granted when submitting a COP for approval, such project easements will be granted by the Lessor in accordance with the Act and applicable regulations in 30 CFR Part 585 upon approval of the COP in which the Lessee has demonstrated a need for such easements. Such easements must be in a location acceptable to the Lessor, and will be subject to such conditions as the Lessor may require. The project easement(s) that would be issued in conjunction with an approved COP under this lease will be described in Addendum "D" to this lease, which will be updated as necessary.

Section 7: Conduct of Activities.

The Lessee must conduct, and agrees to conduct, all activities in the leased area and project easement(s) in accordance with an approved SAP or COP, and with all applicable laws and regulations.

The Lessee further agrees that no activities authorized by this lease will be carried out in a manner that:

(a) could unreasonably interfere with or endanger activities or operations carried out under any lease or grant issued or maintained pursuant to the Act, or under any other license or approval from any Federal agency;

(b) could cause any undue harm or damage to the environment;

(c) could create hazardous or unsafe conditions; or

(d) could adversely affect sites, structures, or objects of historical, cultural, or archaeological significance, without notice to and direction from the Lessor on how to proceed.

Section 8: Violations, Suspensions, Cancellations, and Remedies.

If the Lessee fails to comply with (1) any of the applicable provisions of the Act or regulations, (2) the approved SAP or COP, or (3) the terms of this lease, including associated Addenda, the Lessor may exercise any of the remedies that are provided under the Act and applicable regulations, including, without limitation, issuance of cessation of operations orders, suspension or cancellation of the lease, and/or the imposition of penalties, in accordance with the Act and applicable regulations.

The Lessor may also cancel this lease for reasons set forth in subsection 5(a)(2) of the Act (43 U.S.C. § 1334(a)(2)), or for other reasons provided by the Lessor pursuant to 30 CFR 585.437.

Non-enforcement by the Lessor of a remedy for any particular violation of the applicable provisions of the Act or regulations, or the terms of this lease, will not prevent the Lessor from exercising any remedy, including cancellation of this lease, for any other violation or for the same violation occurring at any other time.

Section 9: Indemnification.

The Lessee hereby agrees to indemnify the Lessor for, and hold the Lessor harmless from, any claim caused by or resulting from any of the Lessee's operations or activities on the leased area or project easement(s) or arising out of any activities conducted by or on behalf of the Lessee or its employees, contractors (including Operator, if applicable), subcontractors, or their employees, under this lease, including claims for:

a. loss or damage to natural resources,
b. the release of any petroleum or any Hazardous Materials,
c. other environmental injury of any kind,
d. damage to property,
e. injury to persons, and/or
f. costs or expenses incurred by the Lessor.

Except as provided in any addenda to this lease, the Lessee will not be liable for any losses or damages proximately caused by the activities of the Lessor or the Lessor's employees, contractors, subcontractors, or their employees. The Lessee must pay the Lessor for damage, cost, or expense due and pursuant to this Section within 90 days after written demand by the Lessor. Nothing in this lease will be construed to waive any liability or relieve the Lessee from any penalties, sanctions, or claims that would otherwise apply by statute, regulation, operation of law, or could be imposed by the Lessor or other government agency acting under such laws.

"Hazardous Material" means

1. Any substance or material defined as hazardous, a pollutant, or a contaminant under the *Comprehensive Environmental Response, Compensation, and Liability Act* at 42 U.S.C. §§ 9601(14) and (33);
2. Any regulated substance as defined by the Resource Conservation and Recovery Act ("RCRA") at 42 U.S.C. § 6991 (7), whether or not contained in or released from underground storage tanks, and any hazardous waste regulated under RCRA pursuant to 42 U.S.C. §§ 6921 *et seq.*;
3. Oil, as defined by the Clean Water Act at 33 U.S.C. § 1321(a)(1) and the Oil Pollution Act at 33 U.S.C. § 2701(23); or
4. Other substances that applicable Federal, state, tribal, or local laws define and regulate as "hazardous."

Section 10: Financial Assurance.

The Lessee must provide and maintain at all times a surety bond(s) or other form(s) of financial assurance approved by the Lessor in the amount specified in Addendum "B." As required by the applicable regulations in 30 CFR Part 585, if, at any time during the term of this lease, the Lessor requires additional financial assurance, then the Lessee must furnish the additional financial assurance required by the Lessor in a form acceptable to the Lessor within 90 days after receipt of the Lessor's notice of such adjustment.

Section 11: Assignment or Transfer of Lease.

This lease may not be assigned or transferred in whole or in part without written approval of the Lessor. The Lessor reserves the right, in its sole discretion, to deny approval of the Lessee's application to transfer or assign all or part of this lease. Any assignment will be effective on the date the Lessor approves the Lessee's application. Any assignment made in contravention of this section is void.

Section 12: Relinquishment of Lease.

The Lessee may relinquish this entire lease or any officially designated subdivision thereof by filing with the appropriate office of the Lessor a written relinquishment application, in accordance with applicable regulations in 30 CFR Part 585. No relinquishment of this lease or any portion thereof will relieve the Lessee or its surety of the obligations accrued hereunder, including but not limited to, the responsibility to remove property and restore the leased area and project easement(s) pursuant to section 13 of this lease and applicable regulations.

Section 13: Removal of Property and Restoration of the Leased Area and Project Easement(s) on Termination of Lease.

Unless otherwise authorized by the Lessor, pursuant to the applicable regulations in 30 CFR Part 585, the Lessee must remove or decommission all facilities, projects, cables, pipelines, and obstructions and clear the seafloor of all obstructions created by activities on the leased area and project easement(s) within two years following lease termination, whether by expiration, cancellation, contraction, or relinquishment, in accordance with any approved SAP, COP, or approved Decommissioning Application, and applicable regulations in 30 CFR Part 585.

Section 14: Safety Requirements.

The Lessee must:

a. maintain all places of employment for activities authorized under this lease in compliance with occupational safety and health standards and, in addition, free from recognized hazards to employees of the Lessee or of any contractor or subcontractor operating under this lease;

b. maintain all operations within the leased area and project easement(s) in compliance with regulations in 30 CFR Part 585 and orders from the Lessor and other Federal agencies with jurisdiction, intended to protect persons, property and the environment on the OCS; and

c. provide any requested documents and records, which are pertinent to occupational or public health, safety, or environmental protection, and allow prompt access, at the site of any operation or activity conducted under this lease, to any inspector authorized by the Lessor or other Federal agency with jurisdiction.

Section 15: Debarment Compliance.

The Lessee must comply with the Department of the Interior's non-procurement debarment and suspension regulations set forth in 2 CFR Parts 180 and 1400 and must communicate the requirement to comply with these regulations to persons with whom it does business related to this lease by including this requirement in all relevant contracts and transactions.

Section 16: Equal Opportunity Clause.

During the performance of this lease, the Lessee must fully comply with paragraphs (1) through (7) of Section 202 of Executive Order 11246, as amended (reprinted in 41 CFR 60-1.4(a)), and the implementing regulations, which are for the purpose of preventing employment discrimination against persons on the basis of race, color, religion, sex, or national origin. Paragraphs (1) through (7) of Section 202 of Executive Order 11246, as amended, are incorporated in this lease by reference.

Section 17: Certification of Nonsegregated Facilities.

By entering into this lease, the Lessee certifies, as specified in 41 CFR 60-1.8, that it does not and will not maintain or provide for its employees any segregated facilities at any of its establishments and that it does not and will not permit its employees to perform their services at any location under its control where segregated facilities are maintained. As used in this certification, the term "facilities" means, but is not limited to, any waiting rooms, work areas, restrooms and washrooms, restaurants and other eating areas, timeclocks, locker rooms and other storage or dressing areas, parking lots, drinking fountains, recreation or entertainment areas, transportation, and housing facilities provided for employees. Segregated facilities include those that are segregated by explicit directive or those that are in fact segregated on the basis of race, color, religion, sex, or national origin, because of habit, local custom, or otherwise; provided, that separate or single-user restrooms and necessary dressing or sleeping areas must be provided to assure privacy as appropriate. The Lessee further agrees that it will obtain identical certifications from proposed contractors and subcontractors prior to awarding contracts or subcontracts unless they are exempt under 41CFR 60-1.5.

Section 18: Notices.

All notices or reports provided from one party to the other under the terms of this lease must be in writing, except as provided herein and in the applicable regulations in 30 CFR Part 585. Written notices and reports must be delivered to the Lessee's or Lessor's Lease Representative, as specifically listed in Addendum "A," either electronically, by hand, by facsimile, or by United States first class mail, adequate postage prepaid. Each party must, as soon as practicable, notify the other of a change to their Lessee's or Lessor's Contact Information listed in Addendum "A" by a written notice signed by a duly authorized signatory and delivered by hand or United States first class mail, adequate postage prepaid. Until such notice is delivered as provided in this section, the last recorded contact information for either party will be deemed current for service of all notices and reports required under this lease. For all operational matters, notices and reports must be provided to the party's Operations Representative, as specifically listed in Addendum "A," as well as the Lease Representative.

Section 19: Severability Clause.

If any provision of this lease is held unenforceable, all remaining provisions of this lease will remain in full force and effect.

Section 20: Modification.

Unless otherwise authorized by the applicable regulations in 30 CFR Part 585, this lease may be modified or amended only by mutual agreement of the Lessor and the Lessee. No such modification or amendment will be binding unless it is in writing and signed by duly authorized signatories of the Lessor and the Lessee.

II. Description of Leased Area

The total acreage of the leased area is approximately 132,370 acres.

This area is subject to later adjustment, in accordance with applicable regulations (*e.g.*, contraction, relinquishment).

Lease OCS-A 0522

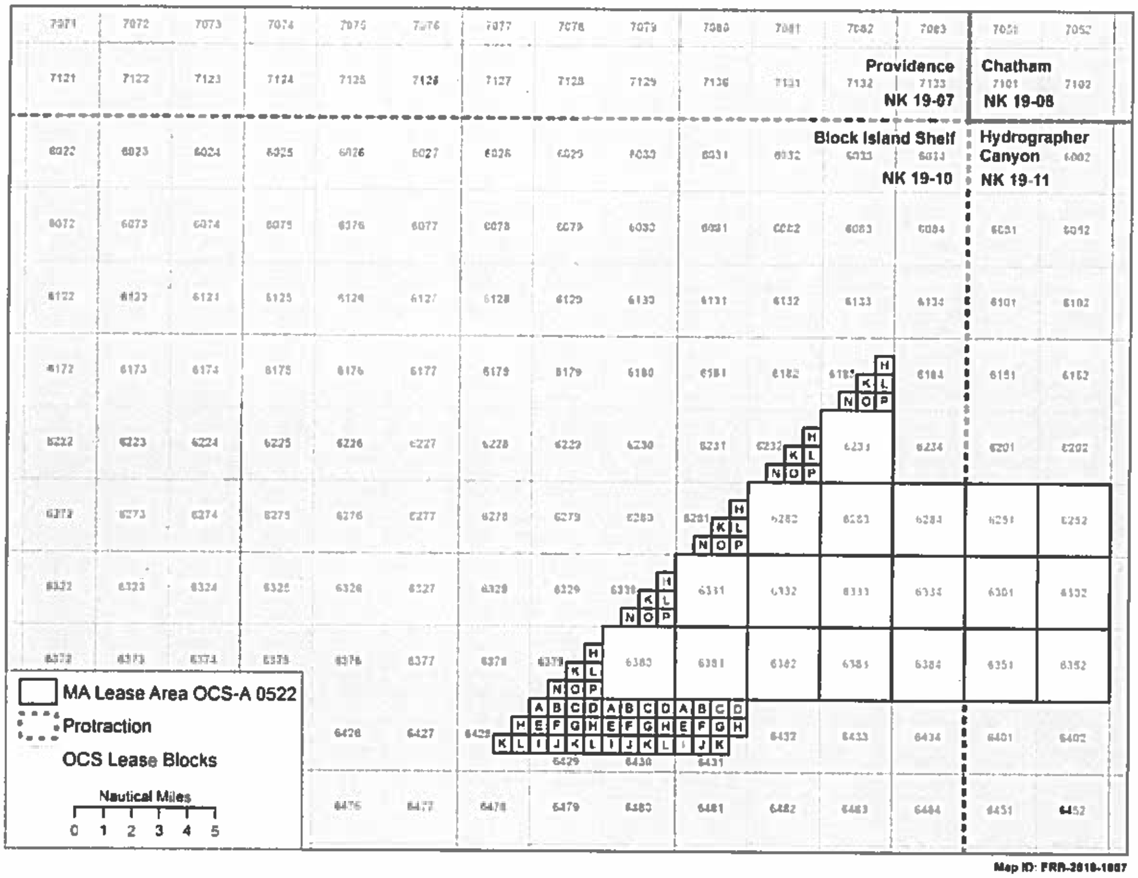
The following Blocks or portions of Blocks lying within Official Protraction Diagram Block Island Shelf NK19-10, are depicted on the map below and comprise 98,210 acres, more or less.

1) Block 6183, SE1/4 of NE1/4, SE1/4 of SW1/4, SE1/4
2) Block 6232, SE1/4 of NE1/4, SE1/4 of SW1/4, SE1/4
3) Block 6233, All of Block
4) Block 6281, SE1/4 of NE1/4, SE1/4 of SW1/4, SE1/4
5) Block 6282, All of Block
6) Block 6283, All of Block
7) Block 6284, All of Block
8) Block 6330, SE1/4 of NE1/4, SE1/4 of SW1/4, SE1/4
9) Block 6331, All of Block
10) Block 6332, All of Block
11) Block 6333, All of Block
12) Block 6334, All of Block
13) Block 6379, SE1/4 of NE1/4, SE1/4 of SW1/4, SE1/4
14) Block 6380, All of Block
15) Block 6381, All of Block
16) Block 6382, All of Block
17) Block 6383, All of Block
18) Block 6384, All of Block
19) Block 6428, SE1/4 of NE1/4, N1/2 of SE1/4
20) Block 6429, N1/2, N1/2 of S1/2
21) Block 6430, N1/2, N1/2 of S1/2
22) Block 6431, N1/2, N1/2 of SW1/4, NW1/4 of SE1/4

The following Blocks or portions of Blocks lying within Official Protraction Diagram Hydrographer Canyon NK19-11, are depicted on the map below and comprise 34,160 acres, more or less.

23) Block 6251, All of Block
24) Block 6252, All of Block
25) Block 6301, All of Block
26) Block 6302, All of Block
27) Block 6351, All of Block
28) Block 6352, All of Block

For the purposes of these calculations, a full Block is 2,304 hectares. The acreage of a hectare is 2.471043930.



III. Renewable Energy Resource

Wind

IV. Description of the Project

A project to generate energy using wind turbine generators and any associated resource assessment activities, located on the Outer Continental Shelf in the leased area, as well as associated offshore substation platforms, inner array cables, and subsea export cables.

V. Description of Project Easement(s)

Once approved, the Lessor will incorporate Lessee's project easement(s) in this lease as ADDENDUM "D."

U.S. DEPARTMENT OF THE INTERIOR
BUREAU OF OCEAN ENERGY MANAGEMENT

ADDENDUM "B"

LEASE TERM AND FINANCIAL SCHEDULE

Lease Number OCS-A 0522

I. Lease Term

The duration of each term of the lease is described below. The terms may be extended or otherwise modified in accordance with applicable regulations in 30 C.F.R. Part 585.

Lease Term	**Duration**
Preliminary Term	1 year
Site Assessment Term	5 years
Operations Term	33 years

Schedule: Addendum "C" includes a schedule and reporting requirements for conducting site characterization activities.

Renewal: The Lessee may request renewal of the operations term of this lease, in accordance with applicable regulations in 30 CFR Part 585. The Lessor, at its discretion, may approve a renewal request to conduct substantially similar activities as were originally authorized under this lease or in an approved plan. The Lessor will not approve a renewal request that involves development of a type of renewable energy not originally authorized in the lease. The Lessor may revise or adjust payment terms of the original lease as a condition of lease renewal.

II. Definitions

"Lease Issuance Date" refers to the date on which this lease has been signed by *both* the Lessee and the Lessor.

"Effective Date" has the same meaning as "effective date" in the Bureau of Ocean Energy Management (BOEM) regulations provided in 30 CFR 585.237.

"Lease Anniversary" refers to the anniversary of the Effective Date of the lease.

"End Date" refers to the earlier of a) the last calendar day of the last month of the Operations Term; or b) the date on which the lease terminates in the event of a lease termination.

"Commercial Operations" means the generation of electricity or other energy product for commercial use, sale, or distribution.

"Commercial Operation Date," or "COD," refers to the date on which the Lessee first begins Commercial Operations on the lease.

"Delivery Point" is the meter identified in the COP where the Lessee's facility interconnects with the electric grid to deliver electricity for sale.

An individual wind generation turbine is said to be "available for Commercial Operations" on or after the first day that it engages in Commercial Operations on the lease; and to be no longer available for Commercial Operations on or after the day when it is permanently decommissioned. These dates are determined by the Construction and Operations Plan (COP).

III. Payments

Unless otherwise authorized by the Lessor in accordance with the applicable regulations in 30 CFR Part 585, the Lessee must make payments as described below.

(a) ***Rent.*** The Lessee must pay rent as described below:

Rent payments prior to the COD, or prior to the lease End Date in the event that the lease terminates prior to the COD, are calculated by multiplying the acres in the leased area times the rental rate per acre as follows:

Lease OCS-A 0522

- Acres in Leased Area: 132,370
- Annual Rental Rate: $3.00 per acre or fraction thereof
- Rental Fee for Entire Leased Area: $3.00 x 132,370 = $397,110

The first year's rent payment of $397,110 is due within 45 days of the date that the lease is received by the Lessee for execution. Rent for the entire leased area for the next year and for each subsequent year is due on or before each Lease Anniversary through the year in which the COD occurs. The rent for each year subsequent to the COD on the imputed portion of the lease not authorized for Commercial Operations is due on or before each Lease Anniversary. The imputed portion of the lease that is not authorized for Commercial Operations at each Lease Anniversary in year t, S_t, and the corresponding Adjusted Annual Rent Payment will be determined as follows:

(A) $S_t = \left(1 - \frac{M_t'}{MAX(M_t': for\ all\ t \geq 2)}\right)$

(B) $Adjusted\ Annual\ Rent\ Payment = S_t * Rental\ Fee\ for\ Entire\ Leased\ Area$

Where:
S_t = Portion of the lease not authorized for Commercial Operations in year t based on the definition of t in Section III (b) (4) below.

M_t' = Actual Nameplate capacity expressed in megawatts (MW) rounded to the nearest second decimal in year t of Commercial Operations on the lease as defined in Section III (b) (4) below, prior to any adjustments as specified in the most recent approved COP for turbine maintenance, replacements, repowering, or decommissioning. For our purposes nameplate capacity is the maximum rated electric output the turbines of the wind farm facility under commercial operations can produce at their rated wind speed designated by the turbine's manufacturer.

$MAX(M_t')$ = Highest value of M_t' projected in the most recent approved version of the COP to be achieved in any year of Commercial Operations on the lease.

The Adjusted Annual Rent Payment calculated in Equation (A) herein, will be rounded up to the nearest dollar. The annual rent payments will be set forth in Addendum "E" when the COP is initially approved or subsequently revised.

Consider an example of a 1,000 MW project on a lease with an Effective Date of January 1, 2014 and a COD of January 1, 2022 on a lease area consisting of 100,000 acres as follows:

Payment (Jan. 1st)	M_t' (MW)	$MAX(M_t')$ (MW)	$\left(1-\frac{M_t'}{MAX(M_t')}\right)$	Rental Fee for Entire Area	Payment Amount
2014	0		1.0		$300,000
...	...		...		...
2021	0		1.0		$300,000
2022	500		0.5		$150,000
2023	500		0.5		$150,000
2024	500	1,000	0.5	$300,000	$150,000
2025	800		0.2		$60,000
2026	800		0.2		$60,000
2027	800		0.2		$60,000
2028	1,000		0.0		$0

In the event a revised COP is approved by BOEM that identifies an alternative installation schedule that differs from the previously-approved COP, the Lessee must make subsequent payments based on the revised installation schedule. In addition, the Lessee must make a payment equal to the sum of any incremental annual rent payments that would have been due at the Lease Anniversary of prior years based on the differences between the Initial Installation Schedules specified in the previously-approved COP and the revised COP, plus interest on the annual balances, in accordance with 30 CFR 1218.54.

Consider an example whereby the initial COP specified an installation schedule with all 1,000 MW online at the COD, i.e., M_t' is 1,000 MW at COD. The following table demonstrates how the back rent payments would be calculated if the project was initially scheduled as a single phase, but then later determined to be the three-phase project as shown in the previous example in a revised COP approved prior to the payment due on January 1, 2023.

Payment (Jan. 1st)	Initial M_t' (MW)	Revised M_t' (MW)	Single-Phase Payment Amount	Three-Phase Payment Amount	Back Rent Payment Amount	Subsequent Rent Payment Amount
2014	0	0	$300,000	$300,000	$0	$0
...	...	...	...	...	...	...
2021	0	0	$300,000	$300,000	$0	$0
2022	1,000	500	$0	$150,000	$150,000	$0
2023	1,000	500	$0	$150,000	$0	$150,000
2024	1,000	500	$0	$150,000	$0	$150,000
2025	1,000	800	$0	$60,000	$0	$60,000
2026	1,000	800	$0	$60,000	$0	$60,000
2027	1,000	800	$0	$60,000	$0	$60,000
2028	1,000	1,000	$0	0	$0	$0

The last rent payment prior to Commercial Operations being authorized on the entire lease area, i.e., the year in which the value of S_t is equal to zero, or prior to the lease End Date, in the event that the lease terminates prior to Commercial Operations being authorized on the entire lease area, will represent the final rent payment, unless a revised COP identifying an alternative maximum initial capacity is approved by BOEM. All rent payments, including the last rent payment, are payable for the full year and will not be prorated to the COD or other installation milestones. The COD is equivalent to the authorization date for the first phase of development on the lease, to be updated based on the initial or revised approved COP documentation. The schedule of rent payments on the lease is defined in Addendum "E". All rent payments, except for the first 6-month rent payment, must be made as required in 30 CFR 1218.51. Late rent payments will be charged interest in accordance with 30 CFR 1218.54.

(1) ***Project Easement.***

Rent for any project easement(s) is described in ADDENDUM "D".

(2) ***Relinquishment.***

If the Lessee submits an application for relinquishment of a portion of the leased area within the first 45 calendar days following the date that the lease is received by the Lessee for execution, and the Lessor approves that application, no rent payment will be due on that relinquished portion of the leased area. Later relinquishments of any leased area will reduce the Lessee's rent payments due the year following the Lessor's approval of the relinquishment, through a reduction in the Acres in Leased Area and the corresponding Rental Fee for the Entire Leased Area and any related Adjusted Annual Rent Payments.

(b) ***Operating Fee.*** The Lessee must pay an operating fee as described below:

(1) **Initial Operating Fee Payment.**

The Lessee must pay an initial prorated operating fee within 45 calendar days after the COD. The initial operating fee payment covers the first year of Commercial Operations on the lease and will be calculated in accordance with subsection (4) below, using an operating fee rate of 0.02 and a capacity factor of 0.4.

(2) **Annual Operating Fee Payments.**

The Lessee must pay the operating fee for each subsequent year of Commercial Operations on or before each Lease Anniversary following the formula in subsection (4) below. The Lessee must calculate each operating fee annually subsequent to the initial operating fee payment using an operating fee rate of 0.02 through the thirty-three year operations term of the lease. The capacity factor of 0.4 will remain in effect until the Lease Anniversary of the year in which the Lessor adjusts the capacity factor.

(3) **Final Operating Fee Payment.**

The final operating fee payment is due on the Lease Anniversary prior to the End Date. The final operating fee payment covers the last year of Commercial Operations on the lease and will be calculated in accordance with the formula in subsection (4) below.

(4) **The formula for calculating the operating fee in year *t*.**

F_t	=	M_t	*	H	*	c_p	*	P_t	*	r_t
(annual operating fee)		(nameplate capacity)		(hours per year)		(capacity factor)		(power price)		(operating fee rate)

Where:

t =	the year of Commercial Operations on the lease starting from each Lease Anniversary, where *t* equals 1 represents the year beginning on the Lease Anniversary prior to, or on, the COD.
F_t =	the dollar amount of the annual operating fee in year *t*.
M_t =	the nameplate capacity expressed in megawatts (MW) rounded to the nearest second decimal place in year *t* of Commercial Operations on the lease. The value of M_t, reflecting the availability of turbines, will be determined based on the COP. This value will be adjusted to reflect any modifications to the COP approved by BOEM as of the date each operating fee payment is due, in accordance with the calculation in Equation 1, for each year of Commercial Operations on the lease.

$$(1) \quad M_t = \sum_{w=1}^{W_t}\left(N_w * \left[\frac{\left(\sum_{d=1}^{D} E_{w,t,d}\right)}{D}\right]\right)$$

Where:

W_t = Number of individual wind generation turbines, *w*, that will be available for Commercial Operations during any day of the year, *t*, per the COP.

N_w = Nameplate capacity of individual wind generation turbine, *w*, per the COP expressed in MW.

$E_{w,t,d}$ = Indicates whether individual wind generation turbine, *w*, will be available for Commercial Operations on day *d* of year *t*. The value is set to 1 for any day in year *t* for which the condition is true, i.e., the wind turbine will be available for Commercial Operations, and zero for any day in year *t* for which the condition is false, i.e., the wind turbine will not be available for Commercial Operations. The month of February is always assumed to have 28 days for purposes of this calculation, where March 1st will be counted as the first day of Commercial Operations if Commercial Operations commence on February 29th of a leap year.

D = Days in the year set equal to 365 in all years for purposes of this calculation.

M_t may be reduced only in the event that installed capacity is permanently decommissioned per the COP. M_t will not be changed in response to routine or unplanned maintenance of units, including the temporary removal of a nacelle for off-site repair or replacement with a similar unit.

EXAMPLE: Assume that the Lease Anniversary is January 1st, the COD is July 1, 2018, that the facility will ultimately have 100 individual wind generation turbines with a nameplate capacity of 5.0 MW each, and that the COP specifies the following, cumulative installation schedule for wind turbines to become available for Commercial Operations:

- July 1, 2018 (COD): 20 turbines (20 new units);
- October 1, 2018: 45 turbines (25 new units);
- January 1, 2019: 50 turbines (5 new units);
- July 1, 2019: 65 turbines (15 new units);
- January 1, 2020: 95 turbines (30 new units);
- February 29, 2020: 100 turbines (5 new units).

Further assume that the COP calls for 50 of the turbines to be decommissioned after September 30, 2039 (t = 22), and that the remaining turbines are decommissioned at the End Date of March 15, 2040 ($t = 23$).

The value of M_t would be estimated as demonstrated in Table 1a for each year of Commercial Operations on the lease in this example.

Table 1a: Example of M_t Calculations for Installation and Decommissioning

t	Turbines	MW	Commercial Operations Period	Comm. Ops. Days	Days in Year	Share of Days	MW	M_t
1	20	100	Jul. 1st to Dec. 31st	184	365	50.41%	50.41	81.92
	25	125	Oct. 1st to Dec. 31st	92		25.21%	31.51	
2	50	250	Jan. 1st to Dec. 31st	365		100.00%	250.00	287.81
	15	75	Jul. 1st to Dec. 31st	184		50.41%	37.81	
3	95	475	Jan. 1st to Dec. 31st	365		100.00%	475.00	495.96
	5	25	Mar. 1st to Dec. 31st	306		83.84%	20.96	
4	100	500	Jan. 1st to Dec. 31st	365		100.00%	500.00	500.00
...	...	...	...	...		...	...	...
21	100	500	Jan. 1st to Dec. 31st	365		100.00%	500.00	500.00
22	50	250	Jan. 1st to Dec. 31st	365		100.00%	250.00	436.98
	50	250	Jan. 1st to Sep. 30th	273		74.79%	186.98	
23	50	250	Jan. 1st to Mar. 15th	74		20.27%	50.68	50.68

To illustrate the impact of decommissioning a portion of the individual wind generation turbines and replacing them with units of greater capacity on the calculation of M_t, assume that at the end of March 31, 2022, 10 units are to be made unavailable due to decommissioning, and that the incremental units have a capacity of 7.0 MW and are expected to be made available for Commercial Operations on September 15, 2022. The impact on M_t in 2022 and in subsequent years starting in 2023 and continuing until decommissioning is illustrated in Table 1b.

Table 1b: Example of M_t Calculations for Repowering

t	Turbines	MW	Commercial Operations Period	Comm. Ops. Days	Days in Year	Share of Days	MW	M_t
5	90 (5.0)	450	Jan. 1st to Dec. 31st	365	365	100.00%	450.00	483.04
	10 (5.0)	50	Jan. 1st. to Mar. 31st	90		24.66%	12.33	
	10 (7.0)	70	Sep. 15th to Dec. 31st	108		29.59%	20.71	
6	90 (5.0)	450	Jan. 1st to Dec. 31st	365		100.00%	450.00	520.00
	10 (7.0)	70	Jan. 1st to Dec. 31st	365		100.00%	70.00	

H = the number of hours in the year for billing purposes which is equal to 8,760 for all years of Commercial Operations on the lease.

c_p = the "Capacity Factor" in Performance Period p, which represents the share of anticipated generation of the facility that is delivered to where the Lessee's facility interconnects with the electric grid (i.e. the Delivery Point) relative to its generation at continuous full power operation at the nameplate capacity, expressed as a decimal between zero and one.

The initial Capacity Factor (C_0) will be set to 0.4.

The Capacity Factor will be subject to adjustment at the end of each Performance Period. After the sixth year of Commercial Operations on the lease has concluded, the Lessee will utilize data gathered from years two through six of Commercial Operations on the lease and propose a revised Capacity Factor to be used to calculate subsequent annual payments, as provided for in Table 2 below. A similar process will be conducted at the conclusion of each five-year Performance Period, thereafter.

Table 2: Definition of Performance Periods

Performance Period (p)	Commercial Operation Years (t)	Payments Affected by Adjustment	Capacity Factor (C)	Date End Year (n)
0 (COD)	Not Applicable	Payments 1 to 7	C_0=0.4	--
1	t = 2 to 6	Payments 8 to 12	C_1	n_1=6
2	t = 7 to 11	Payments 13 to 17	C_2	n_2=11
3	t = 12 to 16	Payments 18 to 22	C_3	n_3=16
4	t = 17 to 21	Payments 23 to 27	C_4	n_4=21
5	t = 22 to 26	Payments 28 to 32	C_5	n_5=26
6	t = 27 to 31	Payment 33	C_6	n_6=31

Adjustments to the Capacity Factor

The Actual 5-year Average Capacity Factor (Xp) is calculated for each Performance Period after COD ($p > 0$) per Equation 2 below. Xp represents the sum of actual, metered electricity generation in megawatt-hours (MWh) at the Delivery Point to the electric grid (A_t) divided by the amount of electricity generation in MWh that would have been produced if the facility operated continuously at its full, stated capacity (M_t) in all of the hours (h_t) in each year, t, of the corresponding five-year period.

(2) $$X_p = \frac{\sum_{t=n-4}^{n} A_t}{\left(\sum_{t=n-4}^{n} M_t * h_t\right)}$$

Where:

M_t = Nameplate Capacity as defined above.

n = "Date End Year" value for the Performance Period, p, as defined in Table 2.

p = Performance Period as defined in Table 2.

A_t = Actual generation in MWh associated with each year of Commercial Operations, t, on the lease that is transferred at the Delivery Point; Delivery Point meter data supporting the values submitted for annual actual generation must be recorded, preserved, and timely provided to the Lessor upon request. In the event the Lessor requires the assistance of the Lessee in obtaining information useful in verifying

	such information, for example by waiving confidentiality with respect to data held by a third party, such assistance must be timely provided. h_t = Hours in the year on which the Actual Generation associated with each year of Commercial Operations, *t*, on the lease is based; this definition of "hours in the year" differs from the definition of H in the operating fee equation above. The hours in the year for purposes of calculating the capacity factor must take into account the actual number of hours, including those in leap years. The value of the Capacity Factor at the outset of Commercial Operations ($p = 0$) is set to 0.4 as stated in equation 3: **(3)** $c_0 = 0.4$ The value of the Capacity Factor corresponding to each Performance Period (c_p) is set according to equations 4A, 4B, and 4C as follows for each value of *p* greater than zero. The Capacity Factor is set equal to the Actual 5-Year Average Capacity Factor provided that the value falls within a range of plus or minus 10 percent of the previous Performance Period's capacity factor. **(4A)** $c_p = X_p \text{ for } c_{p-1} * 0.90 \le X_p \le c_{p-1} * 1.10$ **(4B)** $c_p = c_{p-1} * 0.90 \text{ for } X_p < c_{p-1} * 0.90$ **(4C)** $c_p = c_{p-1} * 1.10 \text{ for } X_p > c_{p-1} * 1.10$ All values for c_p must be rounded to the nearest third decimal place.
P_t =	a measure of the annual average wholesale electric power price expressed in dollars per MW hour. The Lessee must calculate P_t at the time each operating fee payment is due, subject to approval by the Lessor. The Base Price (P_b) must equal the weighted average of the peak and off-peak spot price indices for the Northeast – Massachusetts Hub power market for the most recent year of data available as reported by the Federal Energy Regulatory Commission (FERC). If FERC stops publishing this data or the specified location of the data changes over time, the Lessor must specify an alternate source of data and methodology that is approximately equivalent. The peak and off-peak price indices must be weighted 52.0% and 48.0%, respectively, for purposes of estimating the weighted index value for the Base Price. For example, in the March 12, 2012 State of the Markets Report the peak price index for 2011 was $51.99/MWh and the corresponding off-peak price index for 2011 was $33.94/MWh, resulting in a weighted index value for the Base Price for 2011 (P_{2011}) of $43.33/MWh (=52.0% * $51.99 / MWh + 48.0% *$33.94 / MWh). The calculation of P_b must be

rounded up to the nearest, second decimal place.

The Base Price must be adjusted for inflation from the year associated with the published spot prices to the year in which the operating fee is to be paid as shown in equations (5A) and (5B):

$$\textbf{(5A)}\quad P_t = P_b * \left(\frac{GDP_g}{GDP_{g-1}}\right)^{y-g} * \left(\frac{GDP_g}{GDP_b}\right) \text{ for } g \geq b$$

$$\textbf{(5B)}\quad P_t = P_b * \left(\frac{GDP_g}{GDP_{g-1}}\right)^{y-b} \quad \text{for } g < b$$

Where:

GDP = Annual Implicit Price Deflators for Gross Domestic Product (GDP deflator index) published by the U.S. Bureau of Economic Analysis (BEA) for the specified period.

If BEA stops publishing the data required for this calculation, or the specified location of the data changes over time, the Lessor will specify an alternative source of data and methodology that it considers approximately equivalent.

b = The most recent year for which FERC reports the appropriate electricity spot price data expressed as the year, e.g., 2009, as in the illustrative example below.

g = The most recent year for which GDP deflator indices are available from BEA expressed as the year, e.g., 2011, as in the illustrative example below.

y = The year the annual payment is due expressed as the year corresponding to the value of t described above, e.g., 2013, as in the illustrative example below.

The second term on the right-hand side of equation (5A) represents a projected annual change in the index of inflation employing the last year of data available from BEA, while the third term represents the cumulative change in the index of inflation up to the previous year.

Example:

The following hypothetical example is provided to illustrate the methodology using Equation (5A) and the illustrative values provided for *b, g,* and *y* above, applied to historical GDP deflator data. If the actual FERC price indices are based on 2009 data and the GDP deflator indices are available for 2011, the inflation-adjusted price index value would be determined from equation (5A) as follows for a payment occurring in $y = 2013$:

	$P_{t(2013)} = P_{2009} * \left(\frac{GDP_{2011}}{GDP_{2010}}\right)^{2013-2011} * \left(\frac{GDP_{2011}}{GDP_{2009}}\right) = \frac{\$38.40}{MWh} * \left(\frac{113.361}{110.992}\right)^{2} * \left(\frac{113.361}{109.729}\right) = \frac{\$41.38}{MWh}$ Note: The current GDP deflator index is 113.361 for 2011, 110.992 for 2010, and 109.729 for 2009 (last revised by BEA on April 27, 2012); the FERC index price for the year 2009 is $38.40/MWh (On-peak: $44.60/MWh; Off-peak: $31.68/MWh; last revised March 12, 2012). Although 2011 FERC prices are available, the 2009 prices are used in the example to illustrate the concept. The Lessor and the Lessee will use the latest FERC price indices and revised BEA GDP deflator index values at the time the pricing adjustments are made. The source of data used in the calculations must be noted in the Lessee's documentation supporting their estimate of the value of P_t each year for review and approval by the Lessor.
r_t =	the operating fee rate of 0.02 (2%).

(c) ***Reporting, Validation, Audits, and Late Payments.***

The Lessee must submit the values used in the operating fee formula to the Lessor at the time the annual payment based on these values is made. Submission of this and other reporting, validation, audit and late payment information as requested by the Lessor must be sent to the Lessor using the contact information indicated in Addendum "A", unless the Lessor directs otherwise. Failure to submit the estimated values and the associated documentation on time to the Lessor may result in penalties as specified in applicable regulations.

Within 60 days of the submission by the Lessee of the annual payment, the Lessor will review the data submitted and validate that the operating fee formula was applied correctly. If the Lessor validation results in a different operating fee amount, the amount of the annual operating fee payment will be revised to the amount determined by the Lessor.

The Lessor also reserves the right to audit the meter data upon which the Actual 5-year Average Capacity Factor is based at any time during the lease term. If, as a result of such audit, the Lessor determines that any annual operating fee payment was calculated incorrectly, the Lessor has the right to correct any errors and collect the correct annual operating fee payment amount.

If the annual operating fee is revised downward as a result of the Lessee's calculations, as validated by the Lessor, or an audit of meter data conducted by the Lessee or Lessor, the Lessee will be refunded the difference between the amount of the payment received and the amount of the revised annual operating fee, without interest. Similarly, if the payment amount is revised upward, the Lessee is required to pay the difference between the amount of the payment received and the amount of the revised annual operating fee, plus interest on the balance, in accordance with 30 CFR § 1218.54.

Late operating fee payments will be charged interest in accordance with 30 CFR § 1218.54.

IV. Financial Assurance

The Lessor will base the determination for the amounts of all Site Assessment Plan (SAP), COP, and decommissioning financial assurance requirements on estimates of the cost to meet all accrued lease obligations. The Lessor determines the amount of supplemental and decommissioning financial assurance requirements on a case-by-case basis. The amount of financial assurance required to meet all lease obligations includes:

(a) **Initial Financial Assurance.** Prior to the Lease Issuance date, the Lessee must provide an initial lease-specific bond, or other approved means of meeting the Lessor's initial financial assurance requirements in an amount equal to $100,000.

(b) **Additional Financial Assurance.** In addition to the initial lease-specific financial assurance discussed above, the Lessee is also required to provide additional supplemental bonds associated with the SAP and COP, or other form of financial assurances and a decommissioning bond or other approved means of meeting the Lessee's decommissioning obligations.

(1) Prior to the Lessor's approval of a SAP, the Lessor will require an additional supplemental bond or other form of financial assurance in an amount determined by the Lessor based on the complexity, number, and location of all facilities involved in the site assessment activities planned in the SAP, and estimates of the costs to meet all accrued obligations, in accordance with applicable BOEM regulations (30 CFR 585.515-537). The supplemental financial assurance requirement is in addition to the initial lease-specific financial assurance in the amount of $100,000. The Lessee may meet these obligations by providing a new bond or other acceptable form of financial assurance, or increasing the amount of its existing bond or other form of financial assurance.

(2) Prior to the Lessor's approval of a COP, the Lessor may require an additional supplemental bond or other form of financial assurance in an amount determined by the Lessor based on the complexity, number, location of all facilities, activities and Commercial Operations planned in the COP, and estimates of the costs to meet all accrued obligations, in accordance with applicable BOEM regulations (30 CFR 585.515-537). The supplemental financial assurance requirement is in addition to the initial lease-specific financial assurance in the amount of $100,000 and an additional supplemental bond or other form of financial assurance required with the SAP. The Lessee may meet this obligation by providing a new bond or other acceptable form of financial assurance, or increasing the amount of its existing bond or other form of financial assurance.

(3) The Lessor will require a decommissioning bond or other form of financial assurance based on the anticipated decommissioning costs in accordance with applicable BOEM regulations (30 CFR 585.515-537). The decommissioning obligation must be guaranteed through an acceptable form of financial assurance and will be due according to the schedule beginning before commencement of the installation of commercial facilities on a date or dates to be determined by the Lessor.

(c) **Adjustments to Financial Assurance Amounts.** The Lessor reserves the right to adjust the amount of any financial assurance requirement (initial, supplemental, or decommissioning) associated with this lease and/or reassess the Lessee's cumulative lease obligations, including decommissioning obligations, at any time. If the Lessee's cumulative lease obligations and/or liabilities increase or decrease, the Lessor will notify the Lessee of any intended adjustment to the financial assurance requirements and provide the Lessee an opportunity to comment in accordance with applicable BOEM regulations.

U.S. DEPARTMENT OF THE INTERIOR
BUREAU OF OCEAN ENERGY MANAGEMENT

ADDENDUM "C"

LEASE-SPECIFIC TERMS, CONDITIONS, AND STIPULATIONS

Lease Number OCS-A 0522

The Lessee's rights to conduct activities on the leased area are subject to the following terms, conditions, and stipulations. The Lessor reserves the right to impose additional terms and conditions incident to the future approval or approval with modifications of plans, such as a Site Assessment Plan (SAP) or Construction and Operations Plan (COP).

1 DEFINITIONS

1.1 Definition of "Archaeological Resource": The term "archaeological resource" has the same meaning as "archaeological resource" in the Bureau of Ocean Energy Management (BOEM) regulations provided in 30 CFR 585.112.

1.2 Definition of "Dynamic Management Area (DMA)": The term "DMA" refers to a temporary area designated by the National Oceanic and Atmospheric Administration (NOAA) National Marine Fisheries Service (NMFS) and consisting of a circle around a confirmed North Atlantic right whale sighting. The radius of this circle expands incrementally with the number of whales sighted, and a buffer is included beyond the core area to allow for whale movement. Mandatory or voluntary speed restrictions may be applied by NOAA NMFS within DMAs. Information regarding the location and status of applicable DMAs is available from the NMFS Office of Protected Resources.

1.3 Definition of "Effective Date": The term "Effective Date" has the same meaning as "effective date" in BOEM regulations provided in 30 CFR 585.237.

1.4 Definition of "Geological and Geophysical Survey (G&G Survey)": The term "G&G Survey" serves as a collective term for surveys that collect data on the geology of the seafloor and landforms below the seafloor. High resolution geophysical surveys and geotechnical (sub-bottom) exploration are components of G&G surveys.

1.5 Definition of "Geotechnical Exploration": The term "Geotechnical Exploration," also referred to as "Sub-bottom Sampling," or "Geotechnical Testing," is used to collectively refer to site specific sediment and underlying geologic data acquired from the seafloor and the sub-bottom and includes geotechnical surveys utilizing deep borings, vibracores, and cone penetration tests.

1.6 Definition of "High Resolution Geophysical Survey (HRG Survey)": The term "HRG Survey" means a marine remote-sensing survey using, but not limited to, such equipment as side-scan sonar, magnetometer, shallow and medium (Seismic) penetration sub-bottom profiler systems, narrow beam or multibeam echo sounder, or other such equipment employed for the purposes of providing data on geological conditions, identifying shallow hazards, identifying archaeological resources, charting bathymetry, and gathering other site characterization information.

1.7 Definition of "Protected Species": The term "protected species" includes marine mammals (those protected under the Endangered Species Act and those protected under the Marine Mammal Protection Act), sea turtles, sturgeon, and giant manta ray.

1.8 Definition of "Protected-Species Observer": The term "protected-species observer," or "PSO," means an individual who is trained in the shipboard identification and behavior of protected species.

1.9 Definition of "Ramp-up": The term "ramp-up" means the process of incrementally increasing the acoustic source level of the survey equipment when conducting HRG surveys until it reaches the operational setting.

1.10 Definition of "Site Assessment Activities": The term "site assessment activities" or "site assessment," has the same meaning as "site assessment activities" in 30 CFR 585.112.

1.11 Definition of "Qualified Marine Archaeologist": The term "qualified marine archaeologist" means a person retained by the Lessee who meets the Secretary of the Interior's Professional Qualifications Standards for Archaeology (48 FR 44738-44739), and has experience analyzing marine geophysical data.

2 SCHEDULE

2.1 Site Characterization

2.1.1 Survey Plan(s). Prior to conducting survey activities in support of the submission of a plan, the Lessee must submit to the Lessor at least one complete survey plan. Each distinct survey effort (e.g., mobilization) must be addressed by a survey plan, although a single survey plan may cover more than one effort. Each survey plan must include details and timelines of the surveys to be conducted on this lease necessary to support the submission of a plan (i.e., necessary to satisfy the information requirements in the applicable regulations, including but not limited to 30 CFR 585.606, 610, 611, 621, 626, 627). Each survey plan must include a description of historic property identification surveys that will be conducted to gather the information required by BOEM to complete review of a plan under the National Historic Preservation Act (e.g., offshore and onshore archaeological surveys and surveys within the viewshed of proposed renewable energy structures). Each survey plan must be consistent with the Lessee's Fisheries Communication Plan (see 4.1.3) and include a description of the Lessee's intentions to coordinate with the U.S. Coast Guard to prepare a Notice to Mariners for the specific survey activities described in the survey plan.

The Lessee must submit each survey plan to the Lessor at least 30 calendar days prior to the date of the required pre-survey meeting with the Lessor (See 2.1.2). Prior to the commencement of any survey activities described in the survey plan, the Lessee must modify each survey plan to address any comments the Lessor submits to the Lessee on the contents of the survey plan in a manner deemed satisfactory by the Lessor.

2.1.2 Pre-Survey Meeting(s) with the Lessor. At least 60 days prior to the initiation of survey activities in support of the submission of a plan (i.e., SAP and/or COP), the Lessee must hold a pre-survey meeting with the Lessor to discuss the applicable proposed survey plan and timelines. The Lessee must ensure the presence at this meeting of a Qualified Marine Archaeologist and any other relevant subject matter experts (e.g., terrestrial archaeologist, architectural historians) related to the proposed historic property identification surveys described in the survey plan unless otherwise authorized by the Lessor. The Lessor may request the presence of other relevant subject matter experts at this meeting.

2.2 Progress Reporting

2.2.1 Semi-Annual Progress Report. The Lessee must submit to the Lessor a semi-annual (i.e., every six months) progress report through the duration of the site assessment term that includes a brief narrative of the overall progress since the last progress report, or – in the case of the first report – since the Effective Date. The progress report must include an update regarding progress in executing the activities included in the survey plan(s), and include as an enclosure an updated survey plan(s) accounting for any modifications in schedule.

3 NATIONAL SECURITY AND MILITARY OPERATIONS

The Lessee must comply with the requirements specified in stipulations 3.1, 3.2 and 3.3 when conducting site characterization activities in support of plan (i.e., SAP and/or COP) submittal.

3.1 Hold and Save Harmless

Whether compensation for such damage or injury might be due under a theory of strict or absolute liability or otherwise, the Lessee assumes all risks of damage or injury to persons or property, which occur in, on, or above the Outer Continental Shelf (OCS), to any persons or to any property of any person or persons in connection with any activities being performed by the Lessee in, on, or above the OCS, if such injury or damage to such person or property occurs by reason of the activities of any agency of the United States Government, its contractors, or subcontractors, or any of its officers, agents or employees, being conducted as a part of, or in connection with, the programs or activities of the individual military command headquarters (hereinafter "the appropriate command headquarters") listed in the contact information provided as an enclosure to this lease.

Notwithstanding any limitation of the Lessee's liability in Section 9 of the lease, the Lessee assumes this risk whether such injury or damage is caused in whole or in part by any act or omission, regardless of negligence or fault, of the United States, its contractors or subcontractors, or any of its officers, agents, or employees. The Lessee further agrees to indemnify and save harmless the United States against all claims for loss, damage, or injury in connection with the programs or activities of the command headquarters, whether the same be caused in whole or in part by the negligence or fault of the United States, its contractors, or subcontractors, or any of its officers, agents, or employees and whether such claims might be sustained under a theory of strict or absolute liability or otherwise.

3.2 Evacuation or Suspension of Activities

3.2.1 General. The Lessee hereby recognizes and agrees that the United States reserves and has the right to temporarily suspend operations and/or require evacuation on this lease in the interest of national security pursuant to Section 3(c) of this lease.

3.2.2 Notification. Every effort will be made by the appropriate military agency to provide as much advance notice as possible of the need to suspend operations and/or evacuate. Advance notice will normally be given before requiring a suspension or evacuation. Temporary suspension of operations may include, but is not limited to the evacuation of personnel and appropriate sheltering of personnel not evacuated. "Appropriate sheltering" means the protection of all Lessee personnel for the entire duration of any Department of Defense activity from flying or falling objects or substances and will be implemented by an order (oral and/or written) from the BOEM Office of Renewable Energy Programs (OREP) Program Manager, after consultation with the appropriate command headquarters or other appropriate military agency, or higher Federal authority. The appropriate command headquarters, military agency, or higher authority will provide information to allow the Lessee to assess the degree of risk to, and provide sufficient protection for, the Lessee's personnel and property.

3.2.3 Duration. Suspensions or evacuations for national security reasons will not generally exceed seventy-two (72) hours; however, any such suspension may be extended by order of the OREP Program Manager. During such periods, equipment may remain in place, but all operations, if any, must cease for the duration of the temporary suspension if so directed by the OREP Program Manager. Upon cessation of any temporary suspension, the OREP Program Manager will immediately notify the Lessee such suspension has terminated and operations on the leased area can resume.

3.2.4 Lessee Point-of-Contact for Evacuation/Suspension Notifications. The Lessee must inform the Lessor of the persons/offices to be notified to implement the terms of 3.2.2 and 3.2.3.

3.2.5 Coordination with Command Headquarters. The Lessee must establish and maintain early contact and coordination with the appropriate command headquarters, in order to avoid or minimize the potential to conflict with and minimize the potential effects of conflicts with military operations.

3.2.6 Reimbursement. The Lessee is not entitled to reimbursement for any costs or expenses associated with the suspension of operations or activities or the evacuation of property or personnel in fulfillment of the military mission in accordance with 3.2.1 through 3.2.5 above.

3.3 Electromagnetic Emissions

The Lessee, prior to entry into any designated defense operating area, warning area, or water test area, for the purpose of commencing survey activities undertaken to support SAP or COP submittal must enter into an agreement with the commander of the appropriate command headquarters to coordinate the electromagnetic emissions associated with such survey activities. The Lessee must ensure that all electromagnetic emissions associated with such survey activities are controlled as directed by the commander of the appropriate command headquarters.

4 STANDARD OPERATING CONDITIONS

4.1 General

4.1.1 Vessel Strike Avoidance Measures. The Lessee must ensure that all vessels conducting activities in support of plan (i.e., SAP and COP) submittal, including those transiting to and from local ports and the lease area, comply with the vessel-strike avoidance measures specified in stipulations 4.1.1.1 through 4.1.1.8.3, except under extraordinary circumstances when complying with these requirements would put the safety of the vessel or crew at risk.

4.1.1.1 The Lessee must ensure that vessel operators and crews maintain a vigilant watch for marine mammals (whales, dolphins, porpoises, seals), sea turtles, and giant manta rays, and slow down or stop their vessel to avoid striking these protected species.

4.1.1.2 The Lessee must ensure that vessels 19.8 meters (m) (65 feet [ft]) in length or greater that operate between November 1 through July 31, operate at speeds of 10 knots (11.5 mph) or less.

4.1.1.3 The Lessee must ensure that vessel operators monitor NMFS North Atlantic Right Whale reporting systems (e.g., the Early Warning System, Sighting Advisory System, and Mandatory Ship Reporting System) from November 1 through July 31 and whenever a DMA is established within any area vessels operate.

4.1.1.4 The Lessee must ensure that all vessel operators comply with 10 knot (18.5 kilometers per hour [km/hr]) speed restrictions in any DMA.

4.1.1.5 The Lessee must ensure that all vessel operators reduce vessel speed to 10 knots or less when mother/calf pairs, pods, or large assemblages of marine mammals are observed near an underway vessel.

4.1.1.6 North Atlantic Right Whales.

4.1.1.6.1 The Lessee must ensure all vessels maintain a separation distance of 500 m (1,640 ft) or greater from any sighted North Atlantic right whale or unidentified large marine mammal.

4.1.1.6.2 The Lessee must ensure that the following avoidance measures are taken if a vessel comes within 500 m (1,640 ft) of any North Atlantic right whale:

4.1.1.6.2.1 If underway, any vessel must steer a course away from any North Atlantic right whale at 10 knots (18.5 km/h) or less until the 500 m (1,640 ft) minimum separation distance has been established (except as provided in 4.1.1.6.2.2).

4.1.1.6.2.2 If a North Atlantic right whale is sighted within 100 m (328 ft) to an underway vessel, the vessel operator must immediately reduce speed and promptly shift the engine to neutral. The vessel operator must not engage the engines until the North Atlantic right whale has moved beyond 100 m (328 ft), at which point the Lessee must comply with 4.1.1.6.2.1.

4.1.1.6.2.3 If a vessel is stationary, the vessel must not engage engines until the North Atlantic right whale has moved beyond 100 m (328 ft), at which point the Lessee must comply with 4.1.1.6.2.1.

4.1.1.7 Large Whales other than the North Atlantic Right Whale.

4.1.1.7.1 The Lessee must ensure all vessels maintain a separation distance of 100 m (328 ft) or greater from any sighted Endangered Species Act (ESA)-listed whales or humpback whales.

4.1.1.7.2 The Lessee must ensure that the following avoidance measures are taken if a vessel comes within 100 m (328 ft) of whale:

4.1.1.7.2.1 If underway, the vessel must reduce speed and shift the engine to neutral, and must not engage the engines until the whale has moved beyond 100 m (328 ft).

4.1.1.7.2.2 If stationary, the vessel must not engage engines until the whale has moved beyond 100 m (328 ft).

4.1.1.8 Small Cetaceans (Dolphins and Porpoises), Seals, Giant Manta Rays, and Sea Turtles.

4.1.1.8.1 The Lessee must ensure that all vessels underway do not divert to approach any small cetacean, seal, sea turtle, or giant manta ray.

4.1.1.8.2 The Lessee must ensure that all vessels maintain a separation distance of 50 meters (164 ft) or greater from any sighted small cetacean, seal, sea turtles, or giant manta ray, except when a small cetacean or seal approaches the vessel, in which case, the Lessee must follow 4.1.1.8.3 below.

4.1.1.8.3 If a small cetacean or seal approaches any vessel underway, the vessel underway must avoid excessive speed or abrupt changes in direction to avoid injury to the animal.

4.1.1.9 Vessel Operator Briefing. The Lessee must ensure that all vessel operators are briefed to ensure they are familiar with the requirements specified in 4.1.1.

4.1.2 Marine Trash and Debris Prevention. The Lessee must ensure that vessel operators, employees, and contractors actively engaged in activity in support of a plan (i.e., SAP and COP) submittal are briefed on marine trash and debris awareness and elimination, as described in the BSEE NTL No. 2015-G03 ("Marine Trash and Debris Awareness and Elimination") or any NTL that supersedes this NTL, except that the Lessor will not require the Lessee to post placards. The Lessee must ensure that these vessel operator employees and contractors receive training on the environmental and socioeconomic impacts associated with marine trash and debris and their responsibilities for ensuring that trash and debris are not intentionally or accidentally discharged into the marine environment. Briefing materials on marine debris awareness, elimination, and protected species are available at http://oocmain.theooc.us/page41.html.

4.1.3 Fisheries Communications Plan (FCP) and Fisheries Liaison. The Lessee must develop a publicly available FCP that describes the strategies that the Lessee intends to use for communicating with fisheries stakeholders prior to and during activities in support of the submission of a plan. The FCP must include the contact information for an individual retained by the Lessee as its primary point of contact with fisheries stakeholders (i.e., Fisheries Liaison). If the Lessee does not develop a project website, the FCP must be made available to the Lessor and the public upon request.

4.1.4 Entanglement Avoidance.

4.1.4.1 The Lessee must ensure that any structures or devices attached to the seafloor for continuous periods greater than 24 hours use the best available mooring systems for minimizing the risk of entanglement or entrainment of marine mammals, manta rays and sea turtles, while still ensuring the safety and integrity of the structure or device. The best available mooring system may include, but is not limited to, vertical and float lines (chains, cables, or coated rope systems), swivels, shackles, and anchor designs.

4.1.4.2 All mooring lines and ancillary attachment lines must use one or more of the following measures to reduce entanglement risk: shortest practicable line length, rubber sleeves, weak-links, chains, cables or similar equipment types that prevent lines from looping or wrapping around animals, or entrapping protected species.

4.1.4.3 Any equipment must be attached by a line within a rubber sleeve for rigidity. The length of the line must be as short as necessary to meet its intended purpose.

4.1.4.4 If an entangled live or dead marine protected species is reported, the Lessee must provide any assistance to authorized stranding response personnel as requested by BOEM or NMFS.

4.2 Archaeological Survey Requirements

4.2.1 Archaeological Survey Required. The Lessee must provide the results of an archaeological survey with its plans.

4.2.2 Qualified Marine Archaeologist. The Lessee must ensure that the analysis of archaeological survey data collected in support of plan (e.g., SAP and/or COP) submittal and the preparation of archaeological reports in support of plan submittal are conducted by a Qualified Marine Archaeologist.

4.2.3 Tribal Pre-Survey Meeting. The Lessee must invite by certified mail the Narragansett Indian Tribe, the Mashpee Wampanoag Tribe, and the Wampanoag Tribe of Gay Head (Aquinnah) to a tribal pre-survey meeting. The purpose of this meeting will be for the Lessee and the Lessee's Qualified Marine Archaeologist to discuss the Lessee's Survey Plan and consider requests to monitor portions of the archaeological survey and the geotechnical exploration activities, including the visual logging and analysis of geotechnical samples (e.g., cores, etc.). The meeting must be held subsequent to the pre-survey meeting with the Lessor (see 2.1.2). Invitation to the tribal pre-survey meeting must be made at least 15 calendar days prior to the date of the proposed tribal pre-survey meeting. The meeting must be scheduled for a date at least 30 calendar days prior to commencement of survey activities performed in support of plan submittal and at a location and time that affords the participants a reasonable opportunity to participate. The anticipated date for the meeting must be identified in the timeline of activities described in the applicable survey plan (see 2.1.1).

4.2.4 Geotechnical Exploration. The Lessee may only conduct geotechnical exploration activities performed in support of plan (i.e., SAP and/or COP) submittal in locations where an analysis of the results of geophysical surveys has been completed. This analysis must include a determination by a Qualified Marine Archaeologist as to whether any potential archaeological resources are present in the area. Except as allowed by the Lessor under 4.2.6, the geotechnical exploration activities must avoid potential archaeological resources by a minimum of 50 m (164 ft), and the avoidance distance must be calculated from the maximum discernible extent of the archaeological resource. A Qualified Marine Archaeologist must certify, in the

Lessee's archaeological reports, that geotechnical exploration activities did not impact potential historic properties identified as a result of the HRG surveys performed in support of plan submittal, except as follows: in the event that the geotechnical exploration activities did impact potential historic properties identified in the archaeological surveys without the Lessor's prior approval, the Lessee and the Qualified Marine Archaeologist who prepared the report must instead provide a statement documenting the extent of these impacts.

4.2.5 Monitoring and Avoidance. The Lessee must inform the Qualified Marine Archaeologist that he or she may be present during HRG surveys and bottom-disturbing activities performed in support of plan (i.e., SAP and/or COP) submittal to ensure avoidance of potential archaeological resources, as determined by the Qualified Marine Archaeologist (including bathymetric, seismic, and magnetic anomalies; side scan sonar contacts; and other seafloor or sub-surface features that exhibit potential to represent or contain potential archaeological sites or other historic properties). In the event that this Qualified Marine Archaeologist indicates that he or she wishes to be present, the Lessee must facilitate the Qualified Marine Archaeologist's presence, as requested by the Qualified Marine Archaeologist, and provide the Qualified Marine Archaeologist the opportunity to inspect data quality.

4.2.6 No Impact without Approval. In no case may the Lessee knowingly impact a potential archaeological resource without the Lessor's prior approval.

4.2.7 Post-Review Discovery Clauses. If the Lessee, while conducting geotechnical exploration or any other bottom-disturbing site characterization activities in support of plan (i.e., SAP and COP) submittal and after review of the location by a Qualified Marine Archaeologist under 4.2.4, discovers an unanticipated potential archaeological resource, such as the presence of a shipwreck (e.g., a sonar image or visual confirmation of an iron, steel, or wooden hull, wooden timbers, anchors, concentrations of historic objects, piles of ballast rock) or evidence of a pre-contact archaeological site (e.g. stone tools, pottery or other pre-contact artifacts) within the project area, the Lessee must:

4.2.7.1 Immediately halt seafloor/bottom-disturbing activities within the area of discovery;

4.2.7.2 Notify the Lessor within 24 hours of discovery;

4.2.7.3 Notify the Lessor in writing via report to the Lessor within 72 hours of its discovery;

4.2.7.4 Keep the location of the discovery confidential and take no action that may adversely affect the archaeological resource until the Lessor has made an evaluation and instructs the applicant on how to proceed; and

4.2.7.5 Conduct any additional investigations as directed by the Lessor to determine if the resource is eligible for listing in the National Register of Historic Places

(30 CFR 585.802(b)). The Lessor will do this if: (1) the site has been impacted by the Lessee's project activities; or (2) impacts to the site or to the area of potential effect cannot be avoided. If investigations indicate that the resource is potentially eligible for listing in the National Register of Historic Places, the Lessor will tell the Lessee how to protect the resource or how to mitigate adverse effects to the site. If the Lessor incurs costs in protecting the resource, under Section 110(g) of the National Historic Preservation Act, the Lessor may charge the Lessee reasonable costs for carrying out preservation responsibilities under the OCS Lands Act (30 CFR 585.802(c-d)).

4.3 **Geological and Geophysical (G&G) Survey Requirements**

4.3.1 General. The Lessee must ensure that all vessels conducting activity in support of a plan (i.e., SAP and COP) submittal comply with the geological and geophysical survey requirements specified in 4.3 except under extraordinary circumstances when complying with these requirements would put the safety of the vessel or crew at risk.

4.3.2 Visibility. The Lessee must not conduct G&G surveys in support of plan (i.e., SAP and COP) submittal at night or if any observation conditions (e.g., darkness, rain, fog, and sea state) prevent visual monitoring of the HRG survey exclusion zone (see 4.3.6.1) or the geotechnical exploration exclusion zone (see 4.3.7.1), except as allowed under 4.3.3.

4.3.3 Nighttime Survey Requirements. If the Lessee intends to conduct G&G survey operations in support of plan submittal at night or when visual observation is otherwise impaired, the Lessee must use PSOs supplemented with night vision technology and a passive acoustic monitoring system to monitor the exclusion zone. The Lessee must submit to the Lessor an alternative monitoring plan detailing the monitoring methodology (e.g., active or passive acoustic monitoring technologies). No nighttime surveys may begin until the Lessor determines that the alternative monitoring plan is adequate to monitor for protected species.

4.3.4 Protected-Species Observer. The Lessee must ensure that the exclusion zone for all G&G surveys performed in support of plan (i.e., SAP and COP) submittal is monitored by NMFS-approved protected-species observers.

4.3.4.1 The Lessor must ensure all PSOs and Passive Acoustic Monitoring (PAM) Operators have completed a PSO and/or PAM training program, as appropriate. PSOs must be approved by NMFS prior to the start of a survey. Instructions and application requirements to become a NMFS-approved PSO can be found at: https://www.greateratlantic.fisheries.noaa.gov/protected/esaobserver/index.html.

4.3.4.2 No later than 7 calendar days prior to the scheduled start of survey activities that require PSOs, the Lessee must provide to the Lessor a list of PSOs that will implement best management practices (BMPs) during survey work. The Lessee must provide the Lessor a current approval from NMFS that indicates the PSOs are currently qualified to work on survey, and documentation or certificate of individual PSOs' successful completion of a commercial PSO training course and/or PAM operator course with an overall examination score of 80% or greater (Baker et. al 2013 available at https://www.fisheries.noaa.gov/resource/document/national-standards-protected-species-observer-and-data-management-program).

4.3.4.3 The Lessee must submit a PSO/PAM Operator schedule showing the number of PSOs/PAM Operators used is sufficient to effectively monitor the affected area identified for each project (e.g., surveys or pile driving) according to the following: a) PSOs/PAM must not be on watch for more than 4 consecutive hours, with at least a 2-hour break after a 4-hour watch, unless otherwise accepted by the Lessor; b) PSOs/PAM must not work for more than 12 hours in any 24-hour period (Baker et al. 2013).

4.3.4.4 The Lessee must ensure PSO data is collected in accordance with standard reporting forms, software tools, and electronic data forms approved by BOEM for the particular activity.

4.3.5 Observation Location and Optical Device Availability. The Lessee must ensure that monitoring occurs from the highest available vantage point on the associated operational platform, allowing for 360-degree scanning. The Lessee must ensure that reticle binoculars and other suitable equipment are available to each observer to adequately perceive and monitor protected marine species within the exclusion zone during surveys conducted in support of plan (i.e., SAP and COP) submittal.

4.3.6 High-Resolution Geophysical Surveys. Stipulations specific to HRG surveys conducted in support of plan (i.e., SAP and COP) submittal where one or more acoustic sound sources is operating at frequencies below 200 kHz are provided in 4.3.6.1 through 4.3.6.9.

4.3.6.1 Establishment of Default Exclusion Zone. The Lessee must ensure a 200-meter radius exclusion zone around the sound source for ESA-listed whales and sea turtles. In the case of the North Atlantic right whale, the Lessee must observe a minimum separation distance of 500 m (1,640 ft), as required under 4.1.1.6.1. Exclusion zones for non-listed marine mammals will be determined through project-specific mitigation and monitoring requirements of Incidental Take Authorizations (ITAs) provided by the National Marine Fisheries Service. If an ITA is not required, default exclusion zones of 100 m (328 ft) for harbor porpoises and humpback whales, and 50 m (164 ft) for all other non-listed marine mammals must be established around each vessel conducting HRG survey activities.

4.3.6.2 High Resolution Geophysical Sound Source Verification. No later than 45 calendar days prior to the commencement of survey activities , the Lessee must submit the results of sound source verification for any active acoustic devices that may be used. The Lessee must submit sound source verification results containing the frequencies, source level (dB re 1μPa), and modeled distances to most current guidance specified by the Lessor for ear injury and behavioral disturbance in the survey area. If existing data is available, the analysis must provide an explanation why the existing data is expected to be representative for the equipment in the area to be surveyed. This explanation must include a discussion of any differences between the equipment tested and the equipment to be used, a discussion of any differences in propagation characteristics conditions (depth, water temperature and bottom conditions), and an explanation for how those differences would affect sound propagation and injury and behavioral disturbance distances. No surveys may begin until the Lessor determines that the sound source verification use of existing information is acceptable.

4.3.6.3 If the existing SSV information is not acceptable, the Lessee must submit to the Lessor a sound source verification plan for field measurements of any HRG equipment that will be used, no later than 30 calendar days prior to the commencement of survey activities. Acoustic measurements must be sufficient to establish the following: frequencies, source level (Peak, SEL, and RMS sound pressure levels re 1 μPa at 1 m), and the sound exposure distance for ear injury and behavioral harassment thresholds for marine mammal hearing groups, sea turtles, and fish specified by the Lessor. The Lessee must take these sound measurements from at least three reference distances at two depths (i.e., a depth at mid-water and a depth at approximately 1 m above the seafloor). The results of the field measurements must be provided to the Lessor for review at least 24 hours in advance of commencing a survey.

4.3.6.3.1 If the Lessor determines that the exclusion zone does not encompass the sound-exposure threshold for ear injury to protected species, the Lessor will consult with NMFS and may impose additional requirements on the Lessee.

4.3.6.4 <u>Modification of Exclusion Zone per Lessee Request</u>. The Lessee may use the field verification results to request modification of the exclusion zone for the specific HRG survey equipment under consideration. Any new exclusion zone radius proposed by the Lessee must be based on the most conservative field measurements of the largest exclusion zone and diving behavior of the protected species in the survey area. The Lessee may periodically reevaluate the modified zone using the field verification procedures described in 4.3.6.3. The Lessee must obtain Lessor approval of any new exclusion zone before it is implemented.

4.3.6.5 <u>Clearance of Exclusion Zone</u>. The Lessee must ensure that active acoustic sound sources will not be activated until the PSO has reported the exclusion zone clear of all marine mammals and sea turtles for 60 minutes.

4.3.6.6 <u>Electromechanical Survey Equipment Ramp-Up</u>. The Lessee must ensure that, when technically feasible, a "ramp-up" of the electromechanical survey equipment occurs at the start or re-start of HRG survey activities. A ramp-up would begin with the power of the smallest acoustic equipment for the HRG survey at its lowest power output. The power output would be gradually turned up and other acoustic sources added in a way such that the source level would increase in steps not exceeding 6 dB per 5-minute period.

4.3.6.7 Shut Down for Protected Species. The Lessee must ensure that anytime a protected species is sighted within the exclusion zone defined in 4.3.6.1, the PSO must notify the Resident Engineer or other authorized individual, and call for an immediate shutdown of the electromechanical survey equipment. HRG survey equipment may be allowed to continue operating if marine mammals voluntarily approach the vessel (e.g., to bow ride) when the sound sources are at full operating power. The vessel operator must comply immediately with such a call by the PSO. Any disagreement or discussion must occur only after shut-down. Subsequent restart of the electromechanical survey equipment may only occur following clearance of the exclusion zone (see 4.3.6.5) and implementation of ramp-up procedures (see 4.3.6.6).

4.3.6.8 Pauses in Electromechanical Survey Sound Source. The Lessee must ensure that, if the electromechanical sound source shuts down for reasons other than encroachment into the exclusion zone by a whale or sea turtle, including reasons such as, but not limited to, mechanical or electronic failure, resulting in the cessation of the sound source for a period greater than 20 minutes, restart of the electromechanical survey equipment commences only after clearance of the exclusion zone (see 4.3.6.5) and implementation of ramp-up procedures (see 4.3.6.6). If the pause is less than 20 minutes the equipment may be restarted as soon as practicable at its operational level as long as visual surveys were continued diligently throughout the silent period and the exclusion zone remained clear of marine mammals and sea turtles. If visual surveys were not continued diligently during the pause of 20-minutes or less, the Lessee must clear the exclusion zone, as described in 9.3.6.5, and implement ramp-up procedures, as described in 4.3.6.6, prior to restarting the electromechanical survey equipment.

4.3.7 Geotechnical Exploration. Stipulations specific to geotechnical exploration limited to borings and vibracores and conducted in support of plan (i.e., SAP and COP) submittal are provided in 4.3.7.1 through 4.3.7.6.

4.3.7.1 Establishment of Default Exclusion Zones. A default exclusion zone distance of 500 m (1,640 ft) for North Atlantic right whales and other listed species must be monitored around each vessel conducting geotechnical survey activities where North Atlantic right whales are expected to occur. If surveys are conducted in an area where North Atlantic right whales are not expected to occur, a default exclusion zone of 200 m (656 ft) for other large whales and sea turtles must be established around each vessel conducting HRG survey activities. Exclusion zones for non-listed marine mammals will be determined through project-specific mitigation and monitoring requirements of ITAs provided by the NMFS. If an ITA is not required, default exclusion zones of 100 m (328 ft) for harbor porpoises and humpback whales, and 50 m (164 ft) for all other non-listed marine mammals must be established around each vessel conducting HRG survey activities.

4.3.7.2 Geotechnical Sound Source Verification. No later than 45 calendar days prior to the commencement of any surveys with any geotechnical survey equipment producing underwater sound levels, the Lessee must submit existing information on the sound levels produced by the equipment. If adequate information on the equipment is not available, the Lessor may require the Lessee to submit a plan to the Lessor for field verification of the sound source levels and of any geotechnical survey equipment operating at frequencies below 200 kHz. The Lessor must approve this verification plan prior to the commencement of the survey. The Lessor may require the Lessee to modify the plan in a manner deemed satisfactory by the Lessor.

4.3.7.2.1 If the Lessor determines that the exclusion zone is not effective to minimize impacts to protected species, the Lessor may impose additional requirements on the Lessee, including, but not limited to, required expansion of this exclusion zone.

4.3.7.3 Clearance of Exclusion Zone. The Lessee must ensure that the geotechnical sound source is not activated until the PSO has reported the exclusion zone clear of all marine mammals and sea turtles for 60 minutes.

4.3.7.4 Modification of Exclusion Zone per Lessee Request. If the Lessee wishes to modify the default exclusion zone for specific geotechnical exploration equipment, the Lessee must submit a plan for verifying the sound source levels of the specific geotechnical exploration equipment to the Lessor. The plan must demonstrate how the field verification activities will comply with the requirements of 4.3.7.2. The Lessor may require that the Lessee modify the plan to address any comments the Lessor submits to the Lessee on the contents of the plan in a manner deemed satisfactory to the Lessor prior to the commencement of field verification activities. Any new exclusion zone radius proposed by the Lessee must be based on the sound exposure distance for ear injury or behavioral harassment thresholds for marine mammal hearing groups, sea turtles, and fish as defined by the Lessor. The Lessee must use this modified zone for all subsequent use of field-verified equipment. The Lessee may periodically reevaluate the modified zone using the field verification procedures described in 4.3.7.2. The Lessee must obtain Lessor approval of any new exclusion zone before it is implemented.

4.3.7.5 Shut Down for Whales and Sea Turtles. If any whales or sea turtles are sighted at or within the exclusion zone, an immediate shut-down of the geotechnical survey equipment is required. The vessel operator must comply immediately with such a call by the PSO. Any disagreement or discussion must occur only after shut-down. Subsequent restart of the geotechnical survey equipment may only occur following clearance of the exclusion zone (see 4.3.7.3).

4.3.7.6 Pauses in Geotechnical Survey Sound Source. The Lessee must ensure that, if the geotechnical sound source shuts down for reasons other than encroachment into the exclusion zone by a whale or sea turtle, including reasons such as, but not limited to, mechanical or electronic failure, resulting in the cessation of the sound source for a period greater than 20 minutes, restart of the geotechnical survey equipment commences only following clearance of the exclusion zone (see 4.3.7.3). If the pause is less than 20 minutes, the equipment may be restarted as soon as practicable as long as visual surveys were continued diligently throughout the silent period and the exclusion zone remained clear of marine mammals and sea turtles. If visual surveys were not continued diligently during the pause of 20 minutes or less, the Lessee must clear the exclusion zone, as described in 4.3.7.3, prior to restarting the geotechnical survey equipment.

4.4 Reporting Requirements

4.4.1 The Lessee must ensure compliance with the following reporting requirements for site characterization activities performed in support of plan (i.e., SAP and COP) submittal and must use the contact information provided as an enclosure to this lease, or updated contact information as provided by the Lessor, to fulfill these requirements:

4.4.2 Field Verification of Exclusion Zone Preliminary Report. The Lessee must report the results of any required sound source verification of the exclusion zone for G&G survey equipment operating below 200 kHz to the Lessor and NMFS prior to using the equipment during survey activities conducted in support of plan submittal. The Lessee must include in its report a preliminary interpretation of the results for all sound sources, which will include details of the operating frequencies, sound pressure levels (SPLs) (measured in Peak, SEL, and RMS), the distance to the ear injury and behavior thresholds, frequency bands measured, as well as associated latitude/longitude positions, ranges, depths and bearings between sound sources and receivers.

4.4.3 Reports of Survey Activities and Observations. The Lessee must provide the Lessor with reports every 90 calendar days following the completion of HRG or geotechnical exploration activities, and a final report at the conclusion of the HRG or geotechnical exploration activities. Each report must include a summary of survey activities, all PSO and incident reports (See Appendices A and B), and an estimate of the number of listed marine mammals, sea turtles, and sturgeon observed and/or taken during these survey activities. The final report must contain a detailed analysis and interpretation of the sound source verification data, if such data was collected by the Lessee.

4.4.4 Reporting Injured or Dead Protected Species. The Lessee must ensure that sightings of any injured or dead protected species (e.g., marine mammals, sea turtles, giant manta ray or sturgeon) are reported to the Lessor, NMFS, and the NMFS Greater Atlantic (Northeast) Region's Stranding Hotline (866-755-6622 or current) within 24 hours of sighting, regardless of whether the injury or death is caused by a vessel. In addition, if the injury or death was caused by a collision with a project-related vessel, the Lessee must ensure that the Lessor is notified of the incident within 24 hours. The Lessee must use the form provided in Appendix A to ADDENDUM "C" to report the sighting or incident. If the Lessee's activity is responsible for the injury or death, the Lessee must ensure that the vessel assist in any salvage effort as requested by NMFS.

4.4.5 Reporting Observed Impacts to Protected Species.

4.4.5.1 The Lessee must report any observed takes of listed marine mammals, sea turtles sturgeon, or giant manta ray resulting in injury or mortality within 24 hours to the Lessor and NMFS.

4.4.5.2 The Lessee must record any observed injuries or mortalities using the form provided in Appendix A to ADDENDUM "C".

4.4.6 Protected Species Observer Reports. The Lessee must ensure that the PSOs record all observations of protected species using standard marine mammal observer data collection protocols. The list of required data elements for these reports is provided in Appendix B to ADDENDUM "C".

4.4.7 Marine Mammal Protection Act Authorization(s). If the Lessee is required to obtain an authorization pursuant to section 101(a)(5) of the Marine Mammal Protection Act prior to conducting survey activities in support of plan submittal, the Lessee must provide to the Lessor a copy of the authorization prior to commencing these activities.

5 SITING CONDITIONS

5.1 **Vessel Transit Corridors.** In its COP project design, Lessee must extend any BOEM-approved vessel transit corridors in adjacent lease areas, unless BOEM determines that such corridors are not necessary or can be modified. Lessee may not construct any surface structures in such vessel transit corridors.

5.2 **Surface Structure Setback.** In its COP project design, the Lessee must incorporate a 750 m setback from any shared lease boundary within which the Lessee may not construct any surface structures, unless the Lessee and the adjacent lessee agree to a smaller setback, the Lessee submits such agreement to BOEM, and BOEM approves it.

APPENDIX B TO ADDENDUM "C"

Lease Number OCS-A 0522

REQUIRED DATA ELEMENTS FOR PROTECTED SPECIES OBSERVER REPORTS

The Lessee must ensure that the PSO record all observations of protected species using standard marine mammal observer data collection protocols. The list of required data elements for these reports is provided below:

1. Vessel name;
2. PSOs' names and affiliations;
3. Date;
4. Time and latitude/longitude when daily visual survey began;
5. Time and latitude/longitude when daily visual survey ended; and
6. Average environmental conditions during visual surveys including:
    a. Wind speed and direction;
    b. Sea state (glassy, slight, choppy, rough, or Beaufort scale);
    c. Swell (low, medium, high, or swell height in meters); and
    d. Overall visibility (poor, moderate, good).
7. Species (or identification to lowest possible taxonomic level);
8. Certainty of identification (sure, most likely, best guess);
9. Total number of animals;
10. Number of juveniles;
11. Description (as many distinguishing features as possible of each individual seen, including length, shape, color and pattern, scars or marks, shape and size of dorsal fin, shape of head, and blow characteristics);
12. Direction of animal's travel relative to the vessel (preferably accompanied by a drawing);
13. Behavior (as explicit and detailed as possible, noting any observed changes in behavior);
14. Activity of vessel when sighting occurred.

BUREAU OF OCEAN ENERGY MANAGEMENT

ADDENDUM "D"

PROJECT EASEMENT

Lease Number OCS-A 0522

This section includes a description of the Project Easement(s), if any, associated with this lease, and the financial terms associated with it. This section will be updated as necessary.

I. Rent

The Lessee must begin submitting rent payments for any project easement associated with this lease commencing on the date that BOEM approves the Construction and Operations Plan (COP) or modification of the COP describing the project easement. Annual rent for a project easement 200 feet wide, centered on the transmission cable, is $70.00 per statute mile. For any additional acreage required, the Lessee must also pay the greater of $5.00 per acre per year or $450.00 per year.

U.S. DEPARTMENT OF THE INTERIOR
BUREAU OF OCEAN ENERGY MANAGEMENT

ADDENDUM "E"

RENT SCHEDULE

Lease Number OCS-A 0522

This section includes a description of the schedule for rent payments that will be determined after the Construction and Operations Plan has been approved or approved with modifications. This section will be updated as necessary.

Unless otherwise authorized by the Lessor in accordance with the applicable regulations in 30 CFR Part 585, the Lessee must make rent payments as described below.

Alternative Monitoring Plan

for

Lease OCS-A 0522 Survey Plan
Geophysical, Geotechnical, and Environmental Site Characterization Campaign in Support of a Construction and Operations Plan

In accordance with Lease stipulation 4.3.3, OCS-A 0522 LLC submits this Alternative Monitoring Plan detailing the monitoring methodology for conducting geophysical surveys at night and during low visibility conditions. In addition to the measures set forth in the applicable Incidental Harassment Authorization (IHA), the following additional measures that have been previously approved by BOEM will be implemented to conduct monitoring at night or when visibility is impaired.

1. PAM operator(s) will work in coordination with the PSO to support survey activities at night and/or as needed during periods when visual observations may be impaired. In order to ensure the active monitoring of the HRG survey exclusion zones, as well as the 500 meter minimum separation distance from the NARW.*

2. During nighttime operations, the PAM Operator will work in co- ordination with the PSO on watch to attempt to verify and localize any marine mammal detections. During periods of low visibility (as determined by the lead PSO), including nighttime operations, if a NARW is detected acoustically, but cannot be localized, all sound sources operating below 200 kHz will be shutdown. If acoustic detection occurs for any other marine mammal or sea turtle encroaching upon the exclusion zones, shutdown procedures will be conducted as described above.*

3. Visual Nighttime Monitoring: In addition to the use of PAM during nighttime operations, PSOs will be equipped with Night Vision Binoculars (NVBs), Clip on Thermal Imagers (COTI) and/or handheld infrared light emitting diode spotlights. PSOs will monitor the exclusion zone and the 500 meter minimum vessel separation distance from the NARW using the night vision technology.

4. Monitoring equipment will be calibrated when possible throughout the duration of survey and true distances measured using the ships radar will be compared to those measured using visual and acoustic monitoring equipment.

*The only exception to the use of PAM is when nearshore survey work in shallower water is conducted with smaller vessels that cannot accommodate both PSOs and PAM operators. In those limited cases, PSOs will be equipped with Night Vision Binoculars (NVBs), Clip on Thermal Imagers (COTI) and/or handheld infrared light emitting diode spotlights.

This lease, which includes any addenda hereto, is hereby entered into by and between the United States of America, ("Lessor"), acting through the Bureau of Ocean Energy Management ("BOEM"), its authorized officer, and

Lessee	Interest Held
	100%

("Lessee"). This lease is effective on the date written above ("Effective Date") and will continue in effect until the lease terminates as set forth in Addendum "B." In consideration of any cash payment heretofore made by the Lessee to the Lessor and in consideration of the promises, terms, conditions, covenants, and stipulations contained herein and attached hereto, the Lessee and the Lessor agree as follows:

Section 1: Statutes and Regulations.

This lease is issued pursuant to subsection 8(p) of the Outer Continental Shelf Lands Act ("the Act"), 43 U.S.C. §§ 1331 *et seq.* This lease is subject to the Act and regulations promulgated pursuant to the Act, including but not limited to, offshore renewable energy and alternate use regulations at 30 CFR Part 585 as well as other applicable statutes and regulations in existence on the Effective Date of this lease. This lease is also subject to those statutes enacted (including amendments to the Act or other statutes) and regulations promulgated thereafter, except to the extent that they explicitly conflict with an express provision of this lease. It is expressly understood that amendments to existing statutes, including but not limited to the Act, and regulations may be made, and/or new statutes may be enacted or new regulations promulgated, which do not explicitly conflict with an express provision of this lease, and that the Lessee bears the risk that such amendments, regulations, and statutes may increase or decrease the Lessee's obligations under the lease.

Section 2: Rights of the Lessee.

(a) The Lessor hereby grants and leases to the Lessee the exclusive right and privilege, subject to the terms and conditions of this lease and applicable regulations, to:

(1) submit to the Lessor for approval a Site Assessment Plan (SAP) and Construction and Operations Plan (COP) for the project identified in Addendum "A" of this lease; and (2) conduct activities in the area identified in Addendum "A" of this lease ("leased area") and/or Addendum "D" of this lease ("project easement(s)"), that are described in a SAP or COP that has been approved by the Lessor. This lease does not, by itself, authorize any activity within the leased area.

(b) The rights granted to the Lessee herein are limited to those activities described in any SAP or COP approved by the Lessor. The rights granted to the Lessee are limited by the lease-specific terms, conditions, and stipulations required by the Lessor per Addendum "C."

(c) This lease does not authorize the Lessee to conduct activities on the Outer Continental Shelf (OCS) relating to or associated with the exploration for, or development or production of, oil, gas, other seabed minerals, or renewable energy resources other than those renewable energy resources identified in Addendum "A."

Section 3: Reservations to the Lessor.

(a) All rights in the leased area and project easement(s) not expressly granted to the Lessee by the Act, applicable regulations, this lease, or any approved SAP or COP, are hereby reserved to the Lessor.

(b) The Lessor will decide whether to approve a SAP or COP in accordance with the applicable regulations in 30 CFR Part 585. The Lessor retains the right to disapprove a SAP or COP based on the Lessor's determination that the proposed activities would have unacceptable environmental consequences, would conflict with one or more of the requirements set forth in subsection 8(p)(4) of the Act (43 U.S.C. § 1337(p)(4)), or for other reasons provided by the Lessor pursuant to 30 CFR 585.613(e)(2) or 30 CFR 585.628(f)(2). Disapproval of plans will not subject the Lessor to liability under the lease. The Lessor also retains the right to approve with modifications a SAP or COP, as provided in applicable regulations.

(c) The Lessor reserves the right to suspend the Lessee's operations in accordance with the national security and defense provisions of Section 12 of the Act and applicable regulations.

(d) The Lessor reserves the right to authorize other uses within the leased area and project easements(s) that will not unreasonably interfere with activities described in an approved SAP and/or COP, pursuant to this lease.

Section 4: Payments.

(a) The Lessee must make all rent payments to the Lessor in accordance with applicable regulations in 30 CFR Part 585, unless otherwise specified in Addendum "B."

(b) The Lessee must make all operating fee payments to the Lessor in accordance with applicable regulations in 30 CFR Part 585, as specified in Addendum "B."

Section 5: Plans.

The Lessee may conduct those activities described in Addendum "A" only in accordance with a SAP or COP approved by the Lessor. The Lessee may not deviate from an approved SAP or COP except as provided in applicable regulations in 30 CFR Part 585.

Section 6: Associated Project Easement(s).

Pursuant to 30 CFR 585.200(b), the Lessee has the right to one or more project easement(s), without further competition, for the purpose of installing gathering, transmission, and distribution cables, pipelines, and appurtenances on the OCS, as necessary for the full enjoyment of the lease, and under applicable regulations in 30 CFR Part 585. As part of submitting a COP for approval, the Lessee may request that one or more easement(s) be granted by the Lessor. If the Lessee requests that one or more easement(s) be granted when submitting a COP for approval, such project easements will be granted by the Lessor in accordance with the Act and applicable regulations in 30 CFR Part 585 upon approval of the COP in which the Lessee has demonstrated a need for such easements. Such easements must be in a location acceptable to the Lessor, and will be subject to such conditions as the Lessor may require. The project easement(s) that would be issued in conjunction with an approved COP under this lease will be described in Addendum "D" to this lease, which will be updated as necessary.

Section 7: Conduct of Activities.

The Lessee must conduct, and agrees to conduct, all activities in the leased area and project easement(s) in accordance with an approved SAP or COP, and with all applicable laws and regulations.

The Lessee further agrees that no activities authorized by this lease will be carried out in a manner that:

(a) could unreasonably interfere with or endanger activities or operations carried out under any lease or grant issued or maintained pursuant to the Act, or under any other license or approval from any Federal agency;

(b) could cause any undue harm or damage to the environment;

(c) could create hazardous or unsafe conditions; or

(d) could adversely affect sites, structures, or objects of historical, cultural, or archaeological significance, without notice to and direction from the Lessor on how to proceed.

Section 8: Violations, Suspensions, Cancellations, and Remedies.

If the Lessee fails to comply with (1) any of the applicable provisions of the Act or regulations, (2) the approved SAP or COP, or (3) the terms of this lease, including associated Addenda, the Lessor may exercise any of the remedies that are provided under the Act and applicable regulations, including, without limitation, issuance of cessation of operations orders, suspension or cancellation of the lease, and/or the imposition of penalties, in accordance with the Act and applicable regulations.

The Lessor may also cancel this lease for reasons set forth in subsection 5(a)(2) of the Act (43 U.S.C. § 1334(a)(2)), or for other reasons provided by the Lessor pursuant to 30 CFR 585.437.

Non-enforcement by the Lessor of a remedy for any particular violation of the applicable provisions of the Act or regulations, or the terms of this lease, will not prevent the Lessor from exercising any remedy, including cancellation of this lease, for any other violation or for the same violation occurring at any other time.

Section 9: Indemnification.

The Lessee hereby agrees to indemnify the Lessor for, and hold the Lessor harmless from, any claim caused by or resulting from any of the Lessee's operations or activities on the leased area or project easement(s) or arising out of any activities conducted by or on behalf of the Lessee or its employees, contractors (including Operator, if applicable), subcontractors, or their employees, under this lease, including claims for:

a. loss or damage to natural resources,
b. the release of any petroleum or any Hazardous Materials,
c. other environmental injury of any kind,
d. damage to property,
e. injury to persons, and/or
f. costs or expenses incurred by the Lessor.

Except as provided in any addenda to this lease, the Lessee will not be liable for any losses or damages proximately caused by the activities of the Lessor or the Lessor's employees, contractors, subcontractors, or their employees. The Lessee must pay the Lessor for damage, cost, or expense due and pursuant to this Section within 90 days after written demand by the Lessor. Nothing in this lease will be construed to waive any liability or relieve the Lessee from any penalties, sanctions, or claims that would otherwise apply by statute, regulation, operation of law, or could be imposed by the Lessor or other government agency acting under such laws.

"Hazardous Material" means

1. A "hazardous substance" or a "pollutant or contaminant" as defined by the *Comprehensive Environmental Response, Compensation, and Liability Act* at 42 U.S.C. §§ 9601(14) and (33);
2. Any "regulated substance" as defined by the Resource Conservation and Recovery Act ("RCRA") at 42 U.S.C. § 6991(7), whether or not contained in or released from underground storage tanks, and any hazardous waste regulated under RCRA pursuant to 42 U.S.C. §§ 6921 *et seq.*;
3. "Oil," as defined by the Clean Water Act at 33 U.S.C. § 1321(a)(1) and the Oil Pollution Act at 33 U.S.C. § 2701(23); or
4. Other substances that applicable Federal, state, tribal, or local laws define and regulate as "hazardous."

Section 10: Financial Assurance.

The Lessee must provide and maintain at all times a surety bond(s) or other form(s) of financial assurance approved by the Lessor in the amount specified in Addendum "B." As required by the applicable regulations in 30 CFR Part 585, if, at any time during the term of this lease, the Lessor requires additional financial assurance, then the Lessee must furnish the additional financial assurance required by the Lessor in a form acceptable to the Lessor within 90 days after receipt of the Lessor's notice of such adjustment.

Section 11: Assignment or Transfer of Lease.

This lease may not be assigned or transferred in whole or in part without written approval of the Lessor. The Lessor reserves the right, in its sole discretion, to deny approval of the Lessee's application to transfer or assign all or part of this lease. Any assignment will be effective on the date the Lessor approves the Lessee's application. Any assignment made in contravention of this section is void.

Section 12: Relinquishment of Lease.

The Lessee may relinquish this entire lease or any officially designated subdivision thereof by filing with the appropriate office of the Lessor a written relinquishment application, in accordance with applicable regulations in 30 CFR Part 585. No relinquishment of this lease or any portion thereof will relieve the Lessee or its surety of the obligations accrued hereunder, including but not limited to, the responsibility to remove property and restore the leased area and project easement(s) pursuant to section 13 of this lease and applicable regulations.

Section 13: Removal of Property and Restoration of the Leased Area and Project Easement(s) on Termination of Lease.

Unless otherwise authorized by the Lessor, pursuant to the applicable regulations in 30 CFR Part 585, the Lessee must remove or decommission all facilities, projects, cables, pipelines, and obstructions and clear the seafloor of all obstructions created by activities on the leased area and project easement(s) within two years following lease termination, whether by expiration, cancellation, contraction, or relinquishment, in accordance with any approved SAP, COP, or approved Decommissioning Application, and applicable regulations in 30 CFR Part 585.

Section 14: Safety Requirements.

The Lessee must:

a. maintain all places of employment for activities authorized under this lease in compliance with occupational safety and health standards and, in addition, free from recognized hazards to employees of the Lessee or of any contractor or subcontractor operating under this lease;

b. maintain all operations within the leased area and project easement(s) in compliance with regulations in 30 CFR Part 585 and orders from the Lessor and other Federal agencies with jurisdiction, intended to protect persons, property and the environment on the OCS; and

c. provide any requested documents and records, which are pertinent to occupational or public health, safety, or environmental protection, and allow prompt access, at the site of any operation or activity conducted under this lease, to any inspector authorized by the Lessor or other Federal agency with jurisdiction.

Section 15: Debarment Compliance.

The Lessee must comply with the Department of the Interior's non-procurement debarment and suspension regulations set forth in 2 CFR Parts 180 and 1400 and must communicate the requirement to comply with these regulations to persons with whom it does business related to this lease by including this requirement in all relevant contracts and transactions.

Section 16: Equal Opportunity Clause.

During the performance of this lease, the Lessee must fully comply with paragraphs (1) through (7) of Section 202 of Executive Order 11246, as amended (reprinted in 41 CFR 60-1.4(a)), and the implementing regulations, which are for the purpose of preventing employment discrimination against persons on the basis of race, color, religion, sex, or national origin. Paragraphs (1) through (7) of Section 202 of Executive Order 11246, as amended, are incorporated in this lease by reference.

Section 17: Certification of Nonsegregated Facilities.

By entering into this lease, the Lessee certifies, as specified in 41 CFR 60-1.8, that it does not and will not maintain or provide for its employees any segregated facilities at any of its establishments and that it does not and will not permit its employees to perform their services at any location under its control where segregated facilities are maintained. As used in this certification, the term "facilities" means, but is not limited to, any waiting rooms, work areas, restrooms and washrooms, restaurants and other eating areas, timeclocks, locker rooms and other storage or dressing areas, parking lots, drinking fountains, recreation or entertainment areas, transportation, and housing facilities provided for employees. Segregated facilities include those that are segregated by explicit directive or those that are in fact segregated on the basis of race, color, religion, sex, or national origin, because of habit, local custom, or otherwise; provided, that separate or single-user restrooms and necessary dressing or sleeping areas must be provided to assure privacy as appropriate. The Lessee further agrees that it will obtain identical certifications from proposed contractors and subcontractors prior to awarding contracts or subcontracts unless they are exempt under 41 CFR 60-1.5.

Section 18: Notices.

All notices or reports provided from one party to the other under the terms of this lease must be in writing, except as provided herein and in the applicable regulations in 30 CFR Part 585. Written notices and reports must be delivered to the Lessee's or Lessor's Lease Representative, as specifically listed in Addendum "A," either electronically, by hand, by facsimile, or by United States first class mail, adequate postage prepaid. Each party must, as soon as practicable, notify the other of a change to their Lessee's or Lessor's Contact Information listed in Addendum "A" by a written notice signed by a duly authorized signatory and delivered by hand or United States first class mail, adequate postage prepaid. Until such notice is delivered as provided in this section, the last recorded contact information for either party will be deemed current for service of all notices and reports required under this lease. For all operational matters, notices and reports must be provided to the party's Operations Representative, as specifically listed in Addendum "A," as well as the Lease Representative.

Section 19: Severability Clause.

If any provision of this lease is held unenforceable, all remaining provisions of this lease will remain in full force and effect.

Section 20: Modification.

Unless otherwise authorized by the applicable regulations in 30 CFR Part 585, this lease may be modified or amended only by mutual agreement of the Lessor and the Lessee. No such modification or amendment will be binding unless it is in writing and signed by duly authorized signatories of the Lessor and the Lessee.

II. Description of Leased Area

The total acreage of the leased area is approximately 43,056 acres.

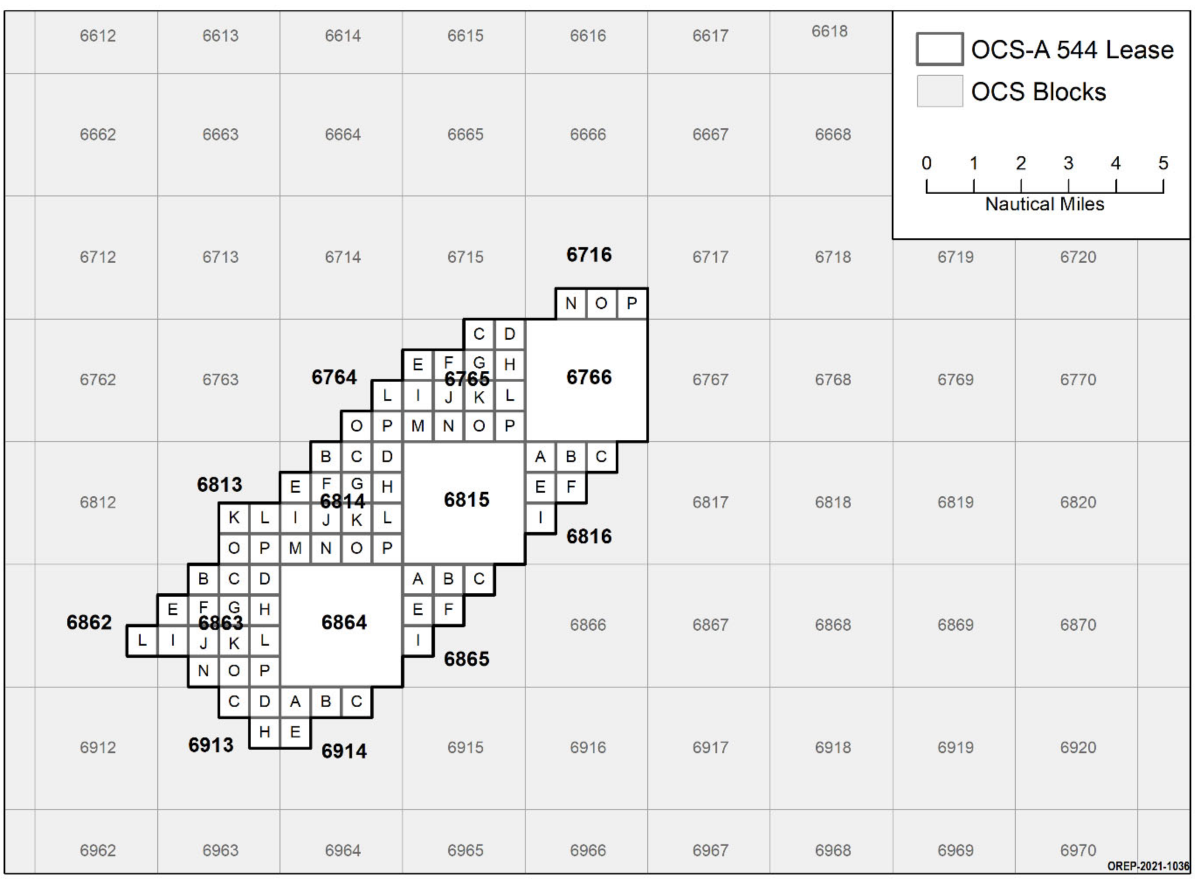
This area is subject to later adjustment, in accordance with applicable regulations (*e.g.*, contraction, relinquishment).

Lease OCS-A 0544
The following Blocks or portions of Blocks lying within Official Protraction Diagram New York NK18-12, are depicted on the map below and comprise 43,056 acres, more or less.

1) Block 6716, SE1/4 of SW1/4, S1/2 of SE1/4
2) Block 6764, E1/2 of SE1/4, SW1/4 of SE1/4
3) Block 6765, E1/2, S1/2 of NW1/4, SW1/4
4) Block 6766, All of Block
5) Block 6813, SE1/4
6) Block 6814, E1/2, E1/2 of NW1/4, SW1/4 of NW1/4, SW1/4
7) Block 6815, All of Block
8) Block 6816, NW1/4 of NE1/4, NW1/4, NW1/4 of SW1/4
9) Block 6862, NE1/4 of SE1/4
10) Block 6863, E1/2, E1/2 of NW1/4, SW1/4 of NW1/4, N1/2 of SW1/4, SE1/4 of SW1/4
11) Block 6864, All of Block
12) Block 6865, NW1/4 of NE1/4, NW1/4, NW1/4 of SW1/4
13) Block 6913, N1/2 of NE1/4, SE1/4 of NE1/4
14) Block 6914, NW1/4 of NE1/4, N1/2 of NW1/4, SW1/4 of NW1/4

For the purposes of these calculations, a full Block is 2,304 hectares. The acreage of a hectare is 2.471043930.

New York Bight - Hudson North Lease Area (OCS-A 544)



III. Renewable Energy Resource

Wind

IV. Description of the Project

A project to generate energy using wind turbine generators and any associated resource assessment activities, located on the Outer Continental Shelf in the leased area, as well as associated offshore substation platforms, inter-array cables, and subsea export cables.

V. Description of Project Easement(s)

Once approved, the Lessor will incorporate Lessee's project easement(s) in this lease as ADDENDUM "D."

U.S. DEPARTMENT OF THE INTERIOR
BUREAU OF OCEAN ENERGY MANAGEMENT

ADDENDUM "B"

LEASE TERM AND FINANCIAL SCHEDULE

Lease Number OCS-A 0544

I. Lease Term

The duration of each term of the lease is described below. The terms may be extended or otherwise modified in accordance with applicable regulations in 30 CFR Part 585.

Lease Term	**Duration**
Preliminary Term	1 year
Site Assessment Term	5 years
Operations Term	33 years

Schedule: Addendum "C" includes a schedule and reporting requirements for conducting site characterization activities.

Renewal: The Lessee may request renewal of the operations term of this lease, in accordance with applicable regulations in 30 CFR Part 585. The Lessor, at its discretion, may approve a renewal request to conduct substantially similar activities as were originally authorized under this lease or in an approved plan. The Lessor will not approve a renewal request that involves development of a type of renewable energy not originally authorized in the lease. The Lessor may revise or adjust payment terms of the original lease as a condition of lease renewal.

II. Definitions

"Lease Issuance Date" refers to the date on which this lease has been signed by *both* the Lessee and the Lessor.

"Effective Date" has the same meaning as "effective date" in the Bureau of Ocean Energy Management (BOEM) regulations provided in 30 CFR 585.237.

"Lease Anniversary" refers to the anniversary of the Effective Date of the lease.

"End Date" refers to the earlier of a) the last calendar day of the last month of the Operations Term; or b) the date on which the lease terminates in the event of a lease termination for another reason under 30 CFR 585.432.

"Commercial Operations" means the generation of electricity or other energy product for commercial use, sale, or distribution.

"Commercial Operation Date," or "COD," refers to the date on which the Lessee first begins Commercial Operations on the lease.

"Delivery Point" is the meter identified in the Construction and Operations Plan (COP) where the Lessee's facility interconnects with the electric grid to deliver electricity for sale.

An individual wind generation turbine is said to be "available for Commercial Operations" on or after the first day that it engages in Commercial Operations on the lease; and to be no longer available for Commercial Operations on or after the day when it is permanently decommissioned. These dates are determined by the COP, the Facility Design Report (FDR) or Fabrication Installation Report (FIR).

III. Payments

Unless otherwise authorized by the Lessor in accordance with the applicable regulations in 30 CFR Part 585, the Lessee must make payments as described below.

(a) ***Rent.*** The Lessee must pay rent as described below:

Rent payments prior to the COD, or prior to the lease End Date in the event that the lease terminates prior to the COD, are calculated by multiplying the acres in the leased area times the rental rate per acre. The acreage for your lease is documented in Addendum A. For example:

- Acres: 100,000
- Annual Rental Rate: $3.00 per acre or fraction thereof
- Rental Fee for Entire Leased Area: $3.00 x 100,000 = $300,000

The first year's rent payment is due within 45 days of the date that the lease is received by the Lessee for execution, in accordance with 30 CFR 585.503. Rent for the entire leased area for the next year and for each subsequent year is due on or before each Lease Anniversary through the year in which the COD occurs. The rent for each year subsequent to the COD on the imputed portion of the lease not authorized for Commercial Operations is due on or before each Lease Anniversary.

Once a portion of the lease begins commercial operations, rent will only be due for the undeveloped or non-operating acreage. The rent calculation becomes a three-step process:

(1) rent is calculated on the portion of the lease not authorized for commercial operations.

(2) rent is calculated on the portion of the lease authorized for commercial operations, but without operating turbines.

(3) the sum of (1) and (2) yield the rent due.

Step (1): The Lessee will continue to pay rent at the lease rate for acreage outside the approved commercial project area. The demarcation between acreage for a commercial project and undeveloped acreage will be defined in the COP or supplemental documents approved by BOEM. For example, if the total lease acreage is 100,000 acres and exactly three-quarters of the lease acreage is approved for commercial operations, 25,000 acres is not authorized for commercial operations.

- Acres: 25,000
- Annual Rental Rate: $3.00 per acre or fraction thereof
- Rental Fee for Undeveloped Leased Area: $3.00 x 25,000 = $75,000

Step (2): Acreage for the approved project area subject to rent will be the complement of the operating name plate capacity divided by the total nameplate capacity, $\frac{M_t}{\sum N_w}$, as defined in Section III (b) (4) below, prior to any adjustments as specified in the most recent approved COP for turbine maintenance, replacements, repowering, or decommissioning. If contiguous acreage for an approved project cannot be developed due to buffers or other surface occupancy restrictions, it will be considered part of the operating area of the lease and covered by the lease's operating fee payment.

- Acres: 75,000
- Annual Rental Rate: $3.00 per acre or fraction thereof
- Rental Fee for Undeveloped Acreage Authorized for Commercial Operations: $3.00 x 75,000 x $(1 - \frac{M_t}{\sum N_w})$ = $Rent

Using the summed capacity of 14.21 megawatt (MW) from the 30 MW project in Table 1 from Section III (b) (4) below, the rental calculation for the project area is: $3.00 x 75,000 x (1 - 0.473667) = $118,425

Step (3): Summing the rent due in steps (1) & (2): $75,000 + $118,425 = $193,425.

- The Adjusted Annual Rent Payment will be rounded up to the nearest dollar.

All rent payments must be made as required in 30 CFR 1218.51. Late rent payments will be charged interest in accordance with 30 CFR 1218.54.

Advance lease rent and operating fee payments are due annually, before the lease anniversary date. All rent payments, including the last rent payment, are payable for the full year and will not be prorated to the COD or other installation milestones. If the installation schedule proceeds more quickly than projected by the lessee, lease payments may need to be reconciled. The Lessee should work with BOEM's Office of Renewable Energy Programs and the Office of Natural Resources Revenue on any payment reconciliation as instructed in Section III (c).

(1) ***Project Easement.***

Rent for any project easement(s) is described in ADDENDUM "D".

(2) ***Relinquishment.***

If the Lessee submits an application for relinquishment of a portion of the leased area within the first 45 calendar days following the date that the lease is received by the Lessee for execution, and the Lessor approves that application, no rent payment will be due on that relinquished portion of the leased area. Later relinquishments of any leased area will reduce the Lessee's rent payments due the year following the Lessor's approval of the relinquishment, through a reduction in the Acres in Leased Area and the corresponding Rental Fee for the Entire Leased Area and any related Adjusted Annual Rent Payments.

(b) ***Operating Fee.*** The Lessee must pay an operating fee as described below:

(1) **Initial Operating Fee Payment.**

The Lessee must pay an initial prorated operating fee within 45 calendar days after the COD. The initial operating fee payment covers the first year of Commercial Operations on the lease and will be calculated in accordance with subsection (4) below, using an operating fee rate of 0.02 and a capacity factor of 0.4.

(2) **Annual Operating Fee Payments.**

The Lessee must pay the operating fee for each subsequent year of Commercial Operations on or before each Lease Anniversary following the formula in subsection (4) below. The Lessee must calculate each operating fee annually subsequent to the initial operating fee payment using an operating fee rate of 0.02 through the thirty-three year operations term of the lease. If the Lessor determines that the Lessee has met the threshold for the supply chain incentive under section 7.2 of Addendum C, then the operating fee rate will be 0.01 instead of 0.02 for five years starting the year after the Lessor makes the determination. After five years at 0.01, the operating fee rate will be 0.02 for the remainder of the lease. The capacity factor of 0.4 will remain in effect until the Lease Anniversary of the year in which the Lessor adjusts the capacity factor.

(3) **Final Operating Fee Payment.**

The final operating fee payment is due on the Lease Anniversary prior to the End Date. The final operating fee payment covers the last year of Commercial Operations on the lease and will be calculated in accordance with the formula in subsection (4) below.

(4) **The formula for calculating the operating fee in year *t*.**

F_t	=	M_t	*	H	*	c_p	*	P_t	*	r_t
(annual operating fee)		(nameplate capacity)		(hours per year)		(capacity factor)		(power price)		(operating fee rate)

Where:

t =	the year of Commercial Operations on the lease starting from each Lease Anniversary, where *t* equals 1 represents the year beginning on the Lease Anniversary prior to, or on, the COD.
F_t =	the dollar amount of the annual operating fee in year *t*.
M_t =	the nameplate capacity expressed in megawatts (MW) rounded to the nearest second decimal place in year *t* of Commercial Operations on the lease. The capacity calculation is a two-step process: (1) scaling each turbine's nameplate capacity in proportion to the number of days in the year that it is operational and (2) summing these scaled values across all turbines. The value of M_t, reflecting the availability of turbines, will be determined based on the FDR or FIR. This value will be adjusted to reflect any changes to installed capacity approved by BOEM as of the date each operating fee payment is due, in accordance with the calculation in Equation 1, for each year of Commercial Operations on the lease. **(1)** $M_t = \sum_{w=1}^{W_t} \left(N_w \; x \left[\frac{Y_{w,t}}{D} \right] \right)$

Where:

W_t = Number of individual wind generation turbines, w, that will be available for Commercial Operations during any day of the year, t, per the FDR or FIR.

N_w = Nameplate capacity of individual wind generation turbine, w, per the FDR or FIR expressed in MW.

$Y_{w,t}$ = Number of days that turbine w is commercially available during year.

D = Days in the year set equal to 365 in all years for purposes of this calculation.

M_t may be reduced only in the event that installed capacity is permanently decommissioned. M_t will not be changed in response to routine or unplanned maintenance of units, including the temporary removal of a nacelle for off-site repair or replacement with a similar unit.

EXAMPLE: Table 1 illustrates the calculations represented by Equation (1) for a single lease year for a lease on which the lessee plans to erect six turbines, each with a nameplate capacity of 5 MW. Based on the days in each turbine's commercial operations period (column B), the exhibit shows the number of days during the year that the turbine is available for operation. Dividing this value by 365 (column D) yields the percent of days during the year that the turbine is available for operation (column E). For each turbine, the resulting percentage (column E) is multiplied by its nameplate capacity (column A) to calculate its scaled capacity for the year (column F). The individual values in column F are then summed across all six turbines to calculate total capacity (Mt).

Table 1: Example of M_t Calculations for Installation

Turbine	Nameplate Capacity (N_w) [A]	Days in Turbine's Commercial operations Period [B]	Number of days Turbine is available for operation in year t ($Y_{w,t}$) [C]	Number of days in the Year [D]	Percent of days available for Commercial Operation $\left(\frac{Y_{w,t}}{D}\right)$ [E = C ÷ D]	Turbine capacity scaled based on percent of days in commercial operation $N_w \times \frac{Y_{w,t}}{D}$ [F = A × E]
#1	5	January 1 to December 31	365	365	100%	5.00
#2	5	January 1 to December 31	365	365	100%	5.00
#3	5	October 1 to December 31	92	365	25.2%	1.26
#4	5	October 1 to December 31	92	365	25.2%	1.26
#5	5	October 1 to December 31	92	365	25.2%	1.26
#6	5	December 1 to December 31	31	365	8.5%	0.42
Available capacity summed across all turbines: $M_t = \sum_{w=1}^{W_t}\left(N_w \times \left[\frac{Y_{w,t}}{D}\right]\right)$ = 14.21						

The same calculation would be performed for the lease during the decommissioning phase.

H =	the number of hours in the year for billing purposes which is equal to 8,760 for all years of Commercial Operations on the lease.
c_p =	the "Capacity Factor" in Performance Period p, which represents the share of anticipated generation of the facility that is delivered to where the Lessee's facility interconnects with the electric grid (i.e. the Delivery Point) relative to its generation at continuous full power operation at the nameplate capacity, expressed as a decimal between zero and one. The initial Capacity Factor (c_0) will be set to 0.4. The Capacity Factor will be subject to adjustment at the end of each Performance Period. After the sixth year of Commercial Operations on the lease has concluded, the Lessee will utilize data gathered from years two through six of Commercial Operations on the lease and propose a revised Capacity Factor to be used to calculate subsequent annual payments, as provided for in Table 2 below. A similar process will be conducted at the conclusion of each five-year Performance Period, thereafter.

Table 2: Definition of Performance Periods

Performance Period (p)	Commercial Operation Years (t)	Payments Affected by Adjustment	Capacity Factor (c)	Date End Year (n)
0 (COD)	Not Applicable	Payments 1 to 7	c_0=0.4	--
1	t = 2 to 6	Payments 8 to 12	c_1	n_1=6
2	t = 7 to 11	Payments 13 to 17	c_2	n_2=11
3	t = 12 to 16	Payments 18 to 22	c_3	n_3=16
4	t = 17 to 21	Payments 23 to 27	c_4	n_4=21
5	t = 22 to 26	Payments 28 to 32	c_5	n_5=26
6	t = 27 to 31	Payment 33	c_6	n_6=31

Adjustments to the Capacity Factor

The Actual 5-year Average Capacity Factor (Xp) is calculated for each Performance Period after COD ($p > 0$) per Equation 2 below. Xp represents the sum of actual, metered electricity generation in megawatt-hours (MWh) at the Delivery Point to the electric grid (A_t) divided by the amount of electricity generation in MWh that would have been produced if the facility operated continuously at its full, stated capacity (M_t) in all of the hours (h_t) in each year, t, of the corresponding five-year period.

$$\textbf{(2)}\ X_p = \frac{\sum_{t=n-4}^{n} A_t}{\left(\sum_{t=n-4}^{n} M_t \; x \; h_t\right)}$$

Where:

M_t = Nameplate Capacity as defined above.

n = "Date End Year" value for the Performance Period, p, as defined in Table 2.

p = Performance Period as defined in Table 2.

A_t = Actual generation in MWh associated with each year of Commercial Operations, t, on the

	lease that is transferred at the Delivery Point; Delivery Point meter data supporting the values submitted for annual actual generation must be recorded, preserved, and timely provided to the Lessor upon request. The generation data for the facility must be the same data reported on the Energy Information Administration's EIA-923. h_t = Hours in the year on which the Actual Generation associated with each year of Commercial Operations, *t*, on the lease is based; this definition of "hours in the year" differs from the definition of H in the operating fee equation above. The hours in the year for purposes of calculating the capacity factor must take into account the actual number of hours, including those in leap years. The value of the Capacity Factor at the outset of Commercial Operations (*p = 0*) is set to 0.4 as stated in equation 3: **(3)** $c_0 = 0.4$
P_t =	a measure of the annual average wholesale electric power price expressed in dollars per MW hour. The Lessee must calculate P_t at the time each operating fee payment is due, subject to approval by the Lessor. The Price (P_t) must equal the simple average of the "on-the-hour" spot price indices for the *NYISO NYC-J* power market for the most recent calendar year of data available as reported by the Federal Energy Regulatory Commission (FERC). Alternatively, P_t may be based on aggregated data from commercial subscription services such as S&P Global Market Intelligence Platform or Hitachi ABB Velocity Suite. BOEM will post the power price data it intends to use for the lessee's reference. The source of data used in the calculations must be noted in the Lessee's documentation supporting their estimate of the value of Pt each year for review and approval by the Lessor. BOEM will use the posted prices to verify the lessee's calculations.
r_t =	the operating fee rate of 0.02 (2%) or 0.01 (1%), as applicable.

(c) ***Reporting, Validation, Audits, and Late Payments.***

The Lessee must submit the values used in the operating fee formula to the Lessor at the time the annual payment based on these values is made. Submission of this and other reporting, validation, audit and late payment information as requested by the Lessor must be sent to the Lessor using the contact information indicated in Addendum "A", unless the Lessor directs otherwise. Failure to submit the estimated values and the associated documentation on time to the Lessor may result in penalties as specified in applicable regulations.

Within 60 days of the submission by the Lessee of the annual payment, the Lessor will review the data submitted and validate that the operating fee formula was applied correctly. If the Lessor validation results in a different operating fee amount, the amount of the annual operating fee payment will be revised to the amount determined by the Lessor.

The Lessor also reserves the right to audit the meter data upon which the Actual 5-year Average Capacity Factor is based at any time during the lease term. If, as a result of such audit, the Lessor determines that any annual operating fee payment was calculated incorrectly, the Lessor has the right to correct any errors and collect the correct annual operating fee payment amount.

If the annual operating fee is revised downward as a result of the Lessee's calculations, as validated by the Lessor, or an audit of meter data conducted by the Lessee or Lessor, the Lessee will be refunded the difference between the amount of the payment received and the amount of the revised annual operating fee, without interest. Similarly, if the payment amount is revised upward, the Lessee is required to pay the difference between the amount of the payment received and the amount of the revised annual operating fee, plus interest on the balance, in accordance with 30 CFR § 1218.54.

Late operating fee payments will be charged interest in accordance with 30 CFR § 1218.54.

IV. <u>Financial Assurance</u>

The Lessor will base the determination for the amounts of all Site Assessment Plan (SAP), COP, and decommissioning financial assurance requirements on estimates of the cost to meet all accrued lease obligations. The Lessor will determine the amount of supplemental and decommissioning financial assurance requirements on a case-by-case basis. The amount of financial assurance required to meet all lease obligations includes:

(a) **Initial Financial Assurance.** Prior to the Lease Issuance date, the Lessee must provide an initial lease-specific bond, or other approved means of meeting the Lessor's initial financial assurance requirements in an amount equal to $100,000.

(b) **Additional Financial Assurance.** In addition to the initial lease-specific financial assurance discussed above, the Lessee is also required to provide additional supplemental bonds associated with the SAP and COP, or other form of financial assurances and a decommissioning bond or other approved means of meeting the Lessee's decommissioning obligations.

(1) Prior to the Lessor's approval of a SAP, the Lessor will require an additional supplemental bond or other form of financial assurance in an amount determined by the Lessor based on the complexity, number, and location of all facilities involved in the site assessment activities planned in the SAP, and estimates of the costs to meet all accrued obligations, in accordance with applicable BOEM regulations (30 CFR 585.515-537). The supplemental financial assurance requirement is in addition to the initial lease-specific financial assurance in the amount of $100,000. The Lessee may meet these obligations by providing a new bond or other acceptable form of financial assurance, or increasing the amount of its existing bond or other form of financial assurance.

(2) Prior to the Lessor's approval of a COP, the Lessor may require an additional supplemental bond or other form of financial assurance in an amount determined by the Lessor based on the complexity, number, location of all facilities, activities and Commercial Operations planned in the COP, and estimates of the costs to meet all

accrued obligations, in accordance with applicable BOEM regulations (30 CFR 585.515-537). The supplemental financial assurance requirement is in addition to the initial lease-specific financial assurance in the amount of $100,000 and an additional supplemental bond or other form of financial assurance required with the SAP. The Lessee may meet this obligation by providing a new bond or other acceptable form of financial assurance, or increasing the amount of its existing bond or other form of financial assurance.

(3) The Lessor will require a decommissioning bond or other form of financial assurance based on the anticipated decommissioning costs in accordance with applicable BOEM regulations (30 CFR 585.515-537). The decommissioning obligation must be guaranteed through an acceptable form of financial assurance and will be due according to the schedule beginning before commencement of the installation of commercial facilities on a date or dates to be determined by the Lessor.

(c) **Adjustments to Financial Assurance Amounts.** The Lessor reserves the right to adjust the amount of any financial assurance requirement (initial, supplemental, or decommissioning) associated with this lease and/or reassess the Lessee's cumulative lease obligations, including decommissioning obligations, at any time. If the Lessee's cumulative lease obligations and/or liabilities increase or decrease, the Lessor will notify the Lessee of any intended adjustment to the financial assurance requirements and provide the Lessee an opportunity to comment in accordance with applicable BOEM regulations.

U.S. DEPARTMENT OF THE INTERIOR
BUREAU OF OCEAN ENERGY MANAGEMENT

ADDENDUM "C"

LEASE-SPECIFIC TERMS, CONDITIONS, AND STIPULATIONS

Lease Number OCS-A 0544

The Lessee's rights to conduct activities on the leased area are subject to the following terms, conditions, and stipulations. The Lessor reserves the right to impose additional terms and conditions incident to the future approval or approval with modifications of plans, such as a Site Assessment Plan (SAP) or Construction and Operations Plan (COP).

1 DEFINITIONS

1.1 Definition of "Archaeological Resource": The term "archaeological resource" has the same meaning as "archaeological resource" in the Bureau of Ocean Energy Management (BOEM) regulations provided in 30 CFR 585.112.

1.2 Definition of "Effective Date": The term "Effective Date" has the same meaning as "effective date" in BOEM regulations provided in 30 CFR 585.237.

1.3 Definition of "Geological and Geophysical Survey (G&G Survey)": The term "G&G Survey" serves as a collective term for surveys that collect data on the geology of the seafloor and landforms below the seafloor. High resolution geophysical surveys and geotechnical (sub-bottom) exploration are components of G&G surveys.

1.4 Definition of "Geotechnical Exploration": The term "Geotechnical Exploration," also referred to as "Sub-bottom Sampling," or "Geotechnical Testing," is used to collectively refer to site specific sediment and underlying geologic data acquired from the seafloor and the sub-bottom and includes geotechnical surveys utilizing deep borings, vibracores, and cone penetration tests.

1.5 Definition of "High Resolution Geophysical Survey (HRG Survey)": The term "HRG Survey" means a marine remote-sensing survey using, but not limited to, such equipment as side-scan sonar, magnetometer, shallow and medium (Seismic) penetration sub-bottom profiler systems, narrow beam or multibeam echo sounder, or other such equipment employed for the purposes of providing data on geological conditions, identifying shallow hazards, identifying archaeological resources, charting bathymetry, and gathering other site characterization information.

1.6 Definition of "Protected Species": The term "protected species" includes marine mammals (those protected under the Endangered Species Act and those protected under the Marine Mammal Protection Act), sea turtles, sturgeon, and giant manta ray.

1.7 Definition of "Site Assessment Activities": The term "site assessment activities" or "site assessment," has the same meaning as "site assessment activities" in 30 CFR 585.112.

1.8 Definition of "Qualified Marine Archaeologist": The term "qualified marine archaeologist" means a person retained by the Lessee who meets the Secretary of the Interior's Professional Qualifications Standards for Archaeology (48 FR 44738- 44739), and has experience analyzing marine geophysical data.

2 SITE CHARACTERIZATION

2.1 **Survey Plan(s):** Prior to conducting each physical, biological, or cultural resources survey in support of the submission of a plan, the Lessee must submit to the Lessor a survey plan. Each distinct survey effort (e.g., mobilization) must be addressed by a survey plan, although a single survey plan may cover more than one survey effort and may cover multiple types of activities (e.g., geotechnical and geophysical surveys on lease and along cable routes).

Each survey plan must include details of activities to be conducted and timelines of each survey effort necessary to support the submission of a plan (i.e., necessary to satisfy the information requirements in the applicable regulations, including but not limited to 30 CFR 585.606, 610, 611, 621, 626, 627, et al.). The Lessor will not accept survey plans that do not provide sufficient detail for review, including but not limited to specific description and illustration of the geographic areas to be surveyed, specific discussion of the survey methods and equipment to be employed, and a schedule of survey activities.

The Lessee must demonstrate compliance with each of the lease stipulations in Section 4 of Addendum "C" and include any waiver requests in its initial survey plan. Each survey plan must be consistent with the Lessee's Fisheries Communication Plan (FCP) (see 3.1.2.1) and Native American Tribal Communications Plan (NATCP) (see 3.1.2.2), and include a description of the Lessee's intentions to coordinate with the U.S. Coast Guard (USCG) to prepare a Notice to Mariners for the specific survey activities described in the survey plan.

The Lessee must submit a survey plan to the Lessor at least 90 calendar days prior to commencement of any survey activities described in the survey plan. Within 30 calendar days from receipt, the Lessor may request the Lessee modify the survey plan to address any comments the Lessor submits to the Lessee on the contents of the survey plan. Comments must be addressed by the Lessee in a manner deemed satisfactory by the Lessor prior to commencement of the survey activities. If the Lessor does not respond with comments or objections within 30 calendar days of receipt of the survey plan, the Lessee may proceed with the survey activities per the proposed schedule. The lack of Lessor comment or objection to the survey plan does not ensure acceptance of the survey results with the SAP and/or COP. If the Lessee is proposing a fisheries survey that could result in the take of species listed under the Endangered Species Act, additional time should be allowed for consultation and/or permits authorizing the activity (see Section 5.1.4).

2.2 Pre-Survey Meeting(s) with the Lessor: If requested by the Lessor, the Lessee must hold a pre-survey meeting with the Lessor prior to the commencement of survey activities to discuss the applicable survey plan. The Lessee must ensure the presence at this meeting of any relevant subject matter experts, as requested by the Lessor.

3 REPORTING

3.1 **Progress Report**: The Lessee must submit to the Lessor a progress report every six months (unless BOEM directs otherwise) through the duration of the site assessment term that includes a brief narrative of the overall progress since the last progress report, or – in the case of the first report – since the Effective Date. Within 60 calendar days from receipt, the Lessor may request the Lessee modify the progress report to address any comments the Lessor submits to the Lessee on the contents of the document. The Lessee must address comments in a manner deemed satisfactory by the Lessor. Should the Lessee not address the comments provided by the Lessor in a timely and adequate manner, BOEM reserves the right to require specific mitigation such as, but not limited to, third party verification/mediation at the Lessee's expense, adjustment of required reporting frequency, or designation that the Lease is not in good standing. This obligation does not expire at the end of the site assessment term and continues until approval of a Construction and Operations Plan.

3.1.1 Engagement: The Lessee shall make reasonable efforts to consult with "Tribes and parties," that may be potentially affected by the project activities on the OCS, which include, but are not limited to:

- Coastal Communities
- Commercial and Recreational Fishing Industries
- Educational and Research Institutions
- Environmental and Public Interest Non-Governmental Organizations
- Federal, State, and Local Agencies
- Federally recognized Tribes (see 5.3.3)
- Mariners and the Maritime Industry
- Ocean Users
- Submarine Cable Operators
- Underserved Communities, as defined in Section 2 of Executive Order 13985

The Lessee shall make reasonable efforts to implement the project in a manner that minimizes, mitigates, and/or redresses the project's adverse effects, if any, on Tribes and parties. To facilitate consultation under this section, the Lessee should work collaboratively with federal, state, and local governments, community organizations, and Tribes.

The Progress Report must:

- Identify Tribes and parties applicable to the project;
- Document, and update for subsequent reports, engagement with Tribes and parties since the previous reporting period;
- Document potential adverse effects from the Lessee's project to the interests of Tribes and parties;
- Document how, if at all, the design or implementation of the project has been informed by or altered to address these potential effects (including by investing in, or directing benefits to Tribes and parties).
- The report must also include a description of any anticipated or scheduled engagement activities for the next reporting period.
- The report must also include feedback from engagement with Tribes and parties regarding transmission planning, prior to proposing any export cable route.
- The report must provide information that can be made available to the public and posted on the BOEM website.

The intent of this requirement is to improve Lessee communication and transparency with Tribes, parties, and the general public, and to encourage lessees to identify and engage with underserved communities, including environmental justice communities that may be disproportionately impacted by the Project's OCS activities, in order to avoid, minimize, and mitigate potential adverse effects by, for example, investing in these communities.

BOEM will protect privileged or confidential information that you submit, as required by the Freedom of Information Act (FOIA) and 30 CFR 585.113. Exemption 4 of FOIA applies to "trade secrets and commercial or financial information that you submit that is privileged or confidential." 5 U.S.C. 552(b)(4). If you wish to protect the confidentiality of such information, clearly mark it ''Contains Privileged or Confidential Information'' and consider submitting such information as a separate attachment. BOEM will not disclose such information, except as required by FOIA. Information that is not labeled as privileged or confidential may be regarded by BOEM as suitable for public release. Further, BOEM will not treat as confidential aggregate summaries of otherwise nonconfidential information.

3.1.2 Communication Plans: The Progress Report must include a section with plan(s) on how the Lessee will communicate with fisheries, federally recognized Tribes, and agencies (see 3.1.2.1, 3.1.2.2, 3.1.2.3). In addition to the plans, each progress report should provide updates on the progress of communication efforts with those and other affected stakeholder or ocean user groups during the reporting period (see 3.1.1).

3.1.2.1 Fisheries Communications Plan and Fisheries Liaison: The Lessee must develop a draft FCP and make it publicly available within 120 days of lease execution. The Lessee must update and refine the FCP from time to time, in response to feedback obtained by engagement with Tribes and parties and BOEM consultation. If the Lessee does not develop a project website, the Lessee must make the FCP available to the Lessor and the public upon request. The plan must include the following:

- A description of the strategies that the Lessee intends to use for communicating with commercial and recreational fisheries prior to and during activities in support of the submission of a plan (e.g. SAP or a COP). This description must include mechanisms to distribute notices to Federal and state fisheries license holders known to operate near the lease area through a local "Notice to Mariners" and outreach to, e.g., Fisheries Management Councils, newsletters, websites, Fisheries Liaison Officers and/or Fisheries Representatives, and applicable state agencies.
- The contact information for an individual retained by the Lessee as its primary point of contact with commercial and recreational fisheries (i.e., Fisheries Liaison).
- The strategy and general timing of discussions with commercial and recreational fisheries regarding the reduction of conflicts with facility designs, pursuant to Lease stipulation 3.1.1.
- A process to file a complaint with the offshore wind operator and seek the replacement of or compensate for lost gear.
- Plans to coordinate with commercial and recreational fisheries to identify peak fishing seasons and, to the extent practicable, avoid interaction offshore between survey vessels and commercial fishermen.

Additionally, the Lessee is required to (i) notify applicable ocean users two weeks in advance of any geological and geophysical survey activities and, (ii) provide an annual summary of filed complaint claims and outcomes to BOEM to better understand the frequency and extent of gear interactions.

3.1.2.2 Native American Tribes Communication Plan: The Lessee must develop a publicly available NATCP that describes the strategies that the Lessee intends to use for communicating with federally recognized Tribes, and that should outline specific methods for engaging with and disseminating information to federally recognized Tribes with cultural and/or historical ties to the lease area. The NATCP must include the contact information for an individual retained by the Lessee as its primary point of contact with federally recognized Tribes (i.e., a Tribal Liaison). The NATCP should include detailed information and protocols for regular engagement with federally recognized Tribes including, but not limited to, the types of engagement activities (e.g., one-on-one meetings, group meetings, open houses, open information sharing meetings, etc.); the frequency of proposed engagements/meetings (e.g., monthly, quarterly, bi-annually, annually, etc.); meeting locations and/or virtual platforms; and contact information (e.g., telephone numbers, email addresses, website addresses, etc.). The Lessee must make the NATCP available to the Lessor and the federally recognized Tribes upon request. The Lessee must provide a draft NATCP to BOEM and federally recognized Tribes for review and comment, and hold a meeting with federally recognized Tribes to discuss the NATCP, within 120 days of lease execution. The Lessee must invite federally recognized Tribes with cultural and historical ties to the lease area to participate in the development of the NATCP. If a federally recognized Tribe wishes to participate, the Lessee should request that the Tribe designate a Tribal Representative from each Tribe to serve as the Tribe's primary point of contact for communicating with the Lessee. If a federally recognized Tribe does not wish to participate in the development of the NATCP, the Lessee is no longer required to include them in NATCP communications. If a Tribe does not respond to outreach from the Lessee, the Lessee will continue to invite the Tribe to participate in NATCP engagement opportunities until the Tribe provides a written response to the Lessee or Lessor.

3.1.2.3 Agency Communication Plan (ACP): The Lessee must develop a publicly available ACP that describes the strategies that the Lessee intends to use for communicating with federal, state and local agencies with authority related to the lease area and should outline specific methods for engaging with and disseminating information related to permits and trust resources to these agencies. The purpose of the ACP is to ensure early and active information sharing, focused discussion of potential issues, and collaborative identification of solutions in order to improve the quality and efficiency of various agency decision-making processes, and to promote the sustainable development of offshore wind energy projects. The ACP must include the contact information for an individual retained by the Lessee as its primary point of contact with agencies, (i.e., an Agency Liaison). The ACP should include detailed information and protocols for regular engagement with permitting and resource agencies including, but not limited to, the types of engagement activities (e.g., one-on-one meetings, interagency meetings, open information sharing meetings, etc.); the frequency of proposed engagements/meetings (e.g., monthly, quarterly, bi-annually, annually, etc.); meeting locations and/or virtual platforms; and contact information (e.g., telephone numbers, email addresses, etc.). The Lessee must make the ACP available to the Lessor and other agencies upon request. The Lessee must provide a draft ACP to BOEM and other permitting and resource agencies with authority related to the lease area for review and comment, and host a meeting with each interested agency, to discuss the ACP within 120 days of lease execution. Meetings may include multiple agencies. The Lessee must invite agencies with permitting roles and/or resource expertise to participate in the ACP. The Lessee should request that the agency designate a primary point of contact(s) for communicating with the Lessee. If an agency states in writing to the Lessee or Lessor that it does not wish to participate in the ACP, the Lessee need no longer include that agency in ACP communications and must document this change in the ACP. If an agency does not respond to outreach from the Lessee, the Lessee will continue to invite the agency to participate in ACP engagement opportunities until the agency provides a response. Note that a decision to not participate in the ACP in no way changes the agency regulatory authority or the need to communicate with that agency. The Lessee must update the ACP or provide other written summary of how the Lessee used information gained during agency engagement to inform project planning and development.

3.1.2.4 Coordinated Engagement: To the maximum extent practicable, the Lessee must coordinate engagement activities for Tribes and parties (see Section 3.1.1) with other regional lessees and document their activities in the Progress Report. Lessee(s) must design coordinated engagement activities to decrease the communication and consultation burden on Tribes and parties. BOEM appreciates that not all engagement can be coordinated.

3.1.3 Survey Plans: The progress report must include an update regarding progress in executing the activities included in the survey plan(s), and include as an enclosure an updated survey plan(s) accounting for any modifications in schedule.

4 NATIONAL SECURITY AND MILITARY OPERATIONS

4.1 **Hold and Save Harmless**: Whether compensation for such damage or injury might be due under a theory of strict or absolute liability or otherwise, the Lessee assumes all risks of damage or injury to persons or property, which occur in, on, or above the Outer Continental Shelf (OCS), to any persons or to any property of any person or persons in connection with any activities being performed by the Lessee in, on, or above the OCS, if such injury or damage to such person or property occurs by reason of the activities of any agency of the United States Government, its contractors, or subcontractors, or any of its officers, agents or employees, being conducted as a part of, or in connection with, the programs or activities of the individual military command headquarters (hereinafter "the appropriate command headquarters") listed in the contact information provided as an enclosure to this lease.

Notwithstanding any limitation of the Lessee's liability in Section 9 of the lease, the Lessee assumes this risk whether such injury or damage is caused in whole or in part by any act or omission, regardless of negligence or fault, of the United States, its contractors or subcontractors, or any of its officers, agents, or employees. The Lessee further agrees to indemnify and save harmless the United States against all claims for loss, damage, or injury in connection with the programs or activities of the command headquarters, whether the same be caused in whole or in part by the negligence or fault of the United States, its contractors, or subcontractors, or any of its officers, agents, or employees and whether such claims might be sustained under a theory of strict or absolute liability or otherwise.

4.2 **Evacuation or Suspension of Activities:**

4.2.1 General: The Lessee hereby recognizes and agrees that the United States reserves and has the right to temporarily suspend operations and/or require evacuation on this lease in the interest of national security consistent with Section 3(c) of this lease.

4.2.2 Notification: Every effort will be made by the appropriate military agency to provide as much advance notice as possible of the need to suspend operations and/or evacuate. Advance notice will normally be given before requiring a suspension or evacuation. Temporary suspension of operations may include, but is not limited to the evacuation of personnel and appropriate sheltering of personnel not evacuated. "Appropriate sheltering" means the protection of all Lessee personnel for the entire duration of any Department of Defense activity from flying or falling objects or substances and will be implemented by an order (oral and/or written) from the BOEM, Office of Renewable Energy Programs (OREP) Program Manager, after consultation with the appropriate command headquarters or other appropriate military agency, or higher Federal authority. The appropriate command headquarters, military agency, or higher authority will provide information to allow the Lessee to assess the degree of risk to, and provide sufficient protection for, the Lessee's personnel and property.

4.2.3 Duration: Suspensions or evacuations for national security reasons will not generally exceed seventy-two (72) hours; however, any such suspension may be extended by order of the OREP Program Manager. During such periods, equipment may remain in place, but all operations, if any, must cease for the duration of the temporary suspension if so directed by the OREP Program Manager. Upon cessation of any temporary suspension, the OREP Program Manager will immediately notify the Lessee such suspension has terminated and operations on the leased area can resume.

4.2.4 Lessee Point-of-Contact for Evacuation/Suspension Notifications: The Lessee must inform the Lessor of the persons/offices to be notified to implement the terms of 4.2.2 and 4.2.3.

4.2.5 Coordination with Command Headquarters: The Lessee must establish and maintain early contact and coordination with the appropriate command headquarters, in order to avoid or minimize the potential to conflict with and minimize the potential effects of conflicts with military operations.

4.2.6 Reimbursement: The Lessee is not entitled to reimbursement for any costs or expenses associated with the suspension of operations or activities or the evacuation of property or personnel in fulfillment of the military mission in accordance with 4.2.1 through 4.2.5 above.

4.3 **Electromagnetic Emissions**:_The Lessee, prior to entry into any designated defense operating area, warning area, or water test area, for the purpose of commencing survey activities undertaken to support SAP or COP submittal must enter into an agreement with the commander of the appropriate command headquarters to coordinate the electromagnetic emissions associated with such survey activities. The Lessee must ensure that all electromagnetic emissions associated with such survey activities are controlled as directed by the commander of the appropriate command headquarters.

5 STANDARD OPERATING CONDITIONS

5.1 General Requirements

5.1.1 Prior to the start of operations, the Lessee must hold a briefing to establish responsibilities of each involved party, define the chains of command, discuss communication procedures, provide an overview of monitoring procedures, and review operational procedures. This briefing must include all relevant personnel, crew members and Protected Species Observers (PSOs). New personnel must be briefed as they join the work in progress.

5.1.2 The Lessee must ensure that all vessel operators and crew members, including PSOs, are familiar with, and understand, the requirements specified in this ADDENDUM "C".

5.1.3 The Lessee must ensure that a copy of ADDENDUM "C" and the Project Design Criteria and Best Management Practices listed in Appendix B of the NMFS Letter of Concurrence issued by the National Marine Fisheries Service (NMFS) on June 29, 2021, is made available on every project-related vessel. The 2021 Biological Assessment and letter of concurrence may be found here: (https://www.boem.gov/environmental-consultations).

5.1.4 Endangered Species Act (ESA) Consultation for Biological Surveys: The Lessee must consult with BOEM, the NMFS, and the U.S. Fish and Wildlife Service (USFWS) prior to designing and conducting biological surveys intended to support offshore renewable energy plans that could interact with ESA-listed species. Please see the 2021 Biological Assessment (BA)and letter of concurrence here: (https://www.boem.gov/renewable-energy/nmfs-esa-consultations) for data collection activities that have been previously consulted upon.

5.2 Protected Species

5.2.1 Protected Species: Unless otherwise authorized by BOEM, Lessee's OCS activities must comply with the standards in the Project Design Criteria and Best Management Practices found in BOEM's notice (https://www.boem.gov/sites/default/files/documents// PDCs%20and%20BMPs%20for%20Atlantic%20Data%20Collection%2011222021.pdf) last revised on November 22, 2021. The 2021 BA and letter of concurrence from which these measures were derived may be found here: (https://www.boem.gov/renewable-energy/nmfs-esa-consultations). At the Lessee's option, the Lessee, its operators, personnel, and contractors may satisfy this requirement by complying with the NMFS-approved measures to safeguard protected species that are most current at the time an activity is undertaken under this lease, including but not limited to new or updated versions of the 2021 BA or 2021 NMFS Letter of Concurrence, or through new or activity-specific consultations.

5.3 Archaeological Survey Requirements

5.3.1 Archaeological Survey Required: The Lessee must provide the results of an archaeological survey with its plans.

5.3.2 Qualified Marine Archaeologist: The Lessee must ensure that the analysis of archaeological survey data collected in support of plan (e.g., SAP and/or COP) submittal and the preparation of archaeological reports in support of plan submittal are conducted by a Qualified Marine Archaeologist.

5.3.3 Tribal Pre-Survey Meeting: The Lessee must coordinate a tribal pre-survey meeting by sending a letter through certified mail, and following up with email or phone calls as necessary, to the following Tribes:

- Absentee-Shawnee Tribe of Indians of Oklahoma;
- Delaware Tribe of Indians;
- Eastern Shawnee Tribe of Oklahoma;

- Mashantucket Pequot Tribal Nation;
- Mashpee Wampanoag Tribe;
- Mohegan Tribe of Connecticut;
- Shawnee Tribe;
- Stockbridge-Munsee Community Band of Mohican Indians;
- The Delaware Nation;
- The Narragansett Indian Tribe;
- The Shinnecock Indian Nation; and
- Wampanoag Tribe of Gay Head (Aquinnah).

The purpose of this meeting will be for the Lessee and the Lessee's Qualified Marine Archaeologist to discuss the Lessee's Survey Plan and consider requests to monitor portions of the archaeological survey and the geotechnical exploration activities, including the visual logging and analysis of geotechnical samples (e.g., cores, etc.). Notification of the tribal pre-survey meeting must be sent at least 15 calendar days prior to the date of the proposed tribal pre-survey meeting. The meeting must be scheduled for a date at least 30 calendar days prior to commencement of survey activities performed in support of plan submittal and at a location and time that affords the participants a reasonable opportunity to participate. The anticipated date for the meeting must be identified in the timeline of activities described in the applicable survey plan (see 2.1). The Lessee must provide the Lessor with documentation of compliance with this stipulation prior to commencement of surveys.

5.3.4 Geotechnical Exploration: The Lessee may only conduct geotechnical exploration activities performed in support of plan (i.e., SAP and/or COP) submittal in locations where an analysis of the results of geophysical surveys has been completed. This analysis must include a determination by a Qualified Marine Archaeologist as to whether any potential archaeological resources are present in the area. Except as allowed by the Lessor under 4.2.6, the geotechnical exploration activities must avoid potential archaeological resources by a minimum of 50 meters (164 feet), and the avoidance distance must be calculated from the maximum discernible extent of the archaeological resource. A Qualified Marine Archaeologist must certify, in the Lessee's archaeological reports, that geotechnical exploration activities did not impact potential historic properties identified as a result of the HRG surveys performed in support of plan submittal, except as follows: in the event that the geotechnical exploration activities did impact potential historic properties identified in the archaeological surveys without the Lessor's prior approval, the Lessee and the Qualified Marine Archaeologist who prepared the report must instead provide a statement documenting the extent of these impacts.

5.3.5 Monitoring and Avoidance: The Lessee must inform the Qualified Marine Archaeologist that he or she may elect to be present during HRG surveys and bottom-disturbing activities performed in support of plan (i.e., SAP and/or COP) submittal to ensure avoidance of potential archaeological resources, as determined by the Qualified Marine Archaeologist (including bathymetric, seismic, and magnetic anomalies; side scan sonar contacts; and other seafloor or sub-surface features that exhibit potential to represent or contain potential archaeological sites or other historic properties). In the event that the Qualified Marine Archaeologist indicates that he or she wishes to be present, the Lessee must reasonably facilitate the Qualified Marine Archaeologist's presence, as requested by the

Qualified Marine Archaeologist, and provide the Qualified Marine Archaeologist the opportunity to inspect data quality.

5.3.6 No Impact without Approval: In no case may the Lessee knowingly impact a potential archaeological resource without the Lessor's prior approval.

5.3.7 Post-Review Discovery Clauses: If the Lessee, while conducting geotechnical exploration or any other bottom-disturbing site characterization activities in support of plan (i.e., SAP and COP) submittal and after review of the location by a Qualified Marine Archaeologist under 4.2.4, discovers an unanticipated potential archaeological resource, such as the presence of a shipwreck (e.g., a sonar image or visual confirmation of an iron, steel, or wooden hull, wooden timbers, anchors, concentrations of historic objects, piles of ballast rock) or evidence of a pre-contact archaeological site (e.g. stone tools, pottery or other pre-contact artifacts) within the project area, the Lessee must:

5.3.7.1 Immediately halt seafloor/bottom-disturbing activities within the area of discovery;

5.3.7.2 Notify the Lessor within 24 hours of discovery;

5.3.7.3 Notify the Lessor in writing via report to the Lessor within 72 hours of its discovery;

5.3.7.4 Keep the location of the discovery confidential and take no action that may adversely impact the archaeological resource until the Lessor has made an evaluation and instructs the applicant on how to proceed; and

5.3.7.5 If (1) the site has been impacted by the Lessee's project activities; or (2) impacts to the site or to the area of potential effect cannot be avoided, conduct additional investigations, as directed by the Lessor, to determine if the resource is eligible for listing in the National Register of Historic Places (30 CFR 585.802(b)). If investigations indicate that the resource is potentially eligible for listing in the National Register of Historic Places, the Lessor will inform the Lessee how to protect the resource or how to mitigate adverse effects to the site. If the Lessor incurs costs in protecting the resource, then, under Section 110(g) of the National Historic Preservation Act, the Lessor may charge the Lessee reasonable costs for carrying out preservation responsibilities under the OCS Lands Act (30 CFR 585.802(c-d)).

5.4 Avian and Bat Survey and Reporting Requirements

5.4.1 Lighting: Any lights used to aid marine navigation by the lessee during construction, operations, and decommissioning of a meteorological buoy must meet USCG requirements for private aids to navigation [https://www.uscg.mil/forms/cg/CG_2554.pdf] and BOEM's Guidelines for Lighting and Marking of Structures Supporting Renewable Energy Development [https://www.boem.gov/2021-lighting-and-marking-guidelines]. For any additional lighting, the lessee must use such lighting only when necessary, and the lighting must be hooded downward and directed when possible, to reduce upward illumination and illumination of adjacent waters.

5.4.2 Motus Wildlife Tracking System: To help address information gaps on offshore movements of birds and bats, including ESA-listed species, the Lessee must install Motus stations on meteorological or environmental data buoys in coordination with U.S. Fish and Wildlife Service's Offshore Motus network.

5.4.3 Bird Deterrents: To minimize the attraction of birds, the Lessee must install bird deterrent devices (e.g., anti-perching), where appropriate.

5.4.4 Avian Annual Reporting: The Lessee must provide an annual report to the Lessor and USFWS using the contact information provided as an Enclosure to this lease, or updated contact information as provided by the Lessor. This report must document any dead or injured birds or bats found during activities conducted in support of plan submittal. The first report must be submitted within 6 months of the start of the first survey conducted in support of plan submittal, and subsequent reports must be submitted annually thereafter until all surveys in support of plan submittal have concluded and all such birds and bats have been reported. If surveys are not conducted in a given year, the annual report may consist of a simple statement to that effect. An annual report must be provided to BOEM and USFWS documenting any dead (or injured) birds or bats found on vessels and structures during construction, operations, and decommissioning. The report must contain the following information: the name of species, date found, location, a picture to confirm species identity (if possible), and any other relevant information. Carcasses with Federal or research bands must be reported to the United States Geological Survey Bird Band Laboratory, available at https://www.pwrc.usgs.gov/bbl/.

5.4.5 Survey Results and Data: The Lessee must provide the results of avian surveys and data to BOEM and USFWS with its plans.

6 PROJECT LABOR AGREEMENTS

The Lessee must make every reasonable effort to enter a Project Labor Agreement(s) (PLA) covering the construction stage of any project proposed for the leased area.

7 SUPPLY CHAIN

7.1 **Supply Chain Statement of Goals**: The Lessee must submit to the Lessor a statement of goals in which the Lessee will describe any plans by Lessee for contributing to the creation of a robust and resilient US-based offshore wind supply chain. The Statement of Goals must include the Lessee's plans for investments in supply chain improvements, if any, to support the offshore wind industry, including investments in:

- Installation, downpipe, survey and other vessels,
- Port infrastructure,
- Grid upgrades,
- Research & development,
- Manufacturing of components and facilities,
- Supply chain architecture like fabrication and assembly halls, port storage, laydown areas,
- Dry docks and navigation channels,
- Onshore and offshore docking and refueling stations for autonomous vehicles,
- Workforce diversity, training, and development, and
- Ensuring equal access to contracting opportunities.

Annually following COP approval, the Lessee must send updates to the Lessor on the Supply Chain Statement of Goals, and the Lessee's progress in meeting those goals. This information may be provided as part of the certification of compliance statement pursuant to 30 CFR 585.633(b).

The Lessee must submit an evaluation of the Lessee's success in meeting these goals no later than the last required Fabrication and Installation Report submission. The Lessee must submit a version of the Statement of Goals, updates, and final report that do not contain confidential information, so that BOEM can make them publicly available.

7.2 **Supply Chain Operating Fee Credit**: To promote the development of the United States' offshore wind supply chain, the Lessee is encouraged to procure major offshore wind components domestically. The Lessee may be eligible for an operating fee rate of 1% for a period of five years. To qualify, the Lessee must satisfy four or more of the following conditions:

- All nacelles for the project are assembled in the United States;
- All turbine blades are manufactured in the United States;
- All towers are manufactured in the United States;
- All foundations are manufactured in the United States;
- All transition pieces are manufactured in the United States;
- All inter-array cables are manufactured in the United States;
- All export cables are manufactured in the United States;
- The offshore substations are manufactured in the United States.

The domestic assembly and manufacturing conditions described above must be meaningful and substantial, as determined by BOEM. For example, a nacelle that is assembled abroad with minor components added in the United States would not satisfy the requirement.

To qualify for the operating fee credit, Lessees must request the credit and must provide to BOEM evidence that four or more of the above-listed conditions were met. Upon BOEM's review and determination that the requesting Lessee has met the criteria to earn the operating fee rate adjustment, the operating fee rate starting in the year after the completion of the review and determination will be 0.01 for five years.

8 SITING CONDITIONS

8.1 **Surface Structure Layout and Orientation**: This lease area, OCS-A 0544, is located adjacent to the existing BOEM lease area OCS-A 0512. In the Lessee's proposed project design in the COP, the Lessee must endeavor to design a surface structure layout that contains two common lines of orientation between OCS-A 0512 and OCS-A 0544 (as described in Navigation and Vessel Inspection Circular 01-19). If the Lessee and the neighboring BOEM lessee (i.e., the lessee for OCS-A 0512) cannot agree on such a surface structure layout, the OCS-A 0544 Lessee must incorporate a 2 nmi setback from the boundary of the neighboring lease, within which the OCS-A 0544 Lessee must not construct any surface structures. Rent will be collected on all areas assigned to the Lessee, as outlined in Addendum A, regardless of potential restrictions.

BUREAU OF OCEAN ENERGY MANAGEMENT

ADDENDUM "D"

PROJECT EASEMENT

Lease Number OCS-A 0544

This section includes a description of the Project Easement(s), if any, associated with this lease, and the financial terms associated with it. This section will be updated as necessary.

I. Rent

The Lessee must begin submitting rent payments for any project easement associated with this lease commencing on the date that BOEM approves the Construction and Operations Plan or modification of the COP describing the project easement. Annual rent for a project easement 200 feet wide, centered on the transmission cable, is $70.00 per statute mile. For any additional acreage required, the Lessee must also pay the greater of $5.00 per acre per year or $450.00 per year.

U.S. DEPARTMENT OF THE INTERIOR
BUREAU OF OCEAN ENERGY MANAGEMENT

ADDENDUM "E"

RENT SCHEDULE

Lease Number OCS-A 0544

This section includes a description of the schedule for rent payments that will be determined if the Construction and Operations Plan has been approved or approved with modifications. BOEM will update this section as necessary.

ENCLOSURE

Alternative Monitoring Plan

for

Lease OCS-A 0522 Survey Plan
Geophysical, Geotechnical, and Environmental Site Characterization Campaign in Support of a Construction and Operations Plan

In accordance with Lease stipulation 4.3.3, OCS-A 0522 LLC submits this Alternative Monitoring Plan detailing the monitoring methodology for conducting geophysical surveys at night and during low visibility conditions. In addition to the measures set forth in the applicable Incidental Harassment Authorization (IHA), the following additional measures that have been previously approved by BOEM will be implemented to conduct monitoring at night or when visibility is impaired.

1. PAM operator(s) will work in coordination with the PSO to support survey activities at night and/or as needed during periods when visual observations may be impaired. In order to ensure the active monitoring of the HRG survey exclusion zones, as well as the 500 meter minimum separation distance from the NARW.*

2. During nighttime operations, the PAM Operator will work in co- ordination with the PSO on watch to attempt to verify and localize any marine mammal detections. During periods of low visibility (as determined by the lead PSO), including nighttime operations, if a NARW is detected acoustically, but cannot be localized, all sound sources operating below 200 kHz will be shutdown. If acoustic detection occurs for any other marine mammal or sea turtle encroaching upon the exclusion zones, shutdown procedures will be conducted as described above.*

3. Visual Nighttime Monitoring: In addition to the use of PAM during nighttime operations, PSOs will be equipped with Night Vision Binoculars (NVBs), Clip on Thermal Imagers (COTI) and/or handheld infrared light emitting diode spotlights. PSOs will monitor the exclusion zone and the 500 meter minimum vessel separation distance from the NARW using the night vision technology.

4. Monitoring equipment will be calibrated when possible throughout the duration of survey and true distances measured using the ships radar will be compared to those measured using visual and acoustic monitoring equipment.

*The only exception to the use of PAM is when nearshore survey work in shallower water is conducted with smaller vessels that cannot accommodate both PSOs and PAM operators. In those limited cases, PSOs will be equipped with Night Vision Binoculars (NVBs), Clip on Thermal Imagers (COTI) and/or handheld infrared light emitting diode spotlights.

OFFICE OF RENEWABLE ENERGY PROGRAMS
ATLANTIC OCS REGION

Project Design Criteria and Best Management Practices for Protected Species Associated with Offshore Wind Data Collection
(Latest Revision: 11/22/2021)

The Bureau of Ocean Energy Management (BOEM) has completed a programmatic consultation with the National Marine Fisheries Service (NMFS) under section 7 of the Endangered Species Act (ESA). On June 29, 2021, NMFS issued a Letter of Concurrence under the ESA that covers site characterization (high resolution geophysical (HRG), geotechnical, and biological surveys) and site assessment/data collection (deployment, operation, and retrieval of meteorological and oceanographic data buoys) activities associated with Atlantic OCS leases.[1] As a result of this consultation, Project Design Criteria (PDCs) and Best Management Practices (BMPs) associated with the mitigation, monitoring, and reporting conditions have been developed for those data collection activities covered in the consultation.[2] These PDCs and BMPs collectively implement the ESA requirements for these offshore wind activities on the Atlantic Outer Continental Shelf as of June 29, 2021. Previous lease stipulations on existing leases issued prior to March 13, 2020 remain binding or the conditions in a lease may otherwise be amended. Similar to the requirements for threatened and endangered species and critical habitat under the ESA, BOEM has revised the mitigation, monitoring, and reporting conditions for all marine mammals as they pertain to leases.

Definitions

1. Definition of "Dynamic Management Area (DMA)": The term "DMA" refers to a temporary area designated by the National Oceanic and Atmospheric Administration, National Marine Fisheries Service (NMFS) based on visual sightings documenting the presence of three or more right whales within a discrete area.

2. Definition of “ESA-Listed Species”: The term ESA-listed species means threatened or endangered species of marine mammal, sea turtle, fish, or coral listed under the Endangered Species Act.

3. Definition of “Geophysical Survey”: The term geophysical survey means sub-bottom profiler devices including any boomers, sparkers, or bubble guns that produces noise to record geophysical data that to which the mitigation, monitoring, and reporting for operation of the sound source.

[1] https://www.boem.gov/renewable-energy/final-nlaa-osw-programmatic
[2] https://www.boem.gov/renewable-energy/orep-data-collection-ba-final

4. Definition of “Geotechnical Survey": The term "geotechnical survey" is used to collectively refer to any physical testing or sampling of the surface or sub-surface of the seafloor.

5. Definition of “Large Whale”: The term “large whale” means baleen whales (North Atlantic right whales, fin whales, sei whales, blue whales, humpback whales, and minke whales); sperm whales; and any unidentified whale.

6. Definition of “Live Bottom Features”: The term “live bottom features” means all sensitive live bottom habitats including submerged aquatic vegetation and consolidated seabed features for this measure such as pavement, scarp walls, and deep/cold-water coral reefs, and shallow/mesophotic reefs as defined in the CMECS Geologic Substrate Classifications.

7. Definition of “Protected Species”: The term protected species” means all threatened and endangered marine species listed under the Endangered Species Act and all marine mammals.

8. Definition of "Ramp-up": The term "ramp-up" means the process of incrementally increasing the acoustic source level of the survey equipment when conducting HRG surveys until it reaches the operational setting.

9. Definition of “Small Cetacean”: The term small cetacean refers to any species of dolphin in the family *Delphinidae* and harbor porpoises in the family *Phocoenidae*.

10. Definition of “Slow Zone”: The term “Slow Zone” refers to announcements by NOAA Fisheries that North Atlantic right whales have been either acoustically detected or visually within a defined area. Slow Zones are inclusive of Dynamic Management Areas.

PDC 1. Avoid Live Bottom Features

BMP 1.1 All vessel anchoring and any seafloor-sampling activities are restricted from seafloor areas with consolidated seabed features including pavement, scarp walls, and deep/cold-water coral reefs and shallow/mesophotic reefs as defined in the Coastal and Marine Ecological Classification Standard for geologic substrate classifications. All vessel anchoring and seafloor sampling must also occur at least 150 m from any known locations of threatened or endangered coral species. All sensitive live bottom habitats (eelgrass, cold-water corals, etc.) should be avoided as practicable. All vessels in coastal waters will operate in a manner to minimize propeller wash and seafloor disturbance and transiting vessels should follow deep-water routes (e.g., marked channels), as practicable, to reduce disturbance to sturgeon and sawfish habitat.

PDC 2. Avoid Spawning and Developmental Habitat of Sturgeon

BMP 2.1 No geotechnical or bottom disturbing activities will take place during the spawning/rearing season within freshwater reaches of rivers where Atlantic or shortnose sturgeon spawning occurs. Any survey plan that includes geotechnical or other benthic sampling activities in freshwater reaches (salinity 0-0.5 ppt) of such rivers will identify a time of year restriction that will avoid such activities during the time of year when Atlantic sturgeon spawning and rearing of early life stages occurs in that river. Appropriate time of year restrictions include the following:

River	**No Work Window**	**Area Affected**
Hudson	April – July	Upstream of the Delaware Memorial Bridge
Delaware	April – July	Upstream of Newburgh, NY - Beacon Bridge/Rt 84

This table will be supplemented with additional rivers as may be necessary.

PDC 3: Marine Debris Awareness and Elimination

BMP 3.1 Marine Debris Awareness Training. The Lessee must ensure that vessel operators, employees, and contractors engaged in offshore activities pursuant to the approved COP complete marine trash and debris awareness training annually. The training consists of two parts: (1) viewing a marine trash and debris training video or slide show (described below); and (2) receiving an explanation from management personnel that emphasizes their commitment to the requirements. The marine trash and debris training videos, training slide packs, and other marine debris related educational material may be obtained at https://www.bsee.gov/debris or by contacting BSEE. The training videos, slides, and related material may be downloaded directly from the website. Operators engaged in marine survey activities must continue to develop and use a marine trash and debris awareness training and certification process that reasonably assures that their employees and contractors are in fact trained. The training process must include the following elements:

- Viewing of either a video or slide show by the personnel specified above;
- An explanation from management personnel that emphasizes their commitment to the requirements;
- Attendance measures (initial and annual); and
- Recordkeeping and the availability of records for inspection by DOI.

BMP 3.2 Training Compliance Report. By January 31 of each year, the Lessee must submit to DOI an annual report that describes its marine trash and debris awareness training process and certifies that the training process has been followed for the previous calendar year. The Lessee must send the reports via email to BOEM (at renewable_reporting@boem.gov) and to BSEE (at marinedebris@bsee.gov).

BMP 3.3 Marking. Materials, equipment, tools, containers, and other items used in

OCS activities, which are of such shape or configuration that they are likely to snag or damage fishing devices, and could be lost or discarded overboard, must be clearly marked with the vessel or facility identification and properly secured to prevent loss overboard. All markings must clearly identify the owner and must be durable enough to resist the effects of the environmental conditions to which they may be exposed.

BMP 3.4 Recovery and Prevention. The Lessee must recover marine trash and debris that is lost or discarded in the marine environment while performing OCS activities when such incident is likely to: (a) cause undue harm or damage to natural resources, including their physical, atmospheric, and biological components, with particular attention to marine trash or debris that could entangle or be ingested by marine protected species; or (b) significantly interfere with OCS uses (e.g., because the marine trash or debris is likely to snag or damage fishing equipment, or presents a hazard to navigation). The Lessee must notify DOI within 48 hours when recovery activities are: (i) not possible because conditions are unsafe; or (ii) not practicable because the marine trash and debris released is not likely to result in any of the conditions listed in (a) or (b) above. Notwithstanding this notification, DOI may still order the Lessee to recover the lost or discarded marine trash and debris if DOI finds the reasons provided by the Lessee in the notification unpersuasive. If the marine trash and debris is located within the boundaries of a potential archaeological resource/avoidance area, or a sensitive ecological/benthic resource area, the Lessee must contact DOI for approval before conducting any recovery efforts.

Recovery of the marine trash and debris should be completed as soon as practicable, but no later than 30 calendar days from the date on which the incident occurred. If the Lessee is not able to recover the marine trash or debris within 48 hours, the Lessee must submit a recovery plan to DOI explaining the recovery activities to recover the marine trash or debris (Recovery Plan). The Lessee must submit the Recovery Plan no later than 10 calendar days from the date on which the incident occurred. Unless DOI objects within 48 hours of the filing of the Recovery Plan, the Lessee can proceed with the activities described in the Recovery Plan. The Lessee must request and obtain approval of a time extension if recovery activities cannot be completed within 30 calendar days from the date on which the incident occurred. The Lessee must enact steps to prevent similar incidents and must submit a description of these actions to BOEM and BSEE within 30 calendar days from the date on which the incident occurred.

BMP 3.5 Reporting. The Lessee must report to DOI (using the email address listed on DOI's most recent incident reporting guidance) all lost or discarded marine trash and debris. This report must be made monthly and submitted no later than the fifth day of the following month. The Lessee is not required to submit a report for those months in which no marine trash and debris was lost or discarded. The report must include the following:

- Project identification and contact information for the Lessee,
- operator, and/or contractor;
- The date and time of the incident;
- The lease number, OCS area and block, and coordinates of the object's location (latitude and longitude in decimal degrees);

- A detailed description of the dropped object, including dimensions (approximate length, width, height, and weight) and composition (e.g., plastic, aluminum, steel, wood, paper, hazardous substances, or defined pollutants);
- Pictures, data imagery, data streams, and/or a schematic/illustration of the object, if available;
- An indication of whether the lost or discarded item could be: a magnetic anomaly of greater than 50 nanoTesla; a seafloor target of greater than 1.6 feet (0.5 meters); or a sub-bottom anomaly of greater than 1.6 feet (0.5 meters) when operating a magnetometer or gradiometer, side scan sonar, or sub-bottom profile in accordance with DOI's most recent, applicable guidance;
- An explanation of how the object was lost; and
- A description of immediate recovery efforts and results.

In addition to the foregoing, the Lessee must submit a report within 48 hours of the incident (48-hour Report) if the marine trash or debris could: (a) cause undue harm or damage to natural resources, including their physical, atmospheric, and biological components, with particular attention to marine trash or debris that could entangle, or be ingested by, marine protected species; or (b) significantly interfere with OCS uses (e.g., because the marine trash or debris is likely to snag or damage fishing equipment, or presents a hazard to navigation). The information in the 48-hour Report must be the same as that listed for the monthly report, but only for the incident that triggered the 48-hour Report. The Lessee must report to DOI if the object is recovered and, as applicable, describe any substantial variance from the activities described in the Recovery Plan that were required during the recovery efforts. The Lessee must include and address information on unrecovered marine trash and debris in the description of the site clearance activities provided in the decommissioning application required under 30 C.F.R. § 585.906.

PDC 4: Minimize Interactions with Protected Species during Geophysical Survey Operations

Per conditions of the existing ESA Section 7 consultation, the Lessee must implement the following measures for all vessels towing boomer, sparker, or bubble gun categories of equipment. Shutdown, pre-start clearance, and ramp-up procedures are not required during HRG survey operations using only other sources (e.g., ultra short baselines, fathometers, parametric shallow penetration sub-bottom profilers, hull-mounted non-parametric sub-bottom profiler/CHIRP systems, side-scan sonars, pingers, acoustic releases, echosounders, and instruments attached to submersible vehicles (HOV/AUV/ROVs)).

BMP 4.1 For situational awareness a Monitoring Zone (500 m in all directions) for ESA-listed species must be monitored around all vessels operating boomer, sparkers, or bubble gun equipment.

4.1.1 The Monitoring Zone must be monitored by approved third-party PSOs at all times and any observed listed species must be recorded (see reporting requirements below).

4.1.2 Any observations of ESA-listed species by crew members aboard any vessel associated with the survey must be relayed to the PSO on duty.

4.1.3 For monitoring around the autonomous surface vessel (ASV) where remote PSO monitoring must occur from the mother vessel, a dual thermal/HD camera must be installed on the mother vessel facing forward and angled in a direction so as to provide a field of view ahead of the vessel and around the ASV. PSOs must be able to monitor the real-time output of the camera on hand-held computer tablets. Images from the cameras must be able to be captured and reviewed to assist in verifying species identification. A monitor must also be installed in the bridge displaying the real-time images from the thermal/HD camera installed on the front of the ASV itself, providing a further forward view of the craft. In addition, night-vision goggles with thermal clip-ons and a handheld spotlight must be provided and used such that PSOs can focus observations in any direction around the mother vessel and/or the ASV.

BMP 4.2 To minimize exposure to noise that could be disturbing, a 500 m Shutdown Zone for North Atlantic right whales and unidentified whales, and a 100 m Shutdown Zone for all other ESA-listed whales visible at the surface must be established around each vessel operating boomer, sparker, or bubble gun equipment.

4.2.1 The Shutdown Zone(s) must be monitored by third-party PSOs at all times when boomer, sparker, or bubble gun categories of equipment is being operated and all observed ESA-listed species must be recorded (see reporting requirements below).

4.2.2 If an ESA-listed whale is detected within or entering the respective Shutdown Zone, any boomer, sparker, or bubble gun categories of equipment that requires PSOs must be shut off until the minimum separation distance is re-established and the measures in (4.3) are carried out (500 m for North Atlantic right whales and 100 m for other ESA-listed whales).

4.2.3 A PSO must notify the survey crew that a shutdown of all active boomer, sparker, and bubble gun acoustic sources is immediately required. The vessel operator and crew must comply immediately with any call for a shutdown by the PSO. Any disagreement or discussion must occur only after shutdown.

BMP 4.3 For non-ESA-listed marine mammals, the Lessee must comply with NMFS permit conditions of any applicable Incidental Take Authorization (ITA) received under the Marine Mammal Protection Act. If an ITA is not required, the Lessee must adhere to the following measures for non-ESA-listed marine mammals for which incidental take has not been authorized.

4.3.1 Prior to powering up survey equipment, a 328-foot (100-meter) clearance zone must be clear of all small cetaceans and seals for 15 minutes; and humpback whales, minke whales, Kogia, and beaked whales for 30 minutes.

4.3.2 If any non-ESA-listed marine mammal is observed within the clearance zone during the monitoring period, the clock must be paused for 15 or 30 minutes depending on the species sighted. If the PSO confirms that the animal has exited the shutdown zone and is headed away from the survey vessel, the clock that was paused may resume.

4.3.3 The clock will reset to respective clearance time if the marine mammal dives and is not resighted by the PSO.

4.3.4 A shutdown zone of 100 meters must be established around the survey vessel. For non-ESA-listed marine mammals, a shutdown of impulsive acoustic sources is required upon observation of a species entering the shutdown zone.

4.3.5 If delphinids from the genera *Delphinus*, *Lagenorhynchus*, *Stenella*, or *Tursiops* and seals are visually detected approaching the vessel or towed acoustic sources, shutdown is not required. If there is uncertainty regarding identification of a marine mammal species (i.e., whether the observed marine mammal(s) belongs to one of the delphinid genera for which shutdown is waived), PSOs must use best professional judgment in making the decision to call for a shutdown.

4.3.6 If the Shutdown Zone(s) cannot be adequately monitored for protected species (i.e., a PSO determines conditions, including at night or other low-visibility conditions, are such that animals cannot be reliably sighted within the Shutdown Zone(s), the survey must be stopped until such time that the Shutdown Zone(s) can be reliably monitored.

<u>BMP 4.4</u> Before any noise-producing survey equipment is deployed, the Monitoring Zones (500 meters for all ESA-listed species and 200 meters for non-ESA-listed marine mammals) must be monitored for 30 minutes of pre-clearance observation.

4.4.1 If any protected species is observed within the respective Monitoring Zone during the 30-minute pre-clearance period, the 30-minute clock must be paused. If the PSO confirms the animal has exited the zone and headed away from the survey vessel, the 30-minute clock that was paused may resume. The pre-clearance clock will reset to 30 minutes if the animal dives or visual contact is otherwise lost.

<u>BMP 4.5</u> A "ramp up" of the boomer, sparker, or bubble gun survey equipment must occur at the start or re-start of geophysical survey activities when technically feasible. A ramp up must begin with the power for the geophysical survey ramped up half power for 5 minutes, and then to full power.

<u>BMP 4.6</u> Following a shutdown for any reason, ramp up of the equipment may begin immediately only if: (a) <u>the shutdown is less than 30 minutes, (b)</u> visual monitoring of the Shutdown Zone(s) continued throughout the shutdown, (<u>c</u>) the animal(s) causing the shutdown was visually followed and confirmed by PSOs to be outside of the Shutdown Zone(s) and heading away from the vessel, and (<u>d</u>) the Shutdown Zone(s) remains clear of all ESA-listed species. If all the conditions above are not met, the Monitoring Zone (500

m for all ESA-listed species) must be monitored for 30 minutes of pre-clearance observation before noise-producing equipment can be turned back on.

BMP 4.7 In order for geophysical surveys to be conducted at night or during low-visibility conditions, PSOs must be able to effectively monitor the Clearance and Shutdown Zone(s). No surveys may occur if the Clearance and Shutdown Zone(s) cannot be reliably monitored for the presence of ESA-listed species.

4.7.1 An Alternative Monitoring Plan (AMP) must be submitted to BOEM detailing the monitoring methodology that will be used during nighttime and low-visibility conditions and an explanation of how it will be effective at ensuring that the Shutdown Zone(s) can be maintained during nighttime and low-visibility survey operations. The plan must be submitted 60 days before survey operations are set to begin.

4.7.2 The plan must include technologies that have the technical feasibility to detect ESA-listed species in the Clearance and Shutdown Zones. Night-vision equipment (i.e., night-vision goggles and/or infrared technology) must be available for use during nighttime monitoring.

4.7.3 PSOs should be trained and experienced with any AMP technology used.

4.7.4 The AMP must describe how calibration will be performed, for example, by including observations of known objects at set distances and under various lighting conditions. This calibration could be performed during mobilization and periodically throughout the survey operation.

4.7.5 PSOs shall make nighttime observations from a platform with no visual barriers, due to the potential for the reflectivity from bridge windows or other structures to interfere with the use of the night vision optics.

BMP 4.8 To minimize risk to North Atlantic right whales, no surveys may occur in Cape Cod Bay from January 1 - May 15 of any year (in an area beginning at 42°04′56.5″ N-070°12′00.0″ W; thence north to 42°12′00.0″ N-070°12′00.0″ W; thence due west to charted mean high water line; thence along charted mean high water within Cape Cod Bay back to beginning point).

BMP 4 .9 Boomer, sparker, or bubble gun sound sources used within the Southeast Right Whale Critical Habitat Unit 2 during the calving and nursing season (December-March) shall not operate at frequencies between 7 kHz and 35 kHz at night or poor visibility (i.e., anytime AMP methods are required).

BMP 4.10 At times when multiple survey vessels using boomer, sparker, or bubble gun categories of equipment are operating within a lease, adjacent lease areas, or exploratory cable routes, a minimum separation distance must be maintained between survey vessels to ensure that sound sources do not overlap.

BMP 4.11 To minimize disturbance to the Northwest Atlantic Ocean Distinct Population Segment of loggerhead sea turtles, a voluntary pause in sparker operation should be implemented for all vessels operating in nearshore critical habitat for loggerhead sea turtles. These conditions apply to critical habitat boundaries for nearshore reproductive habitats LOGG N-3 through LOGG N-16 (79 FR 39855) from April 1 to September 30. Following pre-clearance procedures in 4.1, if any loggerhead or other unidentified sea turtles is observed within a 100-meter monitoring zone during a survey, sparker operation should be paused by turning off the sparker until the sea turtle is beyond 100-meters of the survey vessel. If the animal dives or visual contact is otherwise lost, sparker operation may resume after a minimum 2-minute pause following the last sighting of the animal.

BMP 4.12 Any visual observations of listed species by crew or project personnel must be communicated to PSOs on-duty.

BMP 4.13 During good conditions (e.g., daylight hours; Beaufort scale 3 or less) when survey equipment is not operating, to the maximum extent practicable, PSOs must conduct observations for listed species for comparison of sighting rates and behavior with and without use of active geophysical survey equipment. Any observed listed species must be recorded regardless of any mitigation actions required.

PDC 5. Minimize Vessel Interactions with Protected Species

The Lessee must ensure all vessels associated with survey activities (transiting or actively surveying) must comply with the vessel strike avoidance measures specified below. The only exception is when the safety of the vessel or crew necessitates deviation from these requirements. If any such incidents occur, they must be reported as outlined below.

BMP 5.1 Vessel captain and crew must maintain a vigilant watch for all protected species and reduce speed, stop their vessel, or alter course, as appropriate and regardless of vessel size, to avoid striking any listed species. The presence of a single individual at the surface may indicate the presence of submerged animals in the vicinity; therefore, precautionary measures should always be exercised. If pinnipeds or small delphinids of the following genera: *Delphinus*, *Lagenorhynchus*, *Stenella*, and *Tursiops* are visually detected approaching the vessel (i.e., to bow ride) or towed equipment, vessel speed reduction, course alteration, and shutdown are not required.

BMP 5.2 Anytime a survey vessel is underway (transiting or surveying), the vessel must maintain a 500 m minimum separation distance from ESA-listed species and a PSO must monitor a Vessel Strike Avoidance Zone (500 m or greater from any sighted ESA-listed species or other unidentified large marine mammal visible at the surface) to ensure detection of that animal in time to take necessary measures to avoid striking the animal. If the survey vessel does not require a PSO for the type of survey equipment used, a trained crew lookout may be used as required in 5.3. For monitoring around the autonomous surface vessels, regardless of the equipment it may be operating, a dual thermal/HD camera must be installed on the mother vessel facing forward and angled in a direction so as to provide a field of view ahead of the vessel and around the ASV. A dedicated operator must be able to monitor the real-time output of the camera on hand-held computer tablets. Images from the cameras must be able to be captured and reviewed to assist in verifying species identification. A monitor must also be installed in the bridge displaying the real-time images from the thermal/HD camera installed on the front of the ASV itself, providing a further forward view of the craft.

5.2.1 Survey plans must include identification of vessel strike avoidance measures, including procedures for equipment shut down and retrieval, communication between PSOs/crew lookouts, equipment operators, and the captain, and other measures necessary to avoid vessel strikes while maintaining vessel and crew safety. If any circumstances are anticipated that may preclude the implementation of this PDC, they must be clearly identified in the survey plan and alternative procedures outlined in the plan to ensure minimum distances are maintained and vessel strikes can be avoided.

5.2.2 All vessel crew members must be briefed in the identification of protected species that may occur in the survey area and in regulations and best practices for avoiding vessel collisions. Reference materials must be available aboard all project vessels for identification of listed species. The expectation and process for reporting of protected species sighted during surveys must be clearly communicated and posted in highly visible locations aboard all project vessels, so that there is an expectation for reporting to the designated vessel contact (such as the lookout or the vessel captain), as well as a communication channel and process for crew members to do so.

5.2.3 A minimum separation distance of 500 m from all ESA-listed whales (including unidentified large whales) must be maintained around all surface vessels at all times.

5.2.4 If an ESA-listed whale or large unidentified whale is observed within 500 m of the forward path of any vessel, the vessel operator must steer a course away from the whale at 10 knots (18.5 km/hr) or less until the 500 m minimum separation distance has been established. Vessels may also shift to idle if feasible.

5.2.5 If a large whale is sighted within 200 m of the forward path of a vessel, the vessel operator must reduce speed and shift the engine to neutral. Engines must not be engaged until the whale has moved outside of the vessel's path and beyond 500 m. If stationary, the vessel must not engage engines until the large whale has moved beyond 500 m.

5.2.6 If a sea turtle or manta ray is sighted at any distance within the operating vessel's forward path, the vessel operator must slow down to 4 knots and steer away (unless unsafe to do so). The vessel may resume normal vessel operations once the vessel has passed the individual.

5.2.7 During times of year when sea turtles are known to occur in the survey area, vessels must avoid transiting through areas of visible jellyfish aggregations or floating vegetation (e.g., sargassum lines or mats). In the event that operational safety prevents avoidance of such areas, vessels must slow to 4 knots while transiting through such areas.

5.2.8 Vessels operating in water depths with less than four feet of clearance between the vessel and the bottom should maintain speeds no greater than 4 kts to minimize risk of vessel strikes on sturgeon and sawfish.

BMP 5.3 The Lessee must ensure a PSO or crew lookout is posted during all times to avoid interactions with ESA-listed species when a vessel is underway (transiting or surveying) by monitoring in all direction.

5.3.1 Visual observers monitoring the vessel separation distances from ESA-listed species can be either PSOs or crew members (if PSOs are not required). If the trained lookout is a vessel crew member, this must be their designated role and primary responsibility while the vessel is transiting. Any designated crew lookouts must receive training on protected species identification, vessel strike minimization procedures, how and when to communicate with the vessel captain, and reporting requirements. All observations must be recorded per reporting requirements in 8.

5.3.2 Regardless of monitoring duties, all crew members responsible for navigation duties must receive site-specific training on ESA-listed species sighting/reporting and vessel strike avoidance measures.

5.3.3 Vessels underway must not divert their course to approach any ESA-listed species and marine mammals.

BMP 5.4 Regardless of vessel size, vessel operators must reduce vessel speed to 10 knots (18.5 mph) or less while operating in any Seasonal Management Area (SMA) and Dynamic Management Area (DMA) or Slow Zone triggered by visual detections of North Atlantic right whales. An exception to this requirement is for vessels operating in areas within a portions of a visually designated DMA or Slow Zone where it is not reasonable to expect the presence of North Atlantic right whales (e.g., Long Island Sound, shallow harbors).

BMP 5.5 BOEM encourages increased vigilance through the required best management practices to minimize vessel interactions with protected species, by reducing speeds to 10 knots or less when operating within an acoustically triggered slow zone, and when feasible, avoid Slow Zones.

BMP 5.6 The Lessee must ensure all vessel operators check for information regarding mandatory or voluntary ship strike avoidance (SMAs and DMAs (or Slow Zones that are also designated as DMAs) and daily information regarding North Atlantic right whale sighting locations. These media may include, but are not limited to: NOAA weather radio, U.S. Coast Guard NAVTEX and channel 16 broadcasts, Notices to Mariners, the Whale Alert app, or WhaleMap website.

5.6.1 North Atlantic right whale Sighting Advisory System info can be accessed at: https://apps-nefsc.fisheries.noaa.gov/psb/surveys/MapperiframeWithText.html

5.6.2 Information about active SMAs, DMAs, and Slow Zones can be accessed at: https://www.fisheries.noaa.gov/national/endangered-species-conservation/reducing-vessel-strikes-north-atlantic-right-whales

PDC 6: Minimize Risk During Buoy Deployment, Operations, and Retrieval

The Lessee must ensure any mooring systems used during survey activities must be designed to prevent potential entanglement or entrainment of listed species, and in the unlikely event that entanglement does occur, ensure proper reporting of entanglement events according to the measures specified below.

BMP 6.1 The Lessee must ensure that any buoys attached to the seafloor use the best available mooring systems. Buoys, lines (chains, cables, or coated rope systems), swivels, shackles, and anchor designs must prevent any potential entanglement of listed species while ensuring the safety and integrity of the structure or device.

BMP 6.2 All mooring lines and ancillary attachment lines must use one or more of the following measures to reduce entanglement risk: shortest practicable line length, rubber sleeves, weak-links, chains, cables, or similar equipment types that prevent lines from looping, wrapping, or entrapping protected species.

BMP 6.3 Any equipment must be attached by a line within a rubber sleeve for rigidity. The length of the line must be as short as necessary to meet its intended purpose.

BMP 6.4 During all buoy deployment and retrieval operations, buoys should be lowered and raised slowly to minimize risk to listed species and benthic habitat. Additionally, PSOs or trained project personnel (if PSOs are not required) should monitor for listed species in the area prior to and during deployment and retrieval and work should be stopped if listed species are observed within 500 meters of the vessel to minimize entanglement risk.

BMP 6.5 If a live or dead marine protected species becomes entangled, operators must immediately contact the applicable stranding network coordinator using the reporting contact details (see Reporting Requirements section) and provide any on-water assistance requested.

BMP 6.6 All buoys must be properly labeled with owner and contact information.

PDC 7: Protected Species Observers

The Lessee must use qualified third-party PSOs to observe Clearance and Shutdown Zones for boomer, sparker, or bubble gun categories of acoustic sources with the exception of parametric subbottom profilers or ultra short baseline equipment.

BMP 7.1 All PSOs must have completed a BOEM-approved PSO training program and have received NMFS approval to act as a PSO for geophysical surveys. The Lessee must provide to BOEM upon request, documentation of NMFS approval as PSOs for geophysical activities in the Atlantic and copies of the most recent training certificates of individual PSOs' successful completion of a commercial PSO training course with an overall examination score of 80% or greater. Instructions and application requirements to become a NMFS- approved PSO can be found at: https://www.fisheries.noaa.gov/national/endangered-species-conservation/protected-species-observers.

BMP 7.2 Crew members serving as lookouts when PSOs are not required must receive training on protected species identification, vessel strike minimization procedures, how and when to communicate with the vessel captain, and reporting requirements.

BMP 7.3 PSOs deployed for geophysical survey activities must be employed by a third-party observer provider. While the vessel is underway, they must have no other tasks than to conduct observational effort, record data, and communicate with and instruct relevant vessel crew to the presence of listed species and associated mitigation requirements. PSOs on duty must be clearly listed on daily data logs for each shift.

7.3.1 Non-third-party observers may be approved by NMFS on a case-by-case basis for limited, specific duties in support of approved, third-party PSOs.

BMP 7.4 A minimum of one PSO (assuming PDC 5 is met) must be observing for listed species at all times that boomer, sparker, or bubble gun equipment is operating, or a minimum of one PSO or one Trained Lookout when the survey vessel is actively transiting during daylight hours (30 minutes prior to civil sunrise and through 30 minutes following civil sunset). The Lessee must include a PSO schedule showing that the number of PSOs used is sufficient to effectively monitor the affected area for the project (e.g., surveys) and record the required data. PSOs must not be on watch for more than 4 consecutive hours, with at least a 1-hour break after a 4-hour watch. PSOs must not work for more than 12 hours in any 24-hour period.

BMP 7.5 Visual monitoring must occur from the most appropriate vantage point on the associated operational platform that allows for 360-degree visual coverage around the vessel. If 360-degree visual coverage is not possible from a single vantage point, multiple PSOs must be on watch to ensure such coverage.

BMP 7.6 The Lessee must ensure that suitable equipment is available to each PSO to adequately observe the full extent of the Monitoring and Shutdown Zones during all vessel operations and meet all reporting requirements. The following equipment must be available:

7.6.1 Visual observations must be conducted using binoculars and the naked eye while free from distractions and in a consistent, systematic, and diligent manner.

7.6.2 Rangefinders (at least one per PSO, plus backups) or reticle binoculars (e.g., 7 x 50) of appropriate quality (at least one per PSO, plus backups) to estimate distances to listed species located in proximity to the vessel and Monitoring and Shutdown Zone(s).

7.6.3 Digital cameras with a telephoto lens that is at least 300 mm or equivalent on a full-frame single lens reflex (SLR). The camera or lens should also have an image stabilization system. Cameras should be used to record sightings and verify species identification whenever possible.

7.6.4 An laptop or tablet to collect and record data electronically.

7.6.5 Global Positioning Units (GPS) if data collection/reporting software does not have built-in positioning functionality.

7.6.6 PSO data must be collected in accordance with standard data reporting, software tools, and electronic data submission standards approved by BOEM for the particular activity.

7.6.7 Any other tools deemed necessary to adequately perform PSO tasks.

PDC 8: Reporting Requirements. The Lessee must ensure that monthly reporting of survey activities is submitted to BOEM (at renewable_reporting@boem.gov) by the PSO provider on the 15th of each month for each vessel conducting survey work. Any editing, review, and quality assurance checks must be completed only by the PSO provider prior to submission to BOEM. The PSOs may record data electronically, but the data fields listed below must be recorded and exported to an Excel file. Alternatively, BOEM has developed an Excel spreadsheet with all the necessary data fields that is available upon request. The Lessee must submit final monthly reports to BOEM in coordination with PSO Providers within 90 calendar days following completion of a survey. Final monthly reports must contain vessel departure and return ports, PSO names and training certifications, the PSO provider contact information, dates of the survey, a vessel track, a summary of all PSO documented sightings of protected species, survey equipment shutdowns that occurred, any vessel strike-avoidance measures taken, takes of protected species that occurred, and any observed injured or dead protected species. PSOs must be approved by NMFS prior to the start of a survey, and the Lessee must submit documentation of NMFS' approval upon request to BOEM (at renewable_reporting@boem.gov). Application requirements to become a NMFS-approved PSO for geological and geophysical surveys can be obtained by sending an inquiry to nmfs.psoreview@noaa.gov. DOI will work with the Lessee to ensure that DOI does not release confidential business information found in the monitoring reports.

BMP 8.1 Instructions for HRG Survey Reports. The following data fields for PSO reports of geological and geophysical surveys must be reported in Excel format (.xml file):

Survey Information:

- Project name
- Lease number
- State Coastal Zones
- Survey Contractor
- Survey Type
- Reporting start and end dates
- Visual monitoring equipment used;
- Distance finding method used
- PSO names (last, first), training certification, and affiliation
- PSO location and observation height above sea surface

Operations Information:

- Vessel name(s)
- Sound sources including equipment type, power levels, and frequencies used
- Greatest RMS source level

- Dates of departures and returns to port with port name;

Monitoring Effort Information:

- Date (YYYY-MM-DD)
- Source status at time of observation (on/off)
- Number of PSOs on duty
- Start time of observations for each shift in UTC (HH:MM)
- End time of observations for each shift in UTC (HH:MM)
- Duration of visual observations of protected species
- Wind speed (knots), from direction
- Swell (meters)
- Water depth (meters)
- Visibility (km)
- Glare severity
- Block name and number
- Location: Latitude and Longitude
- Time pre-clearance visual monitoring began in UTC (HH:MM)
- Time pre-clearance monitoring ended in UTC (HH:MM)
- Duration of pre-clearance visual monitoring
- Time of day of pre clearance (day/night)
- Time power-up/ramp-up began
- Time equipment full power was reached
- Duration of power-up/ramp-up (if conducted)
- Time survey activity began (equipment on)
- Time survey activity ended (equipment off)
- Survey Duration
- Did a shutdown/power-down occur?
    - Time shutdown was called for (UTC)
    - Time equipment was shut down (UTC)
- Vessel location (latitude/longitude, decimal degrees) when survey effort begins and ends; vessel location at beginning and end of visual PSO duty shifts; recorded at :30 intervals if obtainable from data collection software
- Habitat or prey observations
- Marine debris sighted

Detection Information (in addition to the Survey, Operation, and Monitoring fields)

- Date (YYYY-MM-DD)
- Sighting ID (multiple sightings of the same animal or group should use the same ID)
- Time at first detection in UTC (YY-MMDDT HH:MM)
- Time at last detection in UTC (YY-MM-DDT HH:MM)
- PSO name(s) (Last, First) on duty
- Effort (ON=Hammer On; OFF=Hammer Off)
- Start time of observations

- End time of observations
- Compass heading of vessel (degrees)
- Beaufort scale
- Precipitation
- Cloud coverage (%)
- Sightings including common name and scientific name
- Certainty of identification
- Number of adults
- Number of juveniles
- Total number of animals or estimated group size
- Bearing to animal(s) when first detected (ship heading + clock face)
- Distance determination method
- Distance from vessel (e.g., reticle distance in meters)
- Description of unidentified animals (include features such as overall size; shape of head; color and pattern; size, shape, and position of dorsal fin; height, direction, and shape of blow, etc.)
- Detection narrative (note behavior, especially changes in relation to survey activity and distance from source vessel)
- Direction of travel/first approach (relative to vessel)
- Behaviors observed: indicate behaviors and behavioral changes observed in sequential order (use behavioral codes)
- If any bow-riding behavior observed, record total duration during detection (HH:MM)
- Initial heading of animal(s) (degrees)
- Final heading of animal(s) (degrees)
- Shutdown zone size during detection (meters)
- Was the animal inside the shutdown zone? (Y/N)
- Closest distance to vessel (reticle distance in meters)
- Time at closest approach (UTC HH:MM)
- Time animal entered shutdown zone (UTC HH:MM)
- Time animal left shutdown zone (UTC HH:MM)
- If observed/detected during ramp-up/power-up: first distance (reticle distance in meters), closest distance (reticle distance in meters), last distance (reticle distance in meters), behavior at final detection
- Did a shutdown/power-down occur? (Y/N)
- Time shutdown was called for (UTC)
- Time equipment was shut down (UTC)
- Detections with PAM

BMP 8.2 The Lessee must submit a final monitoring report to BOEM (renewable_reporting@boem.gov) and NMFS (nmfs.gar.incidental-take@noaa.gov) within 90 days after completion of yearly survey activities. The report must fully document the methods and monitoring protocols, summarize the data recorded during monitoring, estimate the number of listed species that may have been taken during survey activities, describe, assess and compare the effectiveness of mitigation and monitoring measures. Any photos or videos taken by PSOs must be included in the report. Factors that may be contributing to impaired observations during active surveys, such as environmental conditions or equipment malfunctions, must be described. PSO raw sightings and trackline data must also be provided with the final monitoring report.

BMP 8.3 Reporting sightings of North Atlantic right whales:

8.4.1 If a North Atlantic right whale is observed at any time by a PSO or project personnel during surveys or vessel transit, the Lessee or PSO must report sighting within two hours of occurrence when practicable and no later than 24 hours after occurrence. In the event of a sighting of a right whale that is dead, injured, or entangled, efforts must be made to make such reports as quickly as possible to the appropriate regional NOAA stranding hotline (from Maine-Virginia report sightings to 866-755-6622, and from North Carolina-Florida to 877-942-5343). Right whale sightings in any location may also be reported to the U.S. Coast Guard via channel 16 and through the WhaleAlert App (http://www.whalealert.org/).

8.4.2 Further information on reporting a right whale sighting can be found at: https://apps-nefsc.fisheries.noaa.gov/psb/surveys/documents/20120919_Report_a_Right_Whale.pdf

BMP 8.4 In the event of a vessel strike of a protected species by any survey vessel, the Lessee must immediately report the incident to BOEM (renewable_reporting@boem.gov) and NMFS (nmfs.gar.incidental-take@noaa.gov) and the NOAA stranding hotline: From Maine-Virginia, report sightings to 866-755-6622, and from North Carolina-Florida to 877-942-5343. The report must include the following information:

- Name, telephone, and email or the person providing the report;
- The vessel name;
- The Lease Number;
- Time, date, and location (latitude/longitude) of the incident;
- Species identification (if known) or description of the animal(s) involved;
- Vessel's speed during and leading up to the incident;
- Vessel's course/heading and what operations were being conducted (if applicable); Status of all sound sources in use;
- Description of avoidance measures/requirements that were in place at the time of the strike and what additional measures were taken, if any, to avoid strike;
- Environmental conditions (wave height, wind speed, light, cloud cover, weather, water depth);
- Estimated size and length of animal that was struck;
- Description of the behavior of the species immediately preceding and following the strike;
- If available, description of the presence and behavior of any other protected species immediately preceding the strike;
- Disposition of the animal (e.g., dead, injured but alive, injured and moving, blood or tissue observed in the water, last sighted direction of travel, status unknown, disappeared); and

- To the extent practicable, photographs or video footage of the animal(s).

BMP 8.5 Detected or Impacted Protected Species Reporting. The Lessee is responsible for reporting dead or injured protected species, regardless of whether they were observed during operations or due to Lessee activities. The Lessee must report any potential take, strikes, or dead/injured protected species caused by Project vessels to the NMFS Protected Resources Division (nmfs.gar.incidental-take@noaa.gov), NOAA Fisheries 24-hour Stranding Hotline number (866-755-6622), BOEM (at renewable_reporting@boem.gov), and BSEE (at protectedspecies@bsee.gov) as soon as practicable, but no later than 24 hours from the time the incident took place (Detected or Impacted Protected Species Report). In the event that an injured or dead marine mammal or sea turtle is sighted, regardless of the cause, the Lessee must report the incident to the NMFS Protected Resources Division (nmfs.gar.incidental-take@noaa.gov), NMFS 24-hour Stranding Hotline number (866-755-6622), BOEM (at renewable_reporting@boem.gov), and BSEE (at protectedspecies@bsee.gov)) as soon as practicable (taking into account crew and vessel safety), but no later than 24 hours from the sighting (Protected Species Incident Report). Staff responding to the hotline call will provide any instructions for the handling or disposing of any injured or dead protected species by individuals authorized to collect, possess, and transport sea turtles.

8.5.1 The Protected Species Incident Report must include the following information:

- Time, date, and location (latitude/longitude) of the first discovery (and updated location information if known and applicable);
- Species identification (if known) or description of the animal(s) involved;
- Condition of the animal(s) (including carcass condition if the animal is dead);
- Observed behaviors of the animal(s), if alive;
- If available, photographs or video footage of the animal(s); and
- General circumstances under which the animal was discovered.

June 29, 2021

James F. Bennett
Program Manager, Office of Renewable Energy Programs
U.S. Department of the Interior
Bureau of Ocean Energy Management
45600 Woodland Road, VAM-OREP
Sterling, Virginia 20166

Dear Mr. Bennett:

We have completed consultation pursuant to section 7 of the Endangered Species Act (ESA) of 1973, as amended, concerning the effects of certain site assessment and site characterization activities to be carried out to support the siting of offshore wind energy development projects off the U.S. Atlantic coast. The Bureau of Ocean Energy Management (BOEM) is the lead federal agency for this consultation. BOEM's request for consultation included a biological assessment (BA) that was finalized in February 2021 and was supplemented with modified Project Design Criteria (PDC) and supplemental information through June 11, 2021. The activities considered in this consultation may occur in the three Atlantic Renewable Energy Regions (North Atlantic Planning Area, Mid-Atlantic Planning Area, and South Atlantic Planning Area; see Figure 1 in Appendix A) and adjacent coastal waters over the next 10 years (i.e., June 2021 – June 2031). Other action agencies include the U.S. Army Corps of Engineers (USACE), the U.S. Department of Energy (DOE), the U.S. Environmental Protection Agency (EPA), and the National Marine Fisheries Service's (NMFS) Office of Protected Resources (OPR).

ACTION AREA AND PROPOSED ACTIONS

As defined in 50 CFR 402.02, "programmatic consultation is a consultation addressing an agency's multiple actions on a program, region, or other basis. Programmatic consultations allow NMFS to consult on the effects of programmatic actions such as: (1) Multiple similar, frequently occurring, or routine actions expected to be implemented in particular geographic areas; and, (2) A proposed program, plan, policy, or regulation providing a framework for future proposed actions." This programmatic consultation considers category 1--multiple similar, frequently occurring, or routine actions expected to be implemented in particular geographic areas.

The survey activities considered in this consultation are geophysical and geotechnical surveys and the deployment, operation, and retrieval of environmental data collection buoys. These frequent, similar activities are expected to be implemented along the U.S. Atlantic coast in the three Atlantic Renewable Energy Regions (North Atlantic Planning Area, Mid-Atlantic Planning Area, and South Atlantic Planning Area). The meteorological buoys and geophysical and geotechnical surveys are expected to occur to support the potential future siting of offshore wind turbines, cables, and associated offshore facilities such as substations or service platforms.

Action Agencies

As noted above, the activities considered here may be authorized, funded, or carried out by BOEM, the DOE, the EPA, the USACE, and NMFS. The roles of these action agencies are described here.

BOEM

The Outer Continental Shelf Lands Act (OCSLA), as amended, mandates the Secretary of the Interior (Secretary), through BOEM, to manage the siting and development of the Outer Continental Shelf (OCS) for renewable energy facilities. BOEM is delegated the responsibility for overseeing offshore renewable energy development in Federal waters (30 C.F.R. Part 585). Through these regulations, BOEM oversees responsible offshore renewable energy development, including the issuance of leases for offshore wind development. This consultation considers the effects of certain data collection activities (geophysical and geotechnical surveys and deployment of meteorological buoys) that may be undertaken to support offshore wind development. BOEM regulations require that a lessee provide the results of shallow hazard, geological, geotechnical, biological, and archaeological surveys with its Site Assessment Plan and Construction and Operations Plan (see 30 C.F.R. 585.610(b) and 30 C.F.R. 585.626(a)). BOEM also funds data collection projects, such as seafloor mapping through the Environmental Studies Program (ESP). The activities considered here may or may not occur in association with a BOEM lease. This consultation does not obviate the need for an appropriate consultation to occur on lease issuance or the approval of a Site Assessment Plan or Construction and Operations Plan.

DOE

The DOE's Office of Energy Efficiency and Renewable Energy (EERE) provides federal funding (financial assistance) in support of renewable energy technologies. EERE's Wind Energy Technologies Office invests in energy science research and development activities that enable the innovations needed to advance U.S. wind systems, reduce the cost of electricity, and accelerate the deployment of wind power, including offshore wind. EERE's Water Power Technologies Office enables research, development, and testing of emerging technologies to advance marine energy. DOE's financial assistance in support of renewable energy projects could have consequences for listed species in federal or state waters. Data collection activities that may be supported by DOE and are considered in this programmatic consultation include deployment of meteorological buoys and geotechnical and geophysical surveys.

EPA

Section 328(a) of the Clean Air Act (CAA) (42 U.S.C. § 7401 *et seq.*) as amended by Public Law 101-549 enacted on November 15, 1990, required the EPA to establish air pollution control requirements for OCS sources subject to the OCSLA for all areas of the OCS, except those located in the Gulf of Mexico west of 87.5 degrees longitude (near the border of Florida and Alabama),[1] in order to attain and maintain Federal and State ambient air quality standards and comply with the provisions of part C of title I of the Act.[2] To comply with this statutory mandate, on September 4, 1992, EPA promulgated "Outer Continental Shelf Air Regulations" at 40 C.F.R. part 55. (57 Fed. Reg. 40,791). 40 C.F.R part 55 also established procedures for

[1] Public Law 112-74, enacted on December 23, 2011, amended § 328(a) to add an additional exception from EPA regulation for OCS sources "located offshore of the North Slope Borough of the State of Alaska."
[2] Part C of title I contains the Prevention of Significant Deterioration of Air Quality (PSD) requirements.

implementation and enforcement of air pollution control requirements for OCS sources. 40 C.F.R. § 55.2 states:

> OCS source means any equipment, activity, or facility, which:
> (1) Emits or has the potential to emit any air pollutant;
> (2) Is regulated or authorized under OCSLA (43 U.S.C. § 1331 *et seq.*); and,
> (3) Is located on the OCS or in or on waters above the OCS.
> This definition shall include vessels only when they are:
> (1) Permanently or temporarily attached to the seabed and erected thereon and used for the purpose of exploring, developing, or producing resources therefrom …; or
> (2) Physically attached to an OCS facility, in which case only the stationary sources aspects of the vessels will be regulated.

As described in the BA, where activities considered in this consultation emit or will have the potential to emit air pollutants and are located on the OCS or in or on waters above the OCS, the activities may be subject to the 40 C.F.R. part 55 requirements, including the 40 C.F.R. § 55.6 permitting requirements. Such activities are expected to be limited to vessel operations and some meteorological buoys.

USACE

Of the activities considered in this consultation, the deployment of meteorological buoys and carrying out geotechnical surveys may require authorization from the USACE. The USACE has regulatory responsibilities under Section 10 of the Rivers and Harbors Act of 1899 to approve/permit any structures or activities conducted below the mean high water line of navigable waters of the United States. The USACE also has responsibilities under Section 404 of the Clean Water Act (CWA) to prevent water pollution, obtain water discharge permits and water quality certifications, develop risk management plans, and maintain such records. A USACE Nationwide Permit (NWP) 5 or Regional General Permit (RGP) for Scientific Measurement Devices is required for devices and scientific equipment whose purpose is to record scientific data through such means as meteorological stations (which would include buoys); water recording and biological observation devices, water quality testing and improvement devices, and similar structures. In New England States, RGPs are required instead of the NWP. As stated in both types of permit, "*upon completion of the use of the device to measure and record scientific data, the measuring device and any other structures or fills associated with that device (e.g., foundations, anchors, buoys, lines, etc.) must be removed to the maximum extent practicable and the site restored to preconstruction elevations,*" as prescribed by Section 404 of the CWA (U. S. Army Corps of Engineers 2012).

Consideration of Potential Issuance of Incidental Harassment Authorizations for Survey Activities

The Marine Mammal Protection Act (MMPA), and its implementing regulations, allows, upon request, the incidental take of small numbers of marine mammals by U.S. citizens who engage in a specified activity (other than commercial fishing) within a specified geographic region. Incidental take is an unintentional, but not unexpected, "take." Upon receipt and review of an adequate and complete application, NMFS OPR may authorize the incidental take of marine mammals incidental to the marine site characterization surveys pursuant to the MMPA, if the required findings are made. Proponents of some survey activities considered here may be required to obtain Incidental Take Authorizations (ITAs) under the MMPA. Therefore, the Federal actions considered in this consultation include the issuance of ITAs for survey activities described herein. Those ITAs may or may not provide MMPA take authorization for marine mammal species that are also listed under the ESA. As noted above, we have determined that all activities considered (inclusive of all PDC and BMPs) in this consultation will have no effect or are not likely to adversely affect any species listed under the ESA. By definition, that means that no take, as defined in the ESA, is anticipated. However, given the differences in the definitions of "harassment" under the MMPA and ESA, it is possible the site characterization surveys could result in harassment, as defined under the MMPA, but meet the ESA definition of "not likely to adversely affect." This consultation addresses such situations.

Under the MMPA (16 U.S.C. §1361 et seq.), take is defined as "to harass, hunt, capture, or kill, or attempt to harass, hunt, capture, or kill any marine mammal" and further defined by regulation (50 C.F.R. §216.3). Harassment is defined under the MMPA as any act of pursuit, torment, or annoyance which: has the potential to injure a marine mammal or marine mammal stock in the wild (Level A Harassment); or has the potential to disturb a marine mammal or marine mammal stock in the wild by causing disruption of behavioral patterns, including, but not limited to, migration, breathing, nursing, breeding, feeding, or sheltering (Level B Harassment). As defined in the MMPA, Level B harassment does not include an act that has the potential to injure a marine mammal or marine mammal stock in the wild.

Under the ESA, take is defined as "to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture or collect, or to attempt to engage in any such conduct." Harm is defined by regulation (50 C.F.R. §222.102) as "an act which actually kills or injures fish or wildlife. Such an act may include significant habitat modification or degradation which actually kills or injures fish or wildlife by significantly impairing essential behavioral patterns, including, breeding, spawning, rearing, migrating, feeding, or sheltering." NMFS does not have a regulatory definition of "harass." However, on December 21, 2016, NMFS issued interim guidance[3] on the term "harass," under the ESA, defining it as to "create the likelihood of injury to wildlife by annoying it to such an extent as to significantly disrupt normal behavior patterns which include, but are not limited to, breeding, feeding, or sheltering." The NMFS interim ESA definition of "harass" is not equivalent to MMPA Level B harassment. Due to the differences in the definition of "harass" under the MMPA and ESA, there may be activities that result in effects to a marine mammal that would meet the threshold for harassment under both the MMPA and the ESA, while other activities may result in effects that would meet the threshold for harassment under the MMPA but not under the ESA. This issue is addressed further in the Marine Mammals section of this letter.

For this consultation, we considered NMFS' interim guidance on the term "harass" under the ESA when evaluating whether the proposed activities are likely to harass ESA-listed species, and we considered the available scientific evidence to determine the likely nature of the behavioral responses and their potential fitness consequences. As explained below, we determined that the effects to ESA-listed marine mammals resulting from the survey activities considered here would be insignificant and not result in harassment per NMFS' interim guidance on harassment under the ESA.

[3] NMFS Policy Directive 02-110-19; available at *https://media.fisheries.noaa.gov/dam-migration/02-110-19.pdf*; last accessed March 25, 2021.

Activities Considered in this Programmatic Consultation

The survey activities that are considered here consist of high resolution geophysical (HRG) and geotechnical surveys designed to characterize benthic and subsurface conditions and deployment, operation, and retrieval of environmental data collection buoys. A complete description of representative survey equipment to be used is included in Appendix A (Tables A.1 and A.2). Additionally, this consultation considers effects of deploying, operating, and retrieving buoys equipped with scientific instrumentation to collect oceanographic, meteorological, and biological data. All activities considered here will comply with a set of PDC (see Appendix B). We also consider the effects of vessel traffic associated with these activities. All vessels carrying out these activities, including during transits, will comply with measures outlined in Appendix B regardless of the equipment used or the sound levels/frequency at which equipment is operating. This consultation does not consider the effects of any survey activities that have the potential to result in directed or incidental capture or collection of any ESA-listed species (e.g., trawl surveys in areas where ESA-listed sea turtles occur).

This consultation does not evaluate the construction of any commercial electricity generating facilities or transmission cables with the potential to export electricity. Consistent with our understanding of the relevant regulations, BOEM has indicated that any such proposals for installation of electricity generating facilities (i.e., installation of wind turbines) or transmission cables would be a separate federal action (including authorization from BOEM) requiring a separate section 7 consultation. "Effects of the action are all consequences to listed species or critical habitat that are caused by the proposed action, including the consequences of other activities that are caused by the proposed action. A consequence is caused by the proposed action if it would not occur but for the proposed action and it is reasonably certain to occur. Effects of the action may occur later in time and may include consequences occurring outside the immediate area involved in the action" (50 CFR §402.02; see also 50 CFR §402.17). The construction, operation, and/or decommissioning of any offshore wind facility or appurtenant facilities (e.g., cables, substations, etc.) are not consequences of the proposed survey activities considered here as they are not reasonably certain to occur. As such, this consultation does not consider these activities.

Action Area

The action area is defined by regulation as "all areas to be affected directly or indirectly by the Federal action and not merely the immediate area involved in the action" (50 CFR 402.02). The Action Area for this consultation includes the areas to be surveyed and where buoys will be deployed, areas where increased levels of noise will be experienced as well as the vessel transit routes between existing Atlantic coast ports and the survey area. This area encompasses all effects of the proposed action considered here.

Surveys considered in this programmatic consultation will take place at depths 100-meters (m) or less within the three Atlantic Renewable Energy Regions (North Atlantic Planning Area, Mid-Atlantic Planning Area, and South Atlantic Planning Area) located on the Atlantic Outer Continental Shelf (OCS) and may also occur along potential cable corridor routes in nearshore waters of Atlantic coast states. The three planning areas extend from the US/Canada border in the north to Palm Bay, Florida in the south. The North, Mid-Atlantic, and South Atlantic planning areas together extend seaward from the U.S./Canadian border in the North to Palm Bay, Florida in the South. For the purposes of this consultation, the action area includes the Atlantic Renewable Energy Regions in OCS waters out to the 100 m depth contour in the North Atlantic, extending from waters offshore Maine to New Jersey; Mid-Atlantic, extending from waters offshore Delaware to North Carolina; and the South Atlantic extending from waters offshore South Carolina to east-central Florida and the adjacent coastal waters to the Atlantic coast (see Figure 1 in Appendix A for map of the action area). The offshore extent of the action area is defined by the anticipated maximum water depth where potential offshore wind facilities could be constructed. The seaward limit for siting a wind energy facility on the OCS is approximately 25 nautical miles (nm) (46.3 kilometers [km]) from shore or 100 m (328 feet [ft.]) water depth due to economic viability limitations. The current fixed foundation technologies are limited to depths of about 60 m. Although the majority of site assessment and site characterization activities will occur in water <60 m to accommodate the depth limitations in support of fixed foundations for wind turbine generators, floating foundations may be used in water depths >60 m in the future.

IMPLEMENTATION, TRACKING, AND REPORTING FOR THIS PROGRAMMATIC CONSULTATION

As noted above, activities considered in this consultation may be authorized, funded, or carried out by one or more action agencies. When one of these action agencies identifies a proposed activity that they believe falls within the scope of this programmatic consultation, they will first identify a lead action agency for the review (we anticipate that in most cases this will be BOEM). They will then review the activity to confirm that it is consistent with the activities covered by this consultation, including a review to confirm that all relevant PDCs (as outlined in Appendix B) will be implemented. The lead action agency for the activity will send written correspondence to the NMFS Greater Atlantic Regional Fisheries Office (GARFO) (nmfs.gar.esa.section7@noaa.gov) providing a brief summary of the proposed activity, including location and duration, and the agency's determination that the proposed activity is consistent with the scope of activities considered in this consultation. The action agency will also confirm in writing that all relevant PDCs will be implemented. If NMFS GARFO has any questions about the activity or determines it is not within the scope of this consultation, a written reply will be provided to the action agency within 15 calendar days. Activities that are determined to not be within the scope of this consultation can be modified by the action agency to bring them within the scope of this consultation or the action agency can request a stand-alone ESA section 7 consultation outside of this programmatic consultation.

To provide flexibility while maintaining the intent of this programmatic consultation, if an action agency proposes use of an equipment type different than described in this consultation, but can demonstrate that the acoustic characteristics are similar to the representative equipment described in Table A.2 and that implementation of the PDCs will result in the same effects considered here, this can be described when the survey plan is transmitted to us. Similarly, it is possible to consider modifications to the PDCs for a particular survey plan when the lead action agency can demonstrate that the same conservation benefit or risk reduction can be achieved with an alternate proposal.

In order to track activities carried out under this programmatic consultation, by February 15 of each year, BOEM, as the lead agency for this programmatic consultation, will provide a written report to NMFS documenting the activities that occurred under the scope of this consultation in the previous year (e.g., the report for 2021 activities will be due by February 15, 2022). This annual report will also transmit any monitoring reports and any reports of instances where PDCs were not implemented (e.g., where human safety prevented implementation of an otherwise required speed reduction). Following the receipt of the annual report, a meeting will be held if necessary to review and update any PDCs and to update the list of representative equipment.

ESA-LISTED SPECIES AND CRITICAL HABITAT CONSIDERED IN THIS CONSULTATION

In their BA, BOEM described the ESA-listed species and critical habitats that occur along the U.S. Atlantic coast. Of the species listed in the BA, we have determined that oceanic whitetip shark (*Carcharhinus longimanus*), Nassau grouper (*Epinephelus striatus*)[4], staghorn coral (*Acropora cervicornis*), elkhorn coral (*Acropora palmata*), pillar coral (*Dendrogyra cylindrus*), rough cactus coral (*Mycetophyllia ferox*), lobed star coral (*Orbicella annularis*), mountainous star coral (*Orbicella faveolata*), and boulder star coral (*Orbicella franksi*) do not occur in the action area.

ESA-Listed Species in the Action Area

The following listed species occur in the action area and are considered in this consultation:

Table 1. ESA-listed species that may be affected by the proposed action.

Common Name	Scientific Name	ESA Status
Marine Mammals – Cetaceans		
North Atlantic right whale	*Eubalaena glacialis*	Endangered
Fin Whale	*Balaenoptera physalus*	Endangered
Sei Whale	*Balaenoptera borealis*	Endangered
Sperm Whale	*Physeter macrocephalus*	Endangered
Blue whale	*Balaenoptera musculus*	Endangered
Sea Turtles		
Loggerhead turtle - Northwest Atlantic DPS	*Caretta*	Threatened
Green turtle - North Atlantic DPS and South Atlantic DPS	*Chelonia mydas*	Threatened
Kemp’s ridley turtle	*Lepidochelys kempii*	Endangered

[4] Nassau grouper may occur in nearshore and offshore waters in the Florida Straits Planning Area but are not known to occur in nearshore or offshore waters of the South Atlantic Planning Area (NMFS 2013)

Leatherback turtle	*Dermochelys coriacea*	Endangered
Hawksbill turtle	*Eretmochelys imbricata*	Endangered
Fishes		
Atlantic salmon	*Salmo salar*	Endangered
Atlantic sturgeon	*Acipenser oxyrinchus*	Endangered
New York Bight DPS		Endangered
Chesapeake Bay DPS		Endangered
Carolina DPS		Endangered
South Atlantic DPS		Endangered
Gulf of Maine DPS		Threatened
Giant Manta Ray	*Manta birostris*	Threatened
Shortnose sturgeon	*Acipenser brevirostrum*	Endangered
Smalltooth sawfish	*Pristis pectinate*	Endangered

BOEM has determined the proposed action is not likely to adversely affect any of these species. We concur with this determination based on the rationale presented below. More information on the status of the species and critical habitat considered in this consultation, as well as relevant listing documents, status reviews, and recovery plans, can be found within the BA and on NMFS webpages accessible at: *https://www.greateratlantic.fisheries.noaa.gov/protected/section7/listing/index.html*, *https://sero.nmfs.noaa.gov/protected_resources/section_7/threatened_endangered/index.html*, and *https://www.fisheries.noaa.gov/species-directory*.

Critical Habitat in the Action Area

The action area overlaps, at least in part, with critical habitat designated for all five DPSs of Atlantic sturgeon, North Atlantic right whales, and the Northwest Atlantic Ocean DPS of loggerhead sea turtles. While critical habitat is designated for some of the other species considered in this consultation, that critical habitat does not occur in the action area. Critical habitat for the Gulf of Maine DPS of Atlantic salmon is limited to certain mainstem rivers in the State of Maine. At this time, we do not know of any geotechnical or geophysical survey activities that are likely to occur in those waters. As such, the proposed action will not overlap with critical habitat designated for the Gulf of Maine DPS of Atlantic salmon. BOEM determined that the activities considered here may affect, but are not likely to adversely affect critical habitat designated for the five DPSs of Atlantic sturgeon or the Northwest Atlantic DPS of loggerhead sea turtles. We concur with these determinations based on the rationale presented in the Effects of the Action section below.

BOEM determined that the activities considered here would have no effect on critical habitat designated for North Atlantic right whales. We agree with this determination as described briefly below.

Critical Habitat designated for the North Atlantic Right Whale

On January 27, 2016, NMFS issued a final rule designating critical habitat for North Atlantic right whales (81 FR 4837). Critical habitat includes two areas (Units) located in the Gulf of Maine and Georges Bank Region (Unit 1) and off the coast of North Carolina, South Carolina, Georgia and Florida (Unit 2). Geophysical and geotechnical surveys and met buoy deployment may occur in Unit 1 and Unit 2. Note that there are seasonal restrictions on certain acoustic survey equipment in Unit 1 and Unit 2 (PDC 4); however, these seasonal restrictions are in place to further reduce the potential for effects to right whales in these areas and are not related to effects on the features of that critical habitat.

Consideration of Potential Effects to Unit 1

As identified in the final rule (81 FR 4837), the physical and biological features essential to the conservation of the North Atlantic right whale that provide foraging area functions in Unit 1 are: The physical oceanographic conditions and structures of the Gulf of Maine and Georges Bank region that combine to distribute and aggregate *C. finmarchicus* for right whale foraging, namely prevailing currents and circulation patterns, bathymetric features (basins, banks, and channels), oceanic fronts, density gradients, and temperature regimes; low flow velocities in Jordan, Wilkinson, and Georges Basins that allow diapausing *C. finmarchicus* to aggregate passively below the convective layer so that the copepods are retained in the basins; late stage *C. finmarchicus* in dense aggregations in the Gulf of Maine and Georges Bank region; and diapausing *C. finmarchicus* in aggregations in the Gulf of Maine and Georges Bank region.

The activities considered here will not affect the physical oceanographic conditions and structures of the region that distribute and aggregate *C. finmarchicus* for foraging. This is because the activities considered here have no potential to affect currents and circulation patterns, flow velocities, bathymetric features (basins, banks, and channels), oceanic fronts, density gradients, or temperature regimes. Therefore, we have determined that the activities considered in this programmatic consultation will have no effect on Unit 1 of right whale critical habitat.

Consideration of Potential Effects to Unit 2

As identified in the final rule (81 FR 4837), the physical and biological features essential to the conservation of the North Atlantic right whale, which provide calving area functions in Unit 2, are: (i) Sea surface conditions associated with Force 4 or less on the Beaufort Scale; (ii) Sea surface temperatures of 7 °C to 17 °C; and, (iii) Water depths of 6 to 28 meters, where these features simultaneously co-occur over contiguous areas of at least 231 nmi^2 of ocean waters during the months of November through April. When these features are available, they are selected by right whale cows and calves in dynamic combinations that are suitable for calving, nursing, and rearing, and which vary, within the ranges specified, depending on factors such as weather and age of the calves.

The activities considered here will have no effect on the features of Unit 2; this is because geophysical and geotechnical surveys, met buoys, and vessel operations do not affect sea surface state, water temperature, or water depth. Therefore, we have determined that the activities considered in this programmatic consultation will have no effect on Unit 2 of right whale critical habitat

EFFECTS OF THE ACTION ON NMFS LISTED SPECIES AND CRITICAL HABITAT

Potential effects of the proposed action on listed species can be broadly categorized into the following categories: (1) effects to individual animals of exposure to noise associated with the survey activities (HRG, geotechnical), (2) effects of buoy deployment, operation, and retrieval; (3) effects to habitat from survey activities (including consideration of effects to Atlantic sturgeon and loggerhead critical habitat), and (4) effects of vessel use.

Effects of Exposure to Noise Associated With Survey Activities

Here we consider effects of noise associated with HRG and geotechnical surveys on ESA-listed species. Noise associated with meteorological buoys and vessel operations is discussed in those sections of this consultation.

Acoustic Thresholds

Due to the different hearing sensitivities of different species groups, NMFS uses different sets of acoustic thresholds to consider effects of noise on ESA-listed species. Below, we present information on thresholds considered for ESA-listed whales, sea turtles, and fish considered in this consultation.

ESA-listed Whales

NMFS *Technical Guidance for Assessing the Effects of Anthropogenic Noise on Marine Mammal Hearing* compiles, interprets, and synthesizes scientific literature to produce updated acoustic thresholds to assess how anthropogenic, or human-caused, sound affects the hearing of all marine mammals under NMFS jurisdiction (NMFS 2018[5]). Specifically, it identifies the received levels, or thresholds, at which individual marine mammals are predicted to experience temporary or permanent changes in their hearing sensitivity for acute, incidental exposure to underwater anthropogenic sound sources. As explained in the document, these thresholds represent the best available scientific information. These acoustic thresholds cover the onset of both temporary (TTS) and permanent hearing threshold shifts (PTS).

[5] See *https://www.fisheries.noaa.gov/national/marine-mammal-protection/marine-mammal-acoustic-technical-guidance* for more information.

Table 2. Impulsive acoustic thresholds identifying the onset of permanent threshold shift and temporary threshold shift for ESA-listed whales (NMFS 2018).

Hearing Group	Generalized Hearing Range[6]	Permanent Threshold Shift Onset[7]	Temporary Threshold Shift Onset
Low-Frequency Cetaceans (LF: baleen whales)	7 Hz to 35 kHz	Lpk,flat: 219 dB LE,LF,24h: 183 dB	Lpk,flat: 213 dB LE,LF,24h: 168 dB
Mid-Frequency Cetaceans (MF: sperm whales)	150 Hz to 160 kHz	Lpk,flat: 230 dB LE,MF,24h: 185 dB	Lpk,flat: 224 dB LE,MF,24h: 170 dB

These thresholds are a dual metric for impulsive sounds, with one threshold based on peak sound pressure level (0-pk SPL) that does not incorporate the duration of exposure, and another based on cumulative sound exposure level (SEL_{cum}) that does incorporate exposure duration. The two metrics also differ in regard to considering information on species hearing. The cumulative sound exposure criteria incorporate auditory weighting functions, which estimate a species group's hearing sensitivity, and thus susceptibility to TTS and PTS, over the exposed frequency range, whereas peak sound exposure level criteria do not incorporate any frequency dependent auditory weighting functions.

Additionally, NMFS considers exposure to impulsive/intermittent noise greater than 160 dB re 1uPa rms to have the potential to result in Level B harassment, as defined under the MMPA (which does not necessarily equate to ESA harassment). This value is based on observations of behavioral responses of baleen whales (Malme et al. 1983; Malme et al. 1984; Richardson et al. 1986; Richardson et al. 1990), but is used for all marine mammal species.

Sea Turtles

In order to evaluate the effects of exposure to the survey noise by sea turtles, we rely on the available scientific literature. Sea turtles are low frequency hearing specialists, typically hearing frequencies from 30 Hz to 2 kHz, with a range of maximum sensitivity between 100 to 800 Hz (Ridgway et al. 1969, Lenhardt 1994, Bartol et al. 1999, Lenhardt 2002, Bartol and Ketten 2006). Currently, the best available data regarding the potential for noise to cause behavioral disturbance come from studies by O'Hara and Wilcox (1990) and McCauley et al. (2000), who experimentally examined behavioral responses of sea turtles in response to seismic airguns. O'Hara and Wilcox

[6] Represents the generalized hearing range for the entire group as a composite (i.e., all species within the group), where individual species' hearing ranges are typically not as broad. Generalized hearing range chosen based on approximately 65 dB threshold from normalized composite audiogram, with the exception for lower limits for LF cetaceans (Southall et al. 2007).

[7] $L_{pk,flat}$: unweighted ($_{flat}$) peak sound pressure level (L_{pk}) with a reference value of 1 µPa; $L_{E,XF,24h}$: weighted (by species group; $_{LF}$: Low Frequency, or $_{MF}$: Mid-Frequency) cumulative sound exposure level (L_E) with a reference value of 1 μPa^2-s and a recommended accumulation period of 24 hours ($_{24h}$)

(1990) found that loggerhead turtles exhibited avoidance behavior at estimated sound levels of 175 to 176 dB re: 1 μPa (rms) (or slightly less) in a shallow canal. McCauley et al. (2000) reported a noticeable increase in swimming behavior for both green and loggerhead turtles at received levels of 166 dB re: 1 μPa (rms). At 175 dB re: 1 μPa (rms), both green and loggerhead turtles displayed increased swimming speed and increasingly erratic behavior (McCauley et al. 2000). Based on these data, we assume that sea turtles would exhibit a behavioral response when exposed to received levels of 175 dB re: 1 μPa (rms) and higher.

In order to evaluate the effects of exposure to the survey noise by sea turtles that could result in physical effects, we relied on the available literature related to the noise levels that would be expected to result in sound-induced hearing loss (i.e., temporary threshold shift (TTS) or permanent threshold shift (PTS)); we relied on acoustic thresholds for PTS and TTS for impulsive sounds developed by the U.S. Navy for Phase III of their programmatic approach to evaluating the environmental effects of their military readiness activities (U.S. Navy 2017). At the time of this consultation, we consider these the best available data since they rely on all available information on sea turtle hearing and employ the same statistical methodology to derive thresholds as in NMFS recently issued technical guidance for auditory injury of marine mammals (NMFS 2018). Below we briefly detail these thresholds and their derivation. More information can be found in the U.S. Navy's Technical report on the subject (U.S. Navy 2017).

To estimate received levels from airguns and other impulsive sources expected to produce TTS in sea turtles, the U.S. Navy compiled all sea turtle audiograms available in the literature in an effort to create a composite audiogram for sea turtles as a hearing group. Since these data were insufficient to successfully model a composite audiogram via a fitted curve as was done for marine mammals, median audiogram values were used in forming the hearing group's composite audiogram. Based on this composite audiogram and data on the onset of TTS in fishes, an auditory weighting function was created to estimate the susceptibility of sea turtles to TTS. Data from fishes were used since there are currently no data on TTS for sea turtles and fishes are considered to have hearing more similar to sea turtles than do marine mammals (Popper et al. 2014). Assuming a similar relationship between TTS onset and PTS onset as has been described for humans and the available data on marine mammals, an extrapolation to PTS susceptibility of sea turtles was made based on the methods proposed by (Southall et al. 2007). From these data and analyses, dual metric thresholds were established similar to those for marine mammals: one threshold based on peak sound pressure level (0-pk SPL) that does not incorporate the auditory weighting function nor the duration of exposure, and another based on cumulative sound exposure level (SEL_{cum}) that incorporates both the auditory weighting function and the exposure duration (Table 3).

Table 3. Acoustic thresholds identifying the onset of permanent threshold shift and temporary threshold shift for sea turtles exposed to impulsive sounds (U.S. Navy 2017, McCauley et al. 2000).

Hearing Group	Generalized Hearing Range	Permanent Threshold Shift Onset	Temporary Threshold Shift Onset	Behavioral Response
Sea Turtles	30 Hz to 2 kHz	204 dB re: 1 μPa²·s SEL_{cum}	189 dB re: 1 μPa²·s SEL_{cum}	175 dB re: 1 μPa (rms)
		232 dB re: 1 μPa SPL (0-pk)	226 dB re: 1 μPa SPL (0-pk)	

Marine Fish
There are no criteria developed for considering effects to ESA-listed fish specific to HRG equipment. However, all of the equipment that operates within a frequency that these fish species are expected to respond to, produces intermittent or impulsive sounds; therefore, it is reasonable to use the criteria developed for impact pile driving, seismic, and explosives when considering effects of exposure to this equipment (FHWG 2008). However, unlike impact pile driving, which produces repetitive impulsive noise in a single location, the geophysical survey sound sources are moving; therefore, the potential for repeated exposure to multiple pulses is much lower when compared to pile driving. We expect fish to react to noise that is disturbing by moving away from the sound source and avoiding further exposure. Injury and mortality is only known to occur when fish are very close to the noise source and the noise is very loud and typically associated with pressure changes (i.e., impact pile driving or blasting).

The Fisheries Hydroacoustic Working Group (FHWG) was formed in 2004 and consists of biologists from NMFS, United States Fish and Wildlife Service, Federal Highway Administration, USACE, and the California, Washington, and Oregon Department of Transportations, supported by national experts on underwater sound producing activities that affect fish and wildlife species of concern. In June 2008, the agencies signed an MOA documenting criteria for assessing physiological effects of impact pile driving on fish. The criteria were developed for the acoustic levels at which physiological effects to fish could be expected. It should be noted, that these are onset of physiological effects (Stadler and Woodbury, 2009), and not levels at which fish are necessarily mortally damaged. These criteria were developed to apply to all fish species. The interim criteria are:

- Peak SPL: 206 dB re 1 μPa
- SELcum: 187 B re 1μPa^2-s for fishes 2 grams or larger (0.07 ounces).
- SELcum: 183 dB re 1μPa^2-s for fishes less than 2 grams (0.07 ounces).

At this time, these criteria represent the best available information on the thresholds at which physiological effects to ESA-listed marine fish are likely to occur. It is important to note that physiological effects may range from minor injuries from which individuals are anticipated to completely recover with no impact to fitness to significant injuries that will lead to death. The severity of injury is related to the distance from the noise source and the duration of exposure. The closer to the source and the greater the duration of the exposure, the higher likelihood of significant injury. Use of the 183 dB re 1 μPa^2-s cSEL threshold, is not appropriate for this consultation because all sturgeon in the action area will be larger than 2 grams. Physiological effects could range from minor injuries that a fish is expected to completely recover from with no impairment to survival to major injuries that increase the potential for mortality, or result in death.

We use 150 dB re: 1 μPa RMS as a threshold for examining the potential for behavioral responses by individual listed fish to noise with frequency less than 1 kHz. This is supported by information provided in a number of studies (Andersson et al. 2007, Purser and Radford 2011, Wysocki et al. 2007). Responses to temporary exposure of noise of this level is expected to be a range of responses indicating that a fish detects the sound, these can be brief startle responses or in the worst case, we expect that listed fish would completely avoid the area ensonified above 150 dB re: 1 uPa rms. Popper et al. (2014) does not identify a behavioral threshold but notes that the potential for behavioral disturbance decreases with the distance from the source.

HRG Acoustic Sources

HRG surveys are used for a number of site characterization purposes: locating shallow hazards, cultural resources, and hard-bottom areas; evaluating installation feasibility; assisting in the selection of appropriate foundation system designs; and determining the variability of subsurface sediments. The equipment typically used for these surveys includes: Bathymetry/Depth Sounder; Magnetometer; Seafloor Imagery/Side-Scan Sonar; Shallow and Medium (Seismic) Penetration Sub-bottom Profilers (e.g., CHIRPs, boomers, bubble guns). This consultation does not consider the use of seismic airguns because this equipment is not required for site characterization activities to support offshore wind development (due to the shallow sediment depths that need to be examined, compared to the miles into the seabed that are examined for oil and gas exploration where airguns are used).

As described in the BA, BOEM completed a desktop analysis of nineteen HRG sources in Crocker and Fratantonio (2016) to evaluate the distance to thresholds of concern for listed species (see tables in Appendix A). Equipment types or frequency settings that would not be used for the survey purposes by the offshore wind industry were not included in this analysis. To provide the maximum impact scenario for these calculations, the highest power levels and most sensitive frequency setting for each hearing group were used when the equipment had the option for multiple user settings. All sources were analyzed at a tow speed of 2.315 m/s (4.5 knots), which is the expected speed vessels will travel while towing equipment. PTS cumulative exposure distances were calculated for the low-frequency hearing group (sei, fin, and North Atlantic right whales), the mid-frequency group (sperm whales), and for a worst-case exposure scenario of 60 continuous minutes for sea turtles and fish.

Tables 4 and 5 describe the greatest distances to thresholds of concern for the various equipment types analyzed by BOEM. It is important to note that as different species groups have different hearing sensitivities, not all equipment operates within the hearing threshold of all species considered here. Complete tables are included in Appendix B of BOEM’s BA.

Table 1. Summary of greatest PTS Exposure Distances from mobile HRG Sources at Speeds of 4.5 knots.

HRG SOURCE	PTS DISTANCE (m)								
	Highest Source Level (dB re 1 µPa)	**Sea Turtles**		**Fish[b]**		**Baleen Whales**		**Sperm Whales[c]**	
Mobile, Impulsive, Intermittent Sources									
		Peak	*SEL*	*Peak*	*SEL*	*Peak*	*SEL*	*Peak*	*SEL*
Boomers, Bubble Guns	176 dB SEL 207 dB RMS 216 PEAK	0	0	3.2	0	0	0.3	0	0
Sparkers	188 dB SEL 214 dB RMS 225 PEAK	0	0	9	0	2	12.7	0	0.2
Chirp Sub-Bottom Profilers	193 dB SEL 209 dB RMS 214 PEAK	NA	NA	NA	NA	0	1.2	0	0.3
Mobile, Non-impulsive, Intermittent Sources									
Multi-beam echosounder (100 kHz)	185 dB SEL 224 dB RMS 228 PEAK	NA	NA	NA	NA	NA	NA	0	0.5
Multi-beam echosounder (>200 kHz) (mobile, non-impulsive, intermittent)	182 dB SEL 218 dB RMS 223 PEAK	NA	NA	NA	NA	NA	NA	NA	NA
Side-scan sonar (>200 kHz) (mobile, non-impulsive, intermittent)	184 dB SEL 220 dB RMS 226 PEAK	NA	NA	NA	NA	NA	NA	NA	NA

[a] Sea turtle PTS distances were calculated for 203 cSEL and 230 dB peak criteria from Navy (2017).
[b] Fisheries Hydroacoustic Working Group (2008).
[c] PTS injury distances for listed marine mammals were calculated with NOAA's sound exposure spreadsheet tool using sound source characteristics for HRG sources in Crocker and Fratantonio (2016)
NA = not applicable due to the sound source being out of the hearing range for the group.

Using the same sound sources for the PTS analysis, BOEM calculated the distances to 175 dB re 1 µPa rms for sea turtles, 160 dB re 1 µPa rms for marine mammals, and 150 dB re 1 µPa rms for fish were calculated using a spherical spreading model (20 LogR) (Table 5). BOEM has conservatively used the highest power levels for each sound source reported in Crocker and Fratantonio (2016). Additionally, the spreadsheet and geometric spreading models do not consider the tow depth and directionality of the sources; therefore, these are likely overestimates of actual disturbance distances.

Table 5. Summary of greatest disturbance distances by equipment type.

HRG SOURCE	DISTURBANCE DISTANCE (m)			
	Sea Turtles (175 dB re 1uPa rms)	Fish (150 dB re 1uPa rms)	Baleen Whales (160 dB re 1uPa rms)	Sperm Whales (160 dB re 1uPa rms)
Boomers, Bubble Guns	40	708	224	224
Sparkers	90	1,996[a]	502	502
Chirp Sub-Bottom Profilers	2	32	10	10
Multi-beam Echosounder (100 kHz)	NA	NA	NA	<369[b]
Multi-beam Echosounder (>200 kHz)	NA	NA	NA	NA
Side-scan Sonar (>200 kHz)	NA	NA	NA	NA

a – the calculated distance to the 150 dB rms threshold for the Applied Acoustics Dura-Spark is 1,996m; however, the distances for other equipment in this category is significantly smaller
b – this distance was recalculated using the NMFS spreadsheet following receipt of the BA.
NA = not applicable due to the sound source being out of the hearing range for the group.

Marine Mammals
Considering peak noise levels, the equipment resulting in the greatest isopleth to the marine mammal PTS threshold is the sparker (2.0 m for baleen whales, 0 m for sperm whales; Table A.3). Considering the cumulative threshold (24 hour exposure), the greatest distance to the PTS threshold is 12.7 m for baleen whales and 0.5 m for sperm whales. Animals in the survey area during the HRG survey are unlikely to incur any hearing impairment due to the characteristics of the sound sources, considering the source levels (176 to 205 dB re 1 μPa-m) and generally very short pulses and duration of the sound. Individuals would have to make a very close approach and

also remain very close to vessels operating these sources (<13 m) in order to receive multiple exposures at relatively high levels, as would be necessary to have the potential to result in any hearing impairment. Kremser et al. (2005) noted that the probability of a whale swimming through the area of exposure when a sub-bottom profiler emits a pulse is small—because if the animal was in the area, it would have to pass the transducer at close range in order to be subjected to sound levels that could cause PTS and would likely exhibit avoidance behavior to the area near the transducer rather than swim through at such a close range. Further, the restricted beam shape of many of HRG survey devices planned for use makes it unlikely that an animal would be exposed more than briefly during the passage of the vessel. The potential for exposure to noise that could result in PTS is even further reduced by the clearance zone and the use of PSOs to all for a shutdown of equipment operating within the hearing range of ESA-listed whales should a right whale or unidentified large whale be detected within 500 m or 100 m for an identified sei, fin, or sperm whale, see PDC 4. Based on these considerations, it is extremely unlikely that any ESA-listed whale will be exposed to noise that could result in PTS.

Masking is the obscuring of sounds of interest to an animal by other sounds, typically at similar frequencies. Marine mammals are highly dependent on sound, and their ability to recognize sound signals amid other sounds is important in communication and detection of both predators and prey (Tyack 2000). Although masking is a phenomenon which may occur naturally, the introduction of loud anthropogenic sounds into the marine environment at frequencies important to marine mammals increases the severity and frequency of occurrence of masking. The components of background noise that are similar in frequency to the signal in question primarily determine the degree of masking of that signal. In general, little is known about the degree to which marine mammals rely upon detection of sounds from conspecifics, predators, prey, or other natural sources. In the absence of specific information about the importance of detecting these natural sounds, it is not possible to predict the impact of masking on marine mammals (Richardson et al., 1995). In general, masking effects are expected to be less severe when sounds are transient than when they are continuous. Masking is typically of greater concern for those marine mammals that utilize low-frequency communications, such as baleen whales, because of how far low-frequency sounds propagate. NMFS has previously concluded that marine mammal communications would not likely be masked appreciably by the sub-bottom profiler signals given the directionality of the signals for most HRG survey equipment types planned for use for the types of surveys considered here and the brief period when an individual mammal is likely to be within its beam (see for example, 86 FR 22160). Based on this, any effects of masking on ESA-listed whales will be insignificant.

For equipment that operates within the functional hearing range (7 Hz to 35 kHz) of baleen whales, the area ensonified by noise greater than 160 dB re: 1uPa rms will extend no further than 502 m from the source (sparkers; the distance for chirp (10 m) and boomers and bubble guns (224 m) is smaller (Table A.5)). For equipment that operates within the functional hearing range of sperm whales (150 Hz to 160 kHz), the area ensonified by noise greater than 160 dB re: 1uPa rms will extend no further than 369 m from the source (100 kHz Multi-beam echosounder; the distance for sparkers (502 m), boomers and bubble guns (224 m), and chirp (10 m) is smaller; Table A.5).

Given that the distance to the 160 dB re: 1 uPa rms threshold extends beyond the required Shutdown Zone, it is possible that ESA-listed whales will be exposed to potentially disturbing levels of noise during the surveys considered here. We have determined that, in this case, the exposure to noise above the MMPA Level B harassment threshold (160 dB re: 1uPa rms) will result in effects that are insignificant. We expect that the result of this exposure would be, at worst, temporary avoidance of the area with underwater noise louder than this threshold, which is a reaction that is considered to be of low severity and with no lasting biological consequences (e.g., Ellison et al. 2007). The noise source itself will be moving. This means that any co-occurrence between a whale, even if stationary, will be brief and temporary. Given that exposure will be short (no more than a few seconds, given that the noise signals themselves are short and intermittent and because the vessel towing the noise source is moving) and that the reaction to exposure is expected to be limited to changing course and swimming away from the noise source only far/long enough to get out of the ensonified area (502 m or less, depending on the noise source), the effect of this exposure and resulting response will be so small that it will not be able to be meaningfully detected, measured or evaluated and, therefore, is insignificant. Further, the potential for disruption to activities such as breeding, feeding (including nursing), resting, and migrating is extremely unlikely given the very brief exposure to any noise (given that the source is traveling and the area ensonified at any given moment is so small). Any brief interruptions of these behaviors are not anticipated to have any lasting effects. Because the effects of these temporary behavioral changes are so minor, it is not reasonable to expect that, under the NMFS' interim ESA definition of harassment, they are equivalent to an act that would "create the likelihood of injury to wildlife by annoying it to such an extent as to significantly disrupt normal behavior patterns which include, but are not limited to, breeding, feeding, or sheltering."

Sea Turtles

None of the equipment being operated for these surveys that overlaps with the hearing range (30 Hz to 2 kHz) for sea turtles has source levels loud enough to result in PTS or TTS based on the peak or cumulative exposure criteria (Table A.4). Therefore, physical effects are extremely unlikely to occur.

As explained above, we assume that sea turtles would exhibit a behavioral response when exposed to received levels of 175 dB re: 1 µPa (rms) and are within their hearing range (below 2 kHz). For boomers and bubble guns the distance to this threshold is 40 m, and is 90 m for sparkers and 2 m for chirps (Table A.5). Thus, a sea turtle would need to be within 90 m of the source to be exposed to potentially disturbing levels of noise. We expect that sea turtles would react to this exposure by swimming away from the sound source; this would limit exposure to a short time period, just the few seconds it would take an individual to swim away to avoid the noise.

The risk of exposure to potentially disturbing levels of noise is reduced by the use of PSOs to monitor for sea turtles. As required by the PDC 4, a Clearance Zone (500 m in all directions) for ESA-listed species must be monitored around all vessels operating equipment at a frequency of less than 180 kHz. At the start of a survey, equipment cannot be turned on until the Clearance Zone is clear for at least 30 minutes. This condition is expected to reduce the potential for sea turtles to be exposed to noise that may be disturbing. However, even in the event that a sea turtle is submerged and not seen by the PSO, in the worst case, we expect that sea turtles would avoid the area ensonified by the survey equipment that they can perceive. Because the area where increased underwater noise will be experienced is transient and increased underwater noise will only be experienced in a particular area for only seconds, we expect any effects to behavior to be minor and limited to a temporary disruption of normal behaviors, temporary avoidance of the ensonified area and minor additional energy expenditure spent while swimming away from the noisy area. If foraging or migrations are disrupted, we expect that they will quickly resume once the survey vessel has left the area. No sea turtles will be displaced from a particular area for more than a few minutes. While the movements of individual sea turtles will be affected by the sound associated with the survey, these effects will be temporary (seconds to minutes) and localized (avoiding an area no larger than 90 m) and there will be only a minor and temporary impact on foraging, migrating or resting sea turtles. For example, BOEM calculated that for a survey with equipment being towed at 3 knots, exposure of a turtle that was within 90 m of the source would last for less than two minutes. We also note that, to minimize disturbance to the Northwest Atlantic Ocean DPS of loggerhead sea turtles, a voluntary pause in sparker operation will be implemented for all vessels operating in nearshore critical habitat for loggerhead sea turtles if any loggerhead or other sea turtle is observed within a 100 m Clearance Zone during a survey. This will further reduce the potential for behavioral disturbance.

Given the intermittent and short duration of exposure to any potentially disturbing noise from HGR equipment, major shifts in habitat use or distribution or foraging success are not expected. Effects to individual sea turtles from brief exposure to potentially disturbing levels of noise are expected to be minor and limited to a brief startle, short increase in swimming speed and/or short displacement, and will be so small that they cannot be meaningfully measured, detected, or evaluated; therefore, effects are insignificant.

Marine Fish

Of the equipment that may be used for geophysical surveys, only equipment that operates at a frequency within the estimated hearing range of the ESA-listed fish that may occur in the action area (i.e., frequency less than 1 kHz; Lovell et al. 2005; Meyer et al. 2010) may affect these species. Generally, this includes sparkers, boomers, and bubble guns (see Table A.2). All other survey equipment operates at a frequency higher than the ESA-listed fish considered here are expected to hear; therefore, we do not expect any effects to ESA-listed fish exposed to increased underwater noise from the other higher frequency survey equipment. Due to their typically submerged nature, monitoring clearance or shutdown zones for marine fish is not expected to be effective. As required by PDC 4, the surveys will use a ramp up procedure; that is, noise producing equipment will not be used at full energy right away. This gives any fish in the immediate area a “warning” and an opportunity to leave the area before the full energy of the survey equipment is used.

As explained above, the available information suggests that for noise exposure to result in physiological impacts to the fish species considered here, received levels need to be at least 206 dB re: 1uPa peak sound pressure level (SPLpeak) or at least 187 dB re: u1Pa cumulative. The peak thresholds are exceeded only very close to the noise source (<3.2 m for the boomers/bubble guns and <9 m for the sparkers (see Table A.4); the cumulative threshold is not exceeded at any distance. As such, in order to be exposed to peak sound pressure levels of 206 dB re: 1uPa from any of these sources, an individual fish would need to be within 9 m of the source (Table A.4). This is extremely unlikely to occur given the dispersed nature of the distribution of ESA-listed fish in the action area, the use of a ramp up procedure, the moving and intermittent/pulsed characteristic of the noise source, and the expectation that ESA-listed fish will swim away, rather than towards the noise source. Based on this, no physical effects to any ESA-listed fish, including injury or mortality, are expected to result from exposure to noise from the geophysical surveys.

We use 150 dB re: 1 µPa root mean square (RMS) sound pressure level (SPL) as a threshold for examining the potential for behavioral responses to underwater noise by ESA-listed fish. This is supported by information provided in a number of studies (Andersson et al. 2007, Purser and Radford 2011, Wysocki et al. 2007). In the worst case, we expect that ESA-listed fish would completely avoid an area ensonified above 150 dB re: 1uPa rms for the period of time that noise in that area was elevated. The calculated distances to the 150 dB re: 1 uPa rms threshold for the boomers/bubble guns, sparkers, and sub-bottom profilers is 708 m, 1,996 m, and 32 m, respectively (Table A.5). It is important to note that BOEM has conservatively used the highest power levels for each sound source reported in Crocker and Fratantonio (2016) to calculate these distances; thus, they likely overestimate actual sound fields.

Because the area where increased underwater noise will be experienced is transient (because the survey vessel towing the equipment is moving), increased underwater noise will only be experienced in a particular area for a short period of time. Given the transient and temporary nature of the increased noise, we expect any effects to behavior to be minor and limited to a temporary disruption of normal behaviors, potential temporary avoidance of the ensonified area and minor additional energy expenditure spent while swimming away from the noisy area. If foraging, resting, or migrations are disrupted, we expect that these behaviors will quickly resume once the survey vessel has left the area (i.e., in seconds to minutes, given its traveling speed of 3 – 4.5 knots). Therefore, no fish will be displaced from a particular area for more than a few minutes. While the movements of individual fish will be affected by the sound associated with the survey, these effects will be temporary and localized and these fish are not expected to be excluded from any particular area and there will be only a minimal impact on foraging, migrating, or resting behaviors. Sustained shifts in habitat use or distribution or foraging success are not expected. Effects to individual fish from brief exposure to potentially disturbing levels of noise are expected to be limited to a brief startle or short displacement and will be so small that they cannot be meaningfully measured, detected, or evaluated; therefore, effects of exposure to survey noise are insignificant.

Acoustic Effects - Geotechnical Surveys

Geotechnical surveys generally do not use active acoustic sources, but may have some low-level ancillary sounds associated with them. As described in the BA, the loudest noises are from drilling associated with obtaining bore samples. Small-scale drilling noise associated with bore samples taken in shallow water has been measured to produce broadband sounds centered at 10 Hz with source levels at 71-89 dB re 1 µPa rms and 75-97 dB re 1 µPa peak depending on the water depth of the work site (Willis et al. 2010). Another study reported measured drilling noise from a small jack-up rig at 147 – 151 db re 1 µPa rms in the 1 Hz to 22 kHz range at 10 m from source (Erbe and McPherson 2017).

Noise associated with geotechnical surveys is below the level that we expect may result in physiological or behavioral responses by any ESA-listed species considered here. As such, effects to listed whales, sea turtles, or fish from exposure to this noise source are extremely unlikely to occur.

Meteorological Buoys

A meteorological buoy (met buoy) is designed to collect meteorological data for a period of four-five years. During this time, data will be collected and transmitted to onshore facilities. The operation of the meteorological data collection instrumentation (i.e., light detection and ranging remote sensing technology (LIDAR) and Acoustic Doppler Current Profilers (ADCP)) will have no effect on any listed species as it does not operate in any way that could result in effects to listed species. Bathymetric LIDAR uses water-penetrating green light to also measure seafloor and riverbed elevations. ADCP uses extremely high frequency sound (well above the hearing frequency of any species considered in this consultation) to measure water currents. No other acoustic effects from the deployment of the met buoys are anticipated.

Buoys will be deployed and retrieved by vessels; maintenance will also be carried out from vessels. Potential effects of vessel traffic for all activities considered in this consultation is addressed below. PDCs for siting the buoy will result in avoidance of anchoring buoys on any sensitive habitats (i.e., placement will occur on unconsolidated and uncolonized areas only, avoiding eelgrass, corals, etc.) (see PDC 1). Buoys will be anchored to a clump weight anchor and attached to the anchor with heavy chain. We have considered the potential for any listed species, including whales and/or sea turtles, to interact with the buoy and to become entangled in the buoy or mooring system and have determined that this is extremely unlikely to occur for the reasons outlined below.

In order for an entanglement to occur, an animal must first encounter the gear, which has an extremely low likelihood based on the number of buoys and total area where buoys may be deployed (Atlantic OCS). BOEM predicts that up to two met buoys could be deployed in any potential lease area, for a maximum of 60 buoys deployed in the entirety of the Atlantic OCS. Given the small number of buoys and their dispersed locations on the OCS, the potential for encounter between an individual whale or sea turtle and a buoy is extremely low. However even if there is co-occurrence between an individual animal and one or more buoys, entanglement is extremely unlikely to occur. This is because the buoy will be attached to the anchor with heavy gauge chain, which reduces the risk of entanglement due to the tension that the buoy will be under and the gauge of the chain, which prevents any slack in the chain that could result in an entanglement (see PDC 6). There have been no documented incidences of any listed species, including whales or sea turtles, entangled in United States Coast Guard navigational buoys, which have a similar mooring configuration to these met buoys, but also far outnumber the potential number of deployed met buoys (there are 1000s of navigational buoys within the range of ESA-listed whales and sea turtles and no recorded entanglements). Based on the analysis herein, it is extremely unlikely that any ESA-listed species will interact with the buoy and anchor system such that it becomes entangled. As such, effects are extremely unlikely to occur.

Effects to Habitat

Vibracores and grab samples may be used to document habitat types during geophysical and geotechnical survey activities. Both of these survey methods will result in temporary disturbance of the benthos and a potential temporary loss of benthic resources. Additionally, bottom disturbance will occur in the area where a met buoy is anchored.

The vibracores and grab samples will affect an extremely small area (approximately 0.1 to 2.7 ft^2) at each sampling location, with sampling locations several hundred meters apart. While the vibracore and grab sampler will take a portion of the benthos that will be brought onto the ship, because of the small size of the sample and the nature of the removal, there is little to no sediment plume associated with the sampling. While there may be some loss of benthic species at the sample sites, including potential forage items for listed species that feed on benthic resources, the amount of benthic resources potentially lost will be extremely small and limited to immobile individuals that cannot escape capture during sampling. As such a small area will be disturbed and there will be a large distance between disturbed areas, recolonization is expected to be rapid. The amount of potential forage lost for any benthic feeding species is extremely small, localized, and temporary. While the area of the bottom impacted by the anchoring of the met buoy is larger (i.e., several meters in diameter), as stated above, there will be a small number of buoys deployed along the entire Atlantic OCS. Any loss of benthic resources will be small, temporary, and localized.

These temporary, isolated reductions in the amount of benthic resources are not likely to have a measurable effect on any foraging activity or any other behavior of listed species; this is due to the small size of the affected areas in relation to remaining available habitat in the OCS and the temporary nature of any disturbance. As effects to listed species will be so small that they cannot be meaningfully measured, detected, or evaluated, effects are insignificant.

Other Considerations – Geotechnical Surveys
The PDCs include a seasonal prohibition on any activities involving disturbance of the bottom in areas where early life stages of Atlantic or shortnose sturgeon may occur (see PDC 2). The seasonal prohibition is designed to avoid any activity that could disturb potential spawning or rearing substrate during the time of year that spawning or rearing may occur in that river. This PDC will also ensure that no bottom disturbing survey activities will occur at a time that eggs or other immobile or minimally mobile early life stages of sturgeon are present. This will ensure that sampling activities will not result in the disturbance, injury, or mortality of any sturgeon. Based on this, any effects to sturgeon spawning habitat or early life stages are extremely unlikely to occur.

Atlantic Sturgeon Critical Habitat
Critical habitat has been designated for all five DPSs of Atlantic sturgeon (82 FR 39160; effective date September 18, 2017). While there is no Atlantic sturgeon critical habitat in the three Atlantic Renewable Energy Regions located on the Atlantic OCS, survey activities along potential cable routes, including vessel transits, may occur within Atlantic sturgeon critical habitat. While BOEM anticipates that activities would be limited to overlapping with critical habitat designated in the Hudson, Delaware, and James rivers for the New York Bight and Chesapeake Bay DPSs respectively, the conclusions reached here apply to critical habitat designated for all five DPSs.

The PDCs include a seasonal prohibition on any geophysical and geotechnical survey activities involving disturbance of the bottom in freshwater (salinity less than 0.5 parts per thousand (ppt)) areas designated as critical habitat for any DPS of Atlantic sturgeon (see PDC # 2 for more detail). The PDCs also require operation of vessels in a way that ensures that vessel activities do not result in disturbance of bottom habitat.

In order to determine if the proposed action may affect critical habitat, we consider whether it would impact the habitat in a way that would affect its ability to support reproduction and recruitment. Specifically, we consider the effects of the action on the physical features of the proposed critical habitat. The Physical and Biological Features (PBFs) essential for Atlantic sturgeon conservation identified in the final rule (82 FR 39160) are:

> (1) Hard bottom substrate (e.g., rock, cobble, gravel, limestone, boulder, etc.) in low salinity waters (i.e., 0.0 to 0.5 ppt range) for settlement of fertilized eggs, refuge, growth, and development of early life stages;
>
> (2) Aquatic habitat with a gradual downstream salinity gradient of 0.5 up to as high as 30 ppt and soft substrate (e.g., sand, mud) between the river mouth and spawning sites for juvenile foraging and physiological development;
>
> (3) Water of appropriate depth and absent physical barriers to passage (e.g., locks, dams, thermal plumes, turbidity, sound, reservoirs, gear, etc.) between the river mouth and spawning sites necessary to support: (i) Unimpeded movement of adults to and from spawning sites; (ii) Seasonal and physiologically dependent movement of juvenile Atlantic sturgeon to appropriate salinity zones within the river estuary; and, (iii) Staging, resting, or holding of subadults or spawning condition adults. Water depths in main river channels must also be deep enough (e.g., at least 1.2 m) to ensure continuous flow in the main channel at all times when any sturgeon life stage would be in the river.
>
> (4) Water, between the river mouth and spawning sites, especially in the bottom meter of the water column, with the temperature, salinity, and oxygen values that, combined, support: (i) Spawning; (ii) Annual and interannual adult, subadult, larval, and juvenile survival; and, (iii) Larval, juvenile, and subadult growth, development, and recruitment (e.g., 13 degrees Celsius [°C] to 26 °C for spawning habitat and no more than 30 °C for juvenile rearing habitat, and 6 milligrams per liter (mg/L) dissolved oxygen (DO) or greater for juvenile rearing habitat).

PBF 1: Hard bottom substrate (e.g., rock, cobble, gravel, limestone, boulder, etc.) in low salinity waters (i.e., 0.0–0.5 ppt range) for settlement of fertilized eggs, refuge, growth, and development of early life stages

In considering effects to PBF 1, we consider whether the proposed action will have any effect on areas of hard substrate in low salinity waters that may be used for settlement of fertilized eggs, refuge, growth, and development of early life stages; therefore, we consider effects of the action on hard bottom substrate and any change in the value of this feature in the action area.

Vessel operations during transits or surveys would not affect hard bottom habitat in the part of the river with salinity less than 0.5 ppt, because they would not impact the river bottom in any way or change the salinity of portions of the river where hard bottom is found. Similarly, geophysical surveys use acoustics to accurately map the seafloor, which would not impact any hard bottom that is present.

Grab samples, geotechnical surveys, and any other activity that may affect hard bottom is prohibited in areas with salinity less than 0.5 ppt during the time of year that these areas may be used for spawning or rearing (PDC 2). Given the very small footprint of all survey activities that may affect the hard bottom (3-4 inch diameter area would be disturbed during sampling) and the spacing of sampling several hundred meters apart, any effects to hard bottom substrate from survey activities outside of the time of year when these areas may be used for spawning and rearing would be small, localized, and dispersed. Given the dynamic nature of river sediments and the small area that will be disturbed, we expect that substrate conditions will recover to pre-survey conditions within days to weeks of sampling occurring. As such, any effects to hard bottom substrate and the value of this feature in the action area or to any of the critical habitat units as a whole are temporary and so small that they cannot be meaningfully measured, evaluated, or detected and, therefore, are insignificant.

PBF 2: Aquatic habitat with a gradual downstream salinity gradient of 0.5 up to as high as 30 ppt and soft substrate (e.g., sand, mud) between the river mouth and spawning sites for juvenile foraging and physiological development

In considering effects to PBF 2, we consider whether the proposed action will have any effect on areas of soft substrate within transitional salinity zones between the river mouth and spawning sites for juvenile foraging and physiological development; therefore, we consider effects of the action on soft substrate and salinity and any change in the value of this feature in the action area.

Project vessels (whether transiting or surveying) do not have the potential to effect salinity. Vessels are expected to maintain a minimum of 4-feet clearance with the river bottom (see PDC 2) and, therefore, effects to the soft substrate are extremely unlikely. The vessels' operations would not preclude or significantly delay the development of soft bottom habitat in the transitional salinity zone because they would not impact salinity or the river bottom in any way. Similarly, geophysical surveys use acoustics to accurately map the bottom, which would not affect any soft substrate that is present.

Grab samples and geotechnical surveys may impact soft substrate; however, given the very small footprint of any such activities (3-4 inch diameter area would be disturbed during sampling) and the spacing of sampling locations several hundred meters apart, any effects to soft substrate would be small, localized, and dispersed. Given the dynamic nature of river sediments and the small area that will be disturbed, we expect that substrate conditions will recover to pre-survey conditions within days to weeks of sampling occurring. As such, any effects to soft substrate and the value of this feature in the action area, are extremely unlikely or so small that they cannot be meaningfully measured, evaluated, or detected.

PBF 3: Water absent physical barriers to passage between the river mouth and spawning sites

In considering effects to PBF 3, we consider whether the proposed action will have any effect on water of appropriate depth and absent physical barriers to passage (e.g., locks, dams, thermal plumes, turbidity, sound, reservoirs, gear, etc.) between the river mouth and spawning sites necessary to support: unimpeded movements of adults to and from spawning sites; seasonal and physiologically dependent movement of juvenile Atlantic sturgeon to appropriate salinity zones within the river estuary, and; staging, resting, or holding of subadults or spawning condition adults. We also consider whether the proposed action will affect water depth or water flow, as if water is too shallow it can be a barrier to sturgeon movements, and an alteration in water flow could similarly impact the movements of sturgeon in the river, particularly early life stages that are dependent on downstream drift. Therefore, we consider effects of the action on water depth and water flow and whether the action results in barriers to passage that impede the movements of Atlantic sturgeon.

Survey activities, including vessel transits, will have no effect on this feature as they will not have any effect on water depth or water flow and will not be physical barriers to passage for any life stage of Atlantic sturgeon that may occur in this portion of the action area. As explained above, noise associated with the geotechnical surveys is below the threshold that would be expected to result in any disturbance of sturgeon; therefore, noise associated with geotechnical surveys will not affect the habitat in any way that would affect the movement of Atlantic sturgeon. Similarly, while HRG surveys may affect the movement of individual sturgeon, the effects are short-term and transient; noise is not expected to result in a barrier to passage. Based on this analysis, any effects to PBF 3 will be insignificant.

PBF 4: Water with the temperature, salinity, and oxygen values that, combined, provide for DO values that support successful reproduction and recruitment and are within the temperature range that supports the habitat function

In considering effects to PBF 4, we consider whether the proposed action will have any effect on water, between the river mouth and spawning sites, especially in the bottom meter of the water column, with the temperature, salinity, and oxygen values that, combined, support: spawning; annual and interannual adult, subadult, larval, and juvenile survival; and larval, juvenile, and subadult growth, development, and recruitment. Therefore, we consider effects of the action on temperature, salinity and DO needs for Atlantic sturgeon spawning and recruitment. These water quality conditions are interactive and both temperature and salinity influence the DO saturation for a particular area. We also consider whether the action will have effects to access to this feature, temporarily or permanently and consider the effect of the action on the action area’s ability to develop the feature over time. Survey activities, including vessel transit, will have no effect on this feature as they will not have any effect on temperature, salinity or dissolved oxygen.

Summary of effects to Atlantic sturgeon critical habitat
We have determined that the effects of the activities considered here will be insignificant on PBFs 1, 2, and 3, and will have no effects to PBF 4. As such, the activities considered here are not likely to adversely affect Atlantic sturgeon critical habitat designated for any of the five DPSs.

Critical Habitat Designated for the Northwest Atlantic Ocean DPS of Loggerhead Sea Turtles
Critical habitat for the Northwest Atlantic Ocean DPS of loggerhead sea turtles was designated in 2014 (79 FR 39855). Specific areas for designation include 38 occupied marine areas within the range of the Northwest Atlantic Ocean DPS. These areas contain one or a combination of habitat

types: Nearshore reproductive habitat, winter area, breeding areas, constricted migratory corridors, and/or *Sargassum* habitat. There is no critical habitat designated in the North Atlantic Renewable Energy Region. Winter, breeding, and migratory habitat occur in the Mid-Atlantic and South Atlantic regions of the action areas; there is also a small amount of overlap with *Sargassum* critical habitat on the outer edges of the action area near the 100-m isobaths. Geophysical and geotechnical surveys and met buoy deployment may take place within this critical habitat. As explained below, the activities considered in this programmatic consultation are not likely to adversely affect critical habitat designated for the Northwest Atlantic Ocean DPS of loggerheads.

Nearshore Reproductive

The PBF of nearshore reproductive habitat is described as a portion of the nearshore waters adjacent to nesting beaches that are used by hatchlings to egress to the open-water environment as well as by nesting females to transit between beach and open water during the nesting season. The occurrence of designated nearshore reproductive habitat in the action area is limited to the area between the beach to 1 mile offshore along the Atlantic coast from Cape Hatteras, North Carolina to the southern extent of the South Atlantic planning area along the Florida coast.

As described in the final rule, the primary constituent elements (PCE) that support this habitat are the following: (1) Nearshore waters directly off the highest density nesting beaches and their adjacent beaches as identified in 50 CFR 17.95(c) to 1.6 km (1 mile) offshore; (2) Waters sufficiently free of obstructions or artificial lighting to allow transit through the surf zone and outward toward open water; and, (3) Waters with minimal manmade structures that could promote predators (i.e., nearshore predator concentration caused by submerged and emergent offshore structures), disrupt wave patterns necessary for orientation, and/or create excessive longshore currents.

Met buoys will only be deployed in federal waters; therefore, no met buoys will be deployed in nearshore reproductive habitat. HRG and geotechnical surveys and associated vessel transits could occur in this nearshore habitat. The intermittent noise associated with these activities will not be an obstruction to turtles moving through the surf zone; this is because the noise that can be perceived by sea turtles would dissipate to non-disturbing levels within 90 m of the moving source (see further explanation above) and the area with potentially disturbing levels of noise would be limited to one area within 90 m of the source at any given time. Therefore, given the small geographic area affected by noise and that these effects will be temporary (experienced for no more than 2 minutes in any given area), the effects to habitat are insignificant. Any lighting associated with the surveys would be limited to lights on vessels in the ocean, this lighting would not disorient turtles the way that artificial lighting along land can. Additionally, there are no mechanisms by which the HRG and geotechnical surveys and vessel activities would promote predators or disrupt wave patterns necessary for orientation or create excessive longshore currents.

Winter

The PBF of winter habitat is described as warm water habitat south of Cape Hatteras, North Carolina near the western edge of the Gulf Stream used by a high concentration of juveniles and adults during the winter months. The one area of winter critical habitat identified in the final rule extends from Cape Hatteras at the 20 m depth contour straight across 35.27° N. lat. to the 100 m (328 ft.) depth contour, south to Cape Fear at the 20 m (66 ft.) depth contour (approximately

33.47° N. lat., 77.58° W. long.) extending in a diagonal line to the 100 m (328 ft.) depth contour (approximately 33.2° N. lat., 77.32° W. long.). This southern diagonal line (in lieu of a straight latitudinal line) was chosen to encompass the loggerhead concentration area (observed in satellite telemetry data) and identified habitat features, while excluding the less appropriate habitat (e.g., nearshore waters at 33.2° N. lat.). PCEs that support this habitat are the following: (1) Water temperatures above 10°C from November through April; (2) Continental shelf waters in proximity to the western boundary of the Gulf Stream; and, (3) Water depths between 20 and 100 m.

Met buoy deployment/operation, HRG and geotechnical surveys, and vessel transits that may occur within the designated winter habitat will have no effect on this habitat because they will not: affect or change water temperatures above 10° C from November through April; affect continental shelf waters in proximity to the western boundary of the Gulf Stream; or, affect or change water depths between 20 and 100 m.

Breeding
The PBFs of concentrated breeding habitat are sites with high densities of both male and female adult individuals during the breeding season. Two units of breeding critical habitat are identified in the final rule. One occurs in the action area – a concentrated breeding site located in the nearshore waters just south of Cape Canaveral, Florida. The PCEs that support this habitat are the following: (1) High densities of reproductive male and female loggerheads; (2) Proximity to primary Florida migratory corridor; and, (3) Proximity to Florida nesting grounds.

Met buoys, HRG and geotechnical surveys, and vessel transits will not affect the habitat in the breeding units in a way that would change the density of reproductive male or female loggerheads. This is because (as explained fully above), any effects to distribution of sea turtles will be limited to intermittent, temporary disturbance limited to avoidance of an area no more than 90m from the survey vessel. The impacts to habitat from temporary increases in noise will be so small that they will be insignificant.

Constricted Migratory Corridors
The PBF of constricted migratory habitat is high use migratory corridors that are constricted (limited in width) by land on one side and the edge of the continental shelf and Gulf Stream on the other side. The final rule describes two units of constricted migratory corridor habitat. The constricted migratory corridor off North Carolina serves as a concentrated migratory pathway for loggerheads transiting to neritic foraging areas in the north, and back to winter, foraging, and/or nesting areas in the south. The constricted migratory corridor in Florida stretches from the westernmost edge of the Marquesas Keys (82.17° W. long.) to the tip of Cape Canaveral (28.46° N. lat.) and partially overlaps with the action area (i.e., the designated habitat extends further south than the action area). PCEs that support this habitat are the following: (1) Constricted continental shelf area relative to nearby continental shelf waters that concentrate migratory pathways; and, (2) Passage conditions to allow for migration to and from nesting, breeding, and/or foraging areas.

Noise associated with the survey activities considered here will have minor and temporary effects on winter habitat; however, as explained fully above, any effects to sea turtles will be limited to intermittent, temporary disturbance or avoidance of an area no more than 90m from the survey vessel. These temporary and intermittent increases in underwater noise will have insignificant effects on the conditions of the habitat that will not result in any decreased ability or availability of habitat for passage of sea turtles. No other activities will affect passage of loggerhead sea turtles in the wintering habitat.

Sargassum

The PBF of loggerhead *Sargassum* habitat is developmental and foraging habitat for young loggerheads where surface waters form accumulations of floating material, especially *Sargassum*. Two areas are identified in the final rule – the Atlantic Ocean area and the Gulf of Mexico area. The Atlantic Ocean area extends from the Gulf of Mexico along the northern/western boundary of the Gulf Stream and east to the outer edge of the U.S. EEZ. There is a small amount of overlap between the action area and the Atlantic Ocean *Sargassum* critical habitat unit on the outer edges of the action area near the 100-m isobaths. PCEs that support this habitat are the following: (i) Convergence zones, surface-water downwelling areas, the margins of major boundary currents (Gulf Stream), and other locations where there are concentrated components of the *Sargassum* community in water temperatures suitable for the optimal growth of *Sargassum* and inhabitance of loggerheads; (ii) *Sargassum* in concentrations that support adequate prey abundance and cover; (iii) Available prey and other material associated with *Sargassum* habitat including, but not limited to, plants and cyanobacteria and animals native to the *Sargassum* community such as hydroids and copepods; and, (iv) Sufficient water depth and proximity to available currents to ensure offshore transport (out of the surf zone), and foraging and cover requirements by *Sargassum* for post-hatchling loggerheads, i.e., >10 m depth.

Given the distance from shore, met buoy deployment is not anticipated in areas designated as *Sargassum* critical habitat. The occasional project vessel transits, HRG and geotechnical surveys that may occur within the designated *Sargassum* habitat will have no effect on: conditions that result in convergence zones, surface-water downwelling areas, the margins of major boundary currents (Gulf Stream), and other locations where there are concentrated components of the *Sargassum* community in water temperatures suitable for the optimal growth of *Sargassum* and inhabitance of loggerheads; the concentration of *Sargassum*; the availability of prey within *Sargassum*; or the depth of water in any area. This is because these activities do not affect hydrological or oceanographic processes, no *Sargassum* will be removed due to survey activities, and the intermittent noise associated with surveys will not affect the availability of prey within *Sargassum*.

Summary of effects to critical habitat

Any effects to designated critical habitat will be insignificant. Therefore, the survey activities considered in this programmatic consultation are not likely to adversely affect critical habitat designated for the Northwest Atlantic DPS of loggerhead sea turtles.

Vessel Traffic

The HRG and geotechnical surveys are carried out from vessels. Additionally, vessels will be used to transport met buoys to and from deployment sites and to carry out any necessary inspections. As described in BOEM's BA, survey operations involve slow moving vessels, traveling at no more than 3-4.5 knots. HRG and geotechnical surveys typically involve one to three survey vessels operating within the area to be surveyed; up to approximately 36 areas may be surveyed over the 10-year period considered here. During transits to or from survey locations, these vessels would travel at a maximum speed of around 12 knots. Met buoy deployment, retrieval, and inspection will also involve one or two vessels at a time; a total of 60 buoys are considered in this consultation. These vessels will typically travel at speeds of 12 knots or less; however, service vessels (limited to one trip per month per buoy) may travel at speeds of up to 25 knots (BOEM 2021).

Marine Mammals

As detailed in Appendix B, a number of Best Management Practices (BMPs) (see PDC 5), designed to reduce the risk of vessel strike, will be implemented for all activities covered by this programmatic consultation, including the following requirements:

1. All vessel operators and crews will maintain a vigilant watch for marine mammals at all times, and slow down or stop their vessel to avoid any interaction.
2. PSOs monitoring a Vessel Strike Avoidance Zone during all vessel operations.
3. Complying with speed restrictions in North Atlantic right whale management areas including Seasonal Management Areas (SMAs), active Dynamic Management Areas (DMAs)/visually triggered Slow Zones.
4. Daily monitoring of the NMFS North Atlantic right whale reporting systems.
5. Reducing vessel speeds to ≤10 knots when mother/calf pairs, pods, or large assemblages of ESA-listed marine mammals are observed.
6. Maintaining >500 m separation distance from all ESA-listed whales or an unidentified large marine mammal; if a whale is sighted within 200 m of the forward path of the vessel, then reducing speed and shifting the engines into neutral, and must not be engaged until the whale has move outside of the vessel’s path and beyond 500 m.

An examination of all known ship strikes from all shipping sources (civilian and military) indicates vessel speed is a principal factor in whether a vessel strike results in death of a whale (Kelley et al. 2020; Knowlton and Kraus 2001; Laist et al., 2001; Jensen and Silber 2003; Vanderlaan and Taggart 2007). In assessing records with known vessel speeds, Laist et al. (2001) found a direct relationship between the occurrence of a whale strike and the speed of the vessel involved in the collision. The authors concluded that most deaths occurred when a vessel was traveling in excess of 24.1 km/h (14.9 mph; 13 knots (kn)). Additionally, Kelley et al (2020) found that collisions that create stresses in excess of 0.241 megapascals were likely to cause lethal injuries to large whales and through biophysical modeling that vessels of all sizes can yield stresses higher than this critical level. Survey vessels will typically travel slowly (less than 4.5 knots) as necessary for data acquisition, will have PSOs monitoring for whales, and will adjust vessel operations as necessary to avoid striking whales during survey operations and transits. The only times that survey vessels will operate at speeds above 4 knots is during transit to and from the survey site where they may travel at speeds up to 12 knots (although several circumstances described below will restrict speed to 10 knots), a number of measures (see PDC 5) will be in place to minimize the risk of strike during these transits. Slow operating speeds mean that vessel operators have more time to react and steer the vessel away from a whale. The use of dedicated PSOs to keep a constant watch for whales and to alert vessel operators of any sightings also allows vessel operators to avoid striking any sighted whales.

As noted above, vessels used to inspect and maintain met buoys may travel at speeds up to 25 knots. This vessel traffic will be an extremely small increase in the amount of vessel traffic in the action area (i.e., if 60 buoys are deployed this would be a maximum of 60 trips per month spread out along the entire Atlantic OCS), which is transited by thousands of vessels each day. These vessels are subject to all of the vessel related BMPs (see PDC 5) noted above, including use of a dedicated lookout, vessel strike avoidance procedures, and requirements to slow down to 10 knots in areas where North Atlantic right whales have been documented (i.e., within SMAs, DMAs/visually triggered Slow Zones). Based on this analysis, it is extremely unlikely that a vessel associated with the survey activities considered here, when added to the environmental baseline, will strike an ESA-listed whale. We note that similar activities have taken place since at least 2012 in association with BOEM's renewable energy program and there have been no reports of any vessel strikes of marine mammals.

The frequency range for vessel noise (10 to 1000 Hz; MMS 2007) overlaps with the generalized hearing range for sei, fin, and right whales (7 Hz to 35 kHz) and sperm whales (150 Hz to 160 kHz) and would therefore be audible. Vessels without ducted propeller thrusters would produce levels of noise of 150 to 170 dB re 1 µPa-1 meter at frequencies below 1,000 Hz, while the expected sound-source level for vessels with ducted propeller thrusters level is 177 dB (RMS) at 1 meter (BOEM 2015, Rudd et al. 2015). For ROVs, source levels may be as high as 160 dB (BOEM 2021). Given that the noise associated with the operation of project vessels is below the thresholds that could result in injury, no injury is expected.

Marine mammals may experience masking due to vessel noises. For example, right whales were observed to shift the frequency content of their calls upward while reducing the rate of calling in areas of increased anthropogenic noise (Parks et al. 2007) as well as increasing the amplitude (intensity) of their calls (Parks et al. 2011a; Parks et al. 2009). Right whales also had their communication space reduced by up to 84 percent in the presence of vessels (Clark et al. 2009). Although humpback whales did not change the frequency or duration of their vocalizations in the presence of ship noise, their source levels were lower than expected, potentially indicating some signal masking (Dunlop 2016).

Vessel noise can potentially mask vocalizations and other biologically important sounds (e.g., sounds of prey or predators) that marine mammals may rely on. Potential masking can vary depending on the ambient noise level within the environment, the received level and frequency of the vessel noise, and the received level and frequency of the sound of biological interest. In the open ocean, ambient noise levels are between about 60 and 80 dB re 1 µPa in the band between 10 Hz and 10 kHz due to a combination of natural (e.g., wind) and anthropogenic sources (Urick 1983), while inshore noise levels, especially around busy ports, can exceed 120 dB re 1 µPa. When the noise level is above the sound of interest, and in a similar frequency band, masking could occur. This analysis assumes that any sound that is above ambient noise levels and within an animal's hearing range may potentially cause masking. However, the degree of masking increases with increasing noise levels; a noise that is just detectable over ambient levels is unlikely to cause any substantial masking.

Vessel noise has the potential to disturb marine mammals and elicit an alerting, avoidance, or other behavioral reaction. These reactions are anticipated to be short-term, likely lasting the amount of time the vessel and the whale are in close proximity (e.g., Magalhaes et al. 2002; Richardson et al. 1995; Watkins 1981), and not consequential to the animals. Additionally, short-term masking could occur. Masking by passing ships or other sound sources transiting the action area would be short term and intermittent, and therefore unlikely to result in any substantial costs or consequences to individual animals or populations. Areas with increased levels of ambient noise from anthropogenic noise sources such as areas around busy shipping lanes and near harbors and ports may cause sustained levels of masking for marine mammals, which could reduce an animal's ability to find prey, find mates, socialize, avoid predators, or navigate.

Based on the best available information, ESA-listed whales are either not likely to respond to vessel noise or are not likely to measurably respond in ways that would significantly disrupt normal behavior patterns that include, but are not limited to, breeding, feeding or sheltering. Therefore, the effects of vessel noise on ESA-listed whales are insignificant (i.e., so minor that the effect cannot be meaningfully evaluated or detected).

Sea Turtles

As detailed in Appendix B, a number of BMPs (see PDC 5), designed to reduce the risk of vessel strike, will be implemented for all activities covered by this programmatic consultation, including dedicated lookouts on board all transiting vessels, reduced speeds and avoidance of areas where sea turtles are likely to occur (e.g., Sargassum patches), and required separation distances from any observed sea turtles.

Sea turtles are vulnerable to vessel collisions because they regularly surface to breathe and often rest at or near the surface. Sea turtles often congregate close to shorelines during the breeding season, where boat traffic is denser (Schofield et al. 2007; Schofield et al. 2010) which can increase vulnerability to vessel strike in such areas, particularly by smaller, fast moving vessels. Sea turtles, with the exception of hatchlings and pre-recruitment juveniles, spend a majority of their time submerged (Renaud and Carpenter 1994; Sasso and Witzell 2006). Although, Hazel et al. (2007) demonstrated sea turtles preferred to stay within the three meters of the water's surface, despite deeper water being available. Any of the sea turtle species found in the action area can occur at or near the surface in open-ocean and coastal areas, whether resting, feeding or periodically surfacing to breathe.

While research is limited on the relationship between sea turtles, vessel strikes and vessel speeds, sea turtles are at risk of vessel strike where they co-occur with vessels. Sea turtle detection is likely based primarily on the animal's ability to see the oncoming vessel, which would provide less time to react to vessels traveling at speeds at or above 10 knots (Hazel et al. 2007). Hazel et al. (2007) examined vessel strike risk to green sea turtles and suggested that sea turtles may habituate to vessel sound and are more likely to respond to the sight of a vessel rather than the sound of a vessel, although both may play a role in eliciting responses (Hazel et al. 2007). Regardless of what specific stressor associated with vessels turtles are responding, they only appear to show responses (avoidance behavior) at approximately 10 m or closer (Hazel et al. 2007). This is a concern because faster vessel speeds also have the potential to result in more serious injuries (Work et al. 2010). Although sea turtles can move quickly, Hazel et al. (2007) concluded that at vessel speeds above 4 km/hour (2.1 knots) vessel operators cannot rely on turtles to actively avoid being struck. Thus, sea turtles are not considered reliably capable of moving out of the way of vessels moving at speeds greater than 2.1 knots.

While vessel struck sea turtles have been observed throughout their range, including in the action area, the regions of greatest concern for vessel strike are areas with high concentrations of recreational-boat traffic such as the eastern Florida coast, the Florida Keys, and the shallow coastal bays in the Gulf of Mexico (NRC 1990). In general, the risk of strike for sea turtles is considered to be greatest in areas with high densities of sea turtles and small, fast moving vessels such as recreational vessels or speed boats (NRC 1990). Similarly, Foley et al. (2019) concluded that in a study in Florida, vessel strike risk for sea turtles was highest at inlets and passes. Stetzar (2002) reports that 24 of 67 sea turtles stranded along the Atlantic Delaware coast from 1994-1999 had evidence of boat interactions (hull or propeller strike); however, it is unknown how many of these strikes occurred after the sea turtle died. There are no estimates of the total number of sea turtles struck by vessels in the Atlantic Ocean each year. Foley et al. (2019), estimated that strikes by motorized watercraft killed a mean of 1,326–4,334 sea turtles each year in Florida during 2000–2014 (considering the Atlantic and Gulf coasts of Florida). As described in NRC 1990, vessel strike risk for sea turtles in the Atlantic Ocean is highest in Florida.

The proposed survey activities will result in an increase in vessel traffic in the action area. Compared to baseline levels of vessel traffic in the action area (in its entirety and in any particular portion), the survey vessels, which will be likely two or three vessels operating in a particular survey area at a time (and spaced such that the sound fields of any noise producing equipment do not overlap), represent an extremely small fraction of total vessel traffic. For example, the U.S. Coast Guard's Atlantic Coast Port Access Route Study (ACPARS; USCG 2015), reports nearly 36,000 unique vessel transits through wind energy areas and lease areas along the Atlantic Coast. Those vessel transits represent only a fraction of the total coastal traffic as the wind energy areas and lease areas are located further offshore than most of the routes used by coastal tug traffic, for example. The U.S. Coast Guard's New Jersey PARS (USCG 2021) reports between 77,000 and 80,000 unique trips annual in the Atlantic Ocean off a portion of the coast of New Jersey in 2017-2019. This data is not wholly representative of all vessel traffic in this area as it only includes vessels carrying AIS systems, which is only required for vessels 65 feet in length or greater (although smaller vessels can utilize AIS and some do). Even if there were 3-boat surveys occurring in each of the four lease areas located in the New Jersey PARS study area, this would represent an increase of 12 vessels off New Jersey in a single year; this represents an approximately 0.01% increase in vessel traffic in that area. We expect that this increase is similar in other portions of the action area. If we assume that any increase in vessel traffic in the action area would increase the risk of vessel strike to sea turtles, then we could also assume that this would result in a corresponding increase in the number of sea turtles struck by vessels. However, it is unlikely that all vessels represent an equal increase in risk and the slow speeds (up to 4.5 knots) that the majority of vessels considered here will typically be moving, requirements to monitor for sea turtles during vessel transits, avoid or slowdown in areas where sea turtles are likely to occur, and to maintain distance from any sighted turtles, means that the risk to sea turtles from the survey vessels is considerably less than other vessels, particularly small, fast vessels operating in nearshore areas where sea turtle densities are high.

An analysis conducted by NMFS Southeast Regional Office (Barnette 2018) considered sea turtle vessel strike risk in Florida; the portion of the action area where risk is considered highest due to the concentration of sea turtles and vessels. Barnette (2018) concluded that, when using the conservative mean estimate of a sea turtle strike every 193 years (range of 135-250 years) per vessel, it would require approximately 200 new vessels introduced to an area to potentially result in a single sea turtle strike in any single year. Considering that the proposed action will introduce significantly fewer vessels in any particular area and that survey vessels will increase vessel traffic in the action area by less than 0.01%, and the measures that will be in place to reduce risk of vessel strike, as well as the slow speed of the survey vessels, we conclude that any increase in the number of sea turtles struck in the action area because of the increase in traffic resulting from survey vessels added to the environmental baseline is extremely unlikely. Therefore, effects of this increase in traffic are extremely unlikely.

The vessels used for the proposed project will produce low-frequency, broadband underwater sound below 1 kHz (for larger vessels), and higher-frequency sound between 1 kHz to 50 kHz (for smaller vessels), although the exact level of sound produced varies by vessel type.

ESA-listed turtles could be exposed to a range of vessel noises within their hearing abilities. Depending on the context of exposure, potential responses of green, Kemp’s ridley, leatherback, and loggerhead sea turtles to vessel noise disturbance, would include startle responses, avoidance, or other behavioral reactions, and physiological stress responses. Very little research exists on sea turtle responses to vessel noise disturbance. Currently, there is nothing in the available literature specifically aimed at studying and quantifying sea turtle response to vessel noise. However, a study examining vessel strike risk to green sea turtles suggested that sea turtles may habituate to vessel sound and may be more likely to respond to the sight of a vessel rather than the sound of a vessel, although both may play a role in prompting reactions (Hazel et al. 2007). Regardless of the specific stressor associated with vessels to which turtles are responding, they only appear to show responses (avoidance behavior) at approximately 10 m or closer (Hazel et al. 2007).

Therefore, the noise from vessels is not likely to affect sea turtles from further distances, and disturbance may only occur if a sea turtle hears a vessel nearby or sees it as it approaches. These responses appear limited to non-injurious, minor changes in behavior based on the limited information available on sea turtle response to vessel noise.

For these reasons, vessel noise is expected to cause minimal disturbance to sea turtles. If a sea turtle detects a vessel and avoids it or has a stress response from the noise disturbance, these responses are expected to be temporary and only endure while the vessel transits through the area where the sea turtle encountered it. Therefore, sea turtle responses to vessel noise disturbance are considered insignificant (i.e., so minor that the effect cannot be meaningfully evaluated), and a sea turtle would be expected to return to normal behaviors and stress levels shortly after the vessel passes by.

Marine Fish

The only listed fish in the action area that are known to be at risk of vessel strike are shortnose and Atlantic sturgeon and giant manta ray. Vessel activities will have no effect on Atlantic salmon or smalltooth sawfish. There is no information to indicate that Atlantic salmon are struck by vessels; therefore, we have concluded that strike is extremely unlikely to occur. A vessel strike to smalltooth sawfish is extremely unlikely; smalltooth sawfish are primarily demersal and rarely would be at risk from moving vessels. PDC 5 requires vessels to maintain sufficient clearance above the bottom and to reduce speeds to 5 knots or less in waters with less than 4 feet of clearance. These conditions, combined with the low likelihood of vessels operating in nearshore coastal waters of Florida where sawfish occur, is expected to eliminate risk of vessel strikes with smalltooth sawfish.

Giant Manta Ray

Giant manta rays can be frequently observed traveling just below the surface and will often approach or show little fear toward humans or vessels (Coles 1916), which may also make them vulnerable to vessel strikes (Deakos 2010); vessel strikes can injure or kill giant manta rays, decreasing fitness or contributing to non-natural mortality (Couturier et al. 2012; Deakos et al. 2011). However, information about interactions between vessels and giant manta rays is limited. We have at least some reports of vessel strike, including a report of five giant manta rays struck by vessels from 2016 through 2018; individuals had injuries (i.e., fresh or healed dorsal surface propeller scars) consistent with a vessel strike. These interactions were observed by researchers conducting surveys from Boynton Beach to Jupiter, Florida (J. Pate, Florida Manta Project, pers. comm. to M. Miller, NMFS OPR, 2018) and it is unknown where the manta was at the time of the vessel strike. The giant manta ray is frequently observed in nearshore coastal waters and feeding at inlets along the east coast of Florida. As recreational vessel traffic is concentrated in and around inlets and nearshore waters, this overlap exposes the giant manta ray in these locations to an increased likelihood of potential vessel strike injury especially from faster moving recreational vessels. Yet, few instances of confirmed or suspected strandings of giant manta rays are attributed to vessel strike injury. This lack of documented mortalities could also be the result of other factors that influence carcass detection (i.e., wind, currents, scavenging, decomposition etc.); however, giant manta rays appear to be able to be fast and agile enough to avoid most moving vessels, as anecdotally evidenced by videos showing rays avoiding interactions with high-speed vessels.

While there is limited available information on the giant manta ray, we expect the circumstances and factors resulting in vessel strike injury are similar between sea turtles and the giant manta ray because these species are both found in nearshore waters (including in the vicinity of inlets where vessel traffic may also be concentrated) and may spend significant time at or near the surface. Therefore, consistent with Barnette 2018, we will rely on the more robust available data on sea turtle vessel strike injury to serve as a proxy for the giant manta ray. Because the activities considered here will result in far fewer than 200 new vessels, it is extremely unlikely that any giant manta rays will be struck by new or increased vessel traffic.

Sturgeon

Here, we consider whether the increase in vessel traffic is likely to increase the risk of strike for Atlantic or shortnose sturgeon in any part of the action area. Because the increase in traffic will be limited to no more than two or three survey vessels operating in an area being surveyed at one time, the increase in vessel traffic in any portion of the action area, as well as the action area as a whole, will be extremely small.

We do not expect shortnose sturgeon to occur along the survey routes in the Atlantic Ocean because coastal migrations are extremely rare. However, Atlantic sturgeon are present in this part of the action area. Both shortnose and Atlantic sturgeon may occur in nearshore waters and rivers and bays that may be surveyed for potential cable corridors and/or may be used for survey vessel transits to or from ports.

While we know that vessels and sturgeon co-occur in many portions of their range, we have no reports of vessel strikes outside of rivers and coastal bays. The risk of strike is expected to be considerably less in the Atlantic Ocean than in rivers. This is because of the greater water depth, lack of obstructions or constrictions and the more disperse nature of vessel traffic and more disperse distribution of individual sturgeon. All of these factors are expected to decrease the likelihood of an encounter between an individual sturgeon and a vessel and also increase the likelihood that a sturgeon would be able to avoid any vessel. While we cannot quantify the risk of vessel strike in the portions of the Atlantic Ocean that overlap with the action area, we expect the risk to be considerably lower than it is within the Delaware River, which is considered one of the areas with the highest risk of vessel strike for Atlantic sturgeon.

As evidenced by reports and collections of Atlantic and shortnose sturgeon with injuries consistent with vessel strike (NMFS unpublished data[8]), both species are struck and killed by vessels in the Delaware River. Brown and Murphy (2010) reported that from 2005-2008, 28 Atlantic sturgeon carcasses were collected in the Delaware River; approximately 50% showed signs of vessel interactions. Delaware Division of Fish and Wildlife has been recording information on suspected vessel strikes since 2005. From May 2005 – March 2016, they recorded a total of 164 carcasses, 44 of which were presumed to have a cause of death attributable to vessel interaction. Estimates indicate that up to 25 Atlantic sturgeon may be struck and killed in the Delaware River annually (Fox, unpublished 2016). Information on the number of shortnose sturgeon struck and killed by vessels in the Delaware River is currently limited to reports provided to NMFS through our sturgeon salvage permit. A review of the database indicates that of the 53 records of salvaged shortnose sturgeon (2008-2016), 11 were detected in the Delaware River. Of these 11, 6 had injuries consistent with vessel strike. This is considerably less than the number of records of Atlantic sturgeon from the Delaware River with injuries consistent with vessel strike (15 out of 33 over the same time period). Based on this, we assume that more Atlantic sturgeon are struck by vessels in the Delaware River than shortnose sturgeon.

Several major ports are present along the Delaware River. In 2014, there were 42,398 one-way trips reported for commercial vessels in the Delaware River Federal navigation channel (USACE 2014). In 2020, 2,195 cargo ships visited Delaware River ports[9]. Neither of these numbers include any recreational or other non-commercial vessels, ferries, tug boats assisting other larger vessels or any Department of Defense vessels (i.e., Navy, USCG, etc.).

If we assume that any increase in vessel traffic in the Delaware River would increase the risk of vessel strike to shortnose or Atlantic sturgeon, then we could also assume that this would result in

[8] The unpublished data are reports received by NMFS and recorded as part of the sturgeon salvage program authorized under ESA permit 17273.
[9] *https://ajot.com/news/maritime-exchange-reports-2020-ship-arrivals*; last accessed March 24, 2021

a corresponding increase in the number of sturgeon struck and killed in the Delaware River. However, it is unlikely that all vessels represent an equal increase in risk, the slow speeds (4.5 knots) and shallower drafts of the survey vessels may mean that the risk to sturgeon is not as greater as faster moving deep draft cargo or tanker vessels as sturgeon may be able to more readily avoid the survey vessels and may not even overlap in the same part of the water column. The survey activities considered here will involve up to three slow-moving (up to 4.5 knots) vessels operating in a similar area. Sets of survey vessels will be dispersed along the coast and not co-occur in time or space. Even if there were four surveys in a year that transited the Delaware River (equivalent to the number of BOEM leases that are proximal to the entrance of Delaware Bay), that would be an increase of 12 vessels annually. Considering only the number of commercial one way trips in a representative year (42,398), an increase of 12 vessels operating in the Delaware River represents an approximately 0.03% increase in vessel traffic in the Delaware River navigation channel in a particular year. The actual percent increase in vessel traffic is likely even less considering that commercial traffic is only a portion of the vessel traffic in the river. Even in a worst-case scenario that assumes that all 25 Atlantic sturgeon struck and killed in the Delaware River in an average year occurred in the portion of the Delaware River that will be transited by the survey vessels, and that any increase in vessel traffic results in a proportionate increase in vessel strikes, this increase in vessel traffic would result in a hypothetical additional 0.0075 Atlantic sturgeon struck and killed in the Delaware River in a given year. Assuming a maximum case that four, 3-boat surveys transit the Delaware River every year for the 10 years considered here, that would result in a hypothetical additional 0.075 Atlantic sturgeon struck and killed in the Delaware River. Because we expect fewer strikes of shortnose sturgeon, the hypothetical increase in the number of struck shortnose sturgeon would be even less. Given this very small increase in traffic and the similar very small potential increase in risk of strike and a calculated potential increase in the number of strikes that is very close to zero, we conclude that any increase in the number of sturgeon struck because of the increase in traffic resulting from survey vessels operating in the Delaware River or Delaware Bay is extremely unlikely. BOEM has indicated that survey vessels may also transit the lower Chesapeake Bay and New York Bight/lower Hudson River. The risk of vessel strike in these areas is considered to be lower than in the Delaware River; thus, any prediction of vessel strike for the Delaware River can be considered a conservative estimate of vessel strike risk in other areas. Even applying this hypothetical increased risk for all three areas, we would estimate that a hypothetical additional 0.2 Atlantic sturgeon would be killed coast-wide over a 10-year period. As noted above, this is likely an overestimate given the slower speed of survey vessels compared to other vessels which is anticipated to reduce risk. Based on this analysis, effects of this increase in traffic are extremely unlikely. In addition, given the very small increase in risk and the calculated increase in strikes is close to zero, the effect of adding the survey vessels to the baseline cannot be meaningfully measured, detected, or evaluated; therefore, effects are also insignificant.

Vessel Noise

The vessels used for the proposed project will produce low-frequency, broadband underwater sound below 1 kHz (for larger vessels), and higher-frequency sound between 1 kHz to 50 kHz (for smaller vessels), although the exact level of sound produced varies by vessel type. In general, information regarding the effects of vessel noise on fish hearing and behaviors is limited. Some TTS has been observed in fishes exposed to elevated background noise and other white noise, a continuous sound source similar to noise produced from vessels. Caged studies on sound pressure sensitive fishes show some TTS after several days or weeks of exposure to increased background sounds, although the hearing loss appeared to recover (e.g., Scholik and Yan 2002; Smith et al. 2006; Smith et al. 2004a). Smith et al. (2004b) and Smith et al. (2006) exposed goldfish (a fish with hearing specializations, unlike any of the ESA-listed species considered in this opinion) to noise with a sound pressure level of 170 dB re 1 μPa and found a clear relationship between the amount of TTS and duration of exposure, until maximum hearing loss occurred at about 24 hours of exposure. A short duration (e.g., 10-minute) exposure resulted in 5 dB of TTS, whereas a three-week exposure resulted in a 28 dB TTS that took over two weeks to return to pre-exposure baseline levels (Smith et al. 2004b). Recovery times were not measured by researchers for shorter exposure durations, so recovery time for lower levels of TTS was not documented.

Vessel noise may also affect fish behavior by causing them to startle, swim away from an occupied area, change swimming direction and speed, or alter schooling behavior (Engas et al. 1998; Engas et al. 1995; Mitson and Knudsen 2003). Physiological responses have also been documented for fish exposed to increased boat noise. Nichols et al. (2015) demonstrated physiological effects of increased noise (playback of boat noise) on coastal giant kelpfish. The fish exhibited acute stress responses when exposed to intermittent noise, but not to continuous noise. These results indicate variability in the acoustic environment may be more important than the period of noise exposure for inducing stress in fishes. However, other studies have also shown exposure to continuous or chronic vessel noise may elicit stress responses indicated by increased cortisol levels (Scholik and Yan 2001; Wysocki et al. 2006). These experiments demonstrate physiological and behavioral responses to various boat noises that have the potential to affect species' fitness and survival, but may also be influenced by the context and duration of exposure. It is important to note that most of these exposures were continuous, not intermittent, and the fish were unable to avoid the sound source for the duration of the experiment because this was a controlled study. In contrast, wild fish are not hindered from movement away from an irritating sound source, if detected, so are less likely to subjected to accumulation periods that lead to the onset of hearing damage as indicated in these studies. In other cases, fish may eventually become habituated to the changes in their soundscape and adjust to the ambient and background noises.

All fish species can detect vessel noise due to its low-frequency content and their hearing capabilities. Because of the characteristics of vessel noise, sound produced from vessels is unlikely to result in direct injury, hearing impairment, or other trauma to ESA-listed fish. Plus, in the near field, fish are able to detect water motion as well as visually locate an oncoming vessel. In these cases, most fishes located in close proximity that detect the vessel either visually, via sound and motion in the water would be capable of avoiding the vessel or move away from the area affected by vessel sound. Thus, fish are more likely to react to vessel noise at close range than to vessel noise emanating from a greater distance away. These reactions may include physiological stress responses, or avoidance behaviors. Auditory masking due to vessel noise can potentially mask biologically important sounds that fish may rely on. However, impacts from vessel noise would be intermittent, temporary, and localized, and such responses would not be expected to compromise the general health or condition of individual fish from continuous exposures. Instead, the only impacts expected from exposure to project vessel noise for Atlantic sturgeon may include temporary auditory masking, physiological stress, or minor changes in behavior.

Therefore, similar to marine mammals and sea turtles, exposure to vessel noise for fishes could result in short-term behavioral or physiological responses (e.g., avoidance, stress). Vessel noise would only result in brief periods of exposure for fishes and would not be expected to accumulate to the levels that would lead to any injury, hearing impairment or long-term masking of biologically relevant cues. For these reasons, any effects of vessel noise on ESA-listed fish is considered insignificant (i.e., so minor that the effect cannot be meaningfully measured, detected, or evaluated).

Consideration of Effects of the Actions on Air Quality

In order to issue an OCS Air Permit for an activity considered in this consultation, EPA must conclude that the activity will not cause or contribute to a violation of applicable national ambient air quality standards (NAAQS) or prevention of significant deterioration (PSD) increments. The NAAQS are health-based standards that the EPA sets to protect public health with an adequate margin of safety. The PSD increments are designed to ensure that air quality in an area that meets the NAAQS does not significantly deteriorate from baseline levels. At this time, there is no information on the effects of air quality on listed species that may occur in the action area. However, as the PSD increments are designed to ensure that air quality in the area regulated by any OCS Air Permit do not significantly deteriorate from baseline levels, we conclude that any effects to listed species from these emissions will be so small that they cannot be meaningfully measured, detected, or evaluated and therefore are insignificant.

CONCLUSIONS

As explained above, we have determined that the actions considered here are not likely to adversely affect any ESA-listed species or critical habitat. The requirements for reviewing survey activities as they are developed will ensure that surveys carried out under this programmatic consultation do not have effects that exceed those considered here.

Reinitiation of consultation is required and shall be requested by BOEM or by NMFS where discretionary federal involvement or control over the action has been retained or is authorized by law and “(a) If the amount or extent of taking specified in the incidental take statement is exceeded; (b) If new information reveals effects of the action that may affect listed species or critical habitat in a manner or to an extent not previously considered; (c) If the identified action is subsequently modified in a manner that causes an effect to the listed species or critical habitat that was not considered in the biological opinion; or (d) If a new species is listed or critical habitat designated that may be affected by the identified action.” For the activities considered here, no take is anticipated or exempted; take is defined in the ESA as “to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect or attempt to engage in any such conduct.” If there is any incidental take of a listed species, reinitiation would be required. As required by the PDCs outlined in Appendix B, all observations of dead or injured listed species should be reported to us immediately.

Should you have any questions regarding this consultation, please contact Julie Crocker of my staff at (978) 282-8480 or by e-mail (*Julie.Crocker@noaa.gov*).

Sincerely,

Jennifer Anderson

All Figures and Tables Reproduced from BOEM's February 2021 BA

Figure 1. Action Area for this programmatic consultation.

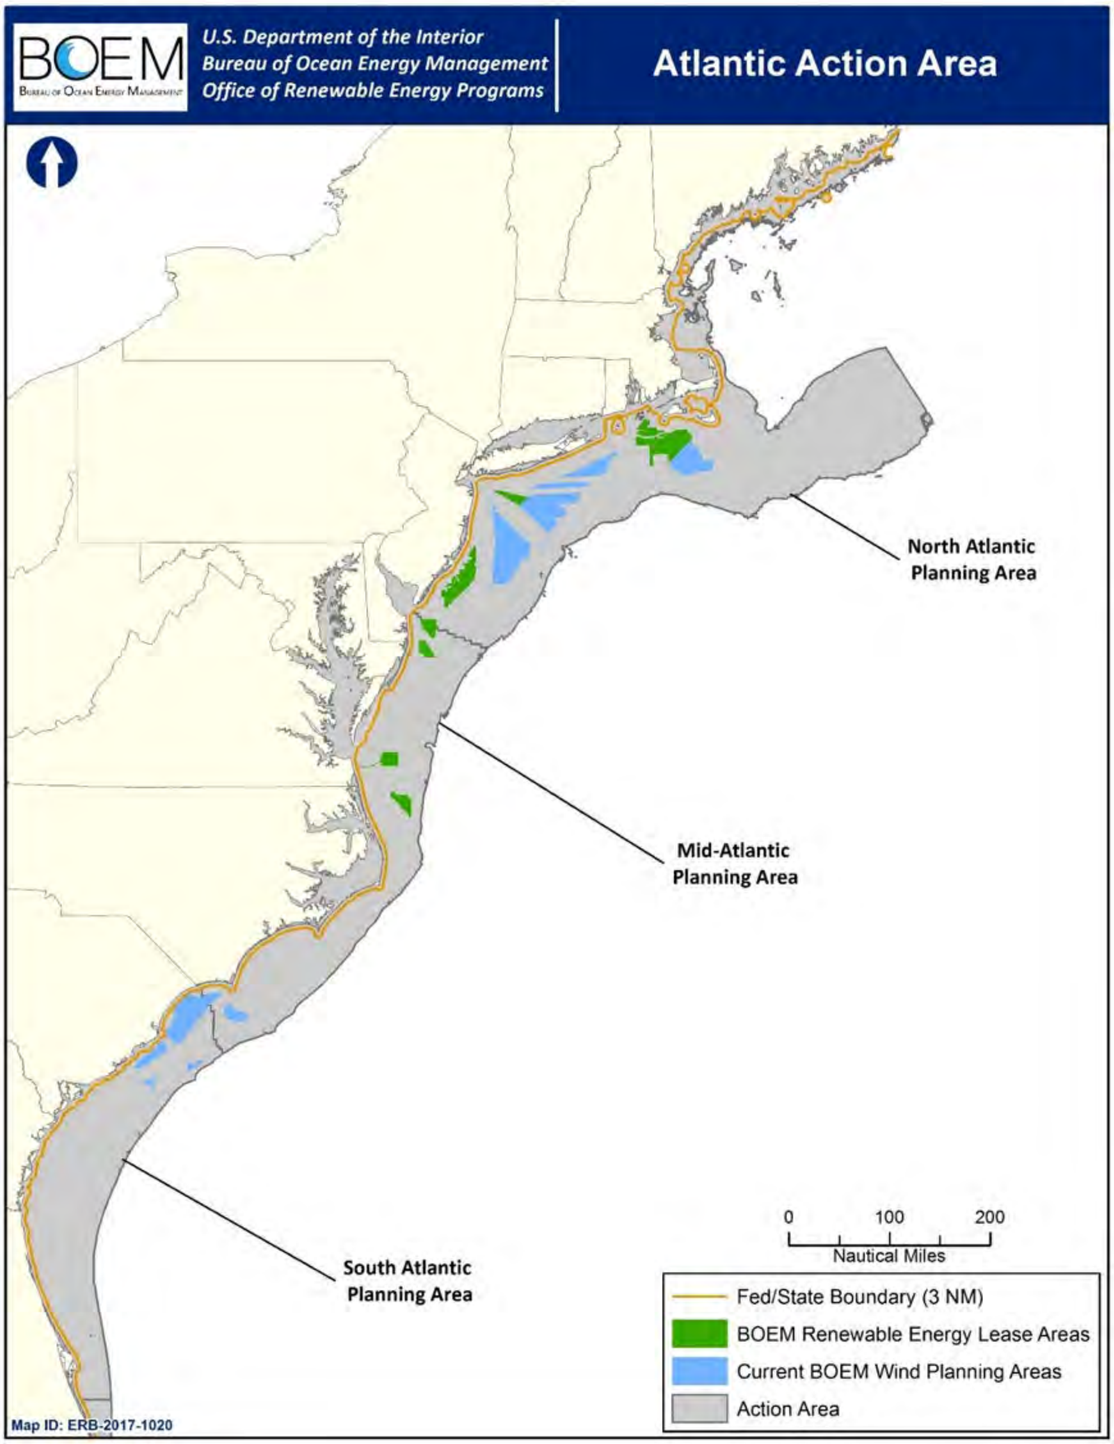

Table A.1 Description of Representative HRG Survey Equipment and Methods

Equipment Type	Data Collection and/or Survey Types	Description of the Equipment
Acoustic Corer™ (https://www.pangeosubsea.com/acoustic-corer/)	Stationary acoustic source deployed on the seafloor with low and mid frequency chirp sonars to detect shallow (15 m to 40 m) subsea hazards such as boulders, cavities, and abandoned infrastructure by generating a 3D, 12-m diameter "acoustic core" to full penetration depth (inset above).	A seabed deployed unit with dual subsurface scanning sonar heads attached to a 12-m boom. The system is set on a tripod on the seafloor. Each arm rotates 180 degrees to cover a full 360 degrees. Chirp sonars of different frequencies can be attached to each arm providing for multi-aspect depth resolution. Acoustic cores supplement geophysical surveys such as bore holes and Cone Penetration Testing.
Bathymetry/ multi-beam echosounder	Bathymetric charting	A depth sounder is a microprocessor-controlled, high-resolution survey-grade system that measures precise water depths in both digital and graphic formats. The system would be used in such a manner as to record with a sweep appropriate to the range of water depths expected in the survey area.
Magnetometer	Collection of geophysical data for shallow hazards and archaeological resources assessments	Surveys would be used to detect and aid in the identification of ferrous or other objects having a distinct magnetic signature. A sensor is typically towed as near as possible to the seafloor and anticipated to be no more than approximately 20 ft. (6 m) above the seafloor.
Shallow and Medium (Seismic) Penetration Profilers (i.e. Chirps, Sparkers, Boomers, Bubble Guns)	Collection of geophysical data for shallow hazards and archaeological resources assessments and to characterize subsurface sediments	High-resolution CHIRP System sub-bottom profiler or boomers are used to generate a profile view below the bottom of the seabed, which is interpreted to develop a geologic cross-section of subsurface sediment conditions under the track line surveyed. Another type of sub-bottom profiler that may be employed is a medium penetration system such as a boomer, bubble pulser or impulse-type system. Sub-bottom profilers are capable of penetrating sediment depth ranges of 10 ft. (3 m) to greater than 328 ft. (100 m), depending on frequency and bottom composition.
Side-Scan Sonar	Collection of geophysical data for shallow hazards and archaeological resources assessments	This survey evaluates surface and near-surface sediments, seafloor morphology, and potential surface obstructions (MMS, 2007a). A typical side-scan sonar system consists of a top-side processor, tow cable, and towfish with transducers (or "pingers") located on the sides. Typically, a lessee would use a digital dual-frequency side-scan sonar system with 300 to 500 kHz frequency ranges or greater to record continuous planimetric images of the seafloor.

Table A.2. Acoustic Characteristics of Representative HRG Survey Equipment. Note list of equipment is representative and surveys may use similar equipment and actual source levels may be below those indicated.

	Highest Measured Source Level (Highest Power Setting)						
HRG Source	**Source Setting**	**PK**	**RMS**	**SEL**	**Pulse Width (s)**	**Main Pulse Frequency (kHz)**	**Inter-Pulse Interval (s) (1/PPS)**
Mobile, Impulsive, Intermittent Sources							
AA200 Boomer Plate	250 J (low)	209	200	169	0.0008	4.3	1.0 (1 pps)
AA251 Boomer Plate	300 J (high)	216	207	176	0.0007	4.3	1.0 (1 pps)
Applied Acoustic Delta Sparker	2400 J at 1 m depth, 0.5 kHz	221	205	185	0.0095	0.5	.33333 (1-3 pps)
Applied Acoustic Dura-Spark	2400 J (high), 400 tips	225	214	188	0.0022	2.7	.33333 (1-3 pps)
Applied Acoustics S-Boom (3 AA252 boomer plates)	700 J	211	205	172	0.0006	6.2	1.0 (1 pps)
Applied Acoustics S-Boom (CSP-N Source)	1000 J	209	203	172	0.0009	3.8	.33333 (3 pps)
ELC820 Sparker	750 J (high) 1m depth	214	206	182	0.0039	1.2	1.0 (1 pps)
FSI HMS-620D Bubble Gun	Dual Channel 86 cm	204	198	173	0.0033	1.1	8.0 (1 per 8 s)
Mobile, Non-Impulsive, Intermittent Sources							
Bathyswath SWATHplus-M	100%, 234 kHz	223	218	180	0.00032	≥200 kHz	0.2000 pps (unknown)
Echotrac CV100 Single-Beam Echosounder	Power 12, 80 cycles, 200 kHz	196	193	159	0.00036	≥200 kHz	0.0500 (20 pps)
EdgeTech 424 with 3200-XS topside processor (Chirp)	100% power, 4-20 kHz	187	180	156	0.0046	7.2-11	.12500 (8 pps)

EdgeTech 512i Sub-bottom Profiler, 8.9 kHz (Chirp)	100% power, 2-12 kHz	186	180	159	0.0087	6.3-8.9	.12500 (8 pps)
EdgeTech 4200 Side-Scan	100%, 100 kHz (also a 400 kHz setting)	206	201	179	0.0072	100 kHz	.03333 (30 pps)
Klein 3000 Side-Scan	132 kHz (also capable of 445 kHz)	224	219	184	0.000343	132 kHz	.03333 (30 pps)
Klein 3900 Side-Scan	445 kHz	226	220	179	0.000084	≥200 kHz	unreported
Knudsen 3202 Sub-bottom Profiler (2 transducers), 5.7 kHz	Power 4	214	209	193	0.0217	3.3-5.7	0.25000 (4 pps)
Reson Seabat 7111 Multibeam Echosounder	100 kHz	228	224	185	0.00015	100 kHz	0.0500 (20 pps)
Reson Seabat T20P Multibeam Echosounder	200, 300, or 400 kHz	221	218	182	0.00025	≥200 kHz	0.0200 (50 pps)

Source: Highest reported source levels reported in Crocker and Fratantonio (2016).

Table 1. Predicted isopleths for peak pressure (using 20 LogR) and cSEL using NOAA's general spreadsheet tool (December 2020 Revision) to predict cumulative exposure distances using the highest power levels were used for each sound source reported in Crocker and Fratantonio (2016).

APPENDIX B

Project Design Criteria (PDC) and Best Management Practices (BMPs) for Threatened and Endangered Species for Site Characterization and Site Assessment Activities to Support Offshore Wind Projects

Any survey plan must meet the following minimum requirements specified below, except when complying with these requirements would put the safety of the vessel or crew at risk.

PDC 1: Avoid Live Bottom Features

BMPs:

1. All vessel anchoring and any seafloor-sampling activities (i.e., drilling or boring for geotechnical surveys) are restricted from seafloor areas with consolidated seabed features.[1] All vessel anchoring and seafloor sampling must also occur at least 150 m from any known locations of threatened or endangered coral species. All sensitive live bottom habitats (eelgrass, cold-water corals, etc.) should be avoided as practicable. All vessels in coastal waters will operate in a manner to minimize propeller wash and seafloor disturbance and transiting vessels should follow deep-water routes (e.g., marked channels), as practicable, to reduce disturbance to sturgeon and sawfish habitat.

PDC 2: Avoid Activities that Could Affect Early Life Stages of Atlantic Sturgeon

BMP:

1. No geotechnical or bottom disturbing activities will take place during the spawning/rearing season within freshwater reaches of rivers where Atlantic or shortnose sturgeon spawning occurs. Any survey plan that includes geotechnical or other benthic sampling activities in freshwater reaches (salinity 0-0.5 ppt) of such rivers will identify a time of year restriction that will avoid such activities during the time of year when Atlantic sturgeon spawning and rearing of early life stages occurs in that river. Appropriate time of year restrictions include the following:

River	No Work Window	Area Affected
Hudson	April – July	Upstream of the Delaware Memorial Bridge
Delaware	April – July	Upstream of Newburgh, NY - Beacon Bridge/Rt 84

This table will be supplemented with additional rivers as necessary.

PDC 3: Marine Trash and Debris Awareness and Prevention

"*Marine trash and debris*" is defined as any object or fragment of wood, metal, glass, rubber, plastic, cloth, paper or any other solid, man-made item or material that is lost or discarded in the marine environment by the Lessee or an authorized representative of the Lessee (collectively, the

[1] Consolidated seabed features for this measure are pavement, scarp walls, and deep/cold-water coral reefs and shallow/mesophotic reefs as defined in the CMECS Geologic Substrate Classifications.

"Lessee") while conducting activities on the OCS in connection with a lease, grant, or approval issued by the Department of the Interior (DOI). To understand the type and amount of marine debris generated, and to minimize the risk of entanglement in and/or ingestion of marine debris by protected species, lessees must implement the following BMPS.

BMPs:

1. Training: All vessel operators, employees, and contractors performing OCS survey activities on behalf of the Lessee (collectively, "Lessee Representatives") must complete marine trash and debris awareness training annually. The training consists of two parts: (1) viewing a marine trash and debris training video or slide show (described below); and (2) receiving an explanation from management personnel that emphasizes their commitment to the requirements. The marine trash and debris training videos, training slide packs, and other marine debris related educational material may be obtained at https://www.bsee.gov/debris. The training videos, slides, and related material may be downloaded directly from the website. Lessee Representatives engaged in OCS survey activities must continue to develop and use a marine trash and debris awareness training and certification process that reasonably assures that they, as well as their respective employees, contractors, and subcontractors, are in fact trained. The training process must include the following elements:
    a. Viewing of either a video or slide show by the personnel specified above;
    b. An explanation from management personnel that emphasizes their commitment to the requirements;
    c. Attendance measures (initial and annual); and
    d. Recordkeeping and availability of records for inspection by DOI.

   By January 31 of each year, the Lessee must submit to DOI an annual report signed by the Lessee that describes its marine trash and debris awareness training process and certifies that the training process has been followed for the previous calendar year. You must send the reports via email to *renewable_reporting@boem.gov* and to *marinedebris@bsee.gov*.

2. Marking: Materials, equipment, tools, containers, and other items used in OCS activities which are of such shape or configuration that they are likely to snag or damage fishing devices, and could be lost or discarded overboard, must be clearly marked with the vessel or facility identification and properly secured to prevent loss overboard. All markings must clearly identify the owner and must be durable enough to resist the effects of the environmental conditions to which they may be exposed.

3. Recovery: Lessees must recover marine trash and debris that is lost or discarded in the marine environment while performing OCS activities when such incident is likely to: (a) cause undue harm or damage to natural resources, including their physical, atmospheric, and biological components, with particular attention to those that could result in the entanglement of or ingestion by marine protected species; or (b) significantly interfere with OCS uses (e.g., are likely to snag or damage fishing

equipment, or present a hazard to navigation). Lessees must notify DOI when recovery activities are (i) not possible because conditions are unsafe; or (ii) not practicable because the marine trash and debris released is not likely to result in any of the conditions listed in (a) or (b) above. The lessee must recover the marine trash and debris lost or discarded if DOI does not agree with the reasons provided by the Lessee to be relieved from the obligation to recover the marine trash and debris. If the marine trash and debris is located within the boundaries of a potential archaeological resource/avoidance area, or a sensitive ecological/benthic resource area, the Lessee must contact DOI for approval prior to conducting any recovery efforts.

Recovery of the marine trash and debris should be completed immediately, but no later than 30 days from the date in which the incident occurred. If the Lessee is not able to recover the marine trash or debris within 48 hours (*See* BMP 4. Reporting), the Lessee must submit a recovery plan to DOI explaining the recovery activities to recover the marine trash or debris ("Recovery Plan"). The Recovery Plan must be submitted no later than 10 calendar days from the date in which the incident occurred. Unless otherwise objected by DOI within 48 hours of the filing of the Recovery Plan, the Lessee can proceed with the activities described in the Recovery Plan. The Lessee must request and obtain approval of a time extension if recovery activities cannot be completed within 30 days from the date in which the incident occurred. The Lessee must enact steps to prevent similar incidents and must submit a description of these actions to BOEM and BSEE within 30 days from the date in which the incident occurred.

4. Reporting: The Lessee must report all marine trash and debris lost or discarded to DOI (using the email address listed on DOI's most recent incident reporting guidance). This report applies to all marine trash and debris lost or discarded, and must be made monthly, no later than the fifth day of the following month. The report must include the following:

    a. Project identification and contact information for the lessee, operator, and/or contractor;
    b. The date and time of the incident;
    c. The lease number, OCS area and block, and coordinates of the object's location (latitude and longitude in decimal degrees);
    d. A detailed description of the dropped object to include dimensions (approximate length, width, height, and weight) and composition (e.g., plastic, aluminum, steel, wood, paper, hazardous substances, or defined pollutants);
    e. Pictures, data imagery, data streams, and/or a schematic/illustration of the object, if available;
    f. Indication of whether the lost or discarded item could be a magnetic anomaly of greater than 50 nanoTesla (nT), a seafloor target of greater than 0.5 meters (m), or a sub-bottom anomaly of greater than 0.5m when operating a magnetometer or gradiometer, side scan sonar, or sub-bottom profile in accordance with DOI's applicable guidance;
    g. An explanation of how the object was lost; and

h. A description of immediate recovery efforts and results, including photos.

In addition to the foregoing, the Lessee must submit a report within 48 hours of the incident ("48-hour Report") if the marine trash or debris could (a) cause undue harm or damage to natural resources, including their physical, atmospheric, and biological components, with particular attention to those that could result in the ingestion by or entanglement of marine protected species; or (b) significantly interfere with OCS uses (e.g., are likely to snag or damage fishing equipment, or present a hazard to navigation). The information in the 48-hour Report would be the same as that listed above, but just for the incident that triggered the 48-hour Report. The Lessee must report to DOI if the object is recovered and, as applicable, any substantial variation in the activities described in the Recovery Plan that were required during the recovery efforts. Information on unrecovered marine trash and debris must be included and addressed in the description of the site clearance activities provided in the decommissioning application required under 30 CFR § 585.906. The Lessee is not required to submit a report for those months in which no marine trash and debris was lost or discarded.

PDC 4: Minimize Interactions with Listed Species during Geophysical Survey Operations
To avoid injury of ESA-listed species and minimize any potential disturbance, the following measures will be implemented for all vessels operating impulsive survey equipment that emits sound at frequency ranges <180 kHz (within the functional hearing range of marine mammals)[2] as well as CHIRP sub bottom profilers. The Clearance Zone is defined as the area around the sound source that needs to be visually cleared of listed species for 30 minutes before the sound source is turned on. The Clearance Zone is equivalent to a minimum visibility zone for survey operations to begin (*See* BMP 6). The Shutdown Zone is defined as the area around the sound source that must be monitored for possible shutdown upon detection of protected species within or entering that zone. For both the Clearance and Shutdown Zones, these are minimum visibility distances and for situational awareness PSOs should observe beyond this area when possible.

BMPs:

1. For situational awareness a Clearance Zone extending at least (500 m in all directions) must be established around all vessels operating sources <180 kHz.
    a. The Clearance Zone must be monitored by approved third-party PSOs at all times and any observed listed species must be recorded (see reporting requirements below).
    b. For monitoring around the autonomous surface vessel (ASV) where remote PSO monitoring must occur from the mother vessel, a dual thermal/HD camera must be installed on the mother vessel facing forward and angled in a direction so as to provide a field of view ahead of the vessel and around the ASV. PSOs must be able to monitor the real-time output of the camera on hand-held computer tablets. Images from the cameras must be able to be captured and reviewed to assist in verifying species identification. A monitor must also be installed in the bridge displaying the real-time images from the thermal/HD camera installed on

[2] Note that this requirement does not apply to Parametric Subbottom Profilers, Ultra Short Baseline, echosounders or side scan sonar; the acoustic characteristics (frequency, narrow beam width, rapid attenuation) are such that no effects to listed species are anticipated.

the front of the ASV itself, providing a further forward view of the craft. In addition, night-vision goggles with thermal clip-ons and a handheld spotlight must be provided and used such that PSOs can focus observations in any direction around the mother vessel and/or the ASV.

2. To minimize exposure to noise that could be disturbing, Shutdown Zone(s) (500 m for North Atlantic right whales and 100 m for other ESA-listed whales visible at the surface) must be established around the sources operating at <180 kHz being towed from the vessel .
    a. The Shutdown Zone(s) must be monitored by third-party PSOs at all times when noise-producing equipment (<180 kHz) is being operated and all observed listed species must be recorded (see reporting requirements below).
    b. If an ESA-listed species is detected within or entering the respective Shutdown Zone, any noise-producing equipment operating below 180 kHz must be shut off until the minimum separation distance from the source is re-established (500 m for North Atlantic right whales and 100 m for other ESA-listed species, including other ESA-listed marine mammals) and the measures in (5) are carried out.
        i. A PSO must notify the survey crew that a shutdown of all active boomer, sparker, and bubble gun acoustic sources below 180 kHz is immediately required. The vessel operator and crew must comply immediately with any call for a shutdown by the PSO. Any disagreement or discussion must occur only after shutdown.
    c. If the Shutdown Zone(s) cannot be adequately monitored for ESA-listed species presence (i.e., a PSO determines conditions, including at night or other low-visibility conditions, are such that listed species cannot be reliably sighted within the Shutdown Zone(s), no equipment operating at <180 kHz can be deployed until such time that the Shutdown Zone(s) can be reliably monitored.
3. Before any noise-producing survey equipment (operating at <180 kHz) is deployed, the Clearance Zone (500 m for all listed species) must be monitored for 30 minutes of pre-clearance observation.
    a. If any ESA-listed species is observed within the Clearance Zone during the 30-minute pre-clearance period, the 30-minute clock must be paused. If the PSO confirms the animal has exited the zone and headed away from the survey vessel, the 30-minute clock that was paused may resume. The pre-clearance clock will reset to 30 minutes if the animal dives or visual contact is otherwise lost.
4. When technically feasible, a “ramp up” of the electromechanical survey equipment must occur at the start or re-start of geophysical survey activities. A ramp up must begin with the power of the smallest acoustic equipment for the geophysical survey at its lowest power output. When technically feasible the power will then be gradually turned up and other acoustic sources added in a way such that the source level would increase gradually.
5. Following a shutdown for any reason, ramp up of the equipment may begin immediately only if: (a) the shutdown is less than 30 minutes, (b) visual monitoring of

the Shutdown Zone(s) continued throughout the shutdown, (c) the animal(s) causing the shutdown was visually followed and confirmed by PSOs to be outside of the Shutdown Zone(s) (500 m for North Atlantic right whales and 100 m for other ESA-listed species, including other ESA-listed marine mammals) and heading away from the vessel, and (d) the Shutdown Zone(s) remains clear of all listed species. If all (a, b, c, and d) the conditions are not met, the Clearance Zone (500 m for all listed species) must be monitored for 30 minutes of pre-clearance observation before noise-producing equipment can be turned back on.

6. In order for geophysical surveys to be conducted at night or during low-visibility conditions, PSOs must be able to effectively monitor the Clearance and Shutdown Zone(s). No may occur if the Clearance and Shutdown Zone(s) cannot be reliably monitored for the presence of ESA-listed species to ensure avoidance of injury to those species.
    a. An Alternative Monitoring Plan (AMP) must be submitted to BOEM (or the federal agency authorizing, funding, or permitting the survey) detailing the monitoring methodology that will be used during nighttime and low-visibility conditions and an explanation of how it will be effective at ensuring that the Shutdown Zone(s) can be maintained during nighttime and low-visibility survey operations. The plan must be submitted 60 days before survey operations are set to begin.
    b. The plan must include technologies that have the technical feasibility to detect all ESA-listed whales out to 500 m and sea turtles to 100 m.
    c. PSOs should be trained and experienced with the proposed alternative monitoring technology.
    d. The AMP must describe how calibration will be performed, for example, by including observations of known objects at set distances and under various lighting conditions. This calibration should be performed during mobilization and periodically throughout the survey operation.
    e. PSOs shall make nighttime observations from a platform with no visual barriers, due to the potential for the reflectivity from bridge windows or other structures to interfere with the use of the night vision optics.
7. To minimize risk to North Atlantic right whales, no surveys may occur in Cape Cod Bay from January 1 - May 15 of any year (in an area beginning at 42°04′56.5″ N-070°12′00.0″ W; thence north to 42°12′00.0″ N-070°12′00.0″ W; thence due west to charted mean high water line; thence along charted mean high water within Cape Cod Bay back to beginning point).
8. Sound sources used within the North Atlantic right whale Critical Habitat Southeastern U.S. Calving Area (i.e., Unit 2) during the calving and nursing season (December-March) shall operate at frequencies <7 kHz and >35 kHz (functional hearing range of right whales) at night or low visibility conditions.
9. At times when multiple survey vessels are operating within a lease area, adjacent lease areas, or exploratory cable routes, a minimum separation distance (to be determined on a survey specific basis, dependent on equipment being used) must be maintained between survey vessels to ensure that sound sources do not overlap.
10. To minimize disturbance to the Northwest Atlantic Ocean DPS of loggerhead sea turtles, a voluntary pause in sparker operation should be implemented for all vessels

operating in nearshore critical habitat for loggerhead sea turtles. These conditions apply to critical habitat boundaries for nearshore reproductive habitats LOGG N-3 through LOGG N-16 (79 FR 39855) from April 1 to September 30. Following pre-clearance procedures, if any loggerhead or other unidentified sea turtles is observed within a 100 m Clearance Zone during a survey, sparker operation should be paused by turning off the sparker until the sea turtle is beyond 100 m of the survey vessel. If the animal dives or visual contact is otherwise lost, sparker operation may resume after a minimum 2-minute pause following the last sighting of the animal.

11. Any visual observations of listed species by crew or project personnel must be communicated to PSOs on-duty.
12. During good conditions (e.g., daylight hours; Beaufort scale 3 or less) when survey equipment is not operating, to the maximum extent practicable, PSOs must conduct observations for protected species for comparison of sighting rates and behavior with and without use of active geophysical survey equipment. Any observed listed species must be recorded regardless of any mitigation actions required.

PDC 5: Minimize Vessel Interactions with Listed Species

All vessels associated with survey activities (transiting [i.e., travelling between a port and the survey site] or actively surveying) must comply with the vessel strike avoidance measures specified below. The only exception is when the safety of the vessel or crew necessitates deviation from these requirements. If any such incidents occur, they must be reported as outlined below under Reporting Requirements (PDC 8). The Vessel Strike Avoidance Zone is defined as 500 m or greater from any sighted ESA-listed species or other unidentified large marine mammal.

BMPs:

1. Vessel captain and crew must maintain a vigilant watch for all protected species and slow down, stop their vessel, or alter course, as appropriate and regardless of vessel size, to avoid striking any listed species. The presence of a single individual at the surface may indicate the presence of submerged animals in the vicinity; therefore, precautionary measures should always be exercised. If pinnipeds or small delphinids of the following genera: Delphinus, Lagenorhynchus, Stenella, and Tursiops are visually detected approaching the vessel (i.e., to bow ride) or towed equipment, vessel strike avoidance and shutdown is not required.
2. Anytime a survey vessel is underway (transiting or surveying), the vessel must maintain a 500 m minimum separation distance and a PSO must monitor a Vessel Strike Avoidance Zone (500 m or greater from any sighted ESA-listed species or other unidentified large marine mammal visible at the surface) to ensure detection of that animal in time to take necessary measures to avoid striking the animal. If the survey vessel does not require a PSO for the type of survey equipment used, a trained crew lookout may be used (see #3). For monitoring around the autonomous surface vessels, regardless of the equipment it may be operating, a dual thermal/HD camera must be installed on the mother vessel facing forward and angled in a direction so as to provide a field of view ahead of the vessel and around the ASV. A dedicated operator must be able to monitor the real-time output of the camera on hand-held computer tablets. Images from the cameras must be able to be captured and reviewed to assist in verifying species identification. A monitor must also be

installed in the bridge displaying the real-time images from the thermal/HD camera installed on the front of the ASV itself, providing a further forward view of the craft.

a. Survey plans must include identification of vessel strike avoidance measures, including procedures for equipment shut down and retrieval, communication between PSOs/crew lookouts, equipment operators, and the captain, and other measures necessary to avoid vessel strike while maintaining vessel and crew safety. If any circumstances are anticipated that may preclude the implementation of this PDC, they must be clearly identified in the survey plan and alternative procedures outlined in the plan to ensure minimum distances are maintained and vessel strikes can be avoided.
b. All vessel crew members must be briefed in the identification of protected species that may occur in the survey area and in regulations and best practices for avoiding vessel collisions. Reference materials must be available aboard all project vessels for identification of listed species. The expectation and process for reporting of protected species sighted during surveys must be clearly communicated and posted in highly visible locations aboard all project vessels, so that there is an expectation for reporting to the designated vessel contact (such as the lookout or the vessel captain), as well as a communication channel and process for crew members to do so.
c. The Vessel Strike Avoidance Zone(s) are a minimum and must be maintained around all surface vessels at all times.
d. If a large whale is identified within 500 m of the forward path of any vessel, the vessel operator must steer a course away from the whale at 10 knots (18.5 km/hr) or less until the 500 m minimum separation distance has been established. Vessels may also shift to idle if feasible.
e. If a large whale is sighted within 200 m of the forward path of a vessel, the vessel operator must reduce speed and shift the engine to neutral. Engines must not be engaged until the whale has moved outside of the vessel's path and beyond 500 m. If stationary, the vessel must not engage engines until the large whale has moved beyond 500 m.
f. If a sea turtle or manta ray is sighted within the operating vessel's forward path, the vessel operator must slow down to 4 knots (unless unsafe to do so) and steer away as possible. The vessel may resume normal operations once the vessel has passed the individual.
g. During times of year when sea turtles are known to occur in the survey area, vessels must avoid transiting through areas of visible jellyfish aggregations or floating vegetation (e.g., sargassum lines or mats). In the event that operational safety prevents avoidance of such areas, vessels must slow to 4 knots while transiting through such areas.
h. Vessels operating in water depths with less than 4 ft. clearance between the vessel and the bottom should maintain speeds no greater than 4 knots to minimize vessel strike risk to sturgeon and sawfish.

3. To monitor the Vessel Strike Avoidance Zone, a PSO (or crew lookout if PSOs are not required) must be posted during all times a vessel is underway (transiting or surveying) to monitor for listed species in all directions.

   a. Visual observers monitoring the vessel strike avoidance zone can be either PSOs or crew members (if PSOs are not required). If the trained lookout is a vessel crew member, this must be their designated role and primary responsibility while the vessel is transiting. Any designated crew lookouts must receive training on protected species identification, vessel strike minimization procedures, how and when to communicate with the vessel captain, and reporting requirements. All observations must be recorded per reporting requirements.
   b. Regardless of monitoring duties, all crew members responsible for navigation duties must receive site-specific training on ESA-listed species sighting/reporting and vessel strike avoidance measures.
4. Regardless of vessel size, vessel operators must reduce vessel speed to 10 knots (18.5 mph) or less while operating in any Seasonal Management Area (SMA), Dynamic Management Area (DMA)/Slow Zones triggered by visual detection of North Atlantic right whales. The only exception to this requirement is for vessels operating in areas within a DMA/visually triggered Slow Zone where it is not reasonable to expect the presence of North Atlantic right whales (e.g. Long Island Sound, shallow harbors). Reducing vessel speed to 10 knots or less while operating in Slow Zones triggered by acoustic detections of North Atlantic right whales is encouraged.
5. Vessels underway must not divert their course to approach any listed species.
6. All vessel operators must check for information regarding mandatory or voluntary ship strike avoidance (SMAs, DMAs, Slow Zones) and daily information regarding North Atlantic right whale sighting locations. These media may include, but are not limited to: NOAA weather radio, U.S. Coast Guard NAVTEX and channel 16 broadcasts, Notices to Mariners, the Whale Alert app, or WhaleMap website.
   a. North Atlantic right whale Sighting Advisory System info can be accessed at: https://apps-nefsc.fisheries.noaa.gov/psb/surveys/MapperiframeWithText.html
   b. Information about active SMAs, DMAs, and Slow Zones can be accessed at: https://www.fisheries.noaa.gov/national/endangered-species-conservation/reducing-vessel-strikes-north-atlantic-right-whales

PDC 6: Minimize Risk During Buoy Deployment, Operations, and Retrieval
Any mooring systems used during survey activities prevent any potential entanglement or entrainment of listed species, and in the unlikely event that entanglement does occur, ensure proper reporting of entanglement events according to the measures specified below.

BMPs:
1. Ensure that any buoys attached to the seafloor use the best available mooring systems. Buoys, lines (chains, cables, or coated rope systems), swivels, shackles, and anchor designs must prevent any potential entanglement of listed species while ensuring the safety and integrity of the structure or device.
2. All mooring lines and ancillary attachment lines must use one or more of the following measures to reduce entanglement risk: shortest practicable line length, rubber sleeves, weak-links, chains, cables or similar equipment types that prevent lines from looping, wrapping, or entrapping protected species.
3. Any equipment must be attached by a line within a rubber sleeve for rigidity. The length of the line must be as short as necessary to meet its intended purpose.

4. During all buoy deployment and retrieval operations, buoys should be lowered and raised slowly to minimize risk to listed species and benthic habitat. Additionally, PSOs or trained project personnel (if PSOs are not required) should monitor for listed species in the area prior to and during deployment and retrieval and work should be stopped if listed species are observed within 500 m of the vessel to minimize entanglement risk.
5. If a live or dead marine protected species becomes entangled, you must immediately contact the applicable NMFS stranding coordinator using the reporting contact details (see Reporting Requirements section) and provide any on-water assistance requested.
6. All buoys must be properly labeled with owner and contact information.

PDC 7: Protected Species Observers
Qualified third-party PSOs to observe Clearance and Shutdown Zones must be used as outlined in the conditions above.

BMPs:
1. All PSOs must have completed an approved PSO training program and must receive NMFS approval to act as a PSO for geophysical surveys. Documentation of NMFS approval for geophysical survey activities in the Atlantic and copies of the most recent training certificates of individual PSOs' successful completion of a commercial PSO training course with an overall examination score of 80% or greater must be provided upon request. Instructions and application requirements to become a NMFS-approved PSO can be found at: *www.fisheries.noaa.gov/national/endangered-species-conservation/protected-species-observers*.
2. In situations where third-party party PSOs are not required, crew members serving as lookouts must receive training on protected species identification, vessel strike minimization procedures, how and when to communicate with the vessel captain, and reporting requirements.
3. PSOs deployed for geophysical survey activities must be employed by a third-party observer provider. While the vessel is underway, they must have no other tasks than to conduct observational effort, record data, and communicate with and instruct relevant vessel crew to the presence of listed species and associated mitigation requirements. PSOs on duty must be clearly listed on daily data logs for each shift.
   a. Non-third-party observers may be approved by NMFS on a case-by-case basis for limited, specific duties in support of approved, third-party PSOs.
4. A minimum of one PSO (assuming condition 5 is met) must be on duty observing for listed species at all times that noise-producing equipment <180 kHz is operating, or the survey vessel is actively transiting during daylight hours (i.e. from 30 minutes prior to sunrise and through 30 minutes following sunset). Two PSOs must be on duty during nighttime operations. A PSO schedule showing that the number of PSOs used is sufficient to effectively monitor the affected area for the project (e.g., surveys) and record the required data must be included. PSOs must not be on watch for more than 4 consecutive hours, with at least a 2-hour break after a 4-hour watch. PSOs must not be on active duty observing for more than 12 hours in any 24-hour period.
5. Visual monitoring must occur from the most appropriate vantage point on the associated operational platform that allows for 360-degree visual coverage around the vessel. If

360-degree visual coverage is not possible from a single vantage point, multiple PSOs must be on watch to ensure such coverage.

6. Suitable equipment must be available to each PSO to adequately observe the full extent of the Clearance and Shutdown Zones during all vessel operations and meet all reporting requirements.
   a. Visual observations must be conducted using binoculars and the naked eye while free from distractions and in a consistent, systematic, and diligent manner.
   b. Rangefinders (at least one per PSO, plus backups) or reticle binoculars (e.g., 7 x 50) of appropriate quality (at least one per PSO, plus backups) to estimate distances to listed species located in proximity to the vessel and Clearance and Shutdown Zone(s).
   c. Digital full frame cameras with a telephoto lens that is at least 300 mm or equivalent. The camera or lens should also have an image stabilization system. Used to record sightings and verify species identification whenever possible.
   d. A laptop or tablet to collect and record data electronically.
   e. Global Positioning Units (GPS) if data collection/reporting software does not have built-in positioning functionality.
   f. PSO data must be collected in accordance with standard data reporting, software tools, and electronic data submission standards approved by BOEM and NMFS for the particular activity.
   g. Any other tools deemed necessary to adequately perform PSO tasks.

PDCs 8: Reporting Requirements

To ensure compliance and evaluate effectiveness of mitigation measures, regular reporting of survey activities and information on listed species will be required as follows.

BMPs:

1. Data from all PSO observations must be recorded based on standard PSO collection and reporting requirements. PSOs must use standardized electronic data forms to record data. The following information must be reported electronically in a format approved by BOEM and NMFS:

   Visual Effort:
   a. Vessel name;
   b. Dates of departures and returns to port with port name;
   c. Lease number;
   d. PSO names and affiliations;
   e. PSO ID (if applicable);
   f. PSO location on vessel;
   g. Height of observation deck above water surface (in meters);
   h. Visual monitoring equipment used;
   i. Dates and times (Greenwich Mean Time) of survey on/off effort and times corresponding with PSO on/off effort;
   j. Vessel location (latitude/longitude, decimal degrees) when survey effort begins and ends; vessel location at beginning and end of visual PSO duty shifts; recorded at 30 second intervals if obtainable from data collection software, otherwise at practical regular interval;

k. Vessel heading and speed at beginning and end of visual PSO duty shifts and upon any change;
l. Water depth (if obtainable from data collection software) (in meters);
m. Environmental conditions while on visual survey (at beginning and end of PSO shift and whenever conditions change significantly), including wind speed and direction, Beaufort scale, Beaufort wind force, swell height (in meters), swell angle, precipitation, cloud cover, sun glare, and overall visibility to the horizon;
n. Factors that may be contributing to impaired observations during each PSO shift change or as needed as environmental conditions change (e.g., vessel traffic, equipment malfunctions);
o. Survey activity information, such as type of survey equipment in operation, acoustic source power output while in operation, and any other notes of significance (i.e., pre-clearance survey, ramp-up, shutdown, end of operations, etc.);

Visual Sighting (all Visual Effort fields plus):

a. Watch status (sighting made by PSO on/off effort, opportunistic, crew, alternate vessel/platform);
b. Vessel/survey activity at time of sighting;
c. PSO/PSO ID who sighted the animal;
d. Time of sighting;
e. Initial detection method;
f. Sightings cue;
g. Vessel location at time of sighting (decimal degrees);
h. Direction of vessel’s travel (compass direction);
i. Direction of animal’s travel relative to the vessel;
j. Identification of the animal (e.g., genus/species, lowest possible taxonomic level, or unidentified); also note the composition of the group if there is a mix of species;
k. Species reliability;
l. Radial distance;
m. Distance method;
n. Group size; Estimated number of animals (high/low/best);
o. Estimated number of animals by cohort (adults, yearlings, juveniles, calves, group composition, etc.);
p. Description (as many distinguishing features as possible of each individual seen, including length, shape, color, pattern, scars or markings, shape and size of dorsal fin, shape of head, and blow characteristics);
q. Detailed behavior observations (e.g., number of blows, number of surfaces, breaching, spyhopping, diving, feeding, traveling; as explicit and detailed as possible; note any observed changes in behavior);
r. Mitigation Action; Description of any actions implemented in response to the sighting (e.g., delays, shutdown, ramp-up, speed or course alteration, etc.) and time and location of the action.
s. Behavioral observation to mitigation;
t. Equipment operating during sighting;
u. Source depth (in meters);

   v. Source frequency;
   w. Animal's closest point of approach and/or closest distance from the center point of the acoustic source;
   x. Time entered shutdown zone;
   y. Time exited shutdown zone;
   z. Time in shutdown zone;
   aa. Photos/Video
2. The project proponent must submit a final monitoring report to BOEM and NMFS (to *renewable_reporting@boem.gov* and *nmfs.gar.incidental-take@noaa.gov*) within 90 days after completion of survey activities. The report must fully document the methods and monitoring protocols, summarizes the survey activities and the data recorded during monitoring, estimates of the number of listed species that may have been taken during survey activities, describes, assesses and compares the effectiveness of monitoring and mitigation measures. PSO sightings and effort data and trackline data in Excel spreadsheet format must also be provided with the final monitoring report.
3. Reporting sightings of North Atlantic right whales:
   a. If a North Atlantic right whale is observed at any time by a PSO or project personnel during surveys or vessel transit, sightings must be reported within two hours of occurrence when practicable and no later than 24 hours after occurrence. In the event of a sighting of a right whale that is dead, injured, or entangled, efforts must be made to make such reports as quickly as possible to the appropriate regional NOAA stranding hotline (from Maine-Virginia report sightings to 866-755-6622, and from North Carolina-Florida to 877-942-5343). Right whale sightings in any location may also be reported to the U.S. Coast Guard via channel 16 and through the WhaleAlert App (http://www.whalealert.org/).
   b. Further information on reporting a right whale sighting can be found at: *https://apps-nefsc.fisheries.noaa.gov/psb/surveys/documents/20120919_Report_a_Right_Whale.pdf*
4. In the event of a vessel strike of a protected species by any survey vessel, the project proponent must immediately report the incident to BOEM (*renewable_reporting@boem.gov*) and NMFS (*nmfs.gar.incidental-take@noaa.gov*) and for marine mammals to the NOAA stranding hotline: from Maine-Virginia, report to 866-755-6622, and from North Carolina-Florida to 877-942-5343 and for sea turtles from Maine-Virginia, report to 866-755-6622, and from North Caroline-Florida to 844-732-8785. The report must include the following information:
   a. Name, telephone, and email or the person providing the report;
   b. The vessel name;
   c. The Lease Number;
   d. Time, date, and location (latitude/longitude) of the incident;
   e. Species identification (if known) or description of the animal(s) involved;
   f. Vessel's speed during and leading up to the incident;
   g. Vessel's course/heading and what operations were being conducted (if applicable);
   h. Status of all sound sources in use;

   i. Description of avoidance measures/requirements that were in place at the time of the strike and what additional measures were taken, if any, to avoid strike;
   j. Environmental conditions (wave height, wind speed, light, cloud cover, weather, water depth);
   k. Estimated size and length of animal that was struck;
   l. Description of the behavior of the species immediately preceding and following the strike;
   m. If available, description of the presence and behavior of any other protected species immediately preceding the strike;
   n. Disposition of the animal (e.g., dead, injured but alive, injured and moving, blood or tissue observed in the water, last sighted direction of travel, status unknown, disappeared); and
   o. To the extent practicable, photographs or video footage of the animal(s).
5. Sightings of any injured or dead listed species must be immediately reported, regardless of whether the injury or death is related to survey operations, to BOEM (*renewable_reporting@boem.gov*), NMFS (*nmfs.gar.incidental-take@noaa.gov*), and the appropriate regional NOAA stranding hotline (from Maine-Virginia report sightings to 866-755-6622, and from North Carolina-Florida to 877-942-5343 for marine mammals and 844-732-8785 for sea turtles). If the project proponent’s activity is responsible for the injury or death, they must ensure that the vessel assist in any salvage effort as requested by NMFS. When reporting sightings of injured or dead listed species, the following information must be included:
   a. Time, date, and location (latitude/longitude) of the first discovery (and updated location information if known and applicable);
   b. Species identification (if known) or description of the animal(s) involved;
   c. Condition of the animal(s) (including carcass condition if the animal is dead);
   d. Observed behaviors of the animal(s), if alive;
   e. If available, photographs or video footage of the animal(s); and
   f. General circumstances under which the animal was discovered.
6. Reporting and Contact Information:
   a. Dead and/or Injured Protected Species:
      1. NMFS Greater Atlantic Region’s Stranding Hotline: 866-755-6622
      2. NMFS Southeast Region’s Stranding Hotline: 877-942-5343 (marine mammals), 844-732-8785 (sea turtles)
   ii. Injurious Takes of Endangered and Threatened Species:
      1. NMFS Greater Atlantic Regional Office, Protected Resources Division (*nmfs.gar.incidental-take@noaa.gov*)
      2. BOEM Environment Branch for Renewable Energy, Phone: 703-787-1340, Email: *renewable_reporting@boem.gov*

OMB Control Number: 1014-0023
OMB Approved Expiration Date: November 30, 2018

UNITED STATES DEPARTMENT OF THE INTERIOR
BUREAU OF SAFETY AND ENVIRONMENTAL ENFORCEMENT (BSEE) GULF OF MEXICO OUTER CONTINENTAL SHELF (OCS) REGION

BSEE NTL No. 2015-G03 Effective Date: December 17, 2015

NOTICE TO LESSEES AND OPERATORS (NTL) OF FEDERAL OIL, GAS, AND SULPHUR LEASES AND PIPELINE RIGHT-OF-WAY HOLDERS IN THE OCS, GULF OF MEXICO OCS REGION

Marine Trash and Debris Awareness and Elimination

This NTL is being issued pursuant to 30 CFR 250.103, and 250.300, to provide information on the Offshore Operators Committee (OOC) marine trash and debris awareness training video and slide show. This NTL also provides the mailing and email addresses for submitting annual training reports. This NTL supersedes and replaces NTL No. 2012-G01, effective January 1, 2012, on this subject and applies to all existing and future oil and gas operations in the Gulf of Mexico OCS unless and until expressly superseded.

Background

Marine trash and debris pose a threat to fish, marine mammals, sea turtles, and other marine animals; cause costly delays and repairs for commercial and recreational boating interests; detract from the aesthetic quality of recreational shore fronts; and increase the cost of beach and park maintenance. As oil and gas industry activities expand into deeper waters, the number of species of protected marine animals exposed to marine debris is increasing and now includes the sperm whale, an endangered species, as well as other marine mammals and five species of sea turtles. The discharge of garbage and debris has been the subject of strict laws, such as MARPOL-Annex V and the Marine Debris Act, 33 U.S.C. 1951 *et seq.*, and regulations imposed by various agencies including the United States Coast Guard and the Environmental Protection Agency

Since oil and gas operations in the Gulf of Mexico may contribute to this problem, 30 CFR 250.300(a) and (b)(6) prohibit you from discharging containers and other materials into the marine environment, and 30 CFR 250.300(c) and (d) require you to make durable identification markings on skid-mounted equipment, portable containers, spools or reels, and drums, and to record and report such items when lost overboard to the District Manager through facility daily operations reports. Therefore, in accordance with 30 CFR 250.300(a) and (b)(6), you should exercise special caution when you handle and transport small items and packaging materials, particularly those made of non-biodegradable, environmentally persistent materials such as plastic or glass that can be lost in the marine environment and washed ashore. Increasing your workers' awareness of the problem and emphasizing their responsibilities will help reduce the litter problem further and control the unintended loss of items such as empty buckets, hard hats, shrink wrap, strip lumber and pipe thread protectors.

Marine Trash and Debris Placards

You should continue to post placards that include each of the information text boxes in Appendix 1 of this NTL in prominent places on all fixed and floating production facilities that have sleeping or food preparation capabilities and on mobile drilling units engaged in oil and gas operations in the Gulf of Mexico OCS. Each of the placards depicted, with the language specified, should be displayed on an approximately 5x8 inch format or larger. These signs should be displayed at line-of-sight height at or near boat landings and heliports, in mess areas, and in the recreation or training or orientation area. One or more areas may be omitted if there is insufficient space. These notices should be referenced, and their contents explained, during any initial orientation given on the facility for visitors or occupants. Placards should be sturdy enough to withstand the local environment and should be replaced when damage or wear compromises readability.

Marine Trash and Debris Awareness Training

All of your offshore employees and those contractors actively engaged in your offshore operations (*e.g.*, wireline operators, contract lease operators, and maintenance or construction crews) should complete marine trash and debris awareness training annually.

The training for employees and contractors consists of two parts: (1) viewing a marine trash and debris training video or slide show; and (2) receiving an explanation from management personnel of the lessee or designated lease operator that emphasizes their commitment to the message of this NTL.

You may obtain the marine trash and debris training video, training slide packs, and other marine debris related educational material produced by the OOC, through the OOC website at http://www.theooc.us/marinedebris.html. The video and slides are offered in English and Spanish versions and the video is available as a DVD or VHS tape. The video, slides, and related material may also be downloaded directly from the website.

Marine Trash and Debris Awareness Training and Certification Process

You should continue to develop and use a marine trash and debris awareness training and certification process that reasonably assures that the employees and contractors specified above are in fact trained. Your training process should include the following elements:

1) viewing of either the video or the slide show by the personnel specified above using one of the following methods:
   a) attendance at periodic meetings held for this purpose;
   b) as part of several scheduled training components;
   c) web-based training with email notification; or
   d) training by a third-party contractor;
2) an explanation from the management that conveys the commitment of the company to achieve the objectives of the trash and debris containment requirement;
3) attendance measures (initial and annual); and
4) recordkeeping and availability of records for inspection by BSEE.

By January 31st of each year, you should provide BSEE with an annual report (1-2 pages) signed by a company official that describes your marine trash and debris awareness training process and certifies that the training process has been followed for the previous calendar year. A sample annual report/certification letter is available at the OOC website above. You should send the report by email to marinedebris@bsee.gov.

In lieu of emailing the report, you may send a printed copy to:

Bureau of Safety and Environmental Enforcement
Gulf of Mexico OCS Region
Office of Environmental Compliance (MS GE466)
1201 Elmwood Park Blvd.
New Orleans, Louisiana 70123

Guidance Document Statement

BSEE issues NTLs as guidance documents in accordance with 30 CFR 250.103 to clarify or provide more detail about certain BSEE regulatory requirements and to outline the information you must provide in your various submittals. Under that authority, this NTL sets forth a policy on, and an interpretation of, a regulatory requirement that provides a clear and consistent approach to complying with the requirements.

Paperwork Reduction Act of 1995 (PRA) Statement

The PRA (44 U.S.C. 3501 et seq.) requires us to inform you that we collect the information described in this NTL to ensure that you conduct operations in a manner that will not jeopardize threatened or endangered species or destroy or adversely modify critical habitat that has been designated for those species. We protect all proprietary information submitted according to the Freedom of Information Act and 30 CFR 250.197. An agency may not conduct or sponsor a collection of information unless it displays a currently valid Office of Management and Budget (OMB) Control Number. We estimate the hour burden to be 1 hour for the training video request; 3 hours relating to recordkeeping; and 1.5 hours for each annual report and certification. The placard postings are exempt from the PRA requirements. Direct comments regarding the burden or any other aspect of this information collection to the BSEE Information Collection Clearance Officer; 45600 Woodland Rd., Sterling, VA 20166.

In addition, this NTL refers to information collection requirements under 30 CFR 250, Subpart C. OMB has approved all of the information collection requirements in these regulations and assigned OMB Control Number 1014-0023.

Contact

Submit any questions regarding this NTL by e-mail to: marinedebris@bsee.gov.

Gulf of Mexico OCS Region

Appendix I

Marine Debris Placards

WHAT IS MARINE DEBRIS?

Marine debris is any object or fragment of wood, metal, glass, rubber, plastic, cloth, paper or any other man-made item or material that is lost or discarded in the marine environment. Marine debris may be intentionally dumped, accidentally dropped, or indirectly deposited. Whatever the source, marine debris is a direct result of human activities on land and at sea. Depending upon its composition, marine debris may sink to the seafloor, drift in the water column, or float on the surface of the sea. Certain debris, such as plastics, can persist for hundreds of years in the marine environment without decomposing.

WARNING!

YOUR ACTIONS MAY SUBJECT YOU TO SEVERE LEGAL CONSEQUENCES!

The disposal and/or discharge of any solid waste anywhere in the marine environment (other than ground-up food particles) is strictly prohibited by U.S. Coast Guard and Environmental Protection Agency regulations. THIS INCLUDES MATERIALS OR DEBRIS ACCIDENTALLY LOST OVERBOARD.

The disposal of equipment, cables, chains, containers or other materials into offshore waters is prohibited by the Bureau of Safety and Environmental Enforcement (30 CFR 250.300(b)(6)). THIS INCLUDES MATERIALS OR DEBRIS ACCIDENTALLY LOST OVERBOARD.

ATTENTION!

MARINE DEBRIS MAY CAUSE SEVERE ECOLOGICAL DAMAGE!

Marine debris discarded or lost from offshore and coastal sources may injure or kill fish, marine mammals, sea turtles, seabirds and other wildlife.

Thousands of marine animals, including marine mammals, sea turtles and seabirds, die every year from entanglement in fishing line, strapping bands, discarded ropes and nets and plastic six-pack rings. Additionally, unknown numbers of marine animals die each year from internal injury, intestinal blockage and starvation as a result of ingesting marine debris.

Marine debris fouls boat propellers and clogs water intake ports on engines thereby endangering the safety of fishermen and boaters and resulting in heavy loss of time and money.

Marine debris detracts from the aesthetic quality of recreational beaches and shorelines and increases the cost of park and beach maintenance.

ATTENTION!

SECURE ALL LOOSE ARTICLES!

NOAA Fisheries now expects petroleum industry personnel to pick up and recover any articles lost overboard from boats and offshore structures as safety conditions permit. Additionally, 30 CFR 250.300 (d) requires recording and reporting items lost overboard to the District Manager through facility daily operations reports.

Protect marine animals, as well as your valuable time and money, by doing the following to prevent accidental loss of these items:

Properly securing all materials, equipment, and personal belongings. Articles such as hardhats, life vests, sunglasses, cigarette lighters, parts bags, buckets, shrink wrap, strip lumber, and pipe thread protectors become marine debris when lost overboard.

Making sure that all trash receptacles have tight fitting lids and that the lids are used.

Providing and using secure cigarette butt containers. Cigarette butts are one of the most common forms of marine debris. Many cigarette butts contain some form of plastic and do not decompose in the ocean. Cigarette butts pose a major threat to marine wildlife as they resemble food and cause gut blockages and starvation when ingested.

Do your part to eliminate marine debris. Encourage others to be responsible about marine debris by making suggestions to secure potential marine debris on your boat or structure or by participating in a beach cleanup.

DEPARTMENT OF HOMELAND SECURITY
U.S. Coast Guard

OMB Approval: 1625-0011
Expiration Date: 05/31/2021

PRIVATE AIDS TO NAVIGATION APPLICATION

(See attached instructions and copy of Code of Federal Regulations, Title 33, Chap. 1, Part 66)

NO PRIVATE AID TO NAVIGATION MAY BE AUTHORIZED UNLESS A COMPLETED APPLICATION FORM HAS BEEN RECEIVED (14 U.S.C. 83; 33 CFR. 66. 01-5).

1. ACTION REQUESTED FOR PRIVATE AIDS TO NAVIGATION: ☐ A. ESTABLISH AND MAINTAIN ☐ B. DISCONTINUE ☐ C. CHANGE ☐ D. TRANSFER OWNERSHIP

2. DATE ACTION TO START:

3. AIDS WILL BE OPERATED: ☐ A. YEAR-ROUND ☐ B. TEMPORARILY UNTIL ☐ C. SEASONAL FROM TO

4. NECESSITY FOR AID *(Continue in Block 8)*

5. GENERAL LOCALITY

6. AUTHORIZING PERMIT FOR THIS STRUCTURE OR BUOY
USACE ☐ PERMIT AND/ OR STATE ☐ PERMIT (Valid Permit Number)

FOR DISTRICT COMMANDERS ONLY		**7. APPLICANT WILL FILL IN APPLICABLE REMAINING COLUMNS**

PRIVACY NOTICE

Authority: 14 U.S.C. 83, 14 U.S.C. 85.

Purpose: To obtain approval to establish a private aid to navigation, applicants must submit CG 2554 (Private Aids to Navigation Application). Information about the private aid to navigation (type, color, geographic position), as well as the applicant's contact information is stored in the U.S. Coast Guard's United States Aids to Navigation Information Management System (USAIMS). USAIMS is the U.S. Coast Guard's comprehensive database for managing information about aids to navigation. USAIMS has user access controls in place to govern who may view or access information.

Routine Uses: Authorized USCG personnel will utilize this information to contact owners in the event of a discrepancy or a mishap to a private aid to navigation. Any external disclosures of data within this record will be made in accordance with DHS/ALL-002, Department of Homeland Security (DHS) Mailing and Other Lists System, November 25, 2008, 73 FR 71659.

Consequences of Failure to Provide Information: Mandatory. Failure to provide the required contact information will prevent approval to establish a private aid to navigation.

U.S. COAST GUARD
PRIVATE AIDS TO NAVIGATION APPLICATION
INSTRUCTIONS

1. The rules, regulations, and procedures pertaining to private aids to navigation are set forth in the excerpt of the Code of Federal Regulations; Title 33, Chapter 1, Part 66 on the following pages.

2. One copy of the application for private aids to navigation shall be forwarded via postal mail, electronic mail, or facsimile to the Commander of the Coast Guard District in which the aids will be located. Sections of charts or sketches showing the work proposed should accompany each application.

3. When making application for private aids to navigation to mark structures and mooring buoys in navigable waters or to mark the excavating or depositing of material therein, evidence is required of the authorization obtained from the U.S. Army Corps of Engineers (USACE), Department of the Army, for such work, (Code of Federal Regulations; Title 33, Part 322.) and/or State Regulatory Agency.

4. The applicant shall complete all of Blocks 1, 2, 3, 4, 5, 9 and 10 for all new applications. When a private aid to navigation is being discontinued, Block 3 need not be completed. Block 6 shall be completed whenever authorization is required to be obtained from Corps of Engineers (See Instruction No. 3). Columns in Block 7 will be completed as follows:
  a. Unlighted buoy(s) - 7a, 7e, 7f, and 7j.
  b. Lighted buoy(s) - 7a, 7b, 7c, 7d, 7e, 7f, 7g, 7h, and 7j.
  c. Daybeacon(s) - 7a, 7e, 7f (if applicable), 7h, 7i, and 7j.
  d. Light(s) on a structure - 7a, 7b, 7c, 7d, 7e, 7f (if applicable), 7g, 7h, 7i, and 7j.

5. When a private aid to navigation is being changed, Block 8 shall be used to describe the nature of the change.

6. The required information for each column includes the following:
  (7a) Proposed number or letter to be assigned to the private aid to navigation.
  (7b) Period of light (time in seconds for one complete cycle).
  (7c) Flash length in seconds. For complex or multiple flashes, explain in column (7j).
  (7d) Color of light.
  (7e) Position as determined by Global Positioning System (GPS), differential GPS, professional surveyor, by two or more horizontal angles, or bearing and distance from a prominent charted landmark. If a prominent charted landmark is not available, show latitude and longitude as precisely as the chart permits.
  (7f) Depth of water at buoy or structure (if marine site). All depths are measured from mean lower low water except on Great Lakes where depths are measured from low water datum.
  (7g) Candela, if known; otherwise, include the following information in column (7j); lens size, lamp voltage and amperage if electric, or details of other illuminant to be used.
  (7h) If lighted, the height of the light's optic above the water.
  (7i) Include details of structure (type, color).
  (7j) Used for the following specific information, plus any other useful details: a. buoys - size, shape, color, and reflective material used; b. structures - dayboard shape and color; c. sound signal on a buoy or structure - type and model, audible range, and characteristic (number of strokes or blasts, period and blast length).

7. This form may be used to cover more than one private aid to navigation in the same geographic area. Draw a line between each aid as indicated in example below. Attach separate sheet if additional space is required.

8. Attach a section of chart showing the proposed location of the private aid(s) to navigation.

9. a. After receipt of the approved form, the applicant will advise the District Commander by telephone, postal mail, electronic mail, or facsimile when the authorized work is actually accomplished.
  b. If the private aid(s) to navigation have not been installed within one year of the approval date, the approved application is automatically cancelled.
  c. Any discrepancy in the operation of the private aid(s) to navigation at any time shall be reported to the District Commander by telephone, postal mail, electronic mail, or facsimile in order that Notices to Mariners may be issued. A discrepancy exists whenever the private aid to navigation is not operating as described in the approved application, i.e., lack of signal, incorrect light characteristic, or improper color, shape, or position of shore structure or buoy. The correction of the discrepancy will also be reported by the same method.

10. All classes of private aids to navigation shall be maintained in proper condition. They are subject to inspection by the Coast Guard at any time and without prior notice to the maintainer.

An agency may not conduct or sponsor, and a person is not required to respond to a collection of information unless it displays a valid OMB control number.

The U.S. Coast Guard estimates the average burden for this report is 1 hour. You may submit any comments concerning the accuracy of this burden estimate or any suggestions for reducing the burden to: COMMANDANT (CG-NAV-1), U.S. COAST GUARD STOP 7418, 2703 MARTIN LUTHER KING JR AVE SE, WASHINGTON DC 20593-7418 or OFFICE OF MANAGEMENT AND BUDGET, PAPERWORK REDUCTION PROJECT (1625-0011), WASHINGTON, DC 20590-0001.

FEDERAL REGULATIONS CONCERNING PRIVATE AIDS TO NAVIGATION, 33 CFR 66

§ 66.01-1 Basic provisions.

(a) No person, public body, or instrumentality not under the control of the Commandant, exclusive of the Armed Forces, will establish and maintain, discontinue, change or transfer ownership of any aid to maritime navigation, without first obtaining permission to do so from the Commandant.

(b) For the purposes of this subpart, the term private aids to navigation includes all marine aids to navigation operated in the navigable waters of the United States other than those operated by the Federal Government (part 62 of this subchapter) or those operated in State waters for private aids to navigation (subpart 66.05).

(c) Coast Guard authorization of a private aid to navigation does not authorize any invasion of private rights, nor grant any exclusive privileges, nor does it obviate the necessity of complying with any other Federal, State or local laws or regulations.

(d) With the exception of radar beacons (racons) and shore based radar stations, operation of electronic aids to navigation as private aids will not be authorized.

§ 66.01-3 Delegation of authority to District Commanders.

(a) Under Section 888 of Pub. L. 107-296, 116 Stat. 2135, the Commandant delegates to the District Commanders within the confines of their respective districts (see Part 3 of this chapter for descriptions) the authority to grant permission to establish and maintain, discontinue, change or transfer ownership of private aids to maritime navigation, and otherwise administer the requirements of this subpart.

(b) The decisions of the District Commander may be appealed within 30 days from the date of decision. The decision of the Commandant in any case is final.

§ 66.01-5 Application procedure.

To establish and maintain, discontinue, change, or transfer ownership of a private aid to navigation, you must apply to the Commander of the Coast Guard District in which the aid is or will be located. You can find application form CG-2554 at http://www.uscg.mil/forms/cg/CG_2554.pdf. You must complete all parts of the form applicable to the aid concerned, and must forward the application to the District Commander. You must include the following information:

(a) The proposed position of the aid to navigation by two or more horizontal angles, bearings and distance from charted landmarks, or the latitude and longitude as determined by GPS or differential GPS. Attach a section of chart or sketch showing the proposed position.

(b) The name and address of the person at whose expense the aid will be maintained.

(c) The name and address of the person who will maintain the aid to navigation.

(d) The time and dates during which it is proposed to operate the aid.

(e) The necessity for the aid.

(f) For lights: The color, characteristic, range, effective intensity, height above water, and description of illuminating apparatus. Attach a copy of the manufacturer's data sheet to the application.

(g) For sound signals: Type (whistle, horn, bell, etc.) and characteristic.

(h) For buoys or daybeacons: Shape, color, number, or letter, depth of water in which located or height above water.

(i) For racons: Manufacturer and model number of racon, height above water of desired installation, and requested coding characteristic. Equipment must have FCC authorization.

§ 66.01-10 Characteristics.

The characteristics of a private aid to navigation must conform to those prescribed by the United States Aids to Navigation System set forth in subpart B of part 62 of this subchapter.

§ 66.01-11 Lights.

(a) Except for range and sector lights, each light approved as a private aid to navigation must:

(1) Have at least the effective intensity required by this subpart omnidirectionally in the horizontal plane, except at the seams of its lens-mold.

(2) Have at least 50% of the effective intensity required by this subpart within ±2° of the horizontal plane.

(3) Have a minimum effective intensity of at least 1 candela for a range of 1 nautical mile, 3 candelas for one of 2 nautical miles, 10 candelas for one of 3 nautical miles, and 54 candelas for one of 5 nautical miles. The District Commander may change the requirements for minimum intensity to account for local environmental conditions. For a flashing light this intensity is determined by the following formula:

$Ie=G/(0.2+t_2-t_1)$

Where:
Ie = Effective intensity
G = The integral of the instantaneous intensity of the flashed light with respect to time
t_1 = Time in seconds at the beginning of the flash
t_2 = Time in seconds at the end of the flash
t_2-t_1 is greater than or equal to 0.2 seconds.

(4) Unless the light is a prefocused lantern, have a means of verifying that the source of the light is at the focal point of the lens.

(5) Emit a color within the angle of 50% effective intensity with color coordinates lying within the boundaries defined by the corner coordinates in Table 66.01-11(5) of this part when plotted on the Standard Observer Diagram of the International Commission on Illumination (CIE).

Table 66.01-11(5)--Coordinates of Chromaticity

Color	Coordinates of chromaticity x axis	y axis
White	0.500	0.382
	0.440	0.382
	0.285	0.264
	0.285	0.332
	0.453	0.440
	0.500	0.440
Green	0.305	0.689
	0.321	0.494
	0.228	0.351
	0.028	0.385
Red	0.735	0.265
	0.721	0.259
	0.645	0.335
	0.665	0.335
Yellow	0.618	0.382
	0.612	0.382
	0.555	0.435
	0.560	0.440

(6) Have a recommended interval for replacement of the source of light that ensures that the lantern meets the minimal required intensity stated in paragraph (a)(3) of this section in case of degradation of either the source of light or the lens.

(7) Have autonomy of at least 10 days if the light has a self-contained power system. Power production for the prospective position should exceed the load during the worst average month of insolation. The literature concerning the light must clearly state the operating limits and service intervals. Low-voltage disconnects used to protect the battery must operate so as to prevent sporadic operation at night.

(b) The manufacturer of each light approved as a private aid to navigation must certify compliance by means of an indelible plate or label affixed to the aid that meets the requirements of § 66.01-14.

§ 66.01-12 May I continue to use the private aid to navigation I am currently using?

If, after March 8, 2004, you modify, replace, or install any light that requires a new application as described in § 66.01-5, you must comply with the rules in this part.

§ 66.01-13 When must my newly manufactured equipment comply with these rules?

After March 8, 2004, equipment manufactured for use as a private aid to navigation must comply with the rules in this part.

§ 66.01-14 Label affixed by manufacturer.

(a) Each light, intended or used as a private aid to navigation authorized by this part, must bear a legible, indelible label (or labels) affixed by the manufacturer and containing the following information:

(1) Name of the manufacturer.
(2) Model number.
(3) Serial number.
(4) Words to this effect: "This equipment complies with requirements of the U.S. Coast Guard in 33 CFR part 66."

(b) This label must last the service life of the equipment.

(c) The manufacturer must provide the purchaser a data sheet containing the following information:
(1) Recommended service life based on the degradation of either the source of light or the lamp.
(2) Range in nautical miles.
(3) Effective intensity in candela.
(4) Size of lamp (incandescent only).
(5) Interval, in days or years, for replacement of dry-cell or rechargeable battery.

§ 66.01-15 Action by Coast Guard.

(a) The District Commander receiving the application will review it for completeness and will assign the aid one of the following classifications:

Class I: Aids to navigation on marine structures or other works which the owners are legally obligated to establish, maintain and operate as prescribed by the Coast Guard.

Class II: Aids to navigation exclusive of Class I located in waters used by general navigation.

Class III: Aids to navigation exclusive of Class I located in waters not ordinarily used by general navigation.

(b) Upon approval by the District Commander, a signed copy of the application will be returned to the applicant. Approval for the operation of radar beacons (racons) will be effective for an initial two year period, then subject to annual review without further submission required of the owner.

§ 66.01-20 Inspection.

All classes of private aids to navigation shall be maintained in proper operating condition. They are subject to inspection by the Coast Guard at any time and without prior notice.

§ 66.01-25 Discontinuance and removal.

(a) No person, public body or instrumentality shall change, move or discontinue any authorized private aid to navigation required by statute or regulation (Class I, § 66.01-15) without first obtaining permission to do so from the District Commander.

(b) Any authorized private aid to navigation not required by statute or regulation (Classes II and III, § 66.01-15) may be discontinued and removed by the owner after 30 days' notice to the District Commander to whom the original request for authorization for establishment of the aid was submitted.

(c) Private aids to navigation which have been authorized pursuant to this part shall be discontinued and removed without expense to the United States by the person, public body or instrumentality establishing or maintaining such aids when so directed by the District Commander.

§ 66.01-30 Corps of Engineers' approval.

(a) Before any private aid to navigation consisting of a fixed structure is placed in the navigable waters of the United States, authorization to erect such structure shall first be obtained from the District Engineer, U.S. Army Corps of Engineers in whose district the aid will be located.

(b) The application to establish any private aid to navigation consisting of a fixed structure shall show evidence of the required permit having been issued by the Corps of Engineers.

§ 66.01-40 Exemptions.

(a) Nothing in the preceding sections of this subpart shall be construed to interfere with or nullify the requirements of existing laws and regulations pertaining to the marking of structures, vessels and other obstructions sunken in waters subject to the jurisdiction of the United States (Part 64 of this subchapter), the marking of artificial islands and structures which are erected on or over the seabed and subsoil of the Outer Continental Shelf (Part 67 of this subchapter), or the lighting of bridges over navigable waters of the United States (Subchapter J of this subchapter).

(b) Persons marking bridges pursuant to Subchapter J of this title are exempted from the provisions of § 66.01-5.

§ 66.01-45 Penalties.

Any person, public body or instrumentality, excluding the armed forces, who shall establish, erect or maintain any aid to maritime navigation without first obtaining authority to do so from the Coast Guard, with the exception of those established in accordance with § 64.11 of this chapter, or who shall violate the regulations relative thereto issued in this part, is subject to the provisions of 14 U.S.C. 83.

§ 66.01-50 Protection of private aids to navigation.

Private aids to navigation lawfully maintained under these regulations are entitled to the same protection against interference or obstruction as is afforded by law to Coast Guard aids to navigation (Part 70 of this subchapter). If interference or obstruction occurs, a prompt report containing all the evidence available should be made to the Commander of the Coast Guard District in which the aids are located.

§ 66.01-55 Transfer of ownership.

(a) When any private aid to navigation authorized by the District Commander, or the essential real estate or facility with which the aid is associated, is sold or transferred, both parties to the transaction shall submit application (§66.01-5) to the Commander of the Coast Guard District in which the aid is located requesting authority to transfer responsibility for maintenance of the aid.

(b) The party relinquishing responsibility for maintenance of the private aid to navigation shall indicate on the application form (CG-2554) both the discontinuance and the change of ownership of the aid sold or transferred.

(c) The party accepting responsibility for maintenance of the private aid to navigation shall indicate on the application form (CG-2554) both the establishment and the change of ownership of the aid sold or transferred.

(d) In the event the new owner of the essential real estate or facility with which the aid is associated refuses to accept responsibility for maintenance of the aid, the former owner shall be required to remove the aid without expense to the United States. This requirement shall not apply in the case of any authorized private aid to navigation required by statute or regulation (Class I, § 66.01-15) which shall be maintained by the new owner until the conditions which made the aid necessary have been eliminated.

MARINE TRASH AND DEBRIS

Net Recovery

Photo Courtesy of USCG

BACKGROUND

Photo Courtesy of Ayhan Dede, Turkey European Cetacean Bycatch Campaign, Turkish Marine Research Foundation

Entangled Sperm Whale

Photo Courtesy of NOAA

Photo Courtesy of Ray Boland, NOAA

FACT:

Marine trash and debris:

- ❖ Pose a threat to fish, marine mammals, sea turtles, sea birds, and other wildlife;
- ❖ Cause costly delays and repairs for commercial and recreational boating interests;
- ❖ Detract from the aesthetic quality of recreational shore fronts; and
- ❖ Increase the cost of beach and park maintenance.

WHAT IS MARINE DEBRIS?

Marine debris is any object or fragment of wood, metal, glass, rubber, plastic, cloth, paper or any other man-made item or material that is lost or discarded in the marine environment.

Photo Courtesy of NOAA

Doll found in stomach of stranded Beaked Whale

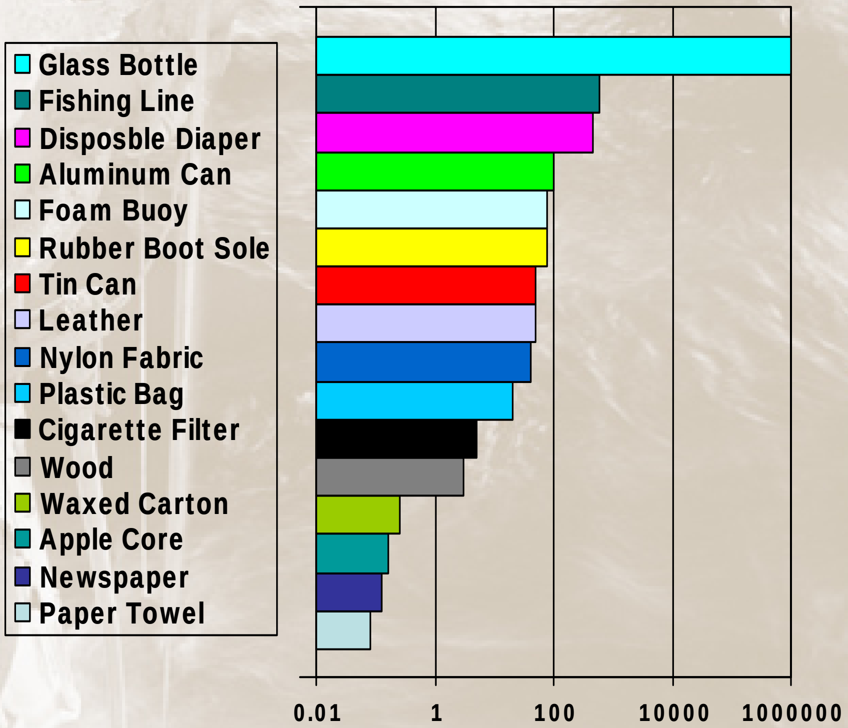
Photo Courtesy of Mote Marine Lab

Kemp's Ridley that swallowed balloon with ribbon

DEBRIS PERSISTS

- Depending upon its composition, marine debris:
  - May sink to the seafloor,
  - Drift in the water column, or
  - Float on the surface of the sea.
- Certain debris, such as plastics, can persist in the marine environment for hundreds of years.
- The effect on the visual or ecological environment is significant.

Debris Persistence (Years)



Information Source: NPS, Mote Marine Lab

FOLLOW OCS RULES AND REGULATIONS

- The disposal and/or discharge of any solid waste in the marine environment is strictly prohibited by U.S. Coast Guard (USCG) and Environmental Protection Agency (EPA) regulations.
- The disposal of equipment, cables, chains, containers, or other materials into offshore waters is prohibited by the Minerals Management Service (MMS).
- Regulations on marine trash and debris are also in MARPOL-Annex V and the Marine Plastic Pollution Research and Control Act.

Photo Courtesy of NPS

ADDITIONAL LEGAL REQUIREMENTS

- ❖ Report materials accidentally lost overboard in accordance with regulations.
- ❖ As safe operations allow, recover materials lost overboard.

Photo Courtesy of NOAA

Photo Courtesy of USGS

Entangled Kemp's Ridley

YOUR ACTIONS MAY SUBJECT YOU TO SEVERE LEGAL CONSEQUENCES!

Photo Courtesy of NPS

Despite improvements to date, oil and gas operations in the Gulf of Mexico can contribute to this problem. Offshore operating regulations **prohibit deliberately discharging** containers and other similar materials (i.e. trash and debris) into the marine environment, and require durable identification markings on equipment, tools, containers (especially drums), and other material.

MARINE DEBRIS MAY CAUSE SEVERE ECOLOGICAL DAMAGE

- Marine debris discarded or lost may injure or kill fish, marine mammals, sea turtles, seabirds, and other wildlife.
- Unknown numbers of marine animals die each year from:
  - Entanglement in discarded fishing line, strapping bands, ropes, nets, and plastic six-pack rings, and
  - Internal injury, intestinal blockage, and starvation from ingesting marine debris.

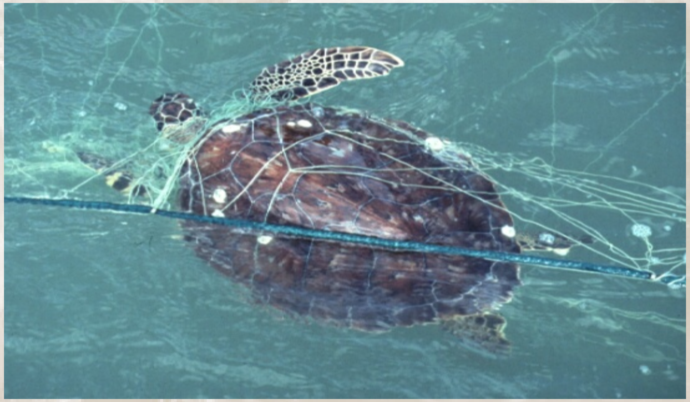


Photo Courtesy of NOAA

Green Turtle trapped in netting

Photo Courtesy of Sea Turtle Survival League

Loggerhead with partially ingested plastic bag

MARINE DEBRIS MAY PUT LIVES AT RISK!

Photo Courtesy of NOAA

Marine debris fouls boat propellers and clogs water intake ports on engines - **endangering the safety** of fishermen and boaters.

MARINE DEBRIS MAY RESULT IN ENVIRONMENTAL DAMAGE

Marine debris takes away from the natural beauty of recreational beaches and shorelines and increases the cost of park and beach maintenance. The beaches are here for us to enjoy and sustain.

Entangled Loggerhead

Photo Courtesy of NOAA

Entangled Right Whale

- Industry efforts to date have reduced, if not eliminated, trash intentionally jettisoned into the Gulf of Mexico. However, there is still a concern about accidental losses from structures and vessels.
- As oil and gas industry activities expand into deeper waters, the number of species of protected marine mammals exposed to our activities has increased. Sightings of sperm whales, endangered species, and some threatened species of sea turtles are not uncommon. We need to ensure a chance meeting of these animals with lost materials or debris from our operations does not occur.

TOP ITEMS LOST FROM OIL & GAS FACILTIES*

1. Hard Hats
2. Five Gallon Containers
3. Other Items
   - Pallets
   - Scaffold Boards
   - Plastic Sheeting
   - Life Jackets
   - Hand Tools
   - Handrails
   - Fire Extinguishers

** Results from an OOC survey conducted in 2004 for 2003 operations*

PREVENTING MARINE DEBRIS

Marine debris can be prevented. Below are some <u>best practices</u> for preventing marine debris from oil & gas facilities:

- Tie it down / Secure it / Stow it to avoid items from being lost overboard.
- Use hardhat chinstraps/tethers.
- Dispose of items properly.
- Cover bins/trash cans/baskets.

Photo Courtesy of NOAA

Photo Courtesy of USGS

PREVENTING MARINE DEBRIS

Additional Best Practices:

Photo Courtesy of USGS

- Practice good housekeeping.
- Observe placards. / Follow marine debris training guidelines.
- Use pre-slung packaging. / Store loose items in baskets/lockers.
- Provide butt buckets in smoke areas.
- Reduce the use of pallets. / Use pallet boxes or alternative bulk containers.
- Conduct survey/hazard hunts to identify potential sources of marine debris.

PREVENTING MARINE DEBRIS

Additional Best Practices:

- Include prevention discussions in pre-job hazard assessment meetings and behavior-based safety programs.
- Increase focus on preventing marine debris, especially in adverse environmental conditions like high winds, high seas, transfer operations, etc.
- If an item is lost overboard, review/discuss in facility safety meetings and share learnings.
- Use OOC marine debris slidepacks as environmental moments in facility meetings.

BE PART OF THE SOLUTION AT WORK OR AT PLAY

Whatever the source, marine debris is a direct result of human activities on land and at sea. At work or play, we need to do our part to not contribute to the problem.

Photo Courtesy of NOAA

- Be an advocate on the marine debris issue.
- Do your part.
- Educate others.
- **What else can we do?**

VIRTUAL TRAINING

Welcome!

Please PRINT and SIGN your name on the sign-in sheet

Laura Giaimo
Environmental Scientist
lgiaimo@geosubseaconsulting.com
Mobile: (507) 250-3995

Cynthia Pyć
Senior Manager of Environmental Affairs
cpyc@vineyardwind.com
Mobile: (832) 312-0431

Environmental Awareness is Everyone's Responsibility!

Vineyard Northeast is dedicated to ***protecting the environment and ensuring compliance with all State and Federal regulatory requirements as well as all permitting documents****.*

- Maintain Compliance
- Maintain positive relationship with community
- Notify **party chief** immediately of any potential **environmental issues**
- Vineyard Northeast will be the only party to communicate with Federal or State agencies

Must not knowingly **impact a potential archaeological resource**

All discoveries of potential **archaeological finds** must be **reported to Vineyard Northeast** immediately

Including: iron, steel, or wooden hull; wooden timbers, anchors; concentrations of historic objects; piles of ballast rock, or pre-contact archaeological site (e.g., stone tools, pottery) within the project area

ALL dead or injured birds or bats found on vessels during operations must be **documented and reported to Vineyard Northeast immediately**, and include:

- Species
- Date found
- Location (coordinates)
- Photo to confirm species identity (include ruler or object to show scale)
- Note and photograph any federal or state research bands

VINEYARD NORTHEAST

MARINE DEBRIS PREVENTION

There is a **zero-tolerance** policy for any trash or debris going overboard

Federal agencies that regulate marine debris:

United States Environmental Protection Agency

BOEM Bureau of Ocean Energy Management

BSEE Bureau of Safety and Environmental Enforcement

United States Coast Guard 1790

VINEYARD NORTHEAST

MARINE DEBRIS PREVENTION

Marine Debris is any solid material that goes over the vessel side or is left on the seafloor

- Directly, indirectly, intentionally or unintentionally – all are marine debris!
- Examples: broken gear, lost beacons, cigarette butts, chains, cables, food wrappers, zip tie pieces, used duct tape, etc…

Please recover any marine debris lost/discarded overboard if safety allows. Any Marine Debris must be reported to Vineyard Northeast **within 24 hours** and a **report must be filed**

Reports should include: Coordinates, time, description of marine debris, actions taken to recover debris

Preventing Marine Debris

1. Dispose of trash in secure containers right away
2. Secure all equipment on deck
3. Limit the use of disposable products wherever possible
4. Know and adhere to your vessels waste management policies
5. If you see something, say something!

Preventing Marine Debris is Everyone's Responsibility!

MARINE SPILL/DISCHARGE PREVENTION

Nothing is to be intentionally discharged from the vessel

What is a Spill?
A spill is any amount of industrial product that hits the water or leaves its designated container

What do I do if I observe a Spill?
Immediately report any spills/discharges to Vineyard Northeast. Respond to leaks and spills on the ship following internal reporting mechanisms.

A USCG-approved spill prevention and containment strategy should be available on the vessel.

All personnel should be familiar with the procedures and policies outlined in this plan.

Compliance with Marine Species Regulations

Interactions with marine species are regulated by federal and state government agencies

Two main types of interactions:

1. Vessel strikes

2. Exposure to noise from geophysical equipment

Our ability to continue commercial activities in the Atlantic depends upon us <u>maintaining compliance</u>

VINEYARD NORTHEAST

MARINE PROTECTED SPECIES

Compliance Tools

1. Environmental Documents: Environmental Management Plan (inclusive of Incidental Harassment Authorization, Lease, Survey Plan, BOEM Lease Waiver(s), & Alternative Monitoring Plan)
2. Protected Species Observers
3. Shutdown, Buffer Zones, & Pre-Clearance Zones
4. Delays
5. Shut-downs
6. Speed restrictions and vessel maneuvering requirements
7. Marine species reporting procedures

Our ability to continue commercial activities in the Atlantic depends upon us maintaining compliance

VINEYARD NORTHEAST

MARINE PROTECTED SPECIES

Protected Species Observers (PSOs)

Conduct visual and acoustic monitoring from dock to dock

-visual monitoring day and night

-acoustic monitoring at night/low visibility

PSOs will communicate any detections of marine mammals to captain/crew/equipment operators and other active survey vessels working for Vineyard Northeast in real-time via Mysticetus software

More detail to be provided in PSO side bar meeting

VINEYARD NORTHEAST

MARINE PROTECTED SPECIES

Pre-Clearance, Shutdown, & Buffer Zones

- All zones refer to a radius around the center of a sound source
- Pre-Clearance Zone (PCZ) is applicable before a sound source is activated
- Shutdown Zone (SZ) is applicable while a sound source is active
- Buffer Zone (BZ) is a zone larger than the SZ, where PSOs will communicate the potential that a shutdown may be necessary
- Different size zones apply to different species/species groups (refer to IHA, BOEM lease, survey plan, alternative monitoring plan, and BOEM lease waivers)
  - PSO's HAVE THE FINAL SAY – mitigations should be implemented with discussions taking place after the mitigation has occurred
  - Zone distances will be discussed in the PSO sidebar discussions

CDP0

Ramp Up, Delays, & Shut-downs

- Designed to prevent exposing marine mammals to potentially harmful levels of noise
- In order to begin surveys or resume operations, PSOs must confirm that the PCZs are clear for various pre-clearance times (refer to IHA, BOEM lease, survey plan, alternative monitoring plan, and BOEM lease waivers)
- Ramp up (soft start) **before starting equipment and after a shutdown exceeding 30 minutes occurs**
- DELAY: If protected species are detected either visually or acoustically within or approaching their respective **PCZ**, then we will *delay* initiating geophysical sound sources
- SHUT-DOWN: If protected species are detected within or approaching their SZs while the sound sources are already active, the equipment will be *shut down* immediately

VINEYARD NORTHEAST

VESSEL STRIKE AVOIDANCE MEASURES

Vessel Strike Avoidance (VSA)

- Vessel speed and maneuvering requirements exist to prevent vessels from striking marine species during transits and surveying
- Whales and sea turtles are especially vulnerable, but all marine mammals, sturgeon, and giant manta rays require VSA
- **NARW are of extra concern**
  - **If you can't distinguish the whale species, treat it as a NARW**
- VSA is required at all times except under extraordinary circumstances that would put the safety of the vessel or crew at risk
  - **November 1 through April 30 speed restriction** operate at or below **10-knots** (<18.5 km/hr)
  - **Route around the animals**, maintaining **minimum distances for protected species**.
  - **Do not divert** or **alter course** in order **to approach** any animals.
  - Avoid **excessive speed** or **abrupt changes in direction**

VINEYARD NORTHEAST

VESSEL STRIKE AVOIDANCE MEASURES

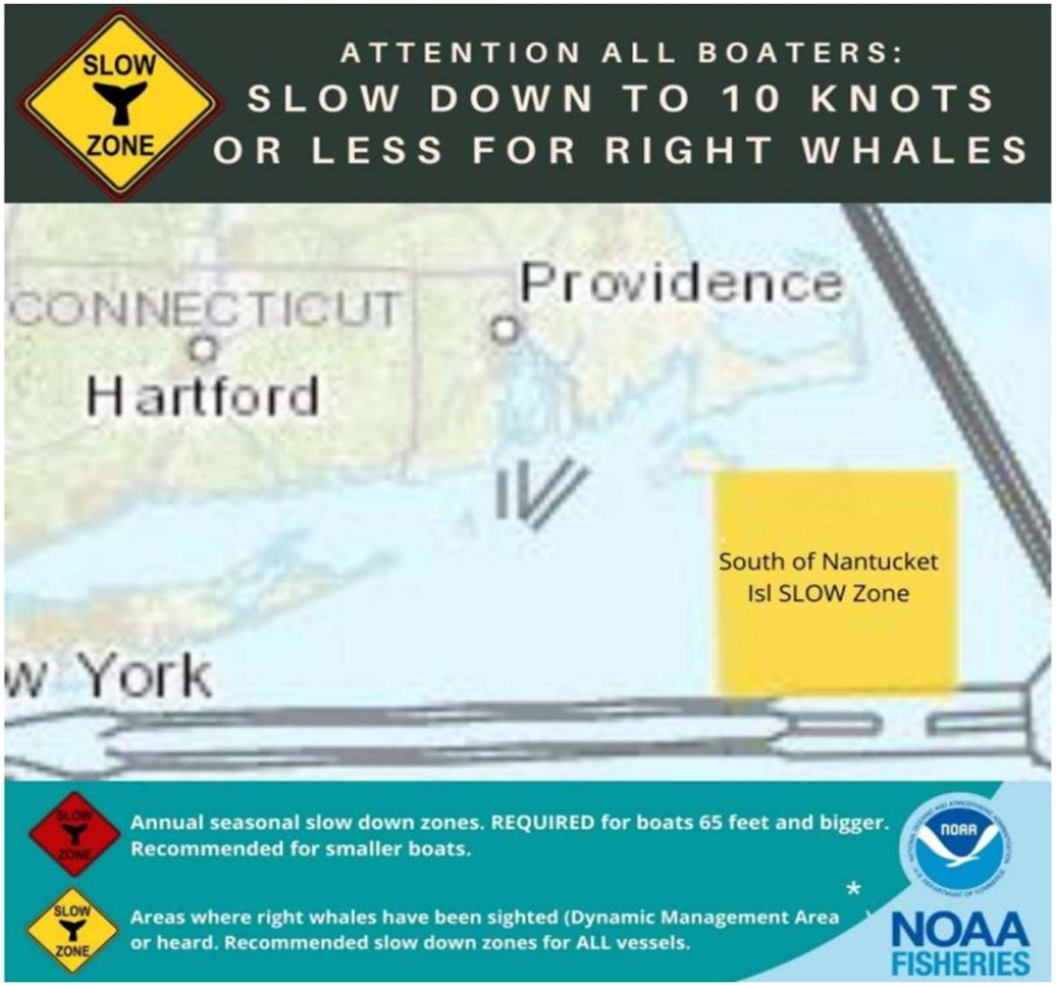
Monitor National Marine Fisheries Service (NMFS) North Atlantic Right Whale reporting systems for the presence of NARWs, including:

- Early Warning System
- Sighting Advisory System
- Mandatory Ship Reporting System
- Additional information: https://www.fisheries.noaa.gov/national/endangered-species-conservation/reducing-ship-strikes-north-atlantic-right-whales

All reporting of NARWs will be communicated by Vineyard Northeast

VINEYARD NORTHEAST

DMA/SMA



Dynamic Management Area (DMA)

- Speed restriction of **10-knot (18.5 km/hr)** or less
- Seasonal speed restriction **November 1 through April 30**

Seasonal Management Area (SMA)

All vessels regardless of size must comply with the 10-knot speed restriction in any SMA, except within Nantucket Sound

- Block Island: November 1 – April 30
- Great South Channel: April 1 – July 31
- Off Race Point: March 1 – April 30
- Cape Cod Bay: January 1 – May 15

Link to find all information: (Scroll to "Dynamic Management Areas")

https://www.fisheries.noaa.gov/national/endangered-species-conservation/reducing-vessel-strikes-north-atlantic-right-whales#dynamic-management-areas

Seasonal Restrictions

Great South Channel Seasonal Management Area (SMA) – All vessels, regardless of size, must comply with a 10-knot speed restriction from April 1 – July 31

Survey activities in the Cape Cod Bay SMA and Off Race Point SMA are limited to the months of August and September.

Vineyard Northeast must not operate more than three HRG survey vessels concurrently within a seasonal restriction area with HRG survey equipment operating at or below 180 kHz.

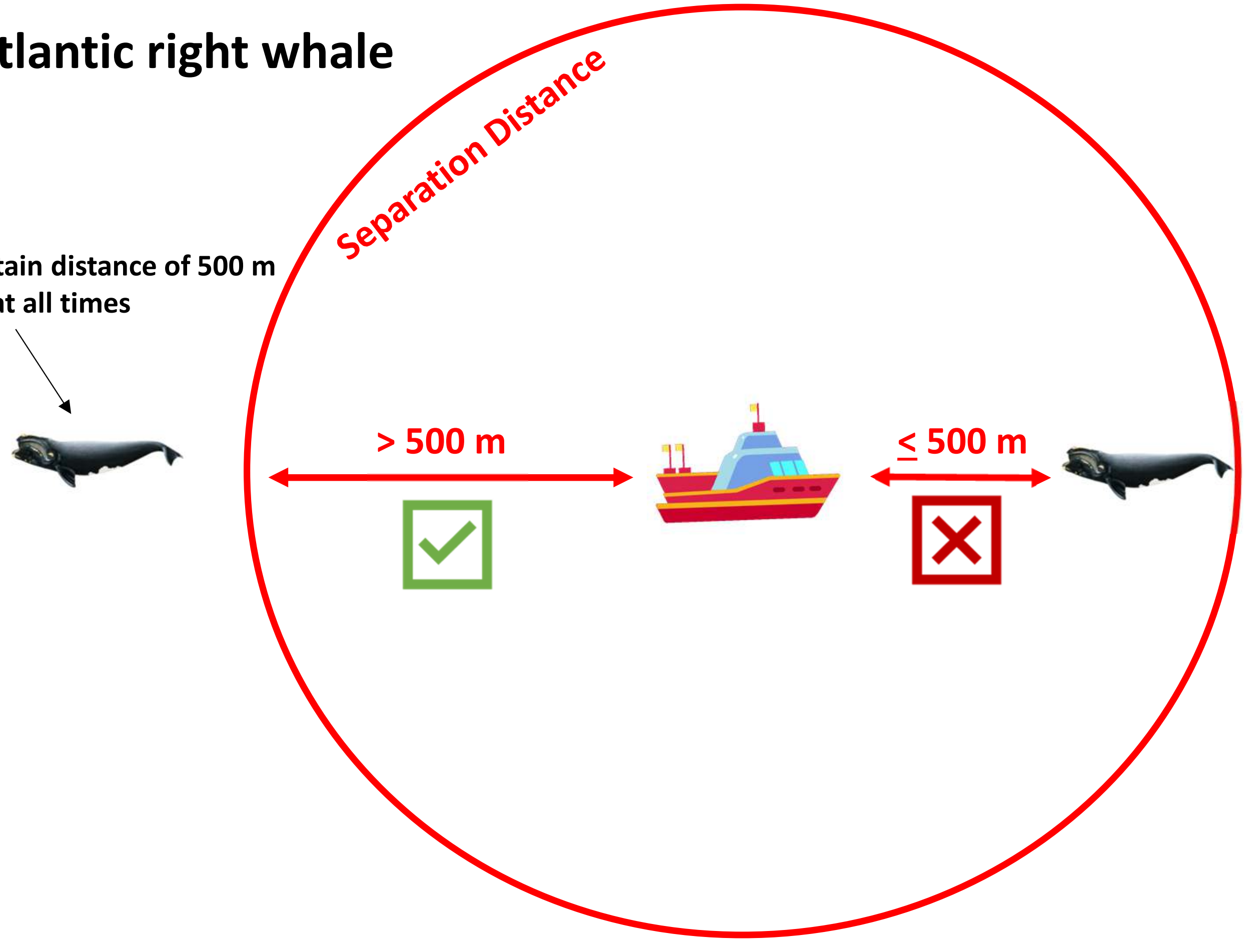
- December through February restriction area is delineated by latitudes and longitudes of 41.183 N; 40.366 N; 69.533 W; and 70.616 W. This area is marked by a solid line in Figure 1.
- March through June restriction area is delineated by a polygon with the following vertices: 40.746 N 70.748 W; 40.953 N 71.284 W; 41.188 N 71.284 W; 41.348 N 70.835 W; 41.35 N 70.455 W; 41.097 N 70.372 W; and 41.021 N 70.37 W. A map of this area is available in the IHA – Figure 1

VINEYARD NORTHEAST

VESSEL STRIKE AVOIDANCE MEASURES GEOPHYSICAL

North Atlantic right whale

Must maintain distance of 500 m or greater at all times



If underway:
- **Steer course away at/below 10 knots maintaining the 500 m separation distance**

If sighted in path or within 500 m
- **Reduce speed to stop and shift to neutral**
- **Don't engage engines until NARW beyond 500 m**

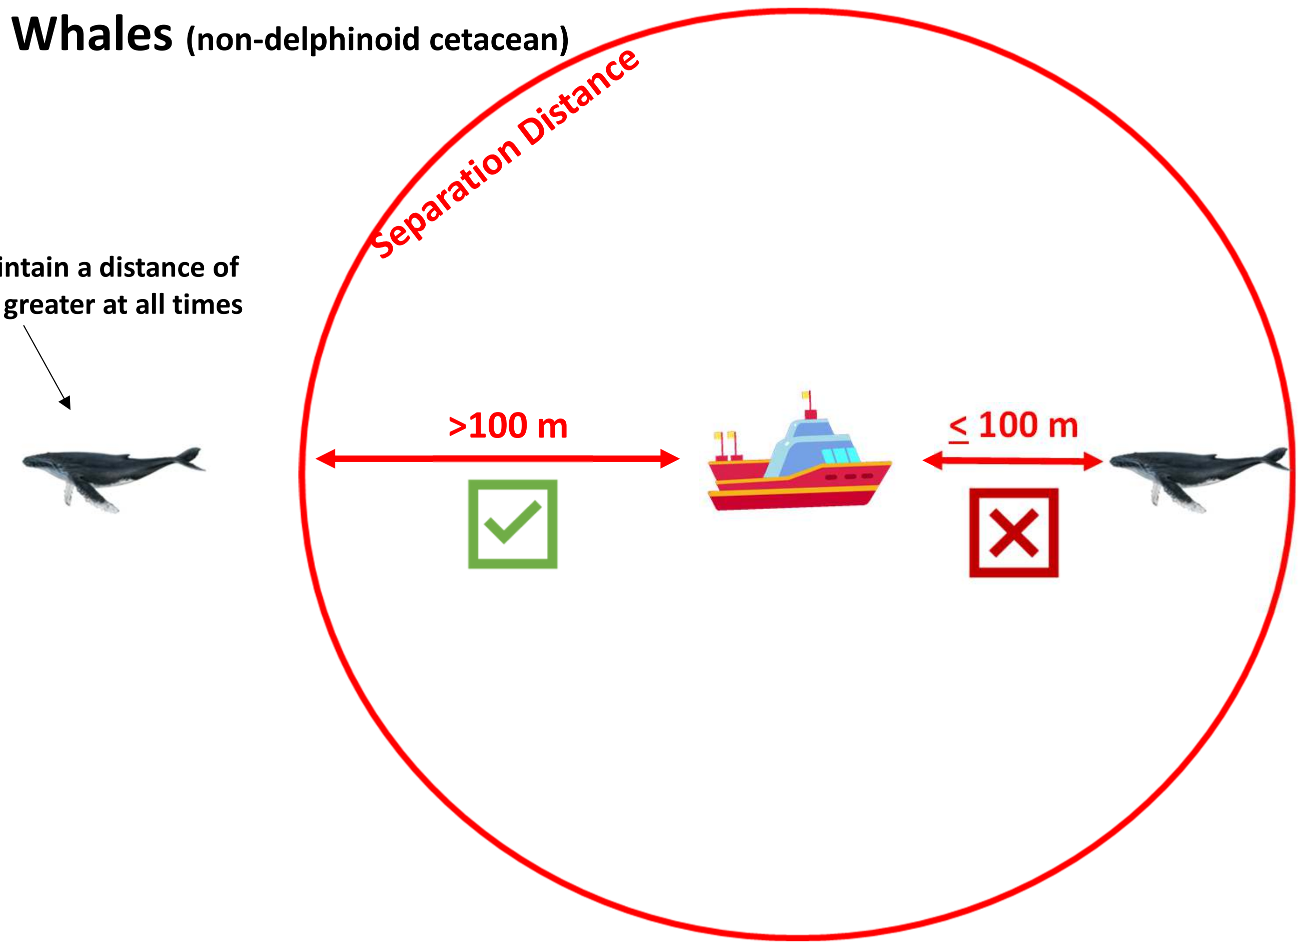
If vessel is stationary
- **Don't start the engine until NARW moves beyond 500 m**

VINEYARD NORTHEAST

VESSEL STRIKE AVOIDANCE MEASURES
GEOPHYSICAL

Large Whales (non-delphinoid cetacean)

Must maintain a distance of
100 m or greater at all times



If sighted in the path or within 100 m:
- Reduce speed and shift the engine to neutral until 100 m is established

If the vessel is stationary
- Don’t start until the large whale moves beyond 100 m

If there are mother/calf pairs, pods, large assemblages of whales:
- Reduce speed to 10 knots or less when within 100 m of an underway vessel

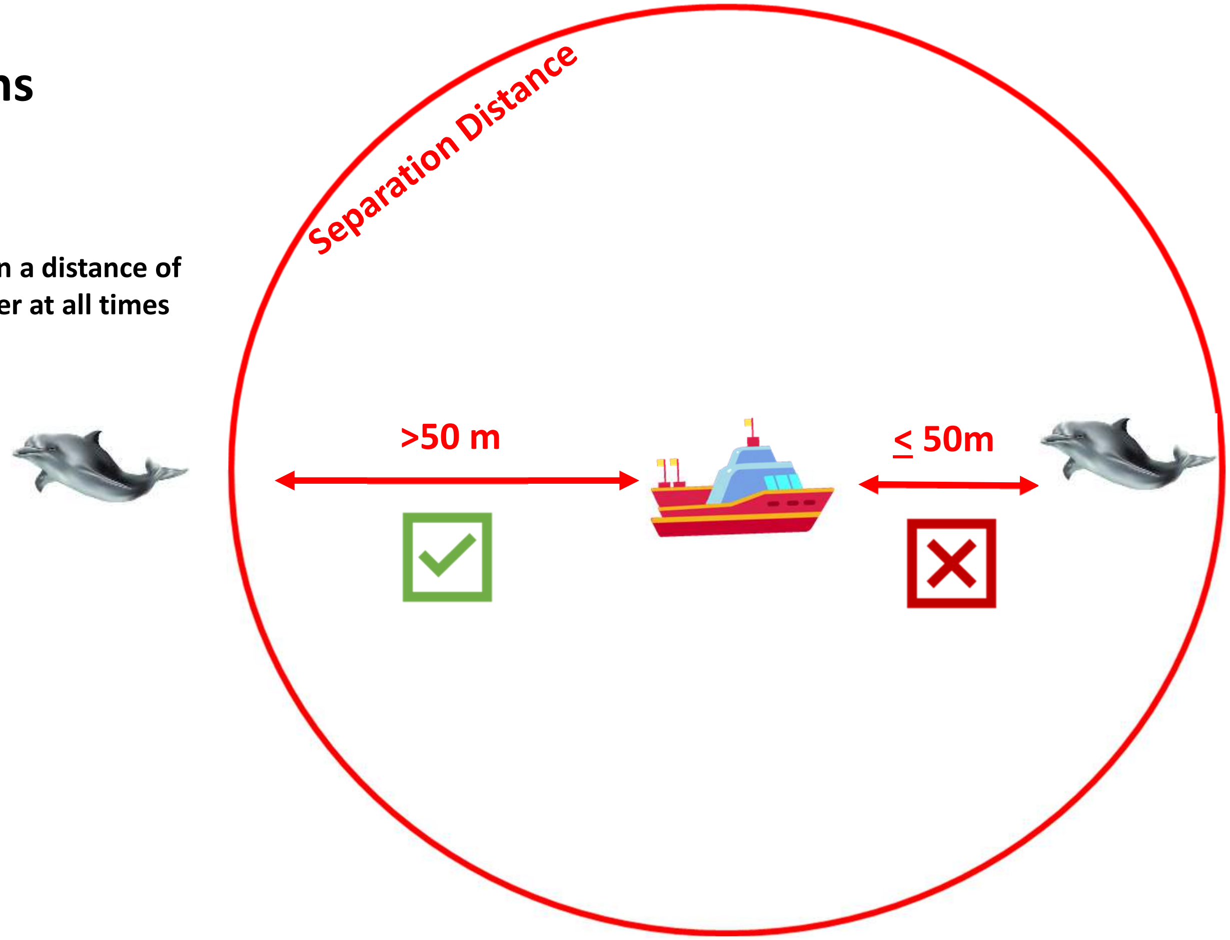
If a whale can NOT be confirmed to species, it must be treated as a NARW with a 500 m separation distance.

VINEYARD NORTHEAST

VESSEL STRIKE AVOIDANCE MEASURES
GEOPHYSICAL

Dolphins

Must maintain a distance of 50 m or greater at all times



If **sighted within the path or within 50 m:**

- Remain parallel to their course and do not adjust speed until they have moved beyond 50 m or abeam of the vessel

If **mother/calf pairs, pods, or large assemblages are observed within 100 m:**

- Reduce speed to 10 knots or less

VINEYARD NORTHEAST

VESSEL STRIKE AVOIDANCE MEASURES
GEOPHYSICAL

Sea Turtles and Seals

Sea Turtles and Seals:

- **Vessels must maintain a distance of 50 m or greater at all times**
- **Vessels should not divert to approach seals**

Dead / Injured Marine Protected Species Reporting

- **Report** all sightings of injured or dead protected species **to Vineyard Northeast** **immediately**, **regardless of whether the injury or death was caused by a vessel.**

- If the activity is responsible for the injury or death, the vessel must assist in any salvage effort at the direction of Vineyard Northeast

- Report as if it were a standard PSO sighting. Provide a narrative of the sighting including date, time, vessel location, weather description, species description, and all other relevant information.

Reporting dead/injured protected species is time critical!

Vessel to Vessel Communication of Sightings

- Whenever multiple Project vessels are operating, any visual observations of listed species (marine mammals and sea turtles) must be communicated to a PSO and/or vessel captains associated with other Project vessels, in near real time
- Sightings should be communicated via Mysticetus, but can be communicated via WhatsApp, SAT phone, cell phone, or radio if the software is inoperable.
- Please record the date and time of the communication, as well as the species sighted.

Sighting sharing should happen as soon as practicable (e.g., after any vessel strike avoidance measures have been implemented and once necessary sighting information has been recorded)

North Atlantic Right Whale

- Appearance: stocky black body, no dorsal fin, strongly bowed lower lip, and callosities (raised patches of rough skin) on the head region that appear white
  - tail is broad, deeply notched, and all black with a smooth trailing edge
  - No dorsal fin
  - V-shaped blow
- Behavior: right whales feed by opening their mouths and swimming through large patches of zooplankton

VINEYARD NORTHEAST

IDENTIFICATION

Humpback Whale

- Appearance: primarily black or dark grey, but individuals have a variable amount of white on pectoral fins and belly
  - Well known for long "pectoral" fins, which can be up to 15 feet in length
  - Flukes can be up to 18 feet wide—are serrated along the trailing edge, and pointed at the tips
- Behavior: well known for aerial displays, such as breaching (jumping out of the water) or slapping the surface with their pectoral fins, tails, or heads

Fin Whale

- Appearance: sleek, with v-shaped head; distinctive coloration pattern: the back and sides of the body are black or dark brownish-gray and the ventral surface is white
  - Tall hooked dorsal fin, located about two-thirds of the way back on the body that rises at a shallow angle from the animal's back
  - Unique, asymmetrical head color: dark on left side of the lower jaw, white on the right side
  - Underside of the tail flukes is white with a gray border
- Behavior: found in social groups (~2-7 whales); fast swimmers
  - Often seen feeding in groups that include Humpback whales, Minke whales, and Atlantic white-sided dolphins

Sei Whale

- Appearance: long, sleek body that is dark bluish-gray to black in color and pale underneath
  - Body is often covered in oval-shaped scars; typically have throat grooves
  - Has an erect dorsal fin located far down (about two thirds) the animals back
  - Can be distinguished by the presence of a single ridge located on the animal's "rostrum"
- Behavior: usually observed alone or in small groups of 2-5 animals
  - Can be sighted by a columnar or bushy blow that is about 10-13 ft (3-4 m) in height
  - Usually does not arch its back or raise its flukes when diving

VINEYARD NORTHEAST

IDENTIFICATION

Minke Whale

- Appearance: small, dark (black or gray), sleek body with white underside
  - Have tall dorsal fins located about two-thirds down their back
  - Body is black to dark grayish/brownish in color with a pale chevron on the back behind the head and above the flippers
- Behavior: Curious and often approach vessels, active at the surface "breaching" and "spy hopping"
  - Bushy blow that is about 6.5-10 ft (2-3 m) high
  - Do not display flukes when diving
  - Before deep dives, they may arch and expose much of their back and body during high rolls above the surface
  - Usually in groups of 2-3

Dolphins & Porpoises

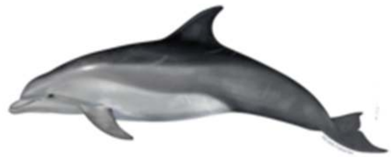
Atlantic White-Sided Dolphin

Appearance: black with white belly and lower beak

- Sides are gray with a white patch that begins below the dorsal fin and is flanked by a yellowish-tan streak that extends to the tail

Behavior: social and playful; seen lobtailing and breaching

Common Bottlenose Dolphin



Appearance: robust body and short, thick beak; light gray to black with lighter coloration on the belly

Behavior: commonly found in groups of 2 to 15 individuals

Short-Beaked Common Dolphin

Appearance: distinct bright coloration and patterns—dark gray cape along the back that creates a "V" just below the dorsal fin on either side of the body; yellow/tan along the flank between the dark cape and white ventral patch

Behavior: usually found in large social groups averaging hundreds of individuals; often breaching, porpoising, "pitch-poling", somersaulting and "bowriding"

Harbor Porpoise

Appearance: small, robust body with a short, blunt beak; dark gray chin patch

- Medium-sized triangular dorsal fin; back is dark gray while their belly and throat are white

Behavior: non-social animals usually in groups of 2-5 animals; when surfacing for air, they do not splash but roll from beak to fluke and arch their backs

Harbor Seal

Appearance: usually blue-gray back with light &dark speckling

- Have short, dog-like snouts
- Fur varies, but **two** basic patterns: light tan, silver, or blue-gray with dark speckling or spots OR dark background with light rings

Gray Seal

Appearance: males have dark gray coat with silver gray spots; females have silver-grey coat with scattered dark spots

- Have elongated, horse-like snouts

Loggerhead Sea Turtle

Appearance: reddish-brown, slightly heart-shaped top shell with pale yellowish bottom shell

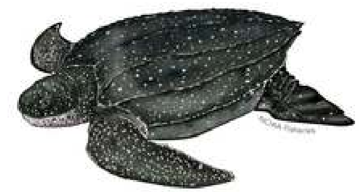
- Large robust head, especially relative to body size
- Neck and flippers are usually dull brown to reddish brown on top and medium to pale yellow on sides and bottom

Kemp's Ridley Sea Turtle

Appearance: grayish-green, nearly circular, top shell with a pale yellowish bottom shell

- Considered the smallest marine turtle in the world
- Top shell contains 5 pairs of costal "scutes"
- Each one of the front flippers has one claw while the back flippers may have one or two

Leatherback Sea Turtle



Appearance: primarily black shell with pinkish-white coloring on their belly

- Largest turtle in the world
- Only sea turtle that doesn't have a hard bony shell
- Their carapace has seven longitudinal ridges and taper to a blunt point, which helps with hydrodynamic structure

COMMUNICATION IS KEY!

Our ability to remain compliant with these requirements depends upon good communication:

- ✓ All time-sensitive information (NARW sightings, marine debris, dead birds/bats, archeological find) must be reported to Vineyard Northeast **immediately**
- ✓ Test your communication method frequently
- ✓ Have a back-up communication method
- ✓ Confirm what was said by repeating it back
- ✓ If you aren't clear, ASK FOR CLARIFICATION

Fisheries Communication Plan

Fisheries Communication Plan

Rev. 9

Vineyard Wind LLC

Document Title:	**Fisheries Communication Plan**
Company	Vineyard Wind LLC
Date:	03/30/2020
Document Type:	Plan
Revision:	9
Previous versions:	Rev. 1 – September 2016 Rev. 2 – October 2017 Rev. 3 – November 2017 Rev. 4 – December 2017 Rev. 5 – March 2018 Rev. 6 – June 2018 Rev. 7 – January 2019 Rev. 8 – August 2019
Authors:	Crista Bank and Erik Peckar

Vineyard Wind Fisheries Communication Plan

Revised March 2020

I. Introduction

Vineyard Wind's Fisheries Communication Plan (FCP) is a living document first drafted in 2011 in order to develop strategies to improve communication with fishermen potentially affected by the development of offshore wind projects. The document continues to evolve with continuous feedback and guidance from fishermen, fishing organizations, and regulatory agencies. The increased participation from the fishing industry will help the offshore wind sector to reduce user conflict, improve project design, and build a better understanding between the two industries.

If you would like to receive updated versions of this FCP as they become available or have any suggestions on how to improve this plan, please send an email to fisheries@vineyardwind.com. Visit vineyardwind.com/fisheries to sign-up for updates, mariner notices, and information requests as well as to access charts, FAQ sheets, and more project information.

II. Vineyard Wind's Lease Areas

a. Overview

Vineyard Wind holds two lease areas for wind energy development on the Outer Continental Shelf (OCS): Lease Area OCS-A 0501 and Lease Area OCS-A 0522. As shown in Figure 2.1, both lease areas are located in the Massachusetts Wind Energy Area (MA WEA). The MA WEA was designated by the Bureau of Ocean Energy Management (BOEM), with significant stakeholder input, including the BOEM MA Renewable Energy Taskforce (made up of local and state elected officials in Massachusetts and Rhode Island), the MA Fishery Working Group (FWG)[1], and the MA Habitat Working Group (HWG)[2] with the intention towards minimizing and avoiding impacts to the marine environment. For example, after considering stakeholder comments, BOEM modified the MA WEA to exclude an area of high fisheries value so as to reduce potential conflict with commercial and recreational fishing activities. Siting choices were considered to minimize and avoid potential impacts to environmental and fisheries resources from offshore wind development on the OCS.

b. Lease Area OCS-A 0501

Lease Area OCS-A 0501 is located approximately 12.4 nautical miles (NM) from the southeast corner of Martha's Vineyard and a similar distance from the southwest side of Nantucket. The Lease Area comprises more than 260 square miles (sq. mi) and is approximately 8.7 nautical miles (NM) wide and 26 NM long. Water depths range from about 121 – 197 feet (ft), gradually increasing as distance from land increases. Lease Area OCS-A 0501 has high wind speeds, excellent seafloor conditions, moderate water depths, and

[1] The FWG is made up of fishermen, fisheries scientists, and other interested parties. Early meetings addressed usage of the potential wind areas by various gear types as well as fisheries science. The FWG, convened by the State of Massachusetts, continues to meet and engage in offshore wind issues.

[2] The HWG is made up of NGOs, scientists, agencies and other interested parties. Early meetings addressed issues such as marine mammal and avian use of the potential wind areas. The HWG, convened by the State of Massachusetts, continues to meet and engage in offshore wind issues.

reasonable proximity to multiple grid connection locations in an area of high electrical load and a need for new generation capacity.

c. Lease Area OCS-A 0522

Lease Area OCS-A 0522 is located approximately 24 – 44 NM south of Nantucket. It comprises more than 330 sq. mi and is approximately 18 NM wide and 12 NM long. Water depths range from about 100 – 198 ft. As with Lease Area OCS-A 0501, Lease Area OCS-A 0522 has high wind speeds, excellent seafloor conditions, moderate water depths, and reasonable proximity to multiple grid connection locations in an area of high electrical load and a need for new generation capacity.

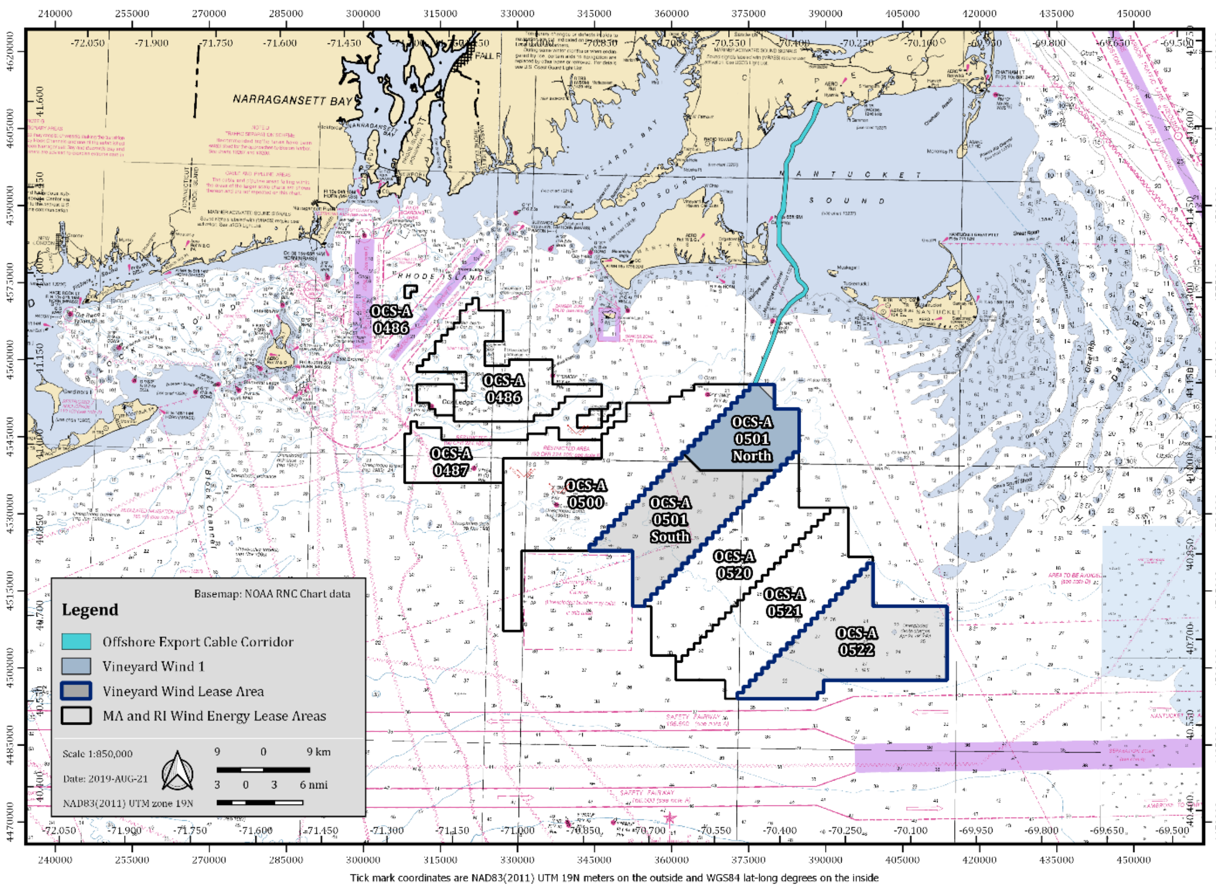

Figure 2.1. Chart of Lease Areas and planned cable corridor route for Vineyard Wind 1.

III. Vineyard Wind's Offshore Wind Projects

a. Overview

Vineyard Wind is developing the nation's first utility-scale offshore wind energy project—Vineyard Wind 1—off the coast of Massachusetts within the northern portion of Lease Area OCS-A 0501. As further described below, Vineyard Wind is also planning projects in the southern portion of Lease Area OCS-A 0501 and in Lease Area OCS-A 0522.

b. Vineyard Wind 1

Vineyard Wind's first offshore wind project is Vineyard Wind 1, which is an 800 MW facility that will be located in the northern portion of Lease Area OCS-A 0501. The project site is approximately 118 sq. mi in size with water depths ranging from 121 – 162 feet. In May 2018, Vineyard Wind 1 was awarded long-term contracts with Massachusetts electric distribution companies and is on track to be the first utility-scale offshore wind project in the US. Once operational, the project will generate clean, renewable, cost-competitive energy for over 400,000 homes and businesses across the Commonwealth, while reducing carbon emissions by over 1.6 million tons per year.

c. Park City Wind

Vineyard Wind's second offshore wind project, named Park City Wind, is an 804 MW facility that will be located in the central portion of Lease Area OCS-A 0501. In December 2019, the Connecticut Department of Energy and Environmental Protection awarded long-term contracts with Connecticut electric distribution companies. Once operational, Park City Wind will deliver approximately 3.7 million megawatt hours of electricity per year, enough to power approximately 400,000 Connecticut households, through a grid interconnection in West Barnstable, Massachusetts.

d. Future Vineyard Wind projects

Vineyard Wind is developing additional projects in the remaining portion of the Lease Area OCS-A 0501 and in Lease Area OCS-A 0522 and is seeking to secure long-term contracts for these projects through state-led energy procurements. For these projects, the proposed wind turbine layout will be set in an east to west, north to south 1x1 NM grid layout, based on fishermen input. As these and all other Vineyard Wind projects moves forward, the company will continue to work to strengthen its communication between potentially affected fishermen and fishery organizations during design, development, construction, operation, and final decommissioning project phases.

IV. Fisheries Communication Plan Objectives and Strategy

a. Objectives

The purpose of the FCP is to define outreach and engagement to potentially affected fishing interests during design, development, construction, operation, and final decommissioning of offshore wind projects, with seven main objectives:

1. Enhance the safety of all who work on the ocean in the wind farms, cable corridors, and landfall sites.
2. Seek stakeholder concerns and strive for open, transparent communication so as to avoid conflicts before they develop, and quickly and fairly resolve conflicts that do develop.
3. Quantify and avoid, minimize and when warranted mitigate adverse impacts on fisheries, and inform appropriate measures for mitigation.
4. Understand, as fully as possible, historic, current, and potential fisheries in the affected areas.
5. Identify gaps in information relating to fish and fisheries to inform research and monitoring strategies.
6. Demonstrate decisions, that may impact the fishing industry, are based on the best available and most credible information, recognizing that information gathering is an on-going iterative process.
7. Facilitate a professional co-existence of these two offshore industries, in which both industries can prosper on a long-term basis.

b. Strategy

The foundation for achieving these objectives will be built on Vineyard Wind's existing relationships with the fishing communities, cultivated since 2010, and to continuously work towards trusted and mutually respectful lines of communications with the diverse fishing communities of the region. Regular, frequent, and open consultation is primary to ensuring all parties are well informed and can work towards the shared objective of maintaining thriving fisheries alongside offshore wind development in the region.

This FCP is based on best practice guidance and has improved with input from the fishing industry through feedback and consultation. Best practice guidance from other resources includes but is not limited to:

- Guidelines for Information Requirements for a Renewable Energy Construction and Operations Plan, Attachment A – Version 3.0, BOEM April 2016
- Fishing Liaison with Offshore Wind and Wet Renewables Group (FLOWW) Best Practice Guidance for Offshore Renewables Developments: Recommendations for Fisheries Liaison, January 2014
- Development of Mitigation Measures to Address Potential Use Conflicts between Commercial Wind Energy Lessees/Grantees and Commercial Fishermen on the Atlantic Outer Continental Shelf, BOEM 2014 – 654
- Fishing and Submarine Cables Working Together – International Cable Protection Committee, February 2009, Second Edition
- Options for Cooperation between Commercial Fishing and Offshore Wind Energy Industries: A review of relevant tools and best practices, SeaPlan November 2015
- Commercial Fisheries Mitigation Strategy – Developing Wind Energy in the Outer Moray Firth, Moray offshore renewables ltd 2003
- Oregon's Fishermen's Cable Committee

V. Fisheries Outreach Team

a. Overview

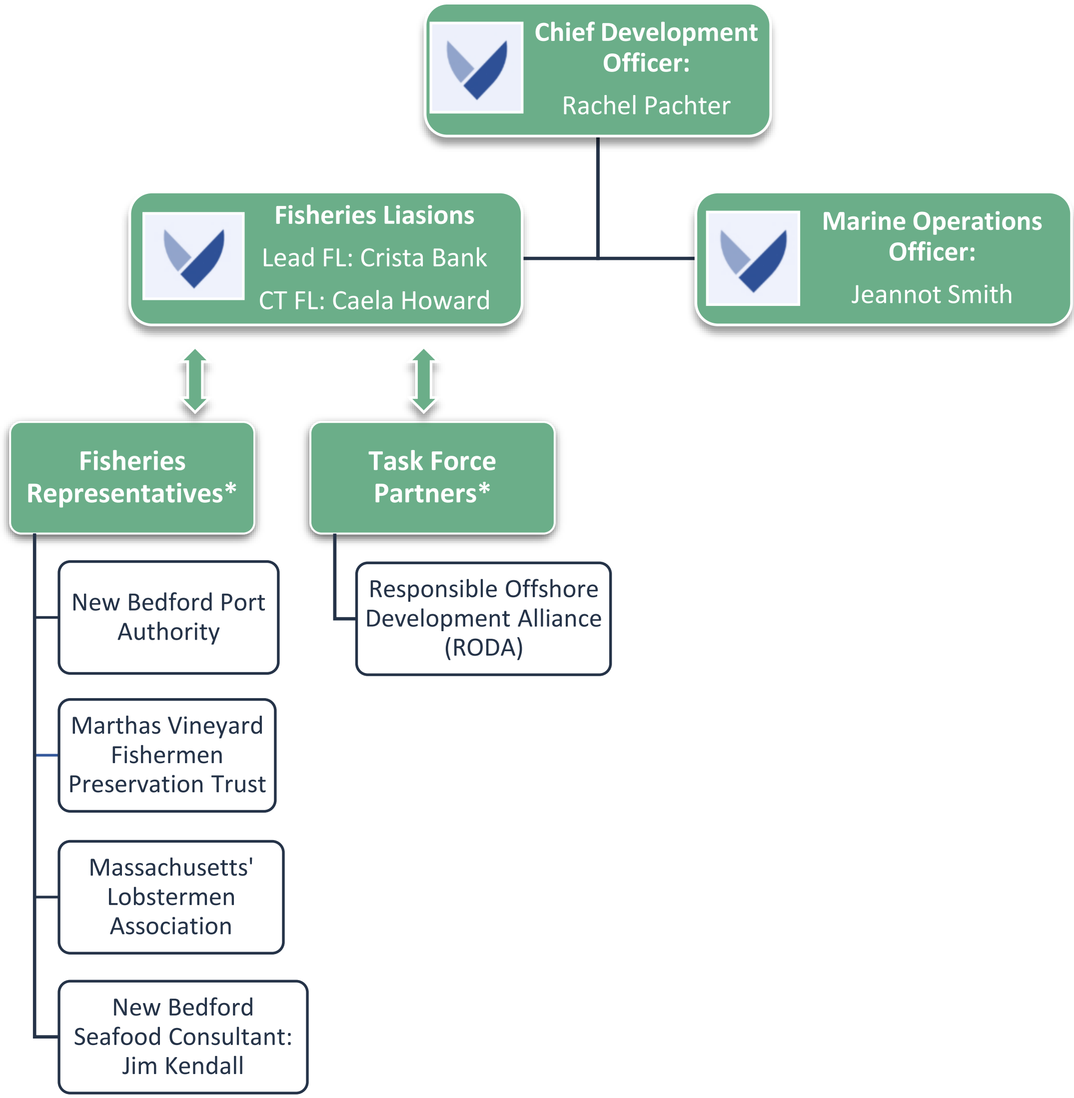
Fisheries communication is conducted through several roles including Fisheries Representatives (FR) and Fisheries Liaisons (FL). Vineyard Wind has hired two FLs and a number of FRs who have been actively engaged with the fishing industry regarding the Vineyard Wind project since 2010. Details describing the different roles and responsibilities of the FL and FR are included in Appendix 1 and 2, respectively. Below is a graphic explaining the communication channel relationship between the FLs and the FRs. Contact details for the FLs and FRs can be found in the Section V.b. and Section V.c.

Vineyard Wind Fisheries Outreach Organization Matrix

- **The Vineyard Wind Fisheries Liaisons (FL) are employed by Vineyard Wind and reports directly to the Vineyard Wind Chief Development Officer. The FLs are responsible for overall implementation of the communications plan, in particular communicating project plans and activities that might impact the fishing industry pre, during, and post construction activities of the offshore wind farm and reporting interactions or concerns from the industry to the Chief Development Officer.**

- **The Fishery Representatives (FR) do not work on behalf of Vineyard Wind, but rather represent their respective fishing communities to Vineyard Wind. The FRs collect and report information about fishing industry activities and concerns to the FL as well as collect and relay accurate/relevant project information to the fishing community from the FLs.**

- **The Marine Operations Officer (MOO) is responsible for safe marine operations by Vineyard Wind, and ensuring that Vineyard Wind is a good neighbor generally while on the water. As such, there is frequent interaction, information exchange, and coordination between the MOO and the FLs.**



The FR represents a particular fishery industry, organization, gear type, port, region, state, or sector(s), and is responsible for communicating concerns, issues, and other input to the project from development and pre-construction into Operation and Maintenance through to the decommissioning of the project. Typically, the FR is an active fisherman, or group representing active fishermen, within the region, fishery, state, or sector they represent. While FRs are compensated for their time and expenses by the project, their duty is to the fishing region, industry, organization, gear-type, or sector they represent. FRs are solicited through a fair and equitable process by the FLs who ensures these individuals or organizations adequately and fairly represent their respective industry, gear type, port, or region and have the support of the fisheries stakeholders they represent.

The FLs facilitates the work of the FRs by serving as a knowledgeable point of contact to which the FRs can efficiently and effectively communicate. The FLs also communicate across fishery communities and regions, inside and outside of the FR network, in order to educate and disseminate vital information regarding the project to fishermen and to receive input back to the project. The FLs work to validate fisheries information through cross-referencing among data sources.

The FLs seeks to:

- develop relationships and direct lines of communication with individuals that are representative of all potentially impacted fishing regions, industries, and interests;
- understand and convey current fishing industry concerns and feedback to the Vineyard Wind development team in order to identify and work towards solutions, as needed;
- identify and engage new FRs;
- confirm appropriate identification of potentially affected fisheries; and
- develop communication methods and tools.

The FLs also work with the FRs and scientists to develop measures to reduce potential impacts to fisheries before any impacts may occur and develop resources and potential methods to monitor fisheries species and potential changes in species abundance and distribution pre/during/post construction. The FL is responsible for implementing this plan and updating it at least annually or as needed.

The FLs and FRs will work together to review, evaluate and improve the effectiveness of the outreach and two-way communication. Vineyard Wind will review these methods quarterly. The FLs and the FRs will also report progress to the Bureau of Ocean Energy Management and National Marine Fisheries Service.

b. Fisheries Liaison

Currently, Crista Bank and Caela Howard serve as Vineyard Wind FLs. Crista Bank serves as the lead fishery liaison. Caela Howard is a FL focused on the Connecticut and New York fishing community. The FL is employed by Vineyard Wind and works on behalf of the project. Crista and Caela's contact information, which is provided below, is posted on Vineyard Wind's website at www.vineyardwind.com/fisheries.

FL Name: Crista Bank
Phone: 508-525-0421
Email: cbank@vineyardwind.com

FL Name: Caela Howard
Phone: 508-386-9832
Email: choward@vineyardwind.com

The FLs are available by phone, email, text, and through our website for ongoing communication. There is a specific form on our website (https://www.vineyardwind.com/fisheries) for fishermen to fill out their contact information and concerns. The form is sent directly to the FLs' email, and a follow-up phone call and/or email is made shortly after receipt of the contact information.

A full job description for the FL is included as Appendix 1.

c. Fisheries Representatives

The current list of FRs, along with contact information, is provided below and posted on Vineyard Wind's website:

FR Name: New Bedford Seafood Consulting
Contact: Jim Kendall
Phone: 508-287-2010 - cell
Email: nbsc@comcast.net

FR Name: New Bedford Port Authority
Contact: Ed Washburn
Phone: 508-961-3000

FR Name: Massachusetts Lobster Association
Contact: Beth Casoni
Phone: 781-545-6984
Email: beth.casoni@lobstermen.com

FR Name: Martha's Vineyard Fishermen's Preservation Trust
Contact: Shelley Edmundson
Phone: 508-687-0344
Email: mvfishermen@gmail.com

Full roles and responsibilities for the FR are included as Appendix 2. FR biographies can be found in Appendix 3.

Vineyard Wind continuously seeks additional FRs to provide regular input to the project development work. Specifically, at this time, Vineyard Wind is seeking FRs in Rhode Island, Connecticut, and New York. If you are interested or have suggestions, please contact Vineyard Wind's FLS Crista and Caela (see above).

d. RODA Joint Industry Task Force Member

Vineyard Wind is a member of RODA's Joint Industry Task force. This group was created to improve communications between the commercial fishing industry and offshore wind energy developers. The goal is to provide a more structured process to explore improved approaches to project siting, design, and operations between the two industries. RODA is a broad membership-based coalition of fishing industry associations and fishing companies.

Name: Responsible Offshore Development Alliance
Contact: Annie Hawkins
Phone: 617 359-2576
Email: annie@rodafisheries.org

In addition to the formal FR roles and participation in RODA's joint industry task force, several organizations and working groups provide direct access to fishermen and have been helpful in disseminating information and providing feedback. Vineyard Wind strives to provide project updates to these organization and working groups regularly. For example, Vineyard Wind has committed to meeting with the Connecticut Commission on Environmental standards on a quarterly basis to provide updates and discuss issues related to the Park City Wind project.

These groups include, but are not limited to:

- NYSERDA Fisheries Technical Working Group (F-TWG)
- Massachusetts Fisheries Working Group
- Rhode Island Fisheries Advisory Board (FAB)
- Massachusetts Department of Marine Fisheries
- Rhode Island Department of Environmental Management
- New England Fishery Management Council
- Mid-Atlantic Fishery Management Council
- Commercial Fisheries Center of Rhode Island
- Long Island Commercial Fishing Association
- Atlantic States Marine Fisheries Commission
- Connecticut Commission on Environmental Standards

Vineyard Wind is committed to working with fishermen and fishing organizations. If you would like to receive emails or text message updates and mariner notices please email the project at fisheries@vineyardwind.com.

VI. Stakeholder Identification and Outreach

a. Overview

Vineyard Wind has proactively engaged with potentially affected fisheries throughout the development of its lease areas. Vineyard Wind regularly communicates with stakeholders and has incorporated input from stakeholders into the project's design, communication plans, and mitigation measures. Vineyard Wind will maintain frequent dialogue with stakeholders as the Project moves forward.

b. Potentially Affected Fisheries

Based on Vineyard Wind's outreach and experience to-date, the fisheries most likely to potentially be affected in Lease Area OCS-A 0501 during the construction, operation and decommissioning of the projects are:

- Nantucket Sound: conch, squid, surf clam, fluke, sea bass, demersal recreational
- Muskeget Channel: Surf Clam, commercial sea bass, demersal recreational
- Lease Areas: Surf clam, squid, fluke, mackerel, whiting, butterfish, scup, monkfish, lobster, scallop, large pelagic recreational

Based on Vineyard Wind's outreach and experience to-date, the fisheries most likely to potentially be affected in Lease Area OCS-A 0522 during the construction, operation, and decommissioning of the projects are:

- Mackerel, whiting, butterfish, Jonah crab, lobster, scallop, surf clam, large pelagic recreational

These groups are prioritized during the implementation of this plan. Regular reviews are used to modify or confirm this prioritization, as needed.

c. Outreach Approach and Tactics

Vineyard Wind employs a variety of outreach and engagement approaches to communicate and maintain relationships with fisheries stakeholders. These include informal conversations with existing contacts, expanding the company's network of FRs, attending fishing industry trade events and recreational fishing shows, presenting at commercial and recreational fishing group meetings, and working with the various associations and organizations that represent fishing interests. Vineyard Wind understands that some fishermen do not feel adequately represented by fishing organizations, or FRs, and therefore prefer to share information and concerns individually and through different channels of communication. Vineyard Wind is committed to recognizing that individual concerns are just as important as group concerns and will continue efforts to respect anonymity.

Target Audience	Principle Channels	Supporting Tactics
Fishing sectors, fishing region, seasonal fisheries, specific fishery gear types, fishermen at sea, charter fishermen, fishing ports	• Fisheries Representatives (FRs) and Fisheries Liaisons (FLs) • Other fishermen • Port Agents • Fish houses • Sector Managers • Media – newspapers, internet, e-mail subscriptions, flyers, and thumb-drives • Fishing organizations, alliances, partnerships, commissions, coalitions, councils, state agencies, federal agencies, and advocacy groups • Local elected officials • Friends and family • Employers	• Access to information via internet, e-mail lists (state and Vineyard Wind), and social media • Industry specific publications or e-mails • Trade magazines • 24-hour phone service for up-to-date project info and emergencies. • Project specific radio alerts to fishermen at sea • FLs contact info on website • Attending and speaking at fishermen working group meetings • Fishermen open house information meetings • FL/FR communication channels • Clear daily two-way communication channels between fishery/fishermen and project during construction

Target Audience	Principle Channels	Supporting Tactics
Recreational fisherman, recreational boaters	• Same as above • Bait shops	• Access to information via Vineyard Wind's website, social media, and newsletters • Advertisements through recreational fishing magazines and websites • FL contact info on website • Attending and speaking at recreational fishing group meetings • Fishermen open house information meetings.

VII. Communication Protocols

a. Overview

Communication is a high priority for Vineyard Wind. It is important to ensure fishermen are aware of the activities in Vineyard Wind's lease areas and along the cable route and feel comfortable to reach out with questions and concerns. It is also important to communicate to the Vineyard Wind survey vessels the expected fishing activities in and around the lease areas, what to be aware of, and how to handle any interactions with the fishing fleet. The protocols outlined below are procedures Vineyard Wind has implemented to date and will continue to adjust and adapt protocols as needed. Similar protocols will be standardized and implemented during project construction.

b. Communication and Notification to Fishing Industry Prior to and During Offshore Work

Our communication strategy, which includes recommendations from fishermen and adopts protocols the MA DMF uses for their biannual inshore trawl survey, are as follows:

1. Send Notices to Mariners to Coast Guard
2. Send notifications with all survey vessel identifying features to Vineyard Wind fisheries email list
3. Publicize through organization websites and newsletters (MA DMF, RI DEM, MLA, sector managers, NOAA port agents, Fishing Support Services navigators, etc.)
4. Publicize through skymate and other current Vessel Monitoring System (VMS) email alerts
5. Maintain a list of fishermen who wish to receive updates via email or text
6. One week before offshore work begins send out an email/text to fixed gear permit holders reminding them that offshore work is about to begin
7. Three days before offshore work begins send out an email/text to fixed gear permit holders that offshore work is on schedule
8. During offshore work send out a regular email updates detailing progress, both for completed areas and areas next on the list. (DMF, MLA, NBPA, MVFPT).
9. Implement a text notification system where fishermen can sign up to receive daily texts of offshore work progress (i.e. more frequently than general updates, and specific to an area or time of work)
10. Attend fisheries trade shows and outreach events to encourage fishermen to sign up for alerts regarding the project's offshore work

11. Vineyard Wind will hire an OFL, preferably a fisherman, to be on project vessels to be on the lookout for fixed gear and fishing activity in the area and to help facilitate communication via VHF radio during project activities.
12. Vineyard Wind will hire, with help from FRs, local fisherman respected among the fleet to help spread the word exactly when the project vessels will be in their immediate area, relay any work zone areas to stay clear of, and communicate when vessels have left the area.
13. Maintain an email (fisheries@vineyardwind.com) that is monitored by a team, so as to ensure timely response even if the FLs are not immediately available. A fisheries team dedicated cell phone number will also be established.

In addition to the protocols listed above, in the time leading up to offshore construction we will hold regular meetings with fishing groups that will be affected during the construction phase to go over the timing of anticipated work, what to expect during construction, and how to best communicate. We will work with our FRs to help coordinate and reach the right fishermen to attend the meetings. Some of the small groups we've identified to date include squid vessels in Nantucket Sound, the conch fleet from the Cape and islands, state permitted clam vessels, and the squid fleet from Pt. Judith.

Additional groups or individuals who want to stay updated on vessel activity and construction plans please visit our website and sign up for email and /or text alerts at fisheries@vineyardwind.com.

c. Communication and Fisheries Protocols on Geological Survey Vessels Working for Vineyard Wind

To help communicate with the fishing industry, Vineyard Wind will have an Onboard Fisheries Liaison (OFL) to assist the Captain with communication and to document fishing gear in the area to help avoid interactions, as described above. The OFL's role is, simply put, to continue the role of the FL offshore, so that there is effective communication on-site, in real time. The OFL reports to the FLs, and serves as the FL's "eyes, ears, and voice" during offshore operations. The OFL records observed fisheries activities, ensures vessel operations are compliant with this FCP and other fisheries related policies, and in particular seeks to avoid negative fisheries interactions by looking out for fixed gear and establishing communications (usually by VHF radio) with fishing vessels when appropriate. If there is a negative fisheries interaction, the OFL works with the FLs and relevant FRs to quickly resolve the matter safely, fairly, and efficiently. Typically, the OFL is contracted for the duration of a vessel's operations for Vineyard Wind, and is an individual familiar with marine operations and fishing practices in the region. Vineyard Wind is currently in the process of establishing a mechanism to hire fishermen, preferably fixed gear fishermen, as OFLs.

Before the survey trip begins, the FL and OFL attends the pre-trip meetings with captain, and crew to go over specific fisheries active in the area. If the FL has known coordinates of fixed gear in the area, the information is shared with the captain and OFL. Captain and crew are instructed to communicate respectfully with fishing industries and to work around fishing gear to the greatest extent practicable.

Captain, crew chief, VW client rep, and OFL sign off on communication protocols and gear interaction protocols outlined below:

Vineyard Wind Protocols for Survey Vessel Captains:

1) Captains establish an agreed upon safety zone to relay to fishing vessels in the area
2) Any communication with fishing vessels is reported to the OFL and will be conducted in a professional manner
3) Preferably the OFL will have their own VHF unit to monitor radio communications and communicate directly with fishermen, as may be necessary or agreed upon with the Captain, especially if language or accent may be a hinderance to communications with fishermen
4) Alert OFL to all gear interactions at the time it occurs, waking the OFL if necessary
5) Have one GPS unit in the wheelhouse set up for LORAN coordinates
6) Work around fishing gear to the greatest extent practicable
7) Plot fixed gear locations while onboard fisheries liaison is off watch and relay information when back on watch

Vineyard Wind Fixed Gear Interaction Protocols for Survey Vessels:

If an incident between a survey vessel and static fishing gear does occur, the following outlines the roles and procedures for such an event:

ON BOARD

1) Immediately alert OFL (wake if off watch)
2) Fishing gear interaction is logged in daily vessel report, recording time, location, photos, etc.
3) If feasible and safe, Vineyard Wind will attach a float or buoy to any gear that is brought on board, moved, or if a line was cut, should the gear be returned or remain in the water. The buoy is intended to help the fishermen locate the gear, and is also marked with Vineyard Wind contact information so that communications can be readily established with the affected fishermen
4) GPS location and time of relocation is recorded
5) Buoy permit number and color is logged
6) Pictures are taken of the gear
7) FL on land is notified of incident as soon as possible

ON LAND

1) FL will cross reference buoy color and permit number with current fishing databases to identify owner of gear
2) If FL is unsuccessful in finding owner of gear, FL will give notice to FRs and other fishing organizations. If still unsuccessful in locating the owner, FL will send notice to the relevant state Environmental Police of gear entanglement
3) Once fisherman/owner of gear is identified, information regarding buoy location and timeline of interaction will be relayed
4) Follow up with fisherman to confirm gear was found
5) If gear is not found Gear Loss form will be filled out and processed

The above procedures will be updated prior to construction and will reflect any feedback and lessons learned on Vineyard Wind projects or learned from other project experiences.

d. Communication during Operations / Safety Management System

An important objective of this plan is to use fisheries communications to enhance safety of all those who work on the ocean in the project area through construction, operations, and decommissioning. Vineyard Wind's Safety Management System (SMS) will outline clear communication protocols and procedures for emergency events such as: collision of a vessel with a turbine structure, gear entanglement, damage to cabling by fishing activity, catastrophic failure of a turbine, or other event. Safety planning will be further elaborated in this plan and the SMS will be a publicly available document that is completed prior to the start of project construction. Tower lighting and marking will adhere to US Coast Guard, Federal Aviation Administration, and Bureau of Ocean Energy Management requirements.

VIII. Financial Compensation

a. Overview

Vineyard Wind is developing and implementing procedures for handling compensation to fishermen for potential gear loss and the loss or reduction of income to fishermen. The level of financial support requires detailed discussions between the impacted fishing community and Vineyard Wind. To start the discussions and gauge the possible economic loss to the fishing fleet Vineyard Wind hired an economist to look at different data sets of fisheries landing values and to produce an economic exposure report. These reports can be found on Vineyard Wind's **website:** www.vineyardwind.com.

b. Gear Loss / Damage

Any potential gear loss or damage from a VW survey vessel should be reported immediately to the FLs. We've heard from many fishermen and FRs that gear loss/damage claims should be simple and direct and be the same across lease holders. Vineyard Wind has not created an official gear loss/damage form yet, but is currently working with the other developers to design one in the hopes that a standardized form and protocol will be established soon. In the interim, the Massachusetts Department of Marine Fisheries has a standardized form that Vineyard Wind can also utilize to a large extent.

c. Lost Revenue

Vineyard Wind will also create a process for filing fishery compensation claims. A third-party fiduciary agent will handle claims, and a review board consisting of members from the fishing industry will assist with the claims process. Until this process is developed fishermen should make any such request through the FLs whose contact information can be found at www.vineyardwind.com/fisheries. If fishermen are displaced at any phase during the construction term, fishermen will be required to submit evidence of income and fishing location(s) to Vineyard Wind to be compensated.

IX. Fisheries Initiatives

a. Overview

Vineyard Wind takes the concerns of the fishing community seriously and understands that while the conversations between stakeholders are not always easy, it is necessary. We understand the time it takes to meet with us or attend working groups is potentially time away from fishing and we have offered compensation for participation in project specific meetings and will continue to do so, if appropriate and helpful to the process. We recognize that continued engagement with the fishing industry improves the overall project and although it seems slow at times, it improves the understanding between industries.

Some of the key initiatives Vineyard Wind has engaged in as a result of consultations with the fishing industry include, but are not limited to:

- Providing thumb drive electronic charts, showing Lease Area OCS-A 0501 and areas of offshore survey work to area fishermen.
- Including Loran navigation lines and closed areas on project charts to facilitate discussion of fishing activities in the area.
- Orienting the wind turbines in a regular grid pattern to allow for navigable uninterrupted travel in multiple directions (to avoid 'zig-zagging').
- Committing to east/west north/south 1 NM alignment
- Considering use of the largest commercially available wind turbines on the market in order to reduce overall project footprints and installation-related impacts
- Removing turbine locations along the 20-fathom contour
- Installing AIS on turbines and Electrical Service Platforms (ESPs) to improve navigation and safety.
- Creating protocols for project vessels to adhere to when encountering fishing activity
- Dedicating a page on Vineyard Wind's website for fishermen (www.vineyardwind.com/fisheries) to find the latest information on surveys and construction, and sign up to receive email or text message alert updates
- Hosting port hours in MA, RI, CT and NY to provide fishermen on the docks access to FLs and project information

b. Fisheries Research

FISHERIES RESEARCH

Vineyard Wind understands how important science and research is to the fishing community. This is one of the primary reasons why Vineyard Wind created an extensive fisheries science program. Vineyard Wind currently provides more than $2 million in annual funding to fisheries research making it the largest offshore wind developer supported program in the US.

The Vineyard Wind fisheries science program prioritizes:

- Establishing relationships with academic institutions and research organizations that engage in collaborative fisheries research;
- Defining research objectives with input from fisheries stakeholders;
- Supporting a regional approach to fisheries research for offshore wind; and
- Making data easily accessible and publicly available.

For Massachusetts, Vineyard Wind has taken steps to address industry concerns by partnering with UMass Dartmouth's School for Marine Sciences and Technology (SMAST), an academic institution trusted throughout the fishing community, and the New England Aquarium. For Connecticut, Vineyard Wind is currently developing partnerships with the University of Connecticut Department of Marine Sciences and Mystic Aquarium.

A video trawl survey of Vineyard Wind's Lease Area OCS-A 0501 and an adjacent control area was completed in October 2018 by researchers from SMAST on the New Bedford-based Fishing Vessel Justice. The goal was to gather preliminary data and to determine the best methods for pre/during/post construction studies in the first project area. This video trawl was an innovative survey method that SMAST scientists wanted to test for use in surveys in the wind energy areas. The result of the test was that further improvements would be needed for the method to be effective, given the soft sea-bottom in the area causing sediment dispersal and hindering video observations.

Vineyard Wind also contracted with SMAST to actively engage with the fishing industry to provide feedback for the pre/during/post construction studies of the project. Four workshops were held in different ports during November and December of 2018 (New Bedford, MA; Kingston, RI; Chatham, MA; and West Tisbury, MA) to share results from the video trawl survey, discuss other potential survey methods, and to work with the fishing industry to help identify research questions for species of concern, both site-specific and regionally. Just over 100 people attended the workshops including over 75 active fishermen. Based on the feedback from the fishing industry, and state and federal regulators, SMAST produced a report with their research recommendations in early 2019. The complete report is available at https://www.vineyardwind.com/document-room (listed under Fisheries/Fisheries Studies). Vineyard Wind has adopted the recommendations and surveys began in Spring of 2019, which include a trawl survey, plankton survey, drop camera survey of macroinvertebrates and benthic communities, and a ventless lobster trap survey. The survey areas for trawl and drop camera include all lease areas in order to support baseline data collection for future projects. Data collected and reports from these studies will be used in future permit applications and will be made public through our website and shared with agencies and other institutions.

Recreational fishermen raised concerns that highly migratory species were not addressed in the SMAST research recommendations. Vineyard Wind reached out to recreational fishing groups and individual fishermen to understand their concerns and brainstorm what could be done to better understand recreational fishing in the area and potential impacts. This led to partnering with the New England Aquarium to initiate a study to document highly migratory species presence across all MA/RI lease areas with help from the pelagic recreational fleet. The results of this effort will be included in future permit applications and made publicly available through our website and shared with agencies and academic institutions.

Data Sharing

The survey and monitoring work Vineyard Wind will conduct will generate a substantial body of environmental, fisheries, and other data, all of which will be available in the public domain in a manner consistent with other academic research. Much of the data is publicly available through the federal and state permitting process, as well as reports or academic publications that may come out of the survey or monitoring work. Vineyard Wind also plans to make all fisheries monitoring data generated by the Project publicly available on its website. For all other environmental and fisheries data, Vineyard Wind will explore cost-effective and appropriate ways to store and make data publicly available and easy to access. Through ROSA and a Regional Science Entity (RSE), Vineyard Wind will work with stakeholders and neighboring developers to find ways to streamline and standardize available data across all offshore efforts.

Responsible Offshore Science Alliance

The need for a regional science approach to offshore wind development is an important component to understand how this new industry may be affecting fisheries and the environment. The absence of a regional science framework has made it challenging for developers and concerned stakeholders to design appropriate studies that can provide consistency across all lease areas. The organization Responsible

Offshore Science Alliance (ROSA) is an attempt to fill that void and bring developers, fishing industry, state, and federal agencies together to develop a regional science framework. Vineyard Wind was part of the working group to get the organization launched, and is currently on the ROSA board of this recently established group that is committed to regional fisheries science.

In engaging SMAST to design pre/during/post-construction studies, as described above, Vineyard Wind asked SMAST (at the suggestion of a comment from NMFS) to consider how these studies might contribute to both a regional and long-term approach to fisheries studies. The study protocol that was developed is considered to be “modular and nested,” allowing specific project studies to contribute to larger regional and longer-term study efforts.

c. Opportunities

At this stage, many in the fishing industry see offshore wind as a threat to their business. However, it is in the developer’s best interest for the fishing industry to thrive and grow. Vineyard Wind is in support of research development to help the fishing industry adjust to the changes offshore wind may bring, either by testing different gear to target species in the wind farm, or testing different technologies to fish more efficiently among turbines.

Vineyard Wind is not proposing to replace fishing jobs with wind development jobs, but there can be opportunities for fishing vessel owners, individual fishermen, and shore side businesses. Some examples include:

1) Fishing vessels as safety zone vessels and scout vessels during construction
2) Fishermen owned shore support businesses
    a. sign up by emailing b2b@vineyardwind.com to be listed on the supply chain network and to learn about supply chain events
    b. attend Meet the Buyer events that are intended to introduce local businesses to wind project contractors
3) Fishermen as OFLs on project vessels to help communicate with fishermen working in the vicinity.
4) Scholarship availability for fishermen and family members to get free training through the local community colleges and MMA for offshore wind technician certifications

Appendix 1 – Fisheries Liaison Roles and Responsibilities

The role & responsibilities of the Fisheries Liaison (FL) include but are not limited to:

- The FL represents the project to fishermen, on behalf of Vineyard Wind, and is the principal contact to the fishing community
- The FL is not someone currently actively engaged in commercial fishing
- The FL is responsible for the overall effective implementation of the fisheries communications plan
- During project pre-construction development, the FL will communicate directly with FRs via email, in person meetings, and conference calls and will provide monthly written reports to management on this outreach. Project management will provide feedback, when necessary, to ensure timely dissemination of information regarding all project activities.
- During project construction, the FL will have direct access to the project management team in order to ensure updated project information is available to the fishing community. It should be noted that changes may take place in real time during construction. Vineyard Wind will endeavor to disseminate that information as quickly and widely as possible either through our website or a 24-hour phone line.
- Refine and enhance this communications plan, given learning experiences and new information received.
- Ensure the project's fisheries communication and communication strategy is effective across all relevant fishing communities, organizations, sectors, regions/ports, seasons, and gear types.
- Establish a clear line of communication with entities from affected fishing regions to ensure all states where the fishing industry could be impacted are well informed during all phases of development and through decommissioning.
- Maintain awareness of ongoing fishery management action development by the New England and Mid-Atlantic Fishery Management Councils and the Atlantic States Fisheries Commission.
- Help develop and refine communication materials in addition to communication plans to ensure effective messaging.
- Develop or recommend mitigation measures.
- Provide a record of relevant project information and communications, including presentations and individual conversations, but maintaining confidentiality as appropriate.
- Participate in BOEM, F-TWG, FAB and MA Fisheries Working Group Meetings
- Maintain a fishery stakeholder database and contacts list for all identified fisheries operating within the vicinity of the offshore development area and export cable corridor throughout all stages of the project.
- Investigate and follow-up on complaints and concerns received or heard about.
- The FL shall have a direct line of communication to the project company's senior management, through which to make recommendations for improvement and address complaints, concerns, and other input received.
- Pro-actively make fisheries aware of upcoming efforts and activities related to the project so as to facilitate shared use of the lease area(s).
- Be available to meet with fishermen representatives in person, via email or social media, phone, or radio outside of regular business hours and on weekends.
- Participate in weekly calls with the project team on conversations, activities, suggestions, questions, and concerns from the fishing community about the project.
- Coordinate and work with FRs, who are active fishermen and serve to facilitate communications between the project and specific fisheries sectors.

- Identify potential FRs and establish working relations; contract OFLs as needed.
- Attend meetings with fisheries groups, regulators, non-government organizations, policy makers, contractors working on the project, and other offshore wind project developers to best ensure shared use of the lease area(s) and good, working relations among the offshore wind industry, fisheries, government, and other stakeholders.
- Supervise and manage contracts as necessary for the effective fisheries surveys and science work undertaken by or on behalf of Vineyard Wind, and participate and provide input into relevant fisheries science initiatives.

Appendix 2 – Fisheries Representatives Roles and Responsibilities

An individual or group's time serving as the Fisheries Representative (FR) will be compensated by Vineyard Wind, but the FR is considered to be an independent, third party agent, serving the fisheries interests, not the project's interests. Role & responsibilities of FRs include but are not limited to:

- Be available to meet with fellow fishermen in person or via email, social media, phone, or radio.
- Pro-actively make the project team aware of fisheries practices, upcoming efforts, and seasons to facilitate shared use of lease area(s).
- Meet directly with the project team at least every quarter to help evaluate communication and outreach efforts, and learn more about project plans.
- Provide a monthly email report to the project team on conversations, activities, suggestions, questions, and concerns from the fishing community about the project; communicate with project management in real time, if needed.
- On occasion, FRs may be asked to serve as guides and points of contact during a particular activity offshore. This may involve, for example, using their own vessel as a guide or scout vessel to the survey vessels, helping to monitor for fishing activities in the area of operation, and communicating with fishing vessels working in the same area.
- Communicate directly with FLs for the purpose of effectively disseminating project information to the FR's constituency.
- Disseminate project information to the fishermen who are based in or visit ports in Massachusetts, Rhode Island, Connecticut, New Jersey and New York and may fish in the Vineyard Wind lease areas and cable route area(s).
- Be available and accessible to their represented fishery.
- Communicate to FLs any potential conflicts regarding surveys and project development.
- Assist FL to understand fishing activity in Vineyard Wind's lease areas and submarine cable routes (e.g. gear types, specific fisheries).
- Work with FLs to develop and refine fisheries communication plan(s).
- Communication planning, identification of communication methods and frequency, outreach meeting facilitation and support, and other tasks, as needed, for engaging local fishermen during all project phases to ensure effective messaging.
- FR will meet directly with the FLs and project management every quarter and evaluate communication and outreach efforts and review quarterly outreach and mitigation measures employed by Vineyard Wind
- Maintain awareness of ongoing fishery management action development by the New England and Mid-Atlantic Fishery Management Councils and the Atlantic States Fisheries Commission.
- Provide input to, or recommend, mitigation measures.
- Participate in working group meetings, such as the Massachusetts Fisheries Working Group, when appropriate for the fishery they represent.

Appendix 3 – Fisheries Representatives

New Bedford Seafood Consulting

Mr. Kendall is the Executive Director of New Bedford Seafood Consulting. He is a former scallop fisherman with over 50 years of experience in the fishing industry and with fisheries issues. Mr. Kendall was a member of a research team for the Commercial Fisheries Research Foundation that focused on discard mortality rates of Southern New England flatfish. Mr. Kendall served as a New England Fishery Management Council member for numerous terms. He has also served on the Massachusetts Fisheries Recovery Commission, the New England Commercial Fishing Law Enforcement Working Group, and is a founding member of the Massachusetts Fishermen's Partnership. Mr. Kendall was featured in the book A Doryman's Reflection: A Fisherman's Life. Additionally, Mr. Kendall has been interviewed on WBSM radio and by the New Bedford Standard Times, the Gloucester Times, and the Boston Globe on fisheries issues.

New Bedford Port Authority

The New Bedford Port Authority (NBPA) is the governing body for New Bedford's harbor and city-owned waterfront properties. It is chaired by the Mayor of New Bedford with six other members. The role of the NBPA is to support the Port of New Bedford by continually upgrading port resources; preserving its spot as the #1 U.S. fishing port; and expanding the New Bedford economy.

The NBPA oversees all the commercial and recreational vessel activity within New Bedford city limits, incorporating the city's entire coastline and harbor.

Massachusetts Lobstermen's Association

The Massachusetts Lobstermen's Association is a member-driven organization that accepts and supports the interdependence of species conservation and the members' collective economic interests. The Massachusetts Lobstermen's Association was established in 1963 by the fishermen, for the fishermen, and is presently one of the leading commercial fishing industry associations in New England. On behalf of the 1,800 members, the MLA works to maintain both the industry and the resource. The MLA strives to be proactive on issues affecting the lobster industry and is active in the management process at both the state and federal levels. The MLA communicates with its members through a monthly newspaper, weekly email, Facebook, Twitter and attendance at meetings. For the past 54 years, the MLA has become a trustworthy voice for the industry on important issues, and is looked to by both the fishing industry and the management community

The Martha's Vineyard Fishermen's Preservation Trust

The Martha's Vineyard Fishermen's Preservation Trust is a Massachusetts 501(c)(3) non-profit corporation established in 2011 to: (i) Preserve the historic fishing fleets, communities, and economies of Martha's Vineyard; (ii) Protect the marine populations and fishing grounds off the coast of Martha's Vineyard and New England; (iii) Educate the community about its local fisheries.

Appendices

1 INTRODUCTION

OCS-A 0522 LLC (Vineyard Northeast) has contracted RPS to provide the protected species monitoring assets required to meet the National Oceanic and Atmospheric Administration, National Marine Fisheries Service (NMFS), and the Bureau of Ocean Energy Management (BOEM) monitoring and mitigation requirements during a high resolution geophysical (HRG) campaign. The details of the HRG campaign were provided to BOEM in a 2022 Geophysical, Geotechnical and Environmental Site Characterization Campaign (G&G) Survey Plan.

As the proposed Vineyard Northeast survey activities will include the use of geophysical equipment operating below 180 kHz (non-impulsive, non-parametric sub-bottom profilers (SBPs), boomers, and sparkers), a Protected Species Monitoring and Mitigation Plan (PSMMP) is required. The PSMMP outlines the sound source monitoring and mitigation, and vessel strike avoidance measures that will be implemented for marine mammals, sea turtles, and other protected species for the duration of the survey campaign.

1.1 Applicable Regulatory Documents and Permits

BOEM Lease OCS-A 0522 (Lease) contains monitoring and mitigation requirements that apply to marine mammals, sea turtles, and other protected species. Additionally, Vineyard Northeast submitted a request to NOAA for an Incidental Harassment Authorization (IHA) pursuant to Section 101(a)(5) of the Marine Mammal Protection Act (MMPA; 16 U.S.C. 1371(a)(5)(D)) which is valid from July 15, 2021, through June 20, 2022. A new IHA will be issued for HRG survey activities conducted after June 20, 2022, and this PSMMP will be updated accordingly.

The HRG campaign shall be conducted in accordance with the measures stipulated in the IHA, Lease (with BOEM-approved Lease waivers), and the BOEM approved Survey Plan (inclusive of an Alternative Monitoring Plan). This document outlines the monitoring, mitigation, and reporting procedures applicable to the survey campaign.

2 MARINE PROTECTED SPECIES

Marine protected species or protected species refers to any marine species for which dedicated monitoring and mitigation procedures will be implemented, including:

- All marine mammals (whales, dolphins, seals, porpoises)
- Sea turtles
- Atlantic sturgeon
- Giant manta ray

3 PROTECTED SPECIES OBSERVERS AND PASSIVE ACOUSTIC MONITORING OPERATORS

3.1 Staffing Plan

For the offshore HRG surveys, an RPS team of three Protected Species Observers (PSOs) and four dual-role Passive Acoustic Monitoring (PAM) Operators / PSOs will be on board each vessel conducting 24-hour survey operations. These personnel will undertake visual and acoustic monitoring, implement mitigation, and conduct data collection and reporting in accordance with the IHA, Lease (with BOEM-approved Lease waivers), and the BOEM approved Survey Plan (inclusive of an Alternative Monitoring Plan).

A minimum of two (2) PSOs must be on duty at all times when high-resolution geophysical (HRG) equipment is in use (i.e., daylight and nighttime operations), with one (1) PAM operator on duty during periods of reduced visibility. Sample schedules are described in Table 1 and Table 2.

For nearshore HRG surveys conducted in daytime hours only, a team of two (2) PSOs will be on the vessel during operations. No PAM operators are required for these vessels as per the Alternative Monitoring Plan.

Both nearshore and offshore vessels will be staffed with a minimum of one (1) designated Lead PSO or Lead PSO/PAM Operator.

3.2 PSO & PAM Operator Requirements

All PSOs will have completed a BOEM/NMFS approved training program. PSOs will have relevant observation experience in the Atlantic. The resumes, NMFS approval letters, and certifications for proposed PSOs will be provided for submittal to BOEM and NMFS for review no later than seven days prior to the scheduled start of the survey (BOEM OCS-A 0522 4.3.4.2).

All PAM Operators will have completed a BOEM/NMFS approved protected species observer training program in addition to a PAM training course. PAM Operators will have relevant observation experience in the Atlantic. The resumes, NMFS approval letters, and certifications for proposed PAM Operators will be submitted to BOEM and NMFS for review no later than seven days prior to the scheduled start of the survey.

3.3 Roles and Responsibilities

PSOs must have no tasks other than to conduct monitoring, alert relevant vessel crew to the presence of protected species, request mitigation, and record observational data for reporting.

Lead PAM Operator / PSO Team Lead

- Coordinate and oversee PAM and PSO operations and ensure compliance with permit monitoring and mitigation conditions
- Acoustically monitor, detect, and identify protected species and determine distance from the location of the animal when detected to the geophysical source
- Record and report protected species sightings, survey activities, and environmental conditions according to the survey plan, Lease (with BOEM-approved Lease waivers), and IHA
- Communicate with the crew to initiate mitigation actions as required by permit conditions
- Maintain and troubleshoot the PAM system hardware and software
- Work with the survey team to deploy and retrieve the hydrophone cable
- Monitor Mysticetus software functionality
- Daily Mysticetus data entry
- Carry out onboard quality control (QC) reviews of PSO data
- Participate in daily meetings and drills with the crew when appropriate

PAM Operator

- Acoustically monitor, detect, and identify marine mammals and determine distance from the location of the animal when detected to the geophysical source
- Record and report marine mammal sightings, survey activities and environmental conditions according to the survey plan, Lease (with BOEM-approved Lease waivers), and IHA
- Communicate with the crew to initiate mitigation actions as required by permit conditions
- Assist Lead PAM Operator in maintaining and troubleshooting the PAM system hardware and software
- Work with the survey team to deploy and retrieve the hydrophone cable
- Daily Mysticetus data entry
- Participate in daily meetings and drills with the crew when appropriate

PSO

- Visually monitor, detect, and identify protected species
- Record and report according to the survey plan, Lease (with BOEM-approved Lease waivers), and IHA
- Monitor and advise on sound source and vessel operations for compliance with the environmental requirements for the survey plan, Lease (with BOEM-approved Lease waivers), and IHA
- Communicate with the crew to initiate mitigation actions as required by permit conditions
- Daily data entry into Mysticetus software
- Participate in daily operation meetings with crew when appropriate

4 VISUAL MONITORING METHODS

4.1 PSO General Monitoring Protocol

Two NMFS approved PSOs will visually monitor permit-defined zones at all times when the vessel is away from dock, and during day and nighttime operations (IHA 5(a)). For small vessels operating nearshore, a minimum of one PSO will monitor permit-defined zones at all times while the vessel is away from dock. The following general protocols apply to all operations:

- Other than brief alerts to bridge personnel of maritime hazards and the collection of ancillary wildlife data, no additional duties may be assigned to the PSO during his/her visual monitoring shift
- No PSO will be allowed more than four consecutive visual monitoring hours before being allocated a two-hour break
- No PSO will be assigned a combined monitoring schedule of more than 12 hours in a 24-hour period
- PSOs will monitor from the most appropriate location on the vessel; the location shall have a 360° view of the sea surface (BOEM-approved Lease waiver 4.3.5), without interfering with the navigation or operation of the vessel.
- Visual monitoring will begin no less than 30 minutes prior to the initiation of the SBPs, boomers, and sparkers and must continue until 30 minutes after the use of acoustic sources ceases or until 30 minutes past sunset (BOEM-approved Lease waiver 4.3.6.5 & IHA 5(d)).
- If a protected species is observed, the PSO should first initiate any necessary mitigation actions. If no mitigation actions are required, they will note and monitor the latitude/longitude of the vessel and relative bearing and estimated range to the animal, until the animal dives or moves out of visual range of the observer.

4.2 Daytime Monitoring During Reduced Visibility

During daytime periods of reduced visibility (any time any of the zones are not fully visible), visual monitoring will continue, augmented by a PSO/PAM Operator until visibility has returned (Alternative Monitoring Plan 1 & 2).

During these periods, all requirements surrounding monitoring durations and break periods will be adhered to. Additionally, no PSO will conduct additional monitoring shifts. This is to ensure that they have a sufficiently long break with at least 8 hours of uninterrupted sleep.

The PSO team and vessel / survey crew will work together to co-ordinate monitoring to the best of their abilities to minimize any operational downtime during daytime periods of reduced visibility. If acoustic monitoring cannot be conducted during periods of reduced visibility during the day due to PSO and PAM operator shift constraints, then the HRG operations must be delayed until visibility returns or until the necessary monitoring can be conducted.

4.2.1 Daytime monitoring equipment

The PSO on duty will monitor for marine protected species using the naked eye and hand-held reticle binoculars. Digital single-lens reflex camera equipment will be provided to record sightings and verify species identification (BOEM OCS-A 0522 4.3.5 & IHA 5(f)).

Reticle binoculars have the capability to localize the distance to detected animals.

4.3 Nighttime Monitoring

If survey operations are conducted at night, the PSOs will use night vision goggles and/or infrared technology (Alternative Monitoring Plan 3 & IHA 5(m)).

4.3.1 Nighttime monitoring equipment

The PSOs on duty will monitor for marine protected species using Morovision PVS-7 Gen 3 PINNACLE night vision goggles with a thermal acquisition clip-on system and handheld infrared light emitting diode spotlights so PSOs can focus observations in any direction (Alternative Monitoring Plan 3).

At night, if reticles cannot be used to localize a detection, distance to detected animals will be determined using range finder sticks or by comparing the location of the animal to known distances, such as the length of the vessel.

4.4 Visual Monitoring Equipment Calibration

Monitoring equipment will be calibrated, when possible, throughout the duration of survey at least once a week using the vessel radar, by comparing estimated distances to known distances and will be conducted during varying sea states and both at night and during the day.

5 PASSIVE ACOUSTIC MONITORING (PAM) METHODS

5.1 PAM Operator General Monitoring Protocol

On vessels conducting 24-hour HRG operations, one NMFS approved PAM Operator will acoustically monitor permit-defined zones during nighttime and periods of reduced visibility, such as fog. If there is an acoustic detection of a marine mammal approaching or within the permit-defined zones, mitigation procedures will be initiated as described in Section 8. Shift schedules and duty restrictions for PAM operators are the same as those described for PSOs in Section 4.1.

PAM Operators will monitor for marine mammals using the PAM system (headphones for aural monitoring and spectrogram and click detectors for visualization) and will work in coordination with the PSO on shift to verify and localize any marine mammal detections. PAM operators will work in a suitable location that does not interfere with navigation or the operation of the vessel. The workstation will have a comfortable, ergonomic position for the PAM operator to monitor the PAM system. The PAM Operator workstation will also be in a location that enables a quick exchange of communication to the source operator for initiation of mitigation measures.

Acoustic monitoring must be consistent, diligent, and free of distractions for the duration of the watch.

5.2 PAM Equipment

During the HRG surveys, a PAM system will be deployed for acoustic monitoring of Shutdown Zones (sometimes referred to as Exclusion Zones) during low-visibility periods (e.g., nighttime and during fog) when boomers, and sparkers are active (Alternative Monitoring Plan 1 & 2). The PAM system uses a towed hydrophone array and PAMGuard software modules configured for the application, vessel, and deployment method.

Each source vessel will have two complete PAM systems installed, a primary system and a secondary system available as back-up should any issues be encountered with the main system.

A passive acoustic monitoring system, developed by Seiche Measurements Limited, designed to detect most species of marine mammals and will be installed on each vessel. The system consists of a six-element hydrophone array cable that will be deployed from the vessel, positioning the hydrophones as far back from the vessel as possible to limit potential masking by vessel noise. The signal from the hydrophone array is processed in a low and mid frequency Asio Fireface soundcard and digitized and displayed in the industry standard acoustic monitoring software, PAMGuard. The array contains a pair of low-frequency hydrophones (10 – 24,000 Hz) for the detection of baleen whales: a low-frequency spectrogram of one of these two hydrophones is visually monitored by the PAM Operator and the PAMGuard Moan Detector is configured to process data from both low frequency hydrophone channels.

The PAM Operator will be proficient in the use of all PAM hardware and software. Each PAM Operator has completed formal RPS, or comparable, PAM Training for which RPS has confirmed the covered content captured all the key elements associated with the system. PAM Operators are trained in the installation, maintenance, and operation of all hardware and software associated with the system, and possess the skills required to monitor for, detect, and localize protected species.

5.3 PAM JSA and PAM Deployment and Retrieval Procedure

A job safety analysis (JSA) will be completed prior to the hydrophone deployment. The PAM Operator will develop, in cooperation with the vessel crew, a vessel-specific deployment and retrieval procedure that considers both the minimization of entanglement risks with other towed equipment and maximization of the system acoustic range.

Hydrophone cable deployment is dependent upon operational constraints. The hydrophone towing cable will not be deployed if it hinders safe operations on the vessel; however, no actions allowable with PAM are afforded to the vessel with respect to sound source use during periods of reduced visibility if the PAM system is not in operation.

5.4 Distance Estimation of Acoustic Detections

There are a variety of methods that can be used to estimate the distance to vocalizing marine mammals using the acoustic detection software, PAMGuard.

When the distance to a vocalizing animal cannot be determined by PAMGuard, the experienced PAM Operator can make a distance estimation assisted by the noise or detection score system developed by Gannier et al. (2002). Gannier et al. monitored sperm whales in the Mediterranean both visually and acoustically. A scale was developed based upon the strength or intensity of the sperm whale clicks at various distances that were then measured when the sperm whales surfaced and were visually observed. Although the scale is subjective, and sounds produced in marine environments will vary according to local conditions, the scale provides a measure for approximating distances when using a single, linear hydrophone array.

6 PROPOSED MONITORING SCHEDULES FOR 24-HOUR OPERATIONS

Table 1: Seven PSO/PAM monitoring schedule

	Lead PSO	PSO 2	PSO3	PSO4	PSO5	PSO6	PSO 7
0:00				IR	PAM	IR	
1:00			IR		PAM		IR
2:00			IR		PAM	IR	
3:00				IR	PAM	IR	
4:00		IR	IR	PAM			
5:00		IR	IR	PAM

23:00			Visual	PAM		IR	
Work	11	11	11	10	11	10	9
Sleep	8	9	8	8	8	9	9

*The monitoring schedule is inclusive of monitoring for vessel strike avoidance and source mitigation purposes

7 VESSEL STRIKE AVOIDANCE ON HRG VESSELS

7.1 North Atlantic Right Whale (NARW) Monitoring Notification Systems

The PSO team will monitor NMFS North Atlantic Right Whale (NARW) reporting systems (e.g., the Early Warning System, Sighting Advisory System, and Mandatory Ship Reporting System) for the presence of NARWs during HRG survey operations within or adjacent to the Seasonal Management Area (SMA), Slow Zones, and any established Dynamic Management Areas (DMAs)(BOEM Lease OCS-A-0522 4.1.1.3 & IHA 5(k)).

https://www.nefsc.noaa.gov/psb/surveys/MapperiframeWithText.html

https://www.fisheries.noaa.gov/national/endangered-species-conservation/reducing-ship-strikes-north-atlantic-right-whales

7.2 Vessel Speed Restriction

Vessel strike avoidance mitigation measures will include all vessels associated with the survey activities, including those transiting to and from local ports and the lease area (BOEM OCS-A 0522 4.1.1).

All survey vessels regardless of size, observe a 10-knot speed restriction in any Dynamic Management Area (DMA), Seasonal Management Area (SMA), or Slow Zone. Additionally, all survey vessels, regardless of size, observe a 10-knot speed restriction in specific areas designated by NMFS for the protection of NARWs from vessel strikes: any DMAs or Slow Zones when in effect, and the Block Island Seasonal Management Area (SMA) (from November 1 through April 30), Cape Cod Bay SMA (from January 1 through May 15), Off Race Point SMA (from March 1 through April 30) and Great South Channel SMA (from April 1 through July 31). Speed restriction does not apply to vessels transiting through Nantucket Sound during non-DMA periods (BOEM-approved Lease waiver 4.1.1.2 & IHA 4(j)viii).

Vessels 19.8 meters (65 feet in length) or greater that operate between November 1 through May 1 must operate at speeds of 10 knots (11.5 mph) or less (BOEM-approved Lease waiver 4.1.1.2).

If protected species are sighted within the relevant separation distance, the vessel must reduce speed and shift the engine to neutral, not engaging the engines until the animals are clear of the area, except under extraordinary circumstances when complying with the requirement puts the safety of the vessel or crew at risk (BOEM OCS-A 0522 4.1.1 & IHA 4(j)).

7.3 Separation Distances

All vessels underway must not divert or alter course in order to approach any whale, delphinid cetacean, or pinniped.

Any vessel underway must avoid excessive speed or abrupt changes in direction to avoid injury to a sighted cetacean, pinniped, sea turtle, or giant manta ray (BOEM OCS-A 0522 4.1.1.8.1 & IHA 4(j)vii).

The vessel operator must reduce vessel speed to 10 knots or less when any large whale, any mother/calf pairs, whale or dolphin pods, or larger assemblages of non-delphinoid cetaceans are observed within 100 m of an underway vessel (IHA 4(j)ii).

7.3.1 North Atlantic Right Whale

All survey vessels will maintain a separation distance of 500 meters or greater from any sighted NARW or any unidentified large marine mammal (BOEM OCS-A 0522 4.1.1.6.1 & IHA 4(j)iii-4(j)iv).

- If underway, the vessel must steer a course away from any sighted NARW at 10 knots or less until the 500-meter minimum separation distance has been established (IHA 4(j)iv).

- If sighted in a vessel's path or within 500 meters to an underway vessel, reduce speed and shift the engines to neutral until the NARW has moved beyond 500 meters and out of the vessel's path, then re-engage engines and steer away at 10 knots or less (IHA 4(j)iv).
- If stationary, the vessel must not engage engines until the NARW has moved beyond 500 meters, at which point the vessel must steer a course away from the NARW at 10 knots or less, maintaining the 500-meter separation distance (IHA 4(j)iv).
- If a whale is observed but the species cannot be confirmed as being other than a North Atlantic right whale, it must be assumed to be a right whale and all applicable strike avoidance procedures for NARWs implemented (IHA 4(j)iii).

7.3.2 Non-delphinoid cetaceans (baleen whales, beaked whales, sperm whales) other than the NARW

All vessels will maintain a separation distance of 100 meters or greater from any sighted non-delphinoid (i.e., mysticetes and sperm whales) cetacean (BOEM OCS-A 0522 4.1.1.7 & IHA 4(j)v).

- If sighted within 100 meters to an underway vessel, reduce speed and shift the engine to neutral until the animal has moved outside of the vessel's path and beyond 100 meters.
- If the vessel is stationary, the vessel must not engage engines until the non-delphinoid cetacean has moved out of the vessel's path and beyond 100 meters.

7.3.3 Delphinoid cetaceans and pinnipeds

All vessels will maintain a separation distance of 50 meters or greater from any sighted delphinoid cetacean or pinniped (BOEM OCS-A 0522 4.1.1.8 & IHA 4(j)vi).

- Vessels should not divert to approach delphinoid cetaceans.
- Underway vessels will remain parallel to a sighted delphinoid cetacean's course whenever possible and avoid excessive speed or abrupt changes in direction. Vessels may not adjust course and speed until the delphinoid cetaceans have moved beyond 50 meters and/or abeam of the underway vessel (IHA 4(j)vi).

7.3.4 Sea turtles and giant manta ray

All vessels will maintain a separation distance of 50 meters or greater from any sighted sea turtle or giant manta ray (BOEM OCS-A 0522 4.1.1.8.2).

- Vessels underway should not divert to approach any sea turtles or giant manta ray (BOEM OCS-A 0522 4.1.1.8.1).

8 SOUND EXPOSURE PROCEDURES

8.1 Survey Equipment Subject to Monitoring and Mitigation Procedures

SBPs, boomers and sparkers that produce sound below 180 kHz are subject to the following monitoring and mitigation protocols.

Both testing and operations of HRG equipment should be limited to the Lease Area, Cable Corridor, and while the vessel is alongside in port.

8.2 Sound Source Monitoring and Mitigation Zones

PSOs must establish and monitor five types of zones around Vineyard Northeast SBPs, boomers, and sparkers. Shutdown Zones (SZ), sometimes referred to as Exclusion Zones (EZ), apply around the sound source (BOEM Lease OCS-A 0522 4.3.6.1). For the purposes of sound exposure mitigation, these zones are established around the survey equipment and not around the vessel itself.

Buffer Zone (BZ): During use of geophysical sources with the potential to result in marine mammal harassment (i.e., anytime boomers and sparkers are active, including ramp-up), occurrences of marine mammals within the Buffer Zone must be communicated to the vessel operator to prepare for a potential shutdown of the acoustic source. This is not applicable when the SZ is greater than 100 meters (IHA 4(e)ii).

- **200 meters**: all other marine mammals other than NARW (IHA 4(e))

Pre-Clearance Zones (PCZ): Applicable during the 30-minute pre-clearance search periods conducted prior to initiating the relevant acoustic sources from silence. Detections of a protected species inside the applicable PCZ during the search will result in a delay to operations. SBPs, boomers, and sparkers must not be initiated until an additional time period (described in Section 8.4) has elapsed with no further sighting of the animal (BOEM Lease OCS-A 0522 4.3.6.5).

- **500 meters:** North-Atlantic right whales (IHA 4(g)i)
- **200 meters:** all marine mammals other than NARW (IHA 4(g)ii)
- **50 meters:** sea turtles

Shutdown Zone (SZ): Once the low frequency (LF) sound sources have been activated, detections of a protected species inside applicable SZs will result in a shutdown of boomer and sparker equipment (IHA 4(c)). SBPs may remain active and are not subject to shutdown procedures.

- **500 meters:** North-Atlantic right whales
- **100 meters**: All other marine mammals with the exception of delphinids from the genera *Delphinus, Lagenorhynchus*, or *Tursiops* are visually detected approaching the vessel or towed acoustic sources, shutdown is not required. If there is uncertainty regarding identification of a marine mammal species (i.e., whether the observed marine mammal(s) belongs to one of the delphinid genera for which shutdown is waived), PSOs must use best professional judgment in making the decision to call for a shutdown (IHA 4(f)vii).
- **50 meters:** Sea turtles

Level B Harassment Zone (HZ):

- **195 meters:** Shutdown of boomer and sparker equipment is required upon observation of a species for which authorization has not been granted or observation of a species for which authorization has been granted but the authorized number of takes has been met (IHA 4(f)viii).

Marine Mammal Monitoring Zone:

- PSOs must establish and monitor a marine mammal Monitoring Zone that represents a distance of **500 meters** from the survey equipment (IHA 4(d)).

Although mitigation will be applied for animals detected in the aforementioned zones, observations will extend to the furthest observable distances.

If Shutdown Zones, Buffer Zone and/or Monitoring Zone are not fully visible to PSOs due to darkness or inclement weather, survey activities may continue, unless a marine mammal is detected within or entering the Shutdown Zones (IHA 5(o)).

8.3 Visual and Acoustic Search Periods

To activate the SBPs, boomers, and sparkers from silence, a minimum of a 30-minute search period must be conducted. SBPs, boomers and sparkers will not be activated until the protected species observer has reported the pre-clearance zones (PCZ) clear of all cetaceans, sea turtles, and pinnipeds for 30 minutes (BOEM Lease OCS-A 0522 4.3.6.5 & IHA 4(g)).

- The visual search period may begin when PSOs can see to the outermost SZ (500 meters) from the geophysical source.

- During nighttime or other periods of reduced visibility, the search must be conducted visually by the PSOs on watch AND acoustically by the PAM Operator. Acoustic monitoring will begin 30 minutes prior to sunset and 30 minutes after sunrise.
- Visual monitoring must continue until 30 minutes after the use of SBPs, boomers, and sparker equipment ceases (IHA 4(b)).

8.4 Delays to Initiation of SBPs, Boomers, and Sparkers

The Lessee must ensure that the sound source is not activated until the PSO has reported the pre-clearance zones (PCZ) clear of all cetaceans, pinnipeds, and sea turtles for 30 minutes, inclusive of dolphins that voluntarily approach the vessel. If any marine mammal or sea turtle was detected visually inside its respective PCZ during the 30-minute search period, initiation of the survey equipment (SBPs, boomers and sparkers) must be delayed (BOEM Lease OCS-A 0522 4.3.6.5 & IHA 4(g)) until:

- An additional time period has elapsed with no further sightings of the animal within the relevant PCZ (IHA 4(g)):
  - **<u>15 minutes</u>** for small odontocetes and seals
  - **<u>30 minutes</u>** for all cetaceans and sea turtles

Both the 30-minute pre-clearance search period and the mandatory delay for animals observed within the PCZ must be completed before source initiation.

8.5 Ramp-Up Procedure

Ramp-up procedures cannot be conducted for individual pieces of survey equipment (i.e., Innomar, boomer etc.) without increasing the HSE risk to personnel operating the equipment.

When technically feasible survey equipment must be ramped up at the start or re-start of survey activities. Ramp-up will be conducted by activating the sound producing equipment in a sequence beginning with the lowest sound output level and adding in additional sound producing equipment incrementally until all of the sound producing equipment is activated (IHA 4(h)).

8.6 Short Breaks in HRG Sourcing Operations

In recognition of occasional short periods of silence for a variety of reasons other than encroachment into the shutdown zone by a non-delphinoid cetacean or sea turtle, including, but not limited to, mechanical or electronic failure, the SBPs, boomers, and sparkers may be silenced for periods of time not exceeding 30 minutes in duration and may be restarted for operations at its operational level if (BOEM Lease OCS-A 0522 4.3.6.8 & IHA 4(f)vi):

1. Visual monitoring by PSOs is continued diligently through the silent period (during visual surveys, the SZ must remain visible throughout the silent period)

   AND

2. No marine protected species are observed in the applicable Shutdown Zone and Buffer Zone.

For a shutdown of 30 minutes or longer, or if visual surveys were not continued diligently during the pause of 30-minutes or less, the PSOs must restart the pre-clearance search period procedures outlined in section 8.3. Acoustic sources can be activated using the full ramp-up procedure after PSOs report that the pre-clearance zones are free of all cetaceans, pinnipeds and sea turtles for 30 minutes (BOEM Lease OCS-A 0522 4.3.6.7 & IHA 4(f)vi).

8.7 Shutdown Procedures

If a protected species is sighted approaching or within the Shutdown Zone, an immediate shutdown of the boomer and sparker is required, EXCEPT if it is a delphinid(s) from the genera ***Delphinus, Lagenorhynchus or Tursiops*** that is voluntarily approaching (i.e., bow riding) the vessel or towed survey equipment and the PSO determines that it is a voluntary approach (IHA 4(f)vii). The vessel operator must comply immediately with the initiation of mitigation by the observer. Any disagreement should be discussed only after shutdown (IHA 4(f)iii).

Subsequent restart of the survey equipment must use the ramp-up provisions described in section 8.5 and may only occur following clearance of the SZ of all protected species under the following conditions (BOEM Lease OCS-A 0522 4.3.6.7 & IHA 4(f)v):

- When an additional time period has elapsed with no further sightings of the animal within the relevant SZ:
  - **15 minutes** for small odontocetes and seals
  - **30 minutes** for all other marine mammals and sea turtles

8.8 Seasonal Restrictions

Survey operations are subject to the following seasonal restrictions (IHA 4(i)):

Survey activities in the Cape Cod Bay SMA and Off Race Point SMA are limited to the months of August and September.

Vineyard Northeast must not operate more than three HRG survey vessels concurrently within a seasonal restriction area with SBPs, boomers, or sparkers operating at or below 180 kHz.

- December through February restriction area is delineated by latitudes and longitudes of 41.183 N; 40.366 N; 69.533 W; and 70.616 W. This area is marked by a solid line in Figure 1 of the IHA.
- March through June restriction area is delineated by a polygon with the following vertices: 40.746 N 70.748 W; 40.953 N 71.284 W; 41.188 N 71.284 W; 41.348 N 70.835 W; 41.35 N 70.455 W; 41.097 N 70.372 W; and 41.021 N 70.37 W. A map of this area is available in the IHA – Figure 1.

9 REPORTING

In cases where multiple vessels are surveying concurrently, any observations of marine mammals must be communicated to PSOs on all active survey vessels via Mysticetus. If Mysticetus software is not operational, sightings will be communicated via a shared WhatsApp marine protected species text channel.

9.1 Data Forms

PSOs will utilize standardized data forms that have been provided to, and approved by, BOEM and NMFS. These forms will contain, at minimum, all of the data elements listed below, and data will be recorded in the field daily.

Project Information

- Project Name
- Lease Number
- State Coastal Zones
- Survey Contractor
- Vessel Name(s)
- Survey Type (typically HRG)
- Reporting start and end dates
- Visual monitoring equipment used (e.g., bionics, magnification, IR cameras, etc.)
- Distance finding method used
- PSO names (last, first) and training
- Observation height above sea surface

Operations Information

- Vessel name(s)
- HRG equipment type, power levels, and frequencies used
- Greatest RMS source Level

Monitoring Effort Information

- Date (YYYY-MM-DD)
- HRG equipment (ON/OFF)
- If visual, how many PSOs on watch at one time?
- PSOs (Last, First) & affiliations
- Start time and latitude/longitude (decimal degrees) of observations
- End time and latitude/longitude (decimal degrees) of observations
- Vessel heading and speed at beginning and end of visual PSO duty shifts and upon any line change
- Duration of visual observation
- Environmental conditions at beginning and end of PSO shift and whenever conditions change significantly
  - Wind speed (knots), from direction
  - Swell (meters)
  - Sea state (glassy, slight, choppy, rough, or Beaufort scale)
  - Water depth (meters)
  - Visibility (km)
  - Glare severity
  - Cloud coverage (%)
- Block name and number
- Location: Latitude and Longitude
- Time pre-clearance visual monitoring began in UTC (HH:MM)
- Time pre-clearance monitoring ended in UTC (HH:MM)
- Duration of pre-clearance visual monitoring
- Was pre-clearance conducted during day or night?
- Time power up/ramp up began
- Time equipment full power was reached
- Duration of power up/ramp up
- Time survey activity began (equipment on)
- Time survey activity ended (equipment off)
- Survey Duration
- Did a shutdown/power down occur?
- Time shutdown was called for (UTC)
- Time equipment was shutdown (UTC)
- Dates of departures and returns to port with port name
- Inhibiting factors of observations (e.g., vessel traffic)
- Habitat or prey observations
- Marine debris sighted

Detection Information

- Date (YYYY-MM-DD)
- Sighting ID (V01, V02, or sequential sighting number for that day) (multiple sightings of same animal or group should use the same ID)
- Date and time at first detection in UTC (YY-MM-DDT HH:MM)
- Time at last detection in UTC (YY-MM-DDT HH:MM)
- PSO name(s) (Last, First)
- Effort (ON/OFF)
- Latitude (decimal degrees dd.ddddd), longitude (decimal degrees dd.ddddd) dd.ddddd), longitude (decimal degrees dd.ddddd)
- Compass heading of vessel (degrees)
- Water depth (meters)
- Swell height (meters)
- Beaufort scale
- Precipitation
- Visibility (km)
- Cloud coverage (%)
- Glare
- Species including common name, scientific name, or family
- Certainty of identification
- Number of adults
- Number of juveniles
- Total number of animals
- Bearing to animal(s) when first detected (ship heading + clock face)
- Range from vessel (reticle distance in meters)
- Description (include features such as overall size; shape of head; color and pattern; size, shape, and position of dorsal fin; height, direction, and shape of blow, etc.)
- Detection narrative (note behavior, especially changes in relation to survey activity and distance from vessel)
- Direction of travel/first approach (relative to vessel)
- Behaviors observed: indicate behaviors and behavioral changes observed in sequential order (use behavioral codes)
- Pace of animal
- If any bow-riding behavior observed, record total duration during detection (HH:MM)
- Initial heading of animal(s) (degrees)
- Final heading of animal(s) (degrees)
- HRG equipment activity at initial detection
- HRG equipment activity at final detection (on or off)
- Shutdown zone size during detection (meters)
- Was the animal inside the Shutdown zone?
- Closest distance to vessel (reticle distance in meters)
- Closest distance to source
- Time at closest approach (UTC HH:MM)
- Time animal entered shutdown zone (UTC HH:MM)
- Time animal left shutdown zone (UTC HH:MM)

- If observed/detected during ramp up/power up: first distance (reticle distance in meters), closest distance (reticle distance in meters), last distance (reticle distance in meters), behavior at final detection
- Shut-down or power-down occurrences
- Time shutdown was called for (UTC)
- Time equipment was shutdown (UTC)
- Detections with IR? (Y/N)
- Watch Status (sighting made by PSO on watch, opportunistic, crew)
- Documentation of whether the marine mammal was estimated to have been within 195 meters of active survey equipment

9.2 Reporting NARW Sightings

The Lead PSO will report any sightings of NARW using the designated form. The report will be sent to the Vineyard Northeast Environmental Project Manager and the RPS Project Manager immediately. The PSO team will make every effort to photograph and document all relevant information associated with the sighting.

The Vineyard Northeast Environmental Project Manager will report the NARW to the NMFS NARW Sighting Advisory System: (866) 755-6622. Vessel Captains shall inform the United States Coast Guard of the sighting via channel 16 (IHA 6(a)(i)).

9.3 Injured/Dead Protected Species, Bird and Bat Reporting

The Lead PSO will report any injured or dead protected species, bird and bat detections using the designated forms. The report will be sent to the Vineyard Northeast Environmental Project Manager and the RPS Project Manager immediately. The PSO team will make every effort to photograph and document all relevant information associated with the sighting.

Sighting of Injured or Dead Protected Species:

The Vineyard Northeast Environmental Project Manager will report the injured or dead animal to BOEM, Office of Protected Resources (OPR) (301-427-8401) and NMFS Northeast Region's Stranding Hotline by phone (978-282-8478) as soon as feasible, but not later than 24 hours after the sighting, regardless of whether the injury or death is caused by a vessel (BOEM OCS-A 0522 4.4.4 & IHA 6(b)i).

Injured or Dead Protected Species- Vessel Strike:

In the event of a ship strike of a marine mammal by any vessel involved in the activities covered by the authorization, the IHA-holder shall report the incident to OPR, NMFS and to the New England/Mid-Atlantic Regional Stranding Coordinator as soon as feasible (IHA 6(b)ii).

In the event that the injury or death was caused by a collision with a project-related vessel, the vessel must assist in any salvage efforts as requested by NMFS. If the injury or death was caused by a collision with a project-related vessel, Vineyard Northeast must ensure that BOEM is notified of the strike within 24 hours. Vineyard Northeast Environmental Project Manager will report the strike to OPR, NMFS, the New England/Mid-Atlantic Regional Stranding Coordinator, and BOEM as soon as feasible (BOEM OCS-A 522 4.4.5).

Unless otherwise directed by BOEM, NOAA Fisheries, or NOAA, the dead or injured marine mammal or sea turtle SHOULD NOT be touched! Dead and injured marine mammals and sea turtles are still protected by the ESA and the MMPA and touching the animals in any manner is considered harassment and is punishable by law.

Any deceased birds should not be disposed of until a positive ID has been confirmed.

9.4 Reporting Potential Takes of Protected Species

RPS will track the exposures from each individual vessel as well as the cumulative exposure total for the survey on a daily basis. Exposure numbers will be calculated and documented in the RPS Data Form and updated/included in the daily report that is distributed to the client, identifying the remaining number of exposures.

The exposures specific to the HRG surveys associated with Lease OCS-A 0522 are outlined in Table 3 per the IHA and the remaining exposures based on the 2021 season tallies.

Table 3: Tracking Numbers of Incidental Take of Marine Mammals Authorized

Species	Authorized Takes by Level B Harassment	Remaining Potential Level B Exposures after 2021 campaign
Fin whale	51	50
Humpback whale	34	32
Minke whale	31	29
North Atlantic right whale	10	10
Sei whale	3	3
Atlantic white sided dolphin	758	758
Bottlenose dolphin	611	611
Pilot whale	107	107
Risso's dolphin	6	6
Common dolphin	2,036	1,731
Sperm whale	3	3
Harbor porpoise	784	784
Gray seal	3,033	3,032
Harbor seal	3,033	3,033

9.5 Reporting Observed Impacts to Protected Species

The Lead PSO/Environmental Team Lead on duty will report any impacts to an ESA species to the RPS Project Manager immediately. In addition, the Lead PSO/Environmental Team Lead on duty will report any observed impacts resulting in injury or mortality of listed marine mammals, sea turtles, Atlantic sturgeon, and giant manta ray to the RPS Project Manager immediately. The RPS Project Manager will inform the Vineyard Northeast Environmental Project Manager.

Vineyard Northeast will report any observed impacts resulting in injury or mortality within 24 hours to BOEM and NMFS (BOEM OCS-A 522 4.4.5).

9.6 Daily Progress Report

A daily detection spreadsheet will be completed and submitted to the Party Chief, onboard client representative, Vineyard Northeast Environmental Project Manager and RPS Project Manager. If there were no detections that day, the Lead PSO will email the distribution list noting that there were no detections on that day. The Daily Progress Report will not serve as a notification to Vineyard Northeast of any urgent matters such as those listed in Section 9.2, 9.3, 9.4, and 9.5 above.

9.7 Monthly Reporting

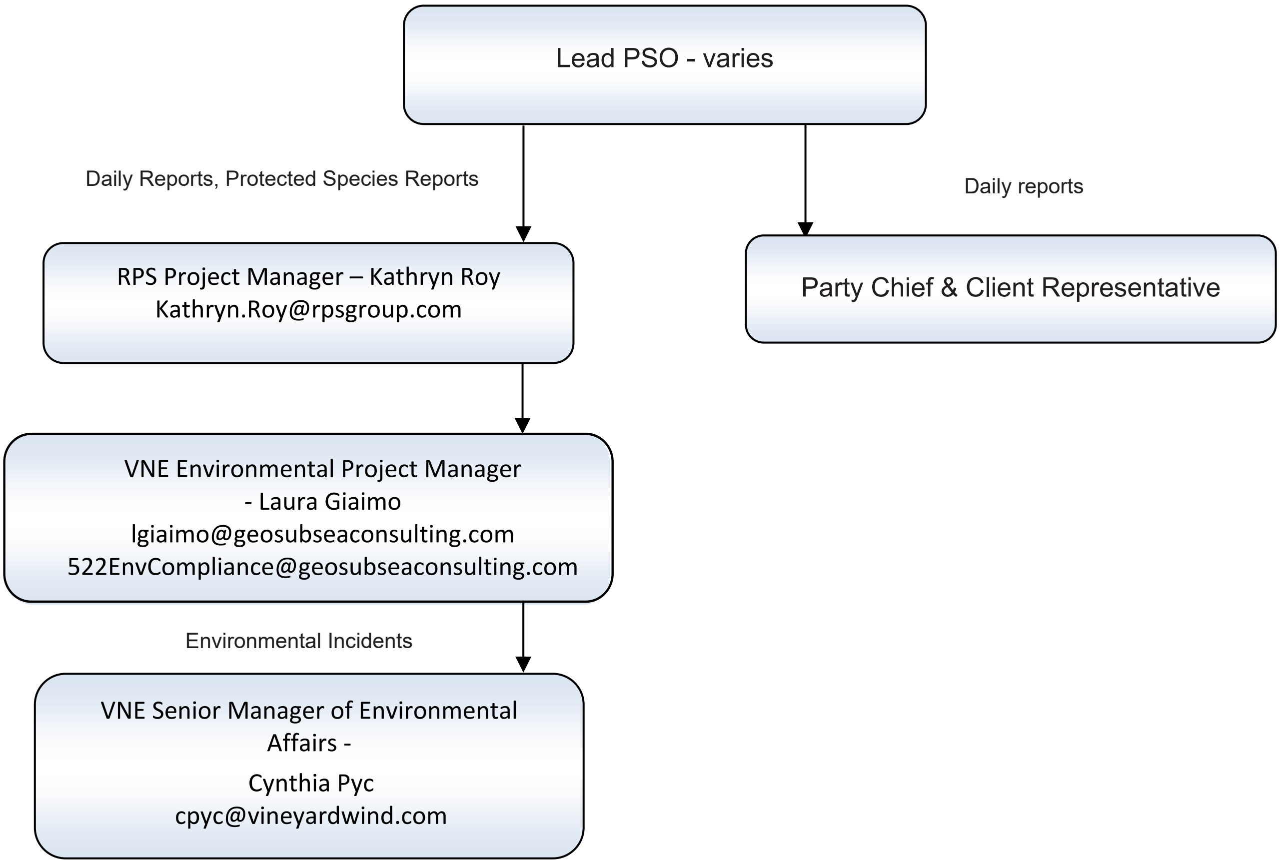
PSO data collection will be collated monthly starting on the 1st and ending on the last day of the month. These datasheets will be submitted to Vineyard Northeast monthly, by the 7th of the following month.

9.8 Final Report

The PSO team will develop a final report summarizing the survey activities and all PSO observations. One combined final report will be prepared for all of the geophysical vessels conducting operations in 2022. The RPS Project Manager will provide the finalized report to the Vineyard Northeast Environmental Project Manager within 30 days of project completion for review.

The RPS Project Manager will submit the final report to Vineyard Northeast for review. Vineyard Northeast will be responsible for submitting the final report to BOEM and NMFS or may instruct RPS to make the submittal on their behalf 90 days after completing of survey activities.

10 COMMUNICATION FLOW CHART



11 RESOURCES

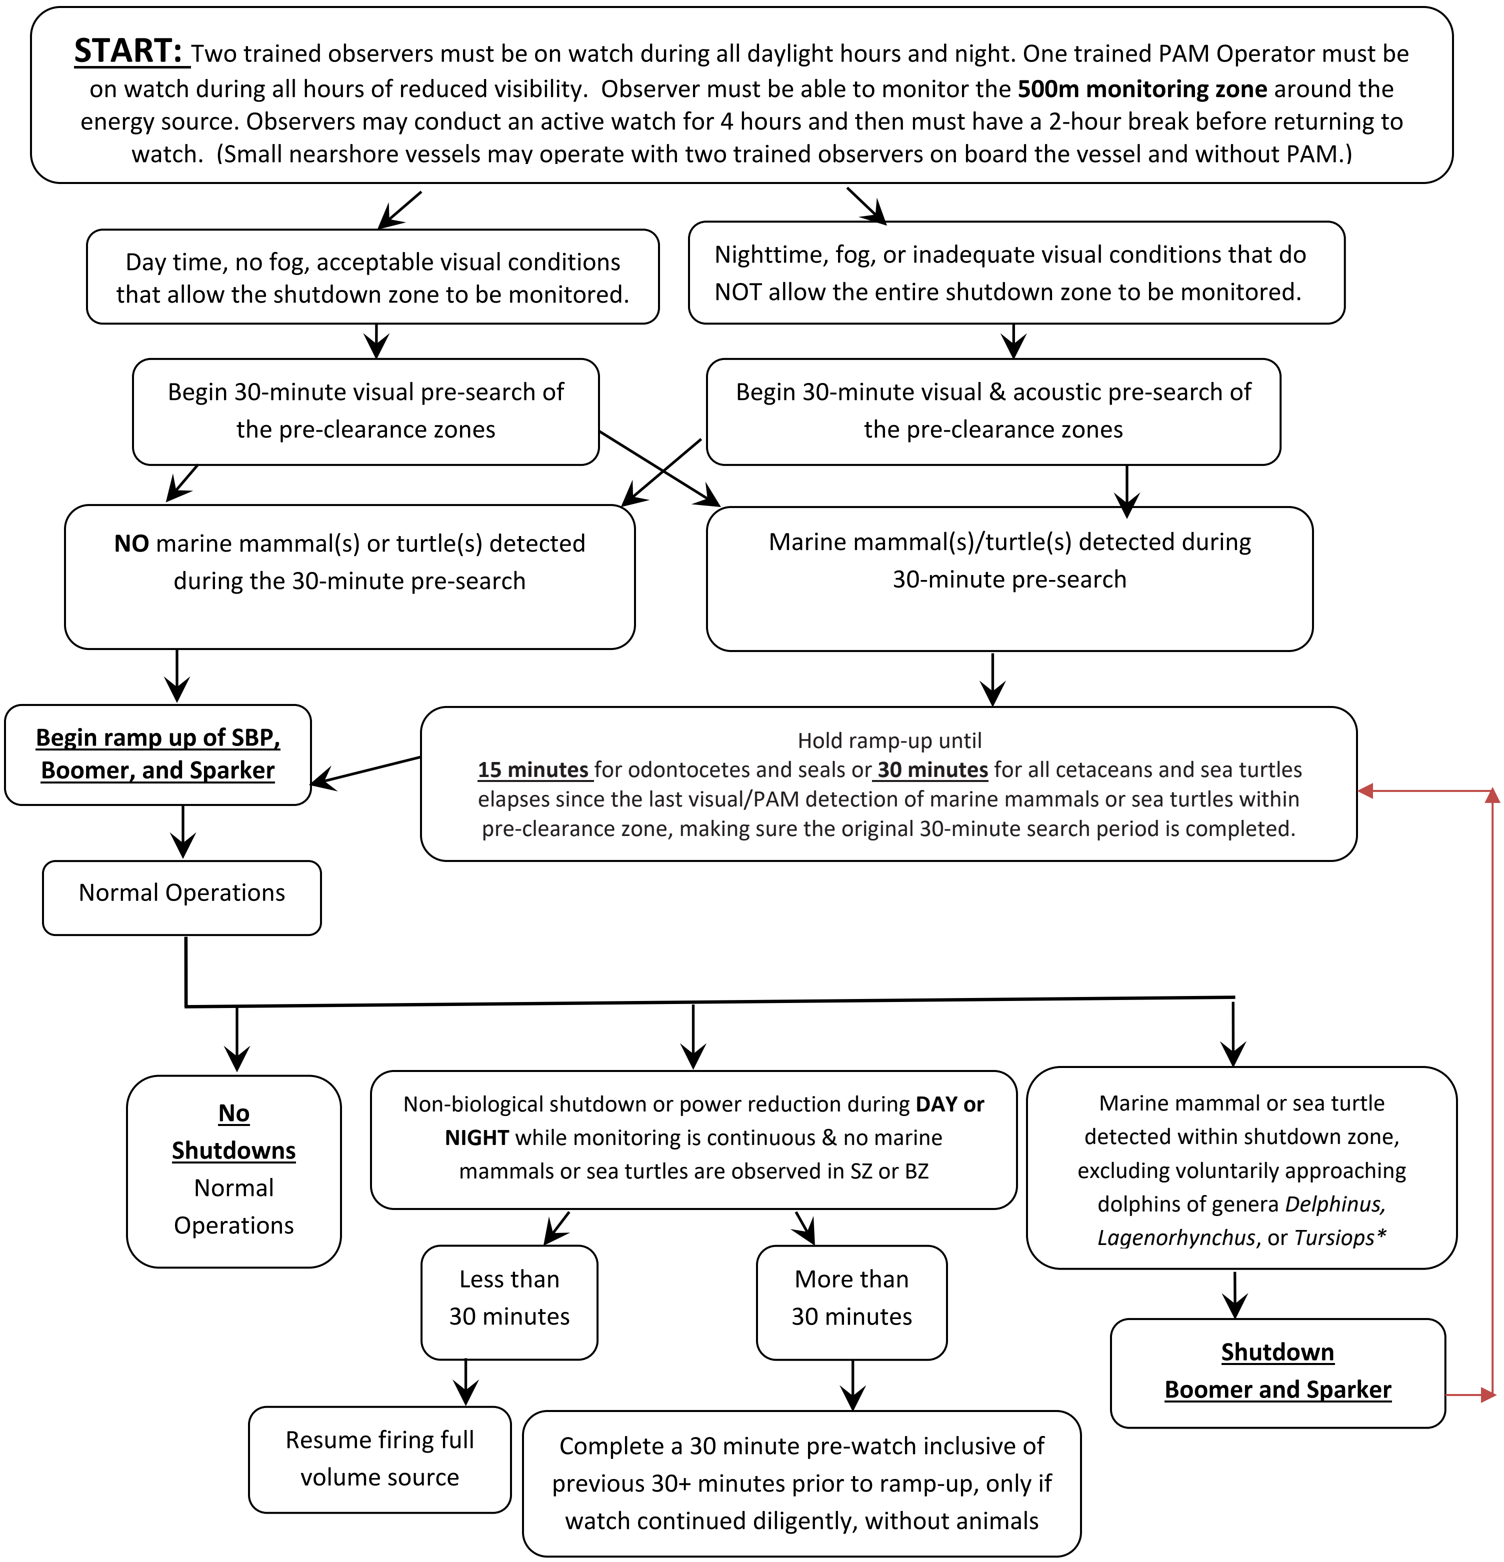
BOEM Lease OCS-A 0522

BOEM-approved Lease waivers OCS-A 0522

NMFS Incidental Harassment Authorization – July 15, 2021

Appendix A
Mitigation Flow Chart

Mitigation Decision Flowchart



*Voluntary approach species are limited to those where takes are granted: Atlantic white sided dolphins, bottlenose dolphins, Risso's dolphins, common dolphins, and harbor porpoise. Other species, such as the White-beaked dolphins, while of the exempt genera, still require a shutdown as no takes have been granted for that species. A shutdown is required if those genera enter the SZ but do not approach the vessel.

Appendix B
Communication Flow Charts & Phrasing

Communication Flow Charts

Ramp-up Communication Procedure for PSOs and PAM Operator

The sound source operator on duty notifies the day PSOs or night PSOs and PAM Operator on watch in person, via VHF radio, or by phone that the vessel would like to activate the source for ramp-up or source testing at least 30 minutes prior to the intended time of the initiation of the source. *Note: The sound source operator may notify the PSO/PAM Operator more than 30 minutes in advance of the intended source operations, if the initiation time is uncertain (i.e. source testing following array deployment) but* ***a 30-minute pre-search must be completed*** *prior to activation of the source*. After 30 minutes have passed, the operator calls or radios the PSO/PAM Operator on watch to ask if the vessel is clear to initiate ramp-up. If the ramp-up is not initiated immediately, the operator must radio to the PSOs to inform them of the delay. When the issue causing the delay has been resolved, the operator must then call the PSO to ask for clearance. Ramp-up begins. Operator informs PSO/PAM Operator that ramp-up has begun and active protected species monitoring continues.

Sound Source Operator requests that day PSOs or night PSOs and PAM Operator begin 30-minute pre-search to clear vessel for ramp-up or source testing

No marine mammals or sea turtles detected inside pre-clearance zones during 30-minute pre-search

Sound Source Operator asks PSO/PAM Operator if vessel is clear to ramp-up
OR
PSO/PAM Operator informs Sound Source Operator that vessel is clear to ramp-up

Marine mammals or sea turtle detected inside pre-clearance zones during 30-minute pre-search

PSO/PAM Operator notifies Sound Source Operator that a marine mammal/sea turtle has been detected inside the pre-clearance zone, vessel is not clear to ramp-up, and ramp up will be delayed.

PSOs and/or PAM Operator continue to monitor the pre-clearance zone. The Sound Source Operator is notified that the vessel is clear to ramp-up when the protected species has not been detected inside the PCZ for 30 minutes (cetaceans & sea turtles) or 15 minutes (odontocetes and seals).

Ramp up of SBP, boomer, and sparker for 20 minutes starting with the smallest acoustic equipment at its lowest practical power output gradually turned up and other HRG equipment added in such a way that the source level would increase gradually

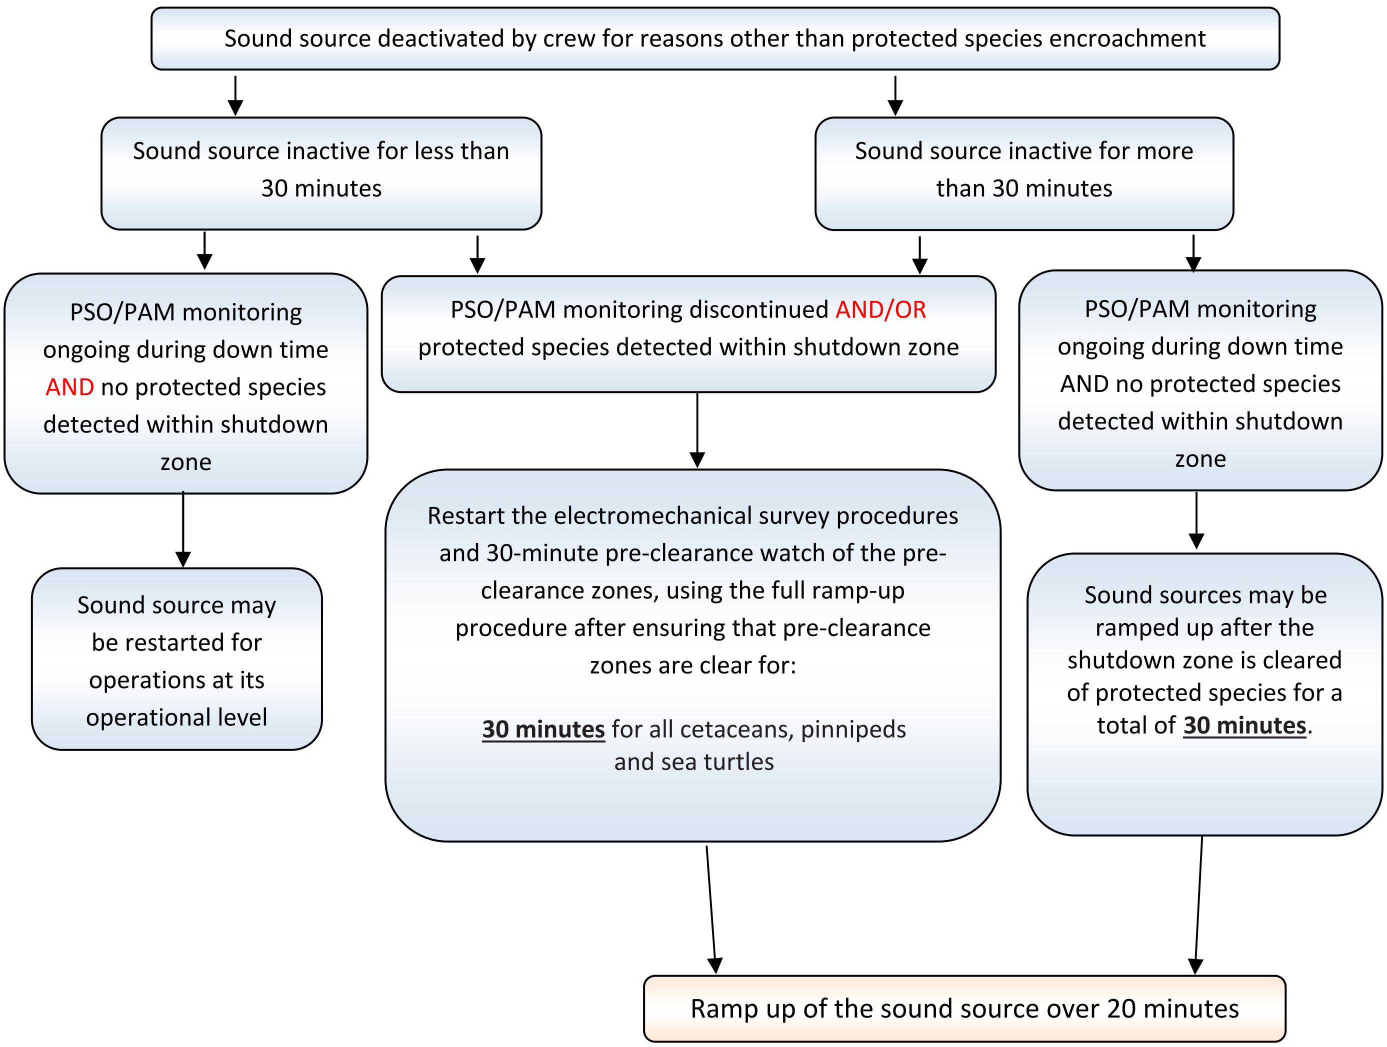
Sound Source Operator notifies PSO/PAM Operator that ramp-up has begun. This may be done in the same communication as when the PSO/PAM Operator gives clearance to begin ramp-up if ramp-up will be initiated immediately. If ramp-up will not begin right away, Sound Source Operator should call the PSO/PAM Operator to check that the pre-clearance zone has remained clear of protected species during the delay, and to ask for clearance to begin ramp-up.

Pre-Clearance Zones (PCZ):

- **500 meters**: North-Atlantic right whales
- **200 meters**: all marine mammals other than NARW
- **50 meters:** sea turtles

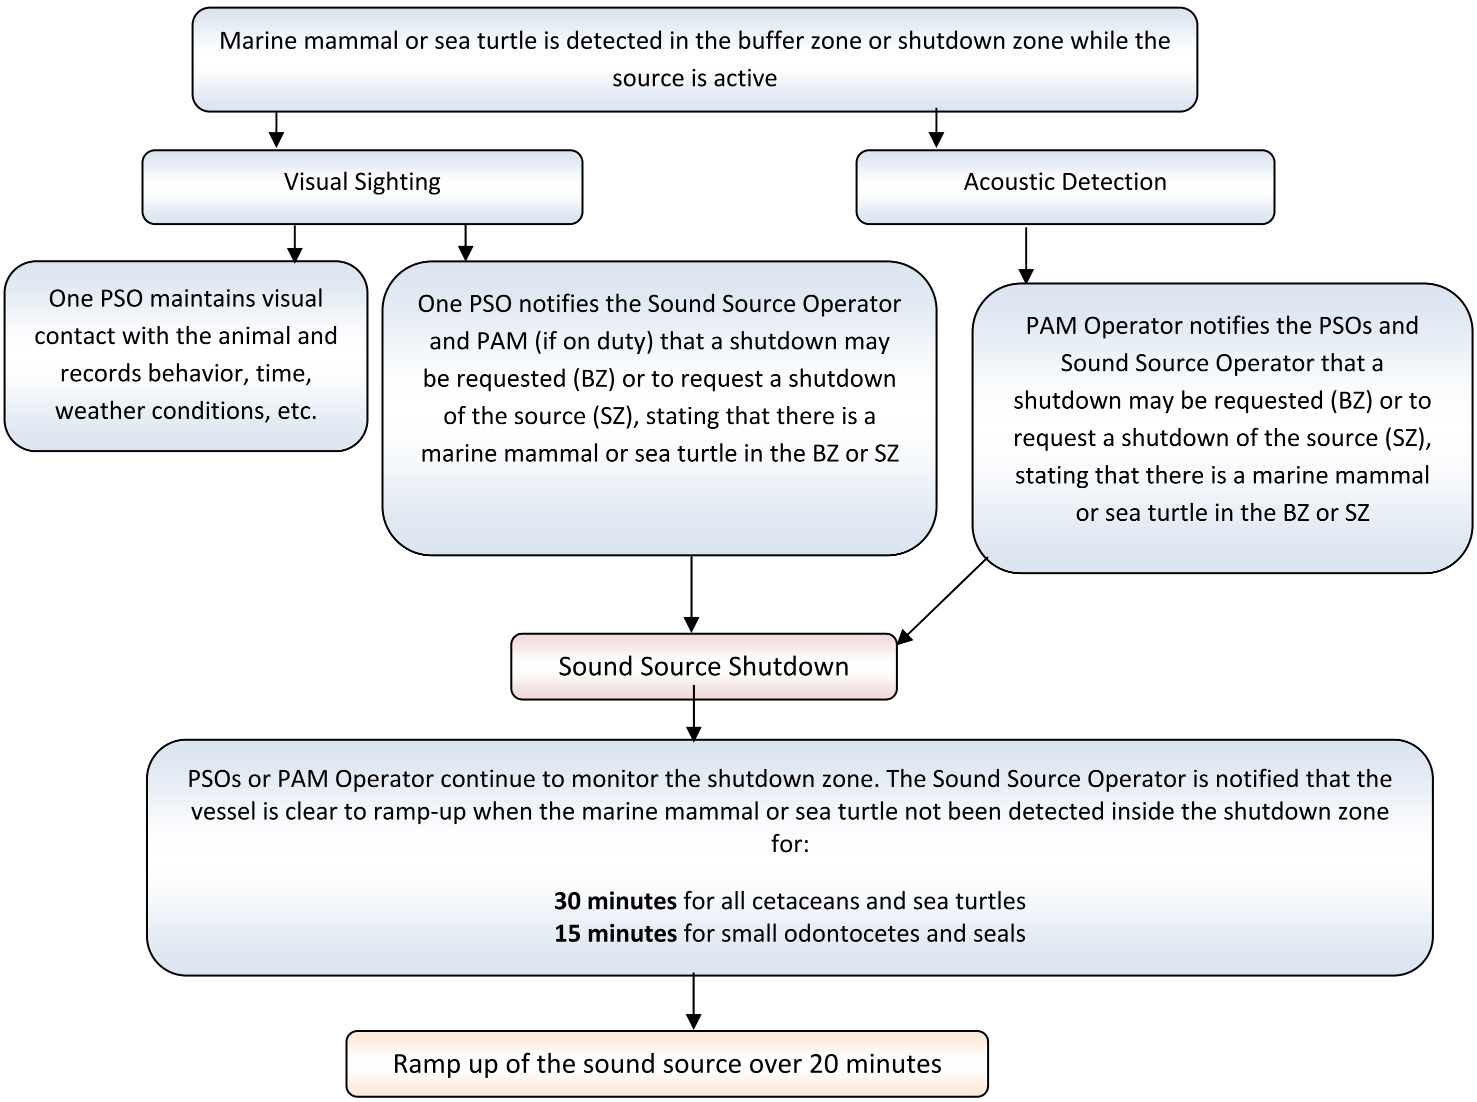
Communication Procedure for Short Sound Source Breaks

SBPs, sparkers, and boomers are turned off for occasional short periods of silence for a variety of reasons other than encroachment into the shutdown zone by a non-delphinoid cetacean or sea turtle, including, but not limited to, mechanical or electronic failure. During these events, sound sources may be silenced for periods of time not exceeding 30 minutes. Survey crew must notify the PSO/PAM team of the shut down and sound source restart will occur based on the following:



Shut-down Communication Procedure for PSOs and PAM Operator

At first detection of a marine mammal inside the *buffer zone*, the PSO or PAM Operator notifies the Sound Source Operator on duty in person, via VHF radio, or by phone that a shutdown of boomers and sparkers may be requested. At first detection of a marine mammal or sea turtle inside the respective *shutdown zone*, the PSO or the PAM Operator notifies the Sound Source Operator on duty in person, via VHF radio, or by phone and requests a shutdown of source operations. During a visual sighting resulting in a shut-down, the second PSO continues to monitor the animal. During an acoustic detection resulting in a shut-down, the PAM Operator begins recording the detection event. The time that the protected species is last detected inside the shutdown zone is noted, and up to 30 minutes following the last detection, the PSO/PAM Operator informs the Sound Source Operator that the vessel is clear for ramp-up. A 20-minute ramp-up occurs.



__**Buffer Zone (BZ):**__ requires alert to equipment operator in anticipation of possible shut down

- **200 meters:** all other marine mammals other than NARW

__**Shutdown Zones (EZ):**__

- **500 meters:** North-Atlantic right whales
- **100 meters**: All other marine mammals with the exception of delphinids from the genera *Delphinus, Lagenorhynchus* (*acutus* only), or *Tursiops*
- **50 meters:** Sea turtles

Communication Procedure for Vessel Strike Avoidance

At first detection of a marine mammal or sea turtle in the vessel's path, the PSO notifies the bridge of the animal's presence and distance from the vessel, in person, via VHF radio, or by phone and requests a Vessel Strike Avoidance. During the sighting, the PSO continues to monitor the marine mammal or sea turtle to continue advising the bridge as to the effectiveness of the Vessel Strike Avoidance.

The vessel operator must reduce vessel speed to 10 knots or less when any large whale, any mother/calf pairs, whale or dolphin pods, or larger assemblages of non-delphinoid cetaceans are observed within 100 m of an underway vessel

Marine mammal or sea turtle is detected in the path of the vessel – PSO notifies bridge of visual detection

Unidentified Whale & North Atlantic right whale – vessel will maintain minimum separation distance of 500 m *

- If underway, steer a course away from any sighted NARW at 10 knots or less maintaining the 500-meter separation distance
- If sighted within 500 meters to underway vessel, or within the vessels path, reduce speed and shift the engine to neutral until the NARW has moved beyond 500 meters and out of path, then re-engage engines (when beyond 500 m) and steer away at 10 knots or less
- If stationary, the vessel must not engage engines until the NARW has moved beyond 500 meters.

Non-delphinoid cetacean – vessel will maintain minimum separation distance of 100 m

- If sighted within 100 meters to underway vessel, reduce speed and shift the engine to neutral until the animal has moved outside of the vessel's path and beyond 100 meters
- If vessel is stationary, the vessel must not engage engines until the non-delphinoid cetacean has moved out of the vessel's path and beyond 100 meters.
- Vessel operator must reduce speed to 10 knots or less when any large whale, any mother/calf pairs, whale or dolphin pods, or large assemblages of non-delphinoid cetaceans are observed near (100 m) of an underway vessel

Delphinoid cetaceans & pinnipeds – vessel will maintain minimum separation distance of 50 m

- Vessels should not divert to approach delphinoid cetaceans or pinnipeds
- Underway vessel will remain parallel to a sighted delphinoid cetacean's course whenever possible, avoiding excessive speed or direction changes until the animal has moved beyond 50 meters or abeam of the underway vessel

Sea turtle & giant manta ray – vessel will maintain minimum separation distance of 50 m

- Vessels should not divert to approach sea turtles or giant manta rays

*Additional NARW guidance:
- 10 knot speed restriction in any DMA, Slow Zone, and SMA
- Seasonal speed restriction Nov1 – April 30 (10 knots or less)
- SMAs

-Block Island Seasonal Management Area (SMA) (from November 1 through April 30),
-Cape Cod Bay SMA (from January 1 through May 15)
-Off Race Point SMA (from March 1 through April 30)
-Great South Channel SMA (from April 1 through July 31)
.

Vineyard Northeast must not operate more than three HRG survey vessels concurrently within a seasonal restriction area with HRG survey equipment operating at or below 180 kHz:

-December through February restriction area is delineated by latitudes and longitudes of 41.183 N; 40.366 N; 69.533 W; and 70.616 W.
-March through June restriction area is delineated by a polygon with the following vertices: 40.746 N 70.748 W; 40.953 N 71.284 W; 41.188 N 71.284 W; 41.348 N 70.835 W; 41.35 N 70.455 W; 41.097 N 70.372 W; and 41.021 N 70.37 W

Standardized Phrasing Communications Between Operations & PSO/PAM

RPS uses a 3-way method of communication when the PSO/PAM team communicates with the vessel and survey operators. This method consists of an initial mitigation request by the PSO/PAM team, to which the vessel and survey operators will respond with the implementation action taken, followed by the PSO/PAM team repeating the implemented action to the vessel and survey operators. Below are examples of this 3-way method of communication applied in various mitigation type scenarios:

STRIKE AVOIDANCE REQUEST

PSO to OPS: *"Dolphins approaching the vessel's bow, maintain speed and direction."*
OPS to PSO: "*Maintain speed and direction."*
PSO to OPS: *"Copy. Speed and direction maintained.*

DETECTION DURING PRE-WATCH

PSO/PAM to OPS: *"There is a sea turtle in the EZ. Delay ramp-up."*
OPS to PSO/PAM: *"Delaying ramp-up at HH:MM."*
PSO/PAM to OPS: *"Copy that. Delay initiated at HH:MM"*

PRE-WATCH CLEARANCE

PSO/PAM to OPS: *"Pre-watch completed HH:MM"*
OPS to PSO/PAM: *"Ramp-Up started at HH:MM"*
PSO/PAM: *"Copy. Ramp-Up started at HH:MM"*

DETECTION DURING RAMP-UP

PSO/PAM to OPS: *"Shutdown for sea turtle in EZ."*
OPS to PSO/PAM: *"Stopping ramp-up at HH:MM."*
PSO/PAM to OPS: *"Copy that. Stopped ramp-up HH:MM"*

DETECTION DURING OPERATIONS

PSO/PAM to OPS: *"Shutdown for whale in EZ."*
OPS to PSO/PAM: *"Shutting down at HH:MM."*
PSO/PAM to OPS: *"Copy that. Shut down HH:MM"*

*If protected species is observed exiting Shutdown Zone:

PSO to OPS: *"The Protected Species has exited the Shutdown Zone. You are clear to Ramp-up."*
OPS to PSO/PAM: *"Ramp-Up started at HH:MM"*
PSO/PAM: *"Copy. Ramp-Up started at HH:MM"*

*If protected species is NOT observed exiting Shutdown Zone:

PSO to OPS: "Visual of animal's last *detection was at HH:MM. You will be clear to Ramp-up at HH:MM*"
OPS to PSO/PAM: *"Ramp-Up started at HH:MM"*
PSO/PAM: *"Copy. Ramp-Up started at HH:MM"*

Appendix C
Mitigation FAQs

MITIGATION FAQS WITH SITUATIONAL EXAMPLES OF MITIGATION IMPLEMENTATION

When monitoring for protected species during site characterization surveys, there is the potential to encounter certain “Gray Areas”. These scenarios can be a source of debate, given their lower frequency of occurrence, and potentially contentious nature. The following are examples of these “Gray Areas” in mitigation that may require additional discussion with land-based managers:

- **Fog Scenarios:**

  In the event of fog encroachment onto the survey site, operations may continue, so long as a pre-watch clearance was completed and maintained prior to the fog encroaching. PAM equipment should be deployed and engaged to assist with monitoring during fog. Once the sound source ceases, another ramp-up cannot be initiated until the Shutdown Zone can be cleared either visually or acoustically.

- **Voluntary Approaching Dolphins* (genera specific):**

  Delphinid species behaviour can be hard to determine depending on various factors. The PSMMP and permit documents contain verbiage allowing for animals determined to be voluntarily approaching the vessel to do so freely without impact to operations. It is suggested that the PSO take up to 10 minutes to determine if any of the animals are breaking their current behaviour to move towards the vessel. If at any point it appears that the vessel is instead encroaching on the animals, this is not considered voluntary approach and vessel strike avoidance and source mitigation measures are put into place.

- **Multiple HRG Equipment Ramp-up (SBP, Boomer, Sparker):**

  The different pieces of HRG equipment used during survey operations operate at various frequencies and have varying operational engagements. Acoustic sources operating below 180 kHz should be “ramped up” as feasible; this means, starting the equipment at the lowest frequency and slowly increasing it over a set period (generally up to 20 minutes). Any equipment that does not have the ability to be turned on in an incremental manner should be turned on, one at a time, from the lowest to the highest operating frequency, after the incremental equipment has been brought to full power.

- **More than one species group detected at the same time:**

  Each of the detected species should be monitored on an individual timeline. If a whale and dolphin were detected in the shutdown zone during the same timeframe, the clearance time would be 30 minutes from the time the whale was last spotted and 15 minutes from the time the dolphin was last detected; clearance would be given for the latest time.

  Ex 1. whale last sighted at 15:30, dolphins last sighted at 15:49, clearance provided at 16:04.

  Ex 2. whale last sighted at 15:59, dolphins last sighted at 16:02, clearance provided at 16:29.

- **Vessel Board Lighting in Limited Visibility:**

  Monitoring the starboard side of the vessel is inhibited by bright deck lights that interfere with both night vision and unaided eye. Communication with the crew is required to allow clearance prior to light being turned on and restricting the time the light is used to prevent possible HSE issues. Passive Acoustic Monitoring will also provide a supplement to this issue.

- **Dolphin* detections during ramp up**

  It is possible to encounter dolphins approaching the vessel while the HRG equipment is in the process of attaining full power. Progressing through the ramp-up will be defined by the species of dolphin* identified to be approaching.

  Example: A pod of common bottlenose dolphins encroach on the vessel during the ramp-up process, which will not trigger a shutdown of operations. As this group was deemed to be voluntarily approaching the vessel, a shutdown is not required and the ramp up procedure should be permitted to continue without interruption.

- **Dolphin* detections during line changes**

  It is possible to encounter dolphins approaching the vessel while the vessel is completing a line change with the HRG equipment operating at reduced power. Whether the equipment can be returned to full volume upon the line start will be defined by the species of dolphin* identified to be approaching.

  Example: A pod of common bottlenose dolphins encroaching on the vessel during a line change will not trigger a delay of operations. As this particular group was deemed to be voluntarily approaching the vessel, a shutdown is not required, and the ramp up procedure should be permitted to continue without interruption.

It is important to note that the described scenarios do not always unfold as defined above and should be evaluated on a case-by-case basis, by addressing the applicable regulatory documents (ie. Lease, IHA, etc.)

* Applies to the genera ***Delphinus, Lagenorhynchus or Tursiops.*** All other species of dolphin, including unidentified dolphins (both visual and PAM detections) will not be considered under this example and will result in a shutdown.

1 INTRODUCTION

Vineyard Mid-Atlantic LLC (Vineyard Mid-Atlantic) has contracted RPS to provide the protected species monitoring assets required to meet the National Oceanic and Atmospheric Administration, National Marine Fisheries Service (NMFS), and the Bureau of Ocean Energy Management (BOEM) monitoring and mitigation requirements during a high resolution geophysical (HRG) campaign.[1] The details of the HRG campaign were provided to BOEM in a Geophysical, Geotechnical and Environmental Site Characterization Campaign (G&G) Survey Plan, last revised July 25, 2022, and approved by BOEM on August 2, 2022.

As the proposed Vineyard Mid-Atlantic survey activities will include the use of geophysical equipment operating below 180 kHz (non-impulsive, non-parametric sub-bottom profilers (SBPs), and impulsive sparkers and boomers), a Protected Species Monitoring and Mitigation Plan (PSMMP) is required. The PSMMP outlines the sound source monitoring and mitigation, and vessel strike avoidance measures that will be implemented for marine mammals, sea turtles, and other protected species for the duration of the survey campaign.

1.1 Applicable Regulatory Documents and Permits

BOEM Lease OCS-A 0544 (Lease) requires that survey activities comply with the most current *Project Design Criteria (PDCs) and Best Management Practices (BMPs) for Protected Species Associated with Offshore Data Collection*[2] (last updated November 22, 2021), issued by BOEM in consultation with NMFS. Further, NMFS issued an Incidental Harassment Authorization (IHA) to Vineyard Northeast pursuant to Section 101(a)(5) of the Marine Mammal Protection Act (MMPA; 15 U.X.C 1371(a)(5)(D)) which is valid from July 27, 2022 through July 26, 2023[3]. This IHA specifies requirements for protection of marine mammals during HRG surveys, including adherence to PDCs 4, 5, and 7. Further, the BOEM-approved survey plan includes an Alternative Monitoring Plan (AMP) for conducting work at night or in low-visibility conditions.

This document outlines the monitoring, mitigation, and reporting procedures applicable to the HRG survey campaign, based on the requirements of the Lease, BOEM's PDCs and BMPs, NMFS IHA, and the BOEM-approved Survey Plan (inclusive of an AMP), which will hereinafter be called "Permitting Documents".

2 MARINE PROTECTED SPECIES

Marine protected species or protected species, refers to any marine species for which dedicated monitoring and mitigation procedures will be implemented, including:

- All marine mammals (whales, dolphins, seals, porpoises)
- Sea turtles
- Atlantic sturgeon
- Shortnose sturgeon
- Giant manta ray
- Smalltooth sawfish

[1] Protected species monitoring during non-HRG survey activities is addressed in a separate plan.

[2] Under this consultation, protected species are defined as threatened and endangered marine species listed under the Endangered Species Act and all marine mammals.

[3] An application for a one-year renewal of the IHA was submitted to NMFS on March 6, 2023.

3 PROTECTED SPECIES OBSERVERS

3.1 Staffing Plan

For the offshore HRG surveys, an RPS team of five Protected Species Observers (PSOs) will be on board each vessel conducting 24-hour survey operations. These personnel will undertake visual monitoring, implement mitigation, and conduct data collection and reporting in accordance with the Permitting Documents.

A minimum of one (1) PSO must be on duty, per source vessel, during daylight hours (civil sunrise to civil sunset) and two (2) PSOs will be on duty, per source vessel, during nighttime and reduced visibility, when high-resolution geophysical (HRG) equipment is in use. Sample schedules are described in Table 1 and Table 2 (PDC 7 BMP 7.4, IHA 4(a)).

For nearshore HRG surveys conducted during daytime hours only, non-independent observers may be approved. In order to be approved to act as PSOs, non-independent observers must have no duties other than marine mammal monitoring while on watch and must be trained on protected species detection and identification, vessel strike minimization procedures, and reporting requirements (IHA 5(b)).

3.2 PSO Requirements

All PSOs must successfully complete relevant training, including completion of all required coursework and passing (80 percent or greater) a written and/or oral examination developed for the training program (IHA 5(g)). PSOs will have relevant observation experience in the Atlantic. The resumes, NMFS approval letters, and certifications for proposed PSOs will be provided for submittal to NMFS for review no later than seven days prior to the scheduled start of the survey (IHA 5(a), IHA 5(c), PDC 7 BMP 1). PSO documents will be submitted to BOEM upon request (PDC 7 BMP 7.1).

During good conditions (e.g., daylight hours; Beaufort scale 3 or less) when survey equipment is not operating, to the maximum extent practicable, PSOs must conduct observations for protected species for comparison of sighting rates and behavior with and without use of active geophysical survey equipment. Any observed listed species must be recorded regardless of any mitigation actions required (IHA 5(m), PDC 4 BMP 4.13).

3.3 Roles and Responsibilities

PSOs must have no tasks other than to conduct monitoring, alert relevant vessel crew to the presence of protected species, request mitigation, and record observational data for reporting.

Lead PSO

- Coordinate and oversee PSO operations and ensure compliance with permit monitoring and mitigation conditions
- Visually monitor, detect, and identify protected species and determine distance from the location of the animal when detected to the geophysical source
- Record and report protected species sightings, survey activities, and environmental conditions according to the Permitting Documents
- Communicate with the crew to initiate mitigation actions as required by permit conditions
- Carry out onboard quality control (QC) reviews of PSO data
- Participate in daily meetings and drills with the crew when appropriate

PSO

- Visually monitor, detect, and identify protected species
- Record and report according to the Permitting Documents

- Monitor and advise on sound source and vessel operations for compliance with the environmental requirements for the Permitting Documents
- Communicate with the crew to implement mitigation actions as required by permit conditions
- Participate in daily operation meetings with crew when appropriate

4 VISUAL MONITORING METHODS

4.1 PSO General Monitoring Protocol

One NMFS approved PSO during daytime and two NMFS approved PSOs during nighttime will visually monitor permit-defined zones at all times when the vessel is away from dock, and during day and nighttime operations (PDC 7 BMP 7.4, IHA 4(a)). The following general protocols apply to all operations:

- Other than brief alerts to bridge personnel of maritime hazards and the collection of ancillary wildlife data, no additional duties may be assigned to the PSO during his/her visual monitoring shift
- PSOs may be on watch for a maximum of four consecutive hours followed by a break of at least two hours between watches and may conduct a maximum of 12 hours of observation per 24-hour period (IHA 5(i)).
- PSOs must coordinate to ensure 360° visual coverage around the vessel from the most appropriate observation posts and must conduct visual observations using binoculars or night-vision equipment and the naked eye while free from distractions and in a consistent, systematic, and diligent manner (IHA 5(h)).
- Visual monitoring will begin no less than 30 minutes prior to the initiation of the SBPs, boomers and sparkers, and must continue until 30 minutes after use of SBPs, boomers and sparkers (IHA 4(b)).
- If a protected species is observed, the PSO should first initiate any necessary mitigation actions. If no mitigation actions are required, they will note and monitor the latitude/longitude of the vessel and relative bearing and estimated range to the animal, until the animal dives or moves out of visual range of the observer.

4.2 Daytime Monitoring During Reduced Visibility

In order for geophysical surveys to be conducted at night or during low-visibility conditions, PSOs must be able to effectively monitor 500 meters around the acoustic source (PDC 4 BMP 4.7).

During these periods, all requirements surrounding monitoring durations and break periods will be adhered to. Additionally, no PSO will conduct additional monitoring shifts. This is to ensure that they have a sufficiently long break with at least 8 hours of uninterrupted sleep.

The PSO team and vessel / survey crew will work together to co-ordinate monitoring to the best of their abilities to minimize any operational downtime during daytime periods of reduced visibility.

4.2.1 Daytime monitoring equipment

The PSO on duty will monitor for marine protected species using the naked eye and hand-held reticle binoculars (at least one per PSO, plus backups). Reticle binoculars have the capability to accurately determine the distance and bearing to observed marine mammals (IHA 5(k)).

Digital single-lens reflex (DSLR) camera equipment including digital cameras with a telephoto lens that is at least 300 mm or equivalent on a full-frame DSLR (at least one plus backups) will be provided to record sightings and verify species identification. The camera or lens must also have an image stabilization system (IHA 5(k)(iv)).

Additionally, PSOs will have access to Global Positioning System (GPS), compasses and means of communication with vessel crew (IHA 5(k)).

4.3 Nighttime Monitoring

If survey operations are conducted at night, the PSOs will use night vision goggles and at least one thermal (infrared) imaging device suited for the marine environment (IHA 5(k)(i), PDC 4 BMP 4.7.2, Alternative Monitoring Plan).

4.3.1 Nighttime monitoring equipment

The PSOs on duty will monitor for marine protected species using Morovision PVS-7 Gen 3 PINNACLE night vision goggles with a thermal acquisition clip-on system and handheld infrared light emitting diode spotlights so PSOs can focus observations in any direction.

At night, if reticles cannot be used to localize a detection, distance to detected animals will be determined using range finder sticks or by comparing the location of the animal to known distances, such as the length of the vessel.

4.4 Visual Monitoring Equipment Calibration

Monitoring equipment will be calibrated, when possible, throughout the duration of survey at least once a week using the vessel radar, by comparing estimated distances to known distances and will be conducted during varying sea states and both at night and during the day.

5 PROPOSED MONITORING SCHEDULES FOR 24-HOUR OPERATIONS

Table 1: Monitoring Schedule

LOCAL TIME	PSO 1	PSO 2	PSO 3	PSO 4	PSO 5
20:00				PSO	PSO
21:00	PSO			PSO	
22:00	PSO			PSO

*The monitoring schedule is inclusive of monitoring for vessel strike avoidance and source mitigation purposes

6 VESSEL STRIKE AVOIDANCE ON HRG VESSELS

6.1 North Atlantic Right Whale (NARW) Monitoring Notification Systems

The PSO team will monitor NMFS's North Atlantic Right Whale (NARW) reporting system and Whale Alert, daily and as able, for the presence of NARWs before and throughout survey operations within or adjacent to the Seasonal Management Area (SMA), Slow Zones, and any established Dynamic Management Areas (DMAs) (IHA 5(n), PDC 5 BMP 5.6).

https://www.nefsc.noaa.gov/psb/surveys/MapperiframeWithText.html

http://www.whalealert.org/

6.2 Vessel Speed Restriction

Vessel operators must comply with the below measures except under extraordinary circumstances when the safety of the vessel or crew is in doubt or the safety of life at sea is in question. These requirements do not apply in any case where compliance would create an imminent and serious threat to a person or vessel (IHA 4(f), PDC 5).

All survey vessels, regardless of size, must observe a 10-knot speed restriction in any Dynamic Management Area (DMA), Seasonal Management Area (SMA), or Slow Zone. The only exception to this requirement is for vessels operating in areas within a DMA/visually triggered Slow Zone where it is not reasonable to expect the presence of North Atlantic right whales (e.g., Long Island Sound, shallow harbors) (IHA 4(f)(ii), PDC 5 BMP 5.4).

https://www.fisheries.noaa.gov/national/endangered-species-conservation/reducing-ship-strikes-north-atlantic-right-whales

6.3 Separation Distances

A visual observer aboard the vessel must monitor a vessel strike avoidance zone around the vessel. Visual observers may be third-party observers or crew members with sufficient training (IHA 4(f)(i), PDC 5 BMP 5.3.1).

When a marine mammal is sighted while a vessel is underway, the vessel must take action as necessary to avoid violating the relevant separation distance (e.g., attempt to remain parallel to the animal's course, avoid excessive speed or abrupt changes in direction until the animal has left the area, reduce speed and shift the engine to neutral) (IHA 4(f)(vii)).

The presence of a single Individual at the surface may indicate the presence of submerged animals in the vicinity; therefore, precautionary measures should always be exercised (PDC 5 BMP 5.1).

The vessel operator must reduce vessel speed to 10 knots or less when any mother/calf pairs, pods, or large assemblages of marine mammals are observed near a vessel (IHA 4(f)(iii)).

Vessels underway must not divert their course to approach any listed species (PDC 5 BMP 5.3.3).

6.3.1 ESA-Listed Whales and Unidentified Whales

All survey vessels will maintain a separation distance of 500 meters or greater from any sighted NARW, ESA-listed whale (Table 3), or any unidentified large marine mammal (IHA 4(f)(iv), PDC 5 BMP 5.2.3).

- If underway, the vessel must steer a course away from any sighted unidentified or ESA-listed whale at 10 knots or less until the 500-meter minimum separation distance has been established. The vessel may also shift to idle if feasible (PDC 5 BMP 5.2.4, IHA 4(f)(iv)).
- If sighted in a vessel's path or within 200 meters to an underway vessel, reduce speed and shift the engines to neutral until the unidentified or ESA-listed whale has moved beyond 500 meters and out of the vessel's path, then re-engage engines and steer away at 10 knots or less (PDC 5 BMP 5.2.4).
- If stationary, the vessel must not engage engines until the unidentified or ESA-listed whale has moved beyond 500 meters, at which point the vessel must steer a course away from the unidentified or ESA-listed whale at 10 knots or less, maintaining the 500-meter separation distance (PDC 5 BMP 5.2.5).
- If a whale is observed but the species cannot be confirmed as being other than an ESA-listed whale, it must be assumed to be an ESA-listed whale and all applicable strike avoidance procedures implemented (IHA 4(f)(iv)).

6.3.2 Non-ESA Listed Whales

All vessels will maintain a separation distance of 200 meters or greater from any sighted non-listed non-delphinoid cetacean (i.e., humpback whales, minke whales) (IHA 4(f)(v), PDC 5 BMP 5.2.5).

- If sighted within 200 meters to an underway vessel, reduce speed and shift the engine to neutral until the animal has moved outside of the vessel's path and beyond 200 meters.
- If the vessel is stationary, the vessel must not engage engines until the non-listed non-delphinoid cetacean has moved out of the vessel's path and beyond 200 meters.

6.3.3 Delphinoid Cetaceans and Pinnipeds

All vessels will maintain a separation distance of 50 meters (as feasible) or greater from any sighted delphinoid cetacean or pinniped (IHA 4(f)(vi)).

- Vessels should not divert to approach delphinoid cetaceans or pinnipeds.
- Underway vessels will remain parallel to a sighted pinniped or delphinoid cetacean's course whenever possible and avoid excessive speed or abrupt changes in direction to avoid injury to the animal.

6.3.4 Sea Turtles and Giant Manta Ray

- If a sea turtle or manta ray is sighted within the operating vessel's forward path **at any distance**, the vessel must slow down to 4 knots (unless unsafe to do so) and steer away as possible. The vessel may resume normal operations once the vessel has passed the individual (PDC 5 BMP 5.2.6).
- During times of year when sea turtles are known to occur in the survey area, vessels must avoid transiting through areas of visible jellyfish aggregations or floating vegetation (e.g., sargassum lines or mats). In the event that operational safety prevents avoidance of such areas, vessels must slow to 4 knots while transiting through such areas (PDC 5 BMP 5.2.7).

6.3.5 Sturgeon sp. and Sawfish

Vessels operating in water depths with less than 4 ft. clearance between the vessel and the bottom should maintain speeds no greater than 4 knots to minimize vessel strike risk to sturgeon and sawfish (PDC 5 BMP 5.2.8)

Table 3 ESA-listed species that may be affected by survey activities

ESA-Listed Cetaceans	ESA-Listed Sea Turtles	ESA-Listed Fish
North Atlantic right whale	Loggerhead turtle	Atlantic sturgeon
Blue whale	Green turtle	Giant manta ray
Fin whale	Kemp's ridley turtle	Shortnose sturgeon
Sei whale	Leatherback turtle	Smalltooth sawfish
Sperm whale	Hawksbill turtle	

7 SOUND EXPOSURE PROCEDURES

7.1 Survey Equipment Subject to Monitoring and Mitigation Procedures

Impulsive equipment that produces sound below 180 kHz (non-impulsive, non-parametric sub-bottom profilers (SBPs), boomers and sparkers) are subject to the following monitoring and mitigation protocols (PDC 4).

The acoustic source must be deactivated when not acquiring data or preparing to acquire data, except as necessary for testing. Unnecessary use of the source shall be avoided (IHA 3(e)).

Both testing and operations of HRG equipment should be limited to the Lease Area, Cable Corridor, and while the vessel is alongside in port.

At times when multiple survey vessels are operating within a lease area, adjacent lease area, or exploratory cable routes, a minimum separation distance of 1 kilometer must be maintained between survey vessels to ensure that sound sources do not overlap (PDC 4 BMP 4.10).

7.2 Sound Source Monitoring and Mitigation Zones

PSOs must establish and monitor four types of zones around Vineyard Mid-Atlantic survey equipment operating below 180 kHz (SBPs, boomers and sparkers). Shutdown Zones (SZ), sometimes referred to as Exclusion Zones (EZ), are based upon the radial distance from the acoustic sources (rather than being based around the vessel itself) (IHA 4(c)). For the purposes of sound exposure mitigation, these zones are established around the survey equipment and not around the vessel itself.

Monitoring Zone (MZ) / Minimum Visibility Zone: For situational awareness, PSOs must establish and monitor a distance of **500 meters** (in all directions) around all vessels operating sources <180 kHz (PDC 4 BMP 4.1). If the 500-meter area cannot be adequately **visually** monitored for ESA-listed species presence (i.e., a PSO determines conditions, including at night or other low-visibility conditions, are such that listed species cannot be reliably sighted within this area), no equipment operating at <180 kHz can be deployed and no surveying may occur until such a time that the area cannot be reliably monitored (PDC 4 BMP 4.2.3, PDC 4 BMP 4.7).

Clearance Zones (CZ): Applicable during the 30-minute pre-clearance search periods conducted prior to initiating the relevant acoustic sources from silence and continuing until 30 minutes after the use of specified acoustic sources cease (IHA 4(b)). Detections of a protected species inside the applicable CZ during the search will result in a delay to operations. Impulsive equipment operating below 180 kHz must not be initiated until an additional time period (described in Section 7.4) has elapsed with no further sighting of the animal.

- **500 meters:** All ESA-listed species, inclusive of sea turtles (IHA Table 3, PDC 4 BMP 4.1)
- **100 meters:** All other cetaceans and pinnipeds (IHA Table 3)

Shutdown Zone (SZ): Once the low frequency (LF) sound sources have been activated, detections of a protected species inside it's applicable SZs will result in a shutdown of **boomer and sparker equipment** (PDC 4 BMP 4.2). SBPs may remain active and are not subject to shutdown procedures.

- **500 meters:** North-Atlantic right whales
- **100 meters**: All other ESA-listed species, inclusive of sea turtles (PDC 4 BMP 4.2)
- **100 meters**: All other marine mammals with the exception of pinnipeds or small delphinid(s) from the genera ***Delphinus, Lagenorhynchus, Stenella or Tursiops*** that voluntarily approach the vessel. For voluntarily approaching delphinids listed above, shutdown is not required. PSOs must use best professional judgment in making the decision to call for a shutdown (IHA 4(e)(iv), PDC 5 BMP 5.1)

Although mitigation will be applied for animals detected in the aforementioned zones, observations will extend to the furthest observable distances.

Table 4 Distances for Clearance, Vessel Separation and Shutdown Zones in meters per species (IHA Table 3)

Level B Harassment Zones (HZ): Shutdown of acoustic sources is required upon observation of either a species for which incidental take is not authorized or a species for which incidental take has been authorized but the authorized number of takes has been met entering or within the Level B harassment zone (IHA 4(e)(vi)).

Table 5 Level B Harassment Zones per Sounds Source

Equipment	Distance to Level B harassment threshold (m)
ET 216 CHIRP	4
GeoMarine Geo Sparker	141
Applied Acoustics AA 251 Boomer	178

7.3 Visual Search Periods

To activate the SBPs, boomers and sparkers from silence, a minimum of a 30-minute search period must be conducted, with equipment operators notifying the designated PSO no less than 60 minutes prior to the planned ramp-up time (IHA 4(d)(i)). SBPs, boomers and sparkers will not be activated until the protected species observer has reported the pre-clearance zones (CZ) clear of all cetaceans, sea turtles, and pinnipeds for 30 minutes (IHA 4(d), PDC 4 BMP 4.3). The visual search period may begin when PSOs can see to the outermost CZ (500 meters) from the geophysical source.

During nighttime the search must be conducted visually by the PSOs using night vision and thermal equipment.

7.4 Delays to Initiation of SBPs, Boomers, and Sparkers

Any PSO on duty has the authority to delay the start of survey operations if a marine mammal is detected within the applicable pre-start clearance zone (IHA 4(d)(iv)).

The Lessee must ensure that the sound source is not activated until the PSO has reported the pre-clearance zones (CZ) clear of all cetaceans, pinnipeds, and sea turtles for 30 minutes, inclusive of dolphins that voluntarily approach the vessel. If any marine mammal or sea turtle was detected visually inside its respective CZ during the 30-minute search period, initiation of the survey equipment (SBPs, boomers and sparkers) must be delayed until (IHA 4(d)(vi), PDC 4 BMP 4.3):

- The animals have been observed exiting the zones

  OR

- An additional time period has elapsed with no further sightings
  - 15 minutes for small odontocetes and seals
  - 30 minutes for all other cetaceans and sea turtles

Both the 30-minute pre-clearance search period and the mandatory delay for animals observed within the CZ must be complete before source initiation.

7.5 Ramp-Up Procedure

The operator must notify a designated PSO of the planned start of ramp-up as agreed upon with the lead PSO; the notification time must not be less than 60 minutes prior to the planned ramp-up to allow the PSOs time to monitor the Shutdown Zones for 30 minutes prior to the initiation of ramp-up (pre-start clearance). (IHA 4(d)(i)).

A PSO conducting pre-start clearance observations must be notified again immediately prior to initiating ramp-up procedures and the operator must receive confirmation from the PSO that the Shutdown Zone is clear prior to proceeding (IHA 4(d)(iii)).

Ramp-up procedure, involving a gradual increase in source level output, is required at all times as part of the activation of the acoustic source, when technically feasible. Ramp-up will begin with the power for the geophysical survey ramped up half power for 7 minutes, and then to full power.(PDC 4 BMP 4.5). A 30-minute pre-start clearance observation period must occur prior to the start of ramp-up (or initiation of source use if ramp-up is not technically feasible) and continue during the ramp-up (IHA 4(d)).

Ramp-ups shall be scheduled to minimize the time spent with the source activated (IHA 4(d)(ii)).

Ramp-up must not be initiated if any marine mammal is within the applicable Shutdown Zone. If a marine mammal is observed within the applicable Shutdown Zone during the 30-minute pre-start clearance period, PSOs should implement a delay to the initiation of source initiation as outlined in section 7.4.

Ramp-up may occur at times of poor visibility, including nighttime, if appropriate visual monitoring has occurred with no detections of marine mammals in the 30 minutes prior to beginning ramp-up. Acoustic source activation may only occur at night where operational planning cannot reasonably avoid nighttime activation (IHA 4(d)(viii)).

7.6 Short Breaks in HRG Sourcing Operations

In recognition of occasional short periods of silence for a variety of reasons other than encroachment into the shutdown zone by a non-delphinoid cetacean or sea turtle, including, but not limited to, mechanical or electronic failure, the SBPs, boomers and sparkers may be silenced for periods of time not exceeding 30 minutes in duration and may be restarted for operations at its operational level if (IHA 4(d)(ix), PDC 4 BMP 4.6):

1. Visual monitoring by PSOs is continued diligently through the silent period (during visual surveys, the SZ must remain visible throughout the silent period) (IHA 4(d)(ix))

   AND

2. No marine protected species are observed in the applicable SZ during the silent period (IHA4(d)(ix))

If protected species are observed in the applicable SZ during the silent period:

   a. Restart may happen immediately without a ramp-up if the animal is seen entering the exiting the SZ (IHA 4(e)(v))
   b. A clearance period and ramp-up must occur if marine protected species are seen entering the applicable SZ, but are not observed exiting the SZ (IHA 4(e)(v))
      i. Harbor porpoises – 15-minute clearance period
      ii. All other species – 30- minute clearance period

For a shutdown of 30 minutes or longer, or if visual surveys were not continued diligently during the pause of 30-minutes or less, the PSOs must restart the pre-clearance search period procedures outlined in Section 7.2. Acoustic sources can be activated using the full ramp-up procedure after PSOs report that the CZ are free of all cetaceans, pinnipeds and sea turtles for 30 minutes (PDC 4 BMP 5).

7.7 Shutdown Procedures

Any PSO on duty has the authority to call for a shutdown of the acoustic source if a marine mammal is detected within the applicable Shutdown Zone (IHA 4(e)(i)).

The operator must establish and maintain clear lines of communication directly between PSOs on duty and crew controlling the acoustic source to ensure that shutdown commands are conveyed and implemented swiftly while allowing PSOs to maintain watch (IHA 4(e)(ii)).

If a protected species is detected within or entering the applicable Shutdown Zone, an immediate shutdown of the acoustic sources operating below 180 kHz is required, EXCEPT if it is a pinniped or delphinid(s) from the genera ***Delphinus, Lagenorhynchus, Stenella or Tursiops*** (IHA 4(e)(iv)(A), PDC 5 BMP 1)***.*** The vessel operator must comply immediately with the initiation of mitigation by the observer. Any disagreement should be discussed only after shutdown (PCD 4 BMP 2(b)(i), IHA 4(e)(iii)).

<u>Subsequent restart of the survey equipment must use the ramp-up provisions described in Section 7.5 and may only occur following clearance of the SZ of all protected species, except harbor porpoise following a 30-minute pre-clearance watch and ramp-up as described in Sections 7.3 and 7.5. For harbor porpoise, ramp-up can occur after a 15-minute pre-clearance watch (IHA 4(e)(v)).</u>

8 REPORTING

Reporting will be conducted as described below.

8.1 Data Forms

PSOs will utilize standardized data forms that have been provided to, and approved by, BOEM and NMFS. These forms will contain, at minimum, all of the data elements listed below, and data will be recorded in the field daily.

Project Information

- Project Name
- Lease Number
- State Coastal Zones
- Survey Contractor
- Vessel Name(s)
- Maximum Vessel Speed
- Other vessels associated with the survey
- Survey Type (typically HRG)
- Reporting start and end dates
- Visual monitoring equipment used (e.g., bionics, magnification, IR cameras, etc.)
- Distance finding method used
- PSO names (last, first) and training
- Date of PSO Briefing
- Observation height above sea surface

Operations Information

- Vessel name(s)
- HRG equipment type, power levels, and frequencies used
- Greatest RMS source Level
- Vessel location at 30-second intervals

Monitoring Effort Information

- Date (YYYY-MM-DD)
- HRG equipment (ON/OFF)
- If visual, how many PSOs on watch at one time?
- PSOs (Last, First) & affiliations
- PSO watch location
- Start time and latitude/longitude (decimal degrees) of observations
- End time and latitude/longitude (decimal degrees) of observations
- Watch occurred during Day or Night
- Vessel heading and speed at beginning and end of visual PSO duty shifts and upon any line change
- Duration of visual observation
- Environmental conditions at beginning and end of PSO shift and whenever conditions change significantly
  - Wind speed (knots), from direction
  - Swell (meters)
  - Sea state (glassy, slight, choppy, rough, or Beaufort scale)
  - Water depth (meters)
  - Visibility (km)
  - Glare severity

- Cloud coverage (%)

- Block name and number
- Location: Latitude and Longitude
- Time pre-clearance visual monitoring began in UTC (HH:MM)
- Time pre-clearance monitoring ended in UTC (HH:MM)
- Duration of pre-clearance visual monitoring
- Was pre-clearance conducted during day or night?
- Time power up/ramp up began
- Time equipment full power was reached
- Duration of power up/ramp up
- Time survey activity began (equipment on)
- Time survey activity ended (equipment off)
- Survey Duration
- Did a shutdown/power down occur?
- Time shutdown was called for (UTC)
- Time equipment was shutdown (UTC)
- Dates of departures and returns to port with port name
- Inhibiting factors of observations (e.g., vessel traffic)
- Habitat or prey observations
- Marine debris sighted

Detection Information

- Date (YYYY-MM-DD)
- Sighting ID (V01, V02, or sequential sighting number for that day) (multiple sightings of same animal or group should use the same ID)
- Date and time at first detection in UTC (YY-MM-DDT HH:MM)
- Time at last detection in UTC (YY-MM-DDT HH:MM)
- PSO name(s) (Last, First)
- Sighting Cue
- Latitude (decimal degrees dd.ddddd), longitude (decimal degrees dd.ddddd) dd.ddddd), longitude (decimal degrees dd.ddddd)
- Compass heading of vessel (degrees)
- Water depth (meters)
- Swell height (meters)
- Beaufort scale
- Precipitation
- Visibility (km)
- Cloud coverage (%)
- Glare
- Species including common name, scientific name, or family
- Certainty of identification
- Number of adults
- Number of juveniles
- Total number of animals
- Bearing to animal(s) when first detected (ship heading + clock face)
- Range from vessel (reticle distance in meters)

- Description (include features such as overall size; shape of head; color and pattern; size, shape, and position of dorsal fin; height, direction, and shape of blow, etc.)
- Detection narrative (note behavior, especially changes in relation to survey activity and distance from vessel)
- Direction of travel/first approach (relative to vessel)
- Behaviors observed: indicate behaviors and behavioral changes observed in sequential order (use behavioral codes)
- Pace of animal
- If any bow-riding behavior observed, record total duration during detection (HH:MM)
- Initial heading of animal(s) (degrees)
- Final heading of animal(s) (degrees)
- HRG equipment activity at initial detection
- Equipment type operating during detection
- HRG equipment activity at final detection (on or off)
- Shutdown zone size during detection (meters)
- Was the animal inside the Shutdown zone?
- Closest distance to vessel (reticle distance in meters)
- Closest distance to source
- Time at closest approach (UTC HH:MM)
- Time animal entered shutdown zone (UTC HH:MM)
- Time animal left shutdown zone (UTC HH:MM)
- If observed/detected during ramp up/power up: first distance (reticle distance in meters), closest distance (reticle distance in meters), last distance (reticle distance in meters), behavior at final detection
- Shut-down or power-down occurrences
- Time shutdown was called for (UTC)
- Time equipment was shutdown (UTC)
- Detections with IR? (Y/N)
- Watch Status (sighting made by PSO on watch, opportunistic, crew)
- Documentation of whether the marine mammal was estimated to have been within 141 meters of active survey equipment
- Documentation of the number of marine mammals per sighting that were estimated to have been within 141 meters of active survey equipment
- Equipment operating during detection

8.2 Reporting NARW Sightings

The Lead PSO will report any sightings of NARW using the designated form. The report will be sent to the Vineyard Mid-Atlantic Environmental Project Manager and the RPS Project Manager immediately. The PSO team will make every effort to photograph and document all relevant information associated with the sighting.

The Vineyard Mid-Atlantic Environmental Project Manager will report the NARW to the NMFS NARW Sighting Advisory System: (866) 755-6622 within two hours of occurrence, when practicable, or no later than 24 hours after occurrence (IHA 6(d)(i)). Additionally, vessel Captains shall inform the United States Coast Guard of the sighting via Channel 16 (IHA 6(d), PCD 8 BMP 8.4.1).

Survey activities using HRG equipment operating at or below 180 kHz are prohibited from January 1 through May 15 within the North Atlantic right whale SMA in Cape Cod Bay (IHA 4(g)).

8.3 Injured/Dead Protected Species, Bird and Bat Reporting

The Lead PSO will report any injured or dead protected species, bird and bat detections using the designated form. The report will be sent to the Vineyard Mid-Atlantic Environmental Project Manager and the RPS Project Manager immediately. The PSO team will make every effort to photograph and document all relevant information associated with the sighting.

Sighting of Injured or Dead Protected Species:

The Vineyard Mid-Atlantic Environmental Project Manager will report the injured or dead animal to BOEM, NMFS, and NMFS Northeast Region's Stranding Hotline by phone (866) 755-6622 and email as soon as feasible, but not later than 24 hours after the sighting, regardless of whether the injury or death is caused by a vessel (IHA 6(e)(i), PDC 8 BMP 8.5).

Injured or Dead Protected Species- Vessel Strike:

In the event that the injury or death was caused by a collision with a project-related vessel, the vessel must assist in any salvage efforts as requested by NMFS. If the injury or death was caused by a collision with a project-related vessel, Vineyard Mid-Atlantic must ensure that BOEM and NMFS are notified of the strike within 24 hours.

The Vineyard Mid-Atlantic Environmental Project Manager will report the injured or dead animal to NMFS, the New England/Mid-Atlantic Regional Stranding Coordinator and BOEM as soon as feasible, but not later than 24 hours after the sighting, regardless of whether the injury or death is caused by a vessel (IHA 6(e)(ii), PDC 8 BMP 4).

Unless otherwise directed by BOEM, NOAA Fisheries, or NOAA, the dead or injured marine mammal or sea turtle SHOULD NOT be touched! Dead and injured marine mammals and sea turtles are still protected by the ESA and the MMPA and touching the animals in any manner is considered harassment and is punishable by law.

Any deceased birds should not be disposed of until a positive ID has been confirmed unless informed otherwise by your project manager.

8.4 Reporting Potential Takes of Protected Species

RPS will track the exposures from each individual vessel as well as the cumulative exposure totals for the survey on a daily basis. Exposure numbers will be calculated and documented in the RPS Data Form and updated/included in the daily report that is distributed to the client, identifying the remaining number of exposures.

The combined exposures specific to the HRG surveys associated with Lease OCS-A 0522 and OCS-A 0544 are outlined in Table 6 per the IHA.

Table 6 Level B Harassment Take Numbers per Species (IHA Table 1)

Common Name	Level B harassment takes
North Atlantic right whale	40
Blue whale	1
Fin whale	77
Sei whale	5
Minke whale	42
Humpback whale	47
Sperm whale	12
Killer whale	2
False killer whale	5
Atlantic white-sided dolphin	1,124

Atlantic spotted dolphin	29
Common bottlenose dolphin (Offshore)	569
Common bottlenose dolphin (Migratory)	151
Common dolphin (short-beaked)	13,904
Risso's dolphin	101
White-beaked dolphin	30
Long-finned pilot whale	405
Harbor porpoise	2,033
Gray seal	418
Harbor seal	939

8.5 Daily Progress Report

A daily detection spreadsheet will be completed and submitted to the Party Chief, onboard client representative, Vineyard Mid-Atlantic Environmental Project Manager and RPS Project Manager. If there were no detections that day, the Lead PSO will email the distribution list noting that there were no detections on that day. The Daily Progress Report will not serve as a notification to Vineyard Mid-Atlantic of any urgent matters such as those listed in Section 8.2, 8.3 and 8.4 above.

8.6 Monthly Reporting

PSO data collection will be collated monthly starting on the 1st and ending on the last day of the month. These datasheets will be submitted to Geo SubSea monthly, by the 6th of the following month. Geo SubSea will return datasheets to RPS by the 12th, for review and submission to BOEM on the 15th of the month.

Final Report

The PSO team will develop a final report summarizing the survey activities and all PSO observations. One combined final report will be prepared for all of the geophysical vessels conducting operations in 2023. The RPS Project Manager will provide the finalized report to the Vineyard Mid-Atlantic Environmental Project Manager within 30 days of project completion for review.

The RPS Project Manager will submit the final report to Vineyard Mid-Atlantic for review. If BOEM or NMFS reporting is required, Vineyard Mid-Atlantic will be responsible for submitting the final report to BOEM and NMFS or may instruct RPS to make the submittal on their behalf 90 days after completing survey activities.

APPENDIX E

Atlantic Reference Guide (Species Identification)

Thomas A. Jefferson Marc A. Webber Robert L. Pitman

Marine Mammals of the World

A Comprehensive Guide to their Identification

Illustrations by Brett Jarrett

Preface and Acknowledgments

This book represents the latest stage in an ongoing attempt to produce materials that will allow people to more easily identify marine mammals that they may come across during trips to sea, while walking on the beach, or when visiting a museum or other research collection. It is fair to say that this effort grew out of a passion and talent for preparing useful marine mammal identification guides by the late Stephen Leatherwood, a colleague and dear friend to all three of us. Steve (along with co-authors Randy Reeves, Bill Perrin, Bill Evans, Brent Stewart, and several others) had already prepared a number of well-received regional and global field guides on cetacean and marine mammal identification by the time that we first became involved in the effort.

Around 1990, Steve pulled Tom and Marc into a project to produce the world's first guide to identification of all marine mammals of the world, the FAO guide *Marine Mammals of the World* (published as Jefferson et al. 1993). Although we were not entirely happy with how that guide turned-out, many of our colleagues told us the book was very helpful to them, and we continued to get requests for copies for some years after it went out-of-print. It was even used as a text book for some university classes on marine mammal biology.

As the FAO guide neared its ten-year anniversary, we began to realize that it was badly out-of-date, and there was a clear need to prepare a replacement that both updated the archaic species classification system of the FAO guide, and expanded upon those features that others found useful in the guide. Sadly, the 'father' of this entire effort, Steve Leatherwood, had passed away of lymphoma in early 1997. Although we felt reluctant to do another field guide without Steve, some of our colleagues were urging us to update the FAO guide. Eventually, we decided not just to update the FAO guide, but to produce a much more useful and complete guide to identify marine mammals of the world. To help us in the effort to produce a better marine mammal identification guide, we asked Bob to come onboard. Once Academic Press agreed to publish the book, we set-about the task of writing and brought in Brett Jarrett to paint the illustrations.

It is important to realize that we do not see this book as an end-product. We hope to periodically produce new editions of the book, each one updated and improved over the last version. This is necessary, as marine mammal taxonomy is constantly evolving (and doing so very fast in the last few years, as we move from a history of "lumping" back towards "splitting"), and we are always learning more about the species represented. Further to this effort, we would ask readers and users of the book to contact us with any suggestions for changes in the next edition, including any suggestions for better photos. We especially welcome anyone pointing-out any errors, inaccuracies, or inconsistencies that we may have made. Rest assured that your criticisms will not fall on deaf ears, but will help us to improve any future versions.

A book like this cannot be completed without the assistance of a large number of people. First, we would like to thank our editors and colleagues at Academic Press/Elsevier: Phil Carpenter, Dave Cella, Chuck Crumly, Claire Hutchins, Kelly Sonnack, Andy Richford, and Rogue Shindler, for their patience and guidance over the years during this long process. We are also extremely grateful to Emma Powell, who helped us in editing and proofing the pages.

We are very grateful to the many people who sent us photographs for possible inclusion in the book. Their efforts and generosity were integral in assembling what we think is the best and most complete set of marine mammal identification photographs ever compiled. Thanks to the following for sending us photographs for consideration: G. Abel, K. Abernathy, N. Aguilar de Soto, D. Allen, M. Amano, R. C. Anderson, T. Aquino, A. Augé, R. W. Baird, R. Baldwin, L. T. Ballance, A. Bannister/IFAW, N. B. Barros, R. Bastida, G. Bearzi, I. Beasley, B. Becker/

Ferguson, and T. Gerrodette (as well as the photographers) for allowing us to use images taken on recent marine mammal surveys undertaken by the Southwest Fisheries Science Center, NOAA Fisheries—marine mammal photos taken under NMFS Scientific Research Permit No. 774-1714-00 <http://swfsc.noaa.gov/prd.aspx >.

Each species account was sent to several experts on that species for review. We thank the following people for reviewing earlier drafts of the species accounts: A. Aguilar, F. W. Archer, R. W. Baird, A. N. Baker, N. B. Barros, G. Bearzi, I. Beasley, A. Birkun, Jr., J. Bodkin, G. Braulik, R. L. Brownell, Jr., S. Caballero, J. Calambokidis, J. V. Carretta. S. J. Chivers, F. Cipriano, P. J. Clapham, S. M. Dawson, P. J. N. de Bruyn, D. P. DeMaster, M. L. L. Dolar, J. Durban, J. A. Estes, D. Fertl, P. Flores, K. Forney, J. W. Gilpatrick, M.-P. Heide-Jorgensen, E. Hines, L. Karczmarski, C. Kemper, R. Kenney, T. R. Kieckhefer, S. Lariviére, C. Lockyer, H. Marsh, S. Mesnick, the late M. W. Newcomer, G. O'Corry-Crowe, D. K. Odell, B. Page, W. F. Perrin, R. R. Reeves, F. Rosas, L. Rojas-Bracho, D. J. Rugh, M. D. Scott, E. Secchi, K. Sekiguchi, E. Slooten, B. D. Smith, B. S. Stewart, K. Van Waerebeek, Wang Ding, J. Y. Wang, M. T. Weinrich, D. W. Weller, R. S. Wells, S. Wilson, B. Würsig, and K. Zhou.

For help with developing the skull keys, we are particularly indebted to J. V. Carretta, S. J. Chivers, N. Kellar, J. Lipsky, and K. Robertson. In particular, the assistance of W. F. Perrin was instrumental in the refinement of the cetacean skull key, going above and beyond the call of duty by helping us to arrange an informal "workshop" to further refine the key.

The help of all these people was essential to putting together this guide and bringing it to fruition, and we heartily thank them for their contributions. However, any remaining mistakes are ours and ours alone.

1. Introduction

The Need for This Guide

Interest in wildlife in general, and marine mammals in particular, has increased significantly in recent years, both in the general public and in the scientific and management communities. More people than ever are including wildlife watching in their activities, and this includes educational and adventure expeditions to see wild marine mammals up close. At the same time, there is increasing awareness of the integral importance of marine mammals to healthy aquatic ecosystems, and of the growing threats that a variety of human activities pose to these animals and their environments. Research and education programs are seeking to better understand and more clearly communicate the nature of these threats and appropriate steps to reduce or eliminate their impacts.

Good identification guides are integral to all these activities. Although there are many guides to limited geographical areas and some subsets of the world's marine mammal fauna, there are few comprehensive guides that cover all the world's whales, dolphins, porpoises, seals, sea lions, walruses, manatees, dugongs, marine and sea otters, and polar bears. Additionally, few of the existing guides provide special aids to identifying live animals, in-hand specimens, and skulls. This identification guide, compiled after several years of work by the authors and illustrators, is intended as a significant step toward filling that need.

We have attempted to make this volume as complete, comprehensive, and up-to-date as possible. However, we are aware that it is limited by the differences in the amount and quality of information available on the various groups, as well as by the inadequacies of our approach towards representing what is available. Therefore, we prefer to think of this as somewhat of a starting point, to be improved by input from those who use it in the field and lab. Future editions (assuming that there will be future editions, which is mainly determined by how well this one sells) will be modified to correct errors and deficiencies revealed by extensive use. In the mean time, we hope this book helps both amateurs and professionals with the sometimes-difficult task of positively identifying species of marine mammals they see alive or encounter dead.

Most biologists use the term 'marine mammal' to include members of five different mammalian groups: cetaceans (whales, dolphins, and porpoises), pinnipeds (seals, sea lions, and walruses), sirenians (manatees, dugongs, and sea cows), marine and sea otters, and the polar bear. These diverse groups are currently thought to represent five or six different recolonizations of the water by land-dwelling ancestors. The term marine mammal, therefore, implies no systematic or taxonomic relationship. In fact, the cetaceans are more closely related to camels and hippos than they are to other marine mammals, the pinnipeds have more in common with bears and weasels, and the sirenians are more closely allied to elephants and hyraxes. These differences not withstanding, however, all marine mammals have one thing in common—they derive all (or most) of their food from marine (or sometimes fresh) water.

All marine mammals have undergone major adaptations, which permit them to live in the water. The cetaceans and sirenians spend their entire lives in the water, while other marine mammals come ashore for various reasons, at particular times in their life cycle (most commonly to reproduce, molt, or rest). Major structural modifications to the bodies of cetaceans, sirenians, and pinnipeds involve the loss of hind limbs (e.g., cetaceans and sirenians), the adaptation of limbs for propulsion through water (e.g., pinnipeds), and the general streamlining of the body for hydrodynamic efficiency (all three groups). Structural modifications to the marine and sea otters and the polar bear by a marine existence are less apparent in body form; these animals in most ways still closely resemble their terrestrial counterparts.

Like its predecessor (Jefferson et al. 1993), since this is an identification guide, we include mainly information useful for identifying marine mammal species. For good introductions to the biology of mammals in general, see Gould and McKay (1990) and Macdonald (1984). More detail specifically on the biology of marine mammals can be found for cetaceans in Leatherwood and Reeves (1983), Evans (1987), Harrison and Bryden (1988), and Martin (1990); for pinnipeds in King (1983), Bonner (1990), Riedman (1990a), and Reeves et al. (1992); for sirenians in Reynolds and Odell (1991) and Reeves et al. (1992); for marine and sea otters in Riedman (1990b) and Reeves et al. (1992); and for polar bears in Stirling (1988) and Reeves et al. (1992). The best sources for basic information on the biology and phylogeny of marine mammals are Reynolds and Rommel (1999), Twiss and Reeves (1999), Berta et al. (2006), Hoelzel (2002), and Perrin et al. (2002).

Marine Mammal Identification and How to Use This Guide

Most available marine mammal identification guides do not provide the most appropriate information for accurate identification, have limited geographic or taxonomic scope, or are badly out-of-date. Two very good recent ones are Reeves et al. (2002) and Shirihai (2006). Marine mammals can be difficult to identify at sea. Even under ideal conditions, an observer often gets little more than a brief view of a splash, blow, dorsal fin, or back, and this is often at a great distance. Rough weather, glare, fog, or other poor sighting conditions only compound the problem. The effects of lighting, in particular, must be kept in mind. Many diagnostic characters may only be visible under good lighting or at close range. One must always acknowledge the limitations of the particular set of conditions that they are exposed to when making a marine mammal identification.

Sexual dimorphism is common in many pinnipeds and cetaceans. Northern elephant seals show an extreme form, which involves both size and body shape differences. The large individual in the background is an adult male, and the smaller one in the foreground is a fully-grown adult female. PHOTO: T. A. JEFFERSON

Many species appear similar to another, especially in the brief glimpses typical at sea. Animals of some poorly-known groups (most notably, beaked whales and Southern Hemisphere fur seals) are especially difficult to identify to species, even with a good look at a live animal or an "in hand" specimen (and even to most marine mammal specialists). For all these reasons, even experts often must log a sighting as "unidentified." In all cases, this designation, accompanied by a detailed description is preferable to recording an incorrect identification. This point cannot be overemphasized!

In addition to the diagnostic variation among species, marine mammals often exhibit other types of variation in morphology and coloration. These are important to keep in mind when making identifications, as such variation can mask diagnostic species characters and cause confusion and even misidentifications. The most common types of such variation in external appearance are discussed briefly below.

Intraspecific geographic variation Marine mammal species generally occur in populations that are (more-or-less) reproductively isolated from each other. If these populations have been separated for a long enough period of time, they may have evolved noticeable differences in their external morphology. Virtually every marine mammal species (with the possible exception of those that only occur as a single population, like the vaquita and possibly the baiji), shows some geographic variation. Much of this variation is subtle and not very noticeable, and therefore will not significantly affect field identification, but sometimes distinct geographic forms may have evolved. These may differ quite strongly in overall size, body shape, coloration, etc. Some such variants have been formally described as subspecies (which, in many cases, are incipient species), and have been given trinomials (subspecific names), but most have not been formally recognized. This book attempts to provide descriptions and illustrations/photos of geographic forms that are well-described and may be recognizable in the field, regardless of whether they have been described as subspecies.

Sexual dimorphism Most marine mammal species show some sexual dimorphism, with one sex being somewhat larger than the other. In addition, many toothed whales and pinnipeds have males and females showing distinct differences in body shape and coloration. These differences usually remain insignificant until near the age of sexual maturity, but can become quite pronounced in adults. One must keep this dimorphism in mind when making identifications, especially in cases where only a single individual is involved. In the species accounts, we make every attempt to describe significant sexual dimorphism as it relates to marine mammal species identification.

Developmental variation Obviously, young marine mammals do not look exactly like adults. Clearly, they are smaller than adults, but they may also have very different body proportions and color patterns. The head and appendages of most newborn marine mammals are typically proportionately larger than they are in adults. It is not uncommon for cetacean calves and pinniped pups to show very different pigmentation than adults. For instance, most dolphins have a muted version of the adult color pattern when first born. Size and other external differences of young animals are described in this book, when adequately documented.

Seasonal variation Seasonal variation in external appearance is not nearly as important in marine mammals as it is in, for instance, birds, and for the most part is not an issue in species identification. However, there are some species in which seasonal differences are important. An example of this is the northern elephant seal, which has a seasonal molt (occurring at different times for different age classes). During the molting period, seals generally look ragged and have a quite different appearance than the more typical pelage of the rest of the year. We attempt to identify seasonal variants in this guide.

Uncommon color morphs Some marine mammal species are characterized by the existence of uncommonly-occurring color morphs. This is the case for some species of dolphins (e.g., short-beaked common dolphins, Pacific white-sided dolphins, northern and southern right whale dolphins), porpoises (e.g., Dall's porpoise), and seals (e.g., subantarctic fur seals), for instance. In addition, melanistic (all-black) individuals, albinos, and other anomalously-white color morphs occasionally occur, and are a possibility for any marine mammal species. Where one or more uncommon color morphs are well-known, we attempt to describe and illustrate them in this book.

Hybrids and intergrades Sometimes animals of different species mate with each other and produce offspring. Hybrids are the result of such interspecific matings. One must always be concerned about the possibility of a hybrid when making marine mammal identifications. Hybrids between baleen whale species, between narwhals and belugas, between dolphin species, between porpoise species, and between pinniped species have been documented. In fact, in the Southern Hemisphere fur seals (genus *Arctocephalus*), species are very similar in appearance and behavior and there is much overlap in ranges. As a result, hybridization is very common, and can be a major confounding factor in making species identifications. Although not documented, hybrids among the many similar species of the beaked whale genus *Mesoplodon* should also be considered a possibility. Finally, intergrades may appear (these are the equivalent of hybrids, but result from a cross between subspecies, not full species). Intergrades are known to be very common in spinner dolphins, for instance, where a "geographic form" of the species in the eastern tropical Pacific (the whitebelly spinner) is now known to be an intergrade swarm. We generally do not describe hybrids and intergrades in this guide, except in those few cases where they appear very commonly. However, one must always be on the lookout for them.

A group of short-beaked common dolphins leap at the bow of a research vessel in the eastern North Pacific, showing some of the individual variation in coloration and body shape that is common in marine mammals. PHOTO: SWFSC/NOAA FISHERIES

Individual variation Beyond all of the types of variation described above, there is individual variation in every species. No two individuals are exactly alike—this variation is actually the raw material of natural selection. There will naturally be some range in all of the species' diagnostic characters. Some species are more variable than others, and certain features (such as total length and tooth counts) tend to show great amounts of individual variation in most species. This should always be kept in mind when making identifications. We attempt to document and illustrate some of the individual variation present within any species in this book, but it should be recognized that we can only present a small fraction of what naturally occurs.

Scarring, injuries and deformities One must always remember that, in the course of evading predators, finding and securing food, interacting with conspecifics, and avoiding impacts of human activities, marine mammals

These Antarctic fur seals at South Georgia show the basic body shape that is typical of all eared seals (otariids). Their ability to bring their hindflippers up under their body and walk on land reminds one of their terrestrial ancestry. PHOTO: M. WEBBER

become scarred and injured. Further, they may develop deformities, either as a result or congenital defects or disease. These may cause an animal to appear quite different than the classic individual illustrating all the diagnostic characters. Most such defects will have little or no impact on the ability to identify marine mammals to species, but some may cause problems. For the most part, we are unable to describe and illustrate the effects of injuries and deformities in this book, but we caution the reader to keep these factors in mind.

Finally, although it is not really a type of variation, the effects of lighting must also be considered. This is especially true when making identifications of living animals in the field, and when examining photographs. Some subtle color pattern components may only be visible in the best lighting, and glare on an animal's body can sometimes look like light-colored patches. This is especially a problem when making an identification from still photographs.

Notes on the Format of the Species Accounts

The species accounts in this guide are the "meat and potatoes" of the book and are designed to be the primary tool used in identifying marine mammals observed at sea. We toyed with the idea of producing a dichotomous key to marine mammals observed at sea, but the paucity of useful cues for most sightings and the variability of marine mammal behavior would make such a key difficult to use. Marine mammal at-sea identification is something that must be learned through doing. Experienced marine mammal observers, like birders, often will be able to make an identification based on a composite of characteristic features and personal knowledge of the local marine mammal fauna. This ability will come with experience, guided by working with seasoned observers and the use of a proper field guide (this guide, or any of the better regional ones).

The species accounts are presented in taxonomic order, with closely-related species grouped together, even though, in some cases the main species that may cause confusion are not especially closely related. The following describes how the species accounts are set-up:

Original description This is given immediately after the scientific name, and is the person (or persons) who originally described the species, and the year in which the description was published. Note that international taxonomic rules require that there always be a comma after the authority, and that the parentheses that occur around some of the dates are intentional (they indicate that the species was originally described in a different genus).

Recently-used synonyms This is a list of synonyms of the scientific name that have been widely used in the past 50 years or so. The list is not intended to be comprehensive. Older, and more obscure, names are not listed here.

Common names For each species, the standard common names in English, Spanish, and French are given here. Note that other common names are used in these languages in some areas, and that there are a wide variety of common names used in other languages as well. However, we have made no attempt to compile a list of all the common names that the species goes by.

Taxonomic information After a brief list of the higher-level taxonomic groupings that the species belongs to, this section contains a very brief summary of any recent taxonomic controversies and taxonomic revisions, and mentions subspecies where widely recognized.

Species characteristics This section includes the main characteristics of the species used in identification of whole specimens, including body shape, color pattern, size, and such things as tooth or baleen counts. For some of the better-known species, there is also a listing of age/sex classes that animals may be divided into, along with descriptions of how to recognize them. However, the latter is only attempted for those situations where such age/sex classes have been well-described.

Recognizable geographic forms There is significant geographic variation in virtually every species of marine mammal. However, beyond this for some species, distinct geographic forms have been described and possess external characteristics that allow them to be identified in the field. When this is the case, we present a short description of such geographic forms in this section. If 'none' is listed, this does not mean that geographic forms do not exist, but rather that we do not feel that they have been adequately-described or that they are not possible to reliably recognize in the field.

Can be confused with Those species that are most commonly confused with the species of interest are listed here, along with tips on how they can be separated. We tend not to repeat all the diagnostic characters of the other species here, but simply list the types of features that should be paid attention to. The reader must generally consult the species account for those species to get details.

Distribution This section includes a short description of the species' range, to be used along with the distribution map provided for each species. We must emphasize that, although we have put considerable effort into providing the most useful range maps possible, the distribution maps should be considered approximate. The range limits shown, especially in offshore areas, are sometimes little more than educated guesses, based on incomplete data from that region, considered in light of available information on the species' distribution and habitat preferences elsewhere. In some cases, the limits of range indicated are probably more a reflection of search effort than of real distribution limits. Therefore, an absence of shading in a certain area does not necessarily mean that the species is not found there (this is especially true for many of the beaked whales, which are still known mostly from strandings—these tell us little about the species' true distribution and habitat preferences).

Ecology and behavior The basic ecology of the species is very briefly summarized here. Although it is often of less use in identification than morphological characteristics, behavior can nonetheless sometimes be used to help in identification. Group sizes, in particular, are often useful. However, it should be emphasized that the behavior of highly complex social mammals is highly variable, and thus coloration and morphology should always be used as the primary features for identification.

Feeding and prey This section contains a brief list of the types of prey items that the species feeds upon.

Threats and status The history of human exploitation of the species is briefly reviewed, and current conservation issues identified. Available population estimates are of variable accuracy, and should thus be taken cautiously. Techniques for estimating sizes of mammal populations at sea are still evolving and are far from standardized, and available tools have been used unevenly, often with violations of underlying assumptions. For these reasons, the density of shading on the distribution maps is intended to show only known or postulated range, and not population density.

Fishing nets, in particular various forms of gillnets and driftnets, kill hundreds of thousands of marine mammals every year—in this case a Dall's porpoise. Fishing net entanglement is now widely recognized as the single largest threat to the continued existence of many marine mammal populations and even some species. PHOTO: T. A. JEFFERSON

Discarded and lost fishing line, rope and net fragments are a hazardous type of marine pollution that injures and kills pinnipeds of many species such as this adult female Juan Fernandez fur seal. PHOTO: M. GOEBEL/NMFS

IUCN status The legal status of each species is also given in the accounts. "Endangered Species Lists" are maintained by both the United States Fish and Wildlife Service (USFWS) (U.S. List of Threatened and Endangered Species) and the International Union for the Conservation of Nature and Natural Resources, now the World Conservation Union (IUCN Red List), among other agencies. In this guide, we present only IUCN designations.

"Endangered" status is assigned to those species considered to be in immediate danger of extinction. Species at risk of soon becoming endangered are generally listed as "Vulnerable" (or some similar designation). Because of incomplete information, political considerations, and the time lag in completing requirements for listing, these status designations do not always accurately reflect the true status of a species (for instance, some species listed as Endangered are at no immediate risk; others not listed may be on the verge of extinction). Nevertheless, they are helpful as warning flags that plans to exploit a given species must proceed only with great caution, and will give some idea of the degree of concern for the species' future.

References For each species, we provide about 4–8 references to which the reader can turn for more information. We have tried to use mostly recent review papers and more easily obtained publications that might be available at large university libraries. The full references are listed at the end of the book.

Notes on the Dichotomous Keys

Marine mammals specimens "in hand" can best be identified by using the dichotomous keys to external features, provided as appendices at the end of the book. With such specimens, it may be possible to view the entire body and to measure relative proportions of features. Various features of coloration and morphology are often useful in such considerations. We have used geographical information as little as possible to separate the species. This will help to avoid biasing observers toward making an identification based on what they think is "supposed" to be there.

Marine mammal skulls can be keyed-out using the keys provided in the appendices. We have assumed that no geographical information is available, so the key can be used to identify an untagged skull of unknown origin in a museum, for instance. It is clear from our own work and discussions with colleagues that is not yet possible to prepare a completely reliable and effective skull key for the non-specialist. Published keys and related literature are marred with errors and inconsistencies. Skulls of many species are sufficiently similar that it will be necessary to examine a full series of each to define reliable diagnostic features. Until that exercise is completed for each species, the skull keys must be considered to be works in progress.

It can sometimes be very difficult, or impossible, to identify marine mammals to species, whether based on at-sea sightings, "in hand" whole specimens, or an unlabeled skull. Great variability in behavior, coloration, body morphology, and bone structure can occur. Sometimes it may only be possible to label an animal or group as "unidentified long-beaked dolphin," "unidentified beaked whale," or "unidentified fur seal," for instance. If this guide helps lead to a specific identification in some cases and to narrow down the choices in others, then it will have served an important function. We are happy to share our experience with others to help them in this endeavor.

Request For Feedback from Users

We are hopeful that there will be future editions of this book (although that decision is up to the publisher, based mainly on how well the book sells). Assuming that there will be future editions, we want to sincerely invite all of the users of this book to provide us with feedback on the accuracy of the information contained herein and leads on better photos. Mistakes and inaccuracies are inevitable when reviewing so much information, and if users of the book contact the authors with suggestions for changes in future editions, we promise to give those serious consideration.

2. Basic Marine Mammal Biology

In this chapter, we will introduce those readers who are unfamiliar with marine mammals to the subjects of this guide. We will not attempt to give a detailed summary of the biology of marine mammals, as that is not the purpose of this book. Besides, it has already been done much better than we could do, elsewhere (e.g., see Berta et al. 2006; Hoelzel 2002; Perrin et al. 2002; Reeves and Stewart 2003). Instead, we will simply provide a brief summary of the basic biology of the group of animals that we call marine mammals, primarily intended for use by those readers who are new to these animals.

What is a Marine Mammal?

It is important to recognize that marine mammals are not a natural biological grouping. Many people do not realize this, but the term "marine mammal" is somewhat of a "catch-all" phrase used for those groups of mammals that have returned to life in the "sea." The most important criterion is that they must get all or most of their food from the aquatic environment. It is not essential that they actually live in the sea. In fact, many species of marine mammals never encounter marine waters, living instead in various land-locked lakes and rivers. However, all of them are thought to have come from marine ancestors.

Marine mammals are not necessarily completely dependent on an aquatic existence. For instance, pinnipeds do not generally mate or give birth in the water, and polar bears may spend great amounts of time moving on land long distances away from the nearest marine waters. But, these mammals, along with the cetaceans and sirenians, do obtain most or all of their sustenance from the water, and this makes them marine mammals. One or two species of otters (the sea otter and marine otter) and the polar bear are also usually included as marine mammals.

In reality, there is no hard-and-fast rule of what is a marine mammal. Some people consider other mammals also to be in this group, but the scheme introduced below is, by far, the most common in use. It originated with the list of "marine mammals" produced when the U.S. Congress passed the Marine Mammal Protection Act of 1972, and has been widely followed ever since.

Types of Marine Mammals

There are several different types of marine mammals. The two most commonly seen and best-known groups of marine mammals are the cetaceans (whales, dolphins, and porpoises) and the pinnipeds (seals, sea lions, and walruses). Most people are very familiar with these animals from seeing them in zoos and aquariums, or on television and in movies. They are both well-adapted to living in the oceans, although the pinnipeds must return to land for some life history stages (e.g., mating, breeding, and molting). Cetaceans are fully-adapted to live their entire lives in the water and never return to land for any significant period of time. The body plans of cetaceans and pinnipeds are radically modified from those of more familiar terrestrial mammals.

The sirenians are much less-often encountered by people, because there are only a few species (four today) and they occur only in certain parts of the world, mainly in the tropical zones. They are also well-adapted to a wholly-aquatic life, although they are largely creatures of the continental margins (and many even inhabit lakes and rivers). Sirenians are unique in being the only vegetarians among the marine mammals. They also have radically modified morphology.

Finally, there are several species of fissipeds (the group of carnivores that have separate digits) that qualify as marine mammals, even though the other members of their taxonomic families are not considered among the marine mammals. These include one bear, the polar bear, and two otters, the sea and marine otters. In general, it can be said that these animals are much less completely adapted to living in the water than are the cetaceans,

Table 1 Recent Marine Mammals of the World—130 species

Order Cetacea (whales, dolphins, and porpoises)	
Suborder Mysticeti (baleen whales)	**Family Balaenidae** (right and bowhead whales) North Atlantic right whale—*Eubalaena glacialis* North Pacific right whale—*Eubalaena japonica* Southern right whale—*Eubalaena australis* Bowhead whale—*Balaena mysticetus*
	Family Neobalaenidae (pygmy right whale) Pygmy right whale—*Caperea marginata*
	Family Balaenopteridae (rorquals) Blue whale—*Balaenoptera musculus* Fin whale—*Balaenoptera physalus* Sei whale—*Balaenoptera borealis* Bryde's whale —*Balaenoptera brydei* and/or *edeni* Omura's whale—*Balaenoptera omurai* Common minke whale—*Balaenoptera acutorostrata* Antarctic minke whale—*Balaenoptera bonaerensis* Humpback whale—*Megaptera novaeangliae*
	Family Eschrichtiidae (gray whale) Gray whale—*Eschrichtius robustus*
Suborder Odontoceti (toothed whales)	**Family Physeteridae** (sperm whale) Sperm whale—*Physeter macrocephalus*
	Family Kogiidae (pygmy and dwarf sperm whales) Pygmy sperm whale—*Kogia breviceps* Dwarf sperm whale—*Kogia sima*
	Family Monodontidae (narwhal and beluga) Narwhal—*Monodon monoceros* White whale or beluga—*Delphinapterus leucas*
	Family Ziphiidae (beaked whales) Baird's beaked whale—*Berardius bairdii* Arnoux's beaked whale—*Berardius arnuxii* Cuvier's beaked whale—*Ziphius cavirostris* Northern bottlenose whale—*Hyperoodon ampullatus* Southern bottlenose whale—*Hyperoodon planifrons* Shepherd's beaked whale—*Tasmacetus shepherdi* Blainville's beaked whale—*Mesoplodon densirostris* Gray's beaked whale—*Mesoplodon grayi* Ginkgo-toothed beaked whale—*Mesoplodon ginkgodens* Hector's beaked whale—*Mesoplodon hectori* Perrin's beaked whale—*Mesoplodon perrini* Hubbs' beaked whale—*Mesoplodon carlhubbsi* Pygmy beaked whale—*Mesoplodon peruvianus* Sowerby's beaked whale—*Mesoplodon bidens* Gervais' beaked whale—*Mesoplodon europaeus* True's beaked whale—*Mesoplodon mirus* Strap-toothed beaked whale—*Mesoplodon layardii* Andrews' beaked whale—*Mesoplodon bowdoini* Stejneger's beaked whale—*Mesoplodon stejnegeri* Spade-toothed beaked whale—*Mesoplodon traversii* Longman's beaked whale—*Indopacetus pacificus*

Table 1 **(continued)**

Family Delphinidae (ocean dolphins)
Irrawaddy dolphin—*Orcaella brevirostris*
Australian snubfin dolphin—*Orcaella heinsohni*
Killer whale—*Orcinus orca*
Short-finned pilot whale—*Globicephala macrorhynchus*
Long-finned pilot whale—*Globicephala melas*
False killer whale—*Pseudorca crassidens*
Pygmy killer whale—*Feresa attenuata*
Melon-headed whale—*Peponocephala electra*
Tucuxi—*Sotalia fluviatilis*
Costero—*Sotalia guianensis*
Indo-Pacific humpback dolphin—*Sousa chinensis*
Atlantic humpback dolphin—*Sousa teuszii*
Rough-toothed dolphin—*Steno bredanensis*
Pacific white-sided dolphin—*Lagenorhynchus obliquidens*
Dusky dolphin—*Lagenorhynchus obscurus*
White-beaked dolphin—*Lagenorhynchus albirostris*
Atlantic white-sided dolphin—*Lagenorhynchus acutus*
Hourglass dolphin—*Lagenorhynchus cruciger*
Peale's dolphin—*Lagenorhynchus australis*
Risso's dolphin—*Grampus griseus*
Common bottlenose dolphin—*Tursiops truncatus*
Indo-Pacific bottlenose dolphin—*Tursiops aduncus*
Pantropical spotted dolphin—*Stenella attenuata*
Atlantic spotted dolphin—*Stenella frontalis*
Spinner dolphin—*Stenella longirostris*
Clymene dolphin—*Stenella clymene*
Striped dolphin—*Stenella coeruleoalba*
Short-beaked common dolphin—*Delphinus delphis*
Long-beaked common dolphin—*Delphinus capensis*
Fraser's dolphin—*Lagenodelphis hosei*
Northern right whale dolphin—*Lissodelphis borealis*
Southern right whale dolphin—*Lissodelphis peronii*
Commerson's dolphin—*Cephalorhynchus commersonii*
Heaviside's dolphin—*Cephalorhynchus heavisidii*
Hector's dolphin—*Cephalorhynchus hectori*
Chilean dolphin—*Cephalorhynchus eutropia*

Family Phocoenidae (porpoises)
Dall's porpoise—*Phocoenoides dalli*
Harbor porpoise—*Phocoena phocoena*
Spectacled porpoise—*Phocoena dioptrica*
Burmeister's porpoise—*Phocoena spinipinnis*
Vaquita or Gulf of California harbor porpoise—*Phocoena sinus*
Finless porpoise—*Neophocaena phocaenoides*

Family Platanistidae (South Asian river dolphin)
South Asian river dolphin—*Platanista gangetica*

Family Iniidae (boto)
Boto or Amazon River dolphin—*Inia geoffrensis*

Family Lipotidae (baiji)
Baiji or Yangtze River dolphin—*Lipotes vexillifer* (probably extinct)

Family Pontoporiidae (franciscana)
Franciscana—*Pontoporia blainvillei*

Table 1 (continued)

Order Sirenia (sea cows)	**Family Trichechidae** (manatees)
	West Indian manatee—*Trichechus manatus*
	West African manatee—*Trichechus senegalensis*
	Amazonian manatee—*Trichechus inunguis*
	Family Dugongidae (dugongs)
	Dugong—*Dugong dugon*
	Steller's sea cow—*Hydrodamalis gigas* (extinct)
Order Carnivora (carnivores)	**Family Mustelidae** (otters)
	Sea otter—*Enhydra lutris*
	Marine otter—*Lontra felina*
	Family Ursidae (bears)
	Polar bear—*Ursus maritimus*
Suborder Pinnipedia (sea lions, walrus, seals)	**Family Otariidae** (fur seals and sea lions)
	Steller sea lion—*Eumetopias jubatus*
	California sea lion—*Zalophus californianus*
	Japanese sea lion—*Zalophus japonicus* (probably extinct)
	Galapagos sea lion—*Zalophus wollebaeki*
	South American sea lion—*Otaria flavescens*
	Australian sea lion—*Neophoca cinerea*
	Hooker's sea lion—*Phocarctos hookeri*
	Northern fur seal—*Callorhinus ursinus*
	Guadalupe fur seal—*Arctocephalus townsendi*
	Juan Fernandez fur seal—*Arctocephalus philippii*
	Galapagos fur seal—*Arctocephalus galapagoensis*
	South American fur seal—*Arctocephalus australis*
	New Zealand fur seal—*Arctocephalus forsteri*
	Subantarctic fur seal—*Arctocephalus tropicalis*
	Antarctic fur seal—*Arctocephalus gazella*
	Cape and Australian fur seals—*Arctocephalus pusillus*
	Family Odobenidae (walrus)
	Walrus—*Odobenus rosmarus*
	Family Phocidae (true seals)
	Harbor seal—*Phoca vitulina*
	Spotted seal—*Phoca largha*
	Ringed seal—*Pusa hispida*
	Baikal seal—*Pusa sibirica*
	Caspian seal—*Pusa caspica*
	Harp seal—*Pagophilus groenlandicus*
	Ribbon seal—*Histriophoca fasciata*
	Gray seal—*Halichoerus grypus*
	Bearded seal—*Erignathus barbatus*
	Hooded seal—*Cystophora cristata*
	Mediterranean monk seal—*Monachus monachus*
	West Indian monk seal—*Monachus tropicalis* (extinct)
	Hawaiian monk seal—*Monachus schauinslandi*
	Northern elephant seal—*Mirounga angustirostris*
	Southern elephant seal—*Mirounga leonina*
	Crabeater seal—*Lobodon carcinophaga*

	Weddell seal—*Leptonychotes weddellii*

pinnipeds, and sirenians. They are only slightly diverged from their closest terrestrial relatives. However, that does not mean that they are not at home at sea. Quite to the contrary, especially the sea otter and polar bear, are well-adapted to living in the harsh conditions of the sea.

Evolutionary History

The major groups of marine mammals have separate evolutionary origins, from different groups of terrestrial mammals. The cetaceans arose >50 mya, and they are now universally thought to be monophyletic (all arising from the same ancestor), but there has been other controversy about their origins. The terrestrial mammal ancestors of cetaceans were previously thought to be a group of primitive, wolf-like, hoofed animals called mesonychid condrylarths. However, recent fossil and molecular evidence suggests that cetaceans are most closely related to the artiodactyls (a group of even-toed, hoofed mammals that includes ruminants such as cattle, camels, and hippos). In particular, hippos have been shown with molecular data (but not fossils) to be the closest modern mammal relative of the whales, and this has thrown doubt on the mesonychid hypothesis. However, some people believe that the mesonychids may actually have been primitive artiodactyls, which would bring all of the facts back into alignment.

There were three major phases of cetacean radiation. The first occurred about 45–53 mya (Eocene) in the shallow, warm, tropical waters of the ancient Tethys Sea. It involved the initial radiation of the most primitive cetaceans, the archaeocetes (now extinct). It included the appearance of *Ambulocetus*, a 4-meter walking protocetacean, which has been seen as a "missing link" in cetacean evolution. The second major phase resulted in the initial radiation of the odontocetes (toothed whales) and mysticetes (baleen whales), about 25–35 mya (Oligocene). These two modern suborders included, at the time, a large array of unusual species, that would later become extinct. The development of important modern adaptations, such as echolocation in the toothed whales, and filter-feeding in the baleen whales, occurred during this period. The final radiation, in the Miocene about 12–15 mya, involved the appearance of modern cetaceans, especially the delphinoids and balaenopterids.

Pinniped evolution has also been plagued with controversy. Traditionally, a diphyletic origin of the pinnipeds was proposed, with walruses and eared seals evolving from ursid (bear-like) ancestors, and true seals originating from mustelid (otter-like) ancestors. However, current thinking favors a monophyletic origin of the pinnipeds from an aquatic carnivore (most probably an ursid) ancestor in the North Pacific about 30–35 mya. The fossil record goes back to at least 25–27 mya. There is still some controversy, most of it involving whether the walrus is most closely related to the phocids or the otariids.

The head of a surfacing fin whale clearly shows the posterior movement of the nasal openings (blowholes) to the top of the head, an element of the evolutionary 'telescoping' of the skull that is characteristic of all living cetaceans. PHOTO: C. JOHNSON

There are five major lineages of pinnipeds, the three extant ones (walruses, eared seals, and true seals), as well as two extinct ones (the Desmatophocidae and *Enaliarctos*). These latter two groups did not survive to modern times, and joined the multitude of other "evolutionary experiments" that did not work out (resulting in the evolutionary dead-end of extinction).

The sirenians have a long evolutionary history, with a fossil record extending back >50 mya. They evolved from proboscideans (represented by modern elephants and hyraxes), and have no connection with either cetaceans or pinnipeds. The earliest sirenians were pig-like, quadrupedal, amphibious mammals. The manatees originated in South America, and the dugongids began in the North Pacific, attaining a wide diversity in the fossil record there. Sirenians attained their maximum diversity in the Oligocene and Miocene but, due largely to the cooling of ocean waters, have since been reduced to the five recent species.

Compared to these ancient groups of marine mammals, the otters and bears are relative newcomers to the oceans. Sea otter evolutionary history is still somewhat unclear, but it is thought that they evolved only a few million years ago, and are closely-related to other otters. The polar bear originated from brown and grizzly bears in Siberia less than one million years ago, and is still so closely-related to them that hybridization in zoos is common. The oldest known fossils are less than 100,000 years old.

Zoogeography, Distribution, and Migration

Marine mammals are not randomly distributed in the world's oceans. It has long been known, for example, that certain species are found exclusively or primarily in waters of a particular depth, temperature range, or oceanographic regime, and not in areas lacking one or all of these characteristics. For most species, however, little is known of the particular factors that cause them to be found in one area and not in another that appears, qualitatively at least, the same.

One major factor affecting productivity, and thus indirectly influencing the distribution of marine mammals, is the pattern of major ocean currents. These currents are driven largely by prevailing winds and are modified in their effects by the "Coriolis Force." Simply stated, the rotation of the earth causes major surface currents to move clockwise in the Northern Hemisphere and counterclockwise in the Southern Hemisphere. This has different implications for animals on east and west sides of ocean basins. In the Northern Hemisphere, warm tropical waters move further north along the east coasts of continental land masses, and warm-water species are often found unexpectedly far north. In the Southern Hemisphere, by contrast, cold polar waters move northward along the west coasts of continents, allowing coldwater marine mammals to range closer to the equator.

The interplay of these surface currents and subsurface movements of major water masses moves nutrients around by upwelling (the vertical turning over of bottom and surface waters) and indrift (the bringing in of nutrients by horizontal currents). As these nutrients and sunlight are the basic ingredients of productivity, areas of light mixing often are more productive than still areas of little or no mixing. Thus, the presence of marine mammals, and other high order predators and consumers in an area is related primarily to prey and only secondarily to the water conditions supporting that productivity. Wherever oceanic conditions are such, it is likely that some species of marine mammal will be present to exploit that richness.

Each species of marine mammal has its particular habitat preference, which may comprise deep or shallow waters, tropical or polar regions, marine or estuarine regions, or any variation in between. Most species occur only in a distinct part of the world, although some are more cosmopolitan (found throughout the globe). The only species that can truly be said to be cosmopolitan, however, is probably the killer whale. It has been recorded in all oceans and seas, in many bays and channels, and even some rivers, from the equator to the pack ice in both hemispheres. It has habitat preferences, to be sure, but there is almost nowhere in the world's oceans and seas where a killer whale sighting would be considered out of the question.

Although seasonal movements are known for most species of marine mammals, not all undergo what could be called true migrations. The baleen whales; sperm whales, and some other large toothed whales; many pinnipeds, and a few other species of marine mammals do have distinct, predictable seasonal movements of large population segments (migrations). The ultimate and proximate reasons for these vary widely, but they are usually related to allowing maximum exploitation of food resources and meeting the needs of mating and breeding. Recently, the importance of predation pressure (especially from killer whales) has also become more appreciated.

Anatomy and Physiology

Although they are all clearly mammals, and thus share the basic mammalian characteristics with others in this class, marine mammals have undergone various evolutionary changes to their body shape and function in order to adapt to their lives in the oceans and freshwaters of the world. All species of marine mammals are streamlined to varying degrees. The cetaceans and some of the pinnipeds show very strong streamlining and are correspondingly fast swimmers. Manatees (along with sea otters and possibly some of the pinnipeds) have taken their hydrodynamic changes to a much lesser extent, but even these species have reduced appendages, and smooth bodies for decreasing drag and turbulence. Most species can move fairly fast underwater, at least for short bursts.

All cetaceans and sirenians have lost their hind limbs (although bony vestiges buried in the abdominal muscles may still be present), and the hind limbs have been radically modified into flippers in pinnipeds. Polar bears and sea otters have only slightly modified hind limbs and can still walk reasonably well on land. The forelimbs have been modified into flippers in the three major groups of marine mammals, and additionally a dorsal fin has evolved for stability (and thermoregulation) in the cetaceans. Further, the cetaceans and sirenians have lost their mammalian fur, and only retain a small scattering of hairs on the body surface. Cetaceans, sirenians, and some pinnipeds also have internal testes.

The head shape of some marine mammals, primarily cetaceans and sirenians, has also been drastically modified from their terrestrial ancestors. The nostrils have moved to the top of the head to allow ease of breathing in water (not requiring the head to be lifted fully out of the water), and the jaws and teeth have been modified to assist in feeding, and in cetaceans, echolocation and batch feeding. The substitution of baleen plates made of keratin for teeth in modern mysticetes is arguably the most radical adaptation of all.

There are many internal adaptations to a marine existence that are difficult to see, unless a specimen is dissected. These include the development of a subcutaneous layer of fat called blubber (which serves functions in energy storage, insulation, and streamlining); varied modifications of the respiratory system to assist in extended breathholding and large pressure changes; modifications to the skull for breathing at sea, housing the baleen plates in mysticetes, and the production of echolocation sounds in odontocetes.

Only bats can rival the cetaceans and sirenians for their evolutionary modifications from the traditional mammalian body plan. It seems that life in a medium different from living on land has required a large number of changes, and this explains why for many centuries, cetaceans were thought to be fish, rather than mammals. It wasn't until naturalists began to look past "skin deep" that they discovered the unmistakable similarities with other mammals.

Life History and Reproduction

Some types of marine mammals are very long-lived, and are among the mammal species reaching the greatest ages. This includes the baleen whales, the larger toothed whales, some dolphins, a few pinnipeds, and the sirenians. It is thought that some large toothed whales, like the killer whale, may routinely live to be as old as humans (perhaps nearing 80–90 years in some cases)! On the other hand, some species, such the porpoises, appear to have short life spans, rarely reaching the age of 20 years.

The reproductive patterns of marine mammals are not radically different from those of their terrestrial relatives in many ways. However, there are obviously some major adaptations that have been necessary to allow marine mammals to reproduce in the water. Cetaceans and sirenians are the only groups of marine mammals that undertake all of their reproductive activities in the water. Pinnipeds and the marine otters and polar bear all mate and give birth on land (with a few minor exceptions).

All marine mammal young are precocial, meaning that they are well-developed when they are born. They must be, to live in or close to the water very early in life. In fact, cetacean and sirenian newborns are capable of swimming as soon as they exit the womb. Seals and other marine mammals generally require a bit of learning before they are ready to tackle the marine environment.

The gestation period of most marine mammal species is around one year, and in pinnipeds, there is a period of delayed implantation of the embryo, which allows for annual reproduction when the natural gestation period may only be 8–9 months. The length of lactation is highly variable, lasting from only a few days in some seals, to many years in some toothed whales.

While seasonal breeding is the rule in all temperate and high-latitude species, some marine mammals that live in the tropics year-round have a protracted breeding period, with at least some births scattered throughout the year. Only a single newborn is born to most marine mammal species under normal circumstances, and twinning is considered rare.

Some of the marine species are unusual among mammals in having a post-reproductive period (or period of reproductive senescence) in females. Generally, this occurs in some of the longer-lived toothed cetaceans. Other species may reproduce until they die.

Unlike most other marine mammals, manatees have teats that are located in the axillary region—in most others they are more posterior. Thus, the manatee calf needs to nurse from a site near the breast, and this is considered to have led to the mermaid myth. Crystal Springs, Florida. PHOTO: T. PUSSER

Feeding Ecology

Different groups of marine mammals have different feeding ecologies. Mysticetes (baleen whales), which are the largest species, feed on shoaling fishes and small invertebrates, some of the smallest. Baleen whales are batch feeders, taking in large amounts of prey and filtering them from the waters with the fringes on the inside of their baleen plates. Most balaenopterids are "gulpers," which means they lunge through a prey patch, taking in huge amounts of sea water with the aid of their expandable throats. Then they close the mouth and use muscular actions to force the water out between the baleen plates, leaving the tiny prey trapped on the inside, which they then swallow.

Right and bowhead whales are much less active in their feeding. They are "skimmers," which swim slowly through patches of prey and filter out the prey (mostly copepods) as the water flows through the baleen plates. The gray whale employs yet a different feeding strategy. It is a "sucker." Gray whales use suction inside their mouth to pull in a batch of amphipods or other invertebrates, as they roll on their sides (usually near the bottom).

The toothed whales, dolphins and porpoises take in individual prey items, generally one at a time. They feed mostly on fishes and squids, which are located and captured with the aid of echolocation, or sonar. Unlike most (but not all) species of baleen whales, toothed whales may use cooperative feeding techniques, sometimes involving dozens to thousands of individuals to corral and herd prey. The killer whale is the only cetacean species that regularly feeds on other marine mammals, and almost all marine mammal groups may become killer whale prey, at one time or another. They will even hunt whales much larger than themselves, while working in cooperative groups, reminiscent of those of wolves and other pack-hunting carnivores.

The pinnipeds generally feed on fishes and squids, although some take primarily invertebrates such as krill. Seals and sea lions take in prey items individually, and almost always feed solitarily. Individuals generally do not cooperate in feeding aggregations. There are few special adaptations for effective feeding in pinnipeds, with the possible exception of incredible deep, repeated diving abilities of some species. For instance, elephant seals can dive for 20 minutes and surface for 3 minutes, 24 hours a day, day after day, for weeks on end!

The sirenians are all herbivores, and therefore do not need to be particularly fast or maneuverable to catch prey. Manatees feed mostly on water hyacinths and other aquatic plants that may be submergent or emergent. Dugongs feed mostly on seagrasses, and leave feeding trails in seagrass beds where they have been active. The extinct Steller's sea cow ate mostly kelp.

The sea otter feeds mostly on invertebrates, such as crabs, clams, mussels, and sea urchins. It can only dive to relatively shallow depths to obtain such items, which are then brought to the surface and eaten as the animal lies on its back at the surface. Sea otters often use rocks as tools to break apart the hard shells of their prey. Polar bears feed mostly on seals, although they do also take beluga whales and even large fish. A common technique is for a polar bear to wait by a breathing hole and then snatch a seal from the hole as it comes up to breath.

A large group of humpback whales corrals a herring school in southeast Alaska. While such cooperation during feeding is common in toothed whales and dolphins, it is relatively rarely seen in baleen whales. PHOTO: T. A. JEFFERSON

Predation/Parasites/Disease

Nearly all marine mammal species suffer from predation, with the killer whale being the only possible exception. Sharks are the major predators for many types of marine mammals, although killer whales (and even false killer whales) may be important predators for others. Predation by killer whales has been postulated to have been a major factor affecting the evolution of the migratory patterns of some of the baleen whales. Recently, killer whale predation has been suggested to be a primary pressure controlling the populations (and even causing depletion of) sea otters and Steller sea lions in the North Pacific. More work needs to be done to confirm or deny these hypotheses.

Disease affects all marine mammal species, although certainly some more than others. A large number of afflictions can affect marine mammals, both in captivity and in the wild. In recent years, morbilliviruses and related distemper viruses have been identified as the causes of some mass die-offs of marine mammals (primarily of cetaceans and pinnipeds). As a result, these diseases have received a great deal of attention from marine mammal biologists and veterinarians.

Although parasites may be present in marine mammals that are considered healthy and functioning normally in their societies, parasites may also cause disease that can result in death (either directly, or indirectly, by causing the animals to strand or be otherwise vulnerable to accidents). A large number of parasite species (mostly internal, but some external) have been identified from marine mammals. Parasites may be present in many organ systems in the body, but are generally found in the respiratory, digestive, circulatory, and reproductive systems.

Behavior and Social Organization

The majority of cetacean species live in social groups, called schools, herds, or pods. A few species are relatively solitary, but even these species gather together for breeding or in feeding aggregations, at times. Pods of large whales generally number less than a dozen or so, but oceanic dolphin schools may number several thousand! The stability of social groups ranges from the very stable, long-term pods of killer whales to very ephemeral and short-lasting associations of many smaller dolphins and porpoises.

Cetaceans have keen senses, with the exception of smell (olfaction), which is probably nearly non-existent in this group. The toothed whales and dolphins, in particular, are acoustic creatures *par excellance*. In addition to a keen sense of hearing, and the ability to tell much about their environment through passive listening, odontocetes also have a highly sophisticated sense of echolocation, or sonar. It is thought that acoustics is the dominant sense in odontocetes, but these animals also appear to have very good vision (both in air and under water).

The supposed high intelligence of dolphins is legendary, but in fact they are on a par with many other species of social predatory mammals. It is true that dolphins are very clever and can learn easily, but there is no reason to believe that their intellectual capabilities are above those of other higher mammals.

Pinnipeds tend to be much more solitary, at least at sea. On haul-outs and rookeries on shore, however, seals and sea lions often gather into huge groups, which have a very specific structure. Most pinnipeds are highly polygynous, with a single male controlling mating access to groups of females (harems). It is due to the highly polygynous nature of pinniped societies that most species have very strong sexual dimorphism (with males growing much larger than females).

Seals and sea lions have keen senses, including good hearing, vision, and smell. No species of pinniped is known to have a well-developed echolocation system, as the toothed whales do, but they can nonetheless tell much about their surroundings with sound. The sense of smell is so well-developed that many pinniped colonies have to be approached from downwind, to avoid stampeding the entire group of animals into the water.

The manatees and dugong generally live in relatively small groups, and are in fact often seen alone. They do gather into feeding and breeding groups, but these are generally short-lasting. The only stable social bond is likely between mother and calf.

Sirenians are generally relatively slow-moving, passive creatures (at least compared to the very active dolphins and seals). As large-bodied vegetarians, they have little need to be able to move very quickly, and have evolved bodies that are more geared towards negative buoyancy than speed (at least in the manatees). Their senses are less well-studied than those of dolphins and sea lions, but vision and hearing at least, are probably not as keen as in those other groups.

Strandings

When marine mammals wash-up on shore unintentionally, whether alive or dead, this is called stranding (or sometimes, beaching). Most marine mammal strandings are of dead animals, but live specimens can also strand, and will usually die unless humans intervene and either push them back to sea or move them to a rehabilitation facility.

Single strandings are most common, but mass strandings of two or more individuals (not including a mother and calf/pup) also occur. In fact, sometimes entire pods of whales strand (usually alive), and witnessing such an event is truly one of the most spectacular (if somewhat sad) sights in nature!

The causes of marine mammal strandings are not always known, but sometimes they are obvious. Single strandings usually involve an animal that is sick or injured and often too weak to swim against the currents and other forces that inevitably bring it to toward shore. In some cases, they die before they reach the beach, but in others they may still be alive. Such live stranded individuals are unlikely to survive, even with good veterinary care.

Strandings of marine mammals are common events, and have provided scientists an opportunity to learn much about these animals. This sperm whale stranded alive on a Hong Kong beach, but later died. PHOTO: S. K. HUNG

Mass strandings usually involve multiple members of a social grouping (sometimes the entire school or pod), and almost invariably consist mostly of living individuals. Very often, one or only a few individuals in the school are sick or hurt, and most of the group is perfectly healthy. Therefore, the chances of "saving" or rehabilitating mass-stranded animals are much better. The cause of the mass beaching is generally related to the strong social bonds of the species that frequently mass strand (most often medium to large odontocetes, like the sperm, pilot, and false killer whales). More and more often, mass strandings and mortalities are being linked to the use of military sonars, which seem to disrupt the physiological mechanisms for safely dealing with deep diving.

Strandings are extremely important phenomena for several groups of marine mammals, especially cetaceans. For many species of whales and dolphins, much of what we know of their biology may come from information gleaned from stranded specimens. For some of the poorly-known beaked whales, stranding records may be all that we have!

Exploitation and Conservation

Marine mammals have long been highly-prized targets of humans looking for a good source of food, furs, oil, and later a whole host of other products. Because they are large, they were attractive subjects of human exploitation, but their relatively inaccessible habitats made them hard to hunt until the last few hundred years. Although there is evidence that prehistoric humans may have at least taken advantage of the fortuitous stranding of a fresh whale or seal on their shores, most marine mammal species were relatively safe from large-scale human exploitation until recently.

The first known large-scale hunting of large whales was by the Basques, starting in the first millennium AD. They mainly targeted the North Atlantic right whale, and were so effective that they decimated that species. Norse and Icelandic whalers also hunted in the North Atlantic, and the Japanese began their culture of whale hunting in the 1600s. In the 1700s, the "Yankee whaling" era, focused largely on sperm whales, began and the United States became a major player in the commercial whaling game. Finally, in the late 1800s, the development of steam-powered vessels and the exploding harpoon heralded in the modern era of commercial whaling. Fast-swimming species, such as the rorquals (blue, fin, sei, Bryde's and minke whales) were now within the reach of commercial whalers. It didn't take long for them to decimate species after species, starting with the largest and working their way down, to commercial extinction.

In recent decades, the direct killing of whales and dolphins has become much less important, and the indirect deaths of especially dolphins and porpoises have increased dramatically. There is now no doubt that more cetaceans die incidentally in fishing nets each year than from any other threat, including whale and dolphin hunting. In the last few decades, we have also seen the development of other major threats to these animals in the form of such things as habitat degradation and loss, environmental contamination, noise pollution and damage, and even live captures for captive display and research. No cetacean species is known to have been wiped-out by humans (yet), but several species are now on the very verge of that fate (e.g., the vaquita in Mexico; the baiji in China may already be extinct).

A relatively new threat facing cetaceans comes in the form of human-made noise that can be potentially disturbing or even damaging to the animals. Shipping and boat noise is certainly an issue in some cases, but the major concerns nowadays have to do with seismic survey noise (generally created with airguns in the search for petrochemicals), and intense sounds created by military sonars (generally used to detect submarines). These sounds have been shown to cause serious problems for some species, and many mass strandings of whales and dolphins have been linked to low- and mid-frequency sonar.

Seals and sea lions also have a long history of human exploitation. Because they were so easy to kill when hauled out on land, some local pinniped populations may have been extirpated by sealers in early times. Species that occur in more remote areas, for instance, the Antarctic seals on the other hand, were not really exploited until the late 1700s or early 1800s. While most species survived the exploitation and even recovered to pre-exploitation numbers and beyond (witness the northern elephant seal, for instance), some were wiped out. The West Indian monk seal was so heavily hunted that the last remaining seals probably died-out in the middle part of the 20th century. The Japanese sea lion is also thought to be extinct, although there is still some hope that a remnant of this species may survive in Japanese or Korean waters.

Like cetaceans, pinnipeds have seen the development of other, more insidious, threats in recent years. Fishing gear entanglements are certainly a major one, and very recently the depletion of prey and other ecosystem effects of large-scale fishing operations have been blamed for the crashes of some pinniped populations (e.g., the Steller sea lion in Alaska waters).

Sirenians seem to be hunted wherever they occur, an unfortunate result of the apparently excellent taste of their flesh and their relative ease of capture. All three species of manatees and the dugong have been brought to levels that threaten extinction in the next few decades. This is largely due to hunting for food, but other threats also apply. Especially in Florida, collisions with high-speed vessels and entrapment in human-made structures also take their toll.

The fifth species of recent sirenian, the giant Steller's sea cow of the cold waters of the North Pacific and Bering Sea was wiped out by sealers and fur traders in the late 1700s, only a few decades after its discovery. This is a truly sad tale of human greed and stupidity, and it should serve as a reminder of the frailty of nature.

Sea otters were also hunted to near extinction throughout much of their range in the North Pacific by fur traders in the 1700–1800s. In fact, they were thought to be extinct along the west coast of the continental US until a small remnant was discovered in the late 1930s. Luckily, this remnant has increased and expanded its range, and still survives today. The polar bear was never driven to near extinction, but it has been heavily exploited by native peoples and westerners. It has a relatively healthy population, and appears to be in no immediate danger, but the effects of global warming are casting some doubts on its ability to survive for more than a few decades into the future.

The perception that all large whales are endangered is wrong. The truth is that most large whales are recovering from past exploitation (the North Atlantic and North Pacific right whales are the major exceptions), and the most serious conservation problems now lie with several of the smaller species. All of the sirenians, a few seals (e.g., the Mediterranean and Hawaiian monk seals), and several of the dolphins and porpoises (e.g., the vaquita, baiji, Indus susu, North Island Hector's dolphin, and Atlantic humpback dolphin) are probably in the worst shape. It is our sincere hope that this book will help people to appreciate the diversity of the world's marine mammals, and inspire them to work towards their protection.

3. Taxonomic Groupings Above the Species Level

In this chapter, we provide a brief overview of the higher-level (above species) classification and taxonomic groupings of marine mammals. It should be noted that marine mammal taxonomy is highly controversial and is currently in a state of flux. So, rather than trying to present the "flavor of the month" and having that perhaps be out-of-date when the user actually reads it, we have instead presented a more classic and conservative system of classification.

As an example, a new phylogenetic classification published in 2005, and based on multiple lines of evidence, suggests some changes in ranking of various taxa. It considers the cetaceans (whales, dolphins, and porpoises) to be a suborder of a more inclusive Order Cetartiodactyla (which would include hippopotamuses, among others). In such a classification, the suborders Mysticeti and Odontoceti would be demoted to infraorders (taxa below the level of suborder).

Whether this arrangement will be accepted and supported by future work remains to be seen, although it currently appears to be well-supported by genetic and morphological data and is gaining support. However, for now, we will stick to presenting the major higher-level groupings in a system that is well-recognized and firmly established (i.e., a bit more conservative).

Order Cetacea—*Whales, dolphins, and porpoises*

The 86 living species currently recognized in the Order Cetacea are divided into two suborders—Odontoceti (toothed whales) and Mysticeti (baleen whales). All representatives of a third suborder, Archaeoceti (ancient whales), are extinct. It is generally agreed that cetaceans are the most derived of all mammals (with the possible exception of bats). Evolved from terrestrial ancestors, they have totally adapted to living in the water, and have no need to come ashore, even for resting or reproduction.

All cetaceans share a similar general body plan: a streamlined (albeit some more-so than others) spindle-shaped torso; flattened paddle-like foreflippers; telescoped skull; nasal openings on top (rather than on the front) of the head; a well-developed blubber layer; internal reproductive organs; newly-derived boneless structures in the form of tail flukes and a dorsal fin or ridge (secondarily-lost in some species); and the loss of such aquatic hindrances as hind limbs (present, if at all, only as vestiges), external ear flaps, and fur (although all have hair at some time during their early development and some retain a few rostral hairs for life). Although they may somewhat resemble fish externally, the cetaceans' internal anatomy effectively betrays their terrestrial mammalian ancestry. For instance, their flippers contain reduced counterparts of all or most of the hand and arm bones characteristic of other mammals; and pelvic rudiments (and occasionally hind limb remnants) are present. The internal anatomy of cetaceans is surprisingly like that of more familiar land mammals, with such interesting exceptions as the presence of a four-chambered stomach and cartilaginous reinforcements of the airways all the way down to the alveoli.

Suborder Mysticeti—*Baleen whales*

There are four families of baleen whales. Mysticetes are universally large (with females growing larger than males); the smallest is the pygmy right whale (<7 m long), and the largest is the blue whale (the largest animal ever to live, up to 33 m or more in length and 160 tons in weight). The baleen whales have a double blowhole, a symmetrical skull, lack of a bony mandibular symphysis, and a sternum consisting of a single bone. In the mouth, the upper jaw is hung with baleen (stiff plates of keratin with fringes on the inside), instead of teeth. Baleen whales are batch feeders, taking in great quantities of water in a single gulp, and then using the fringes on their baleen plates to filter small schooling fish or invertebrates from the water.

Nearly all mysticetes make long-range seasonal migrations. They generally occur in smaller groups than most odontocetes, and tend to have a simpler social organization. There are 14 species in 6 genera.

Family Balaenidae—*Right and bowhead whales*

The right and bowhead whales (four species in two genera) are large and chunky, with heads that comprise up to one-third of their body length. They lack a dorsal fin or any trace of a dorsal ridge. Overall, they tend to be far less streamlined than other baleen whales. Right and bowhead whales have developed a relatively passive skim-feeding technique, and tend to be slower than other whales. The baleen plates are the longest and have some of the finest fringes of the four mysticete families. Viewed in profile, the mouthline is extremely arched and the skull profile is highly convex; all seven cervical (neck) vertebrae are fused together.

Family Neobalaenidae—*Pygmy right whale*

The single species in this family, the pygmy right whale of the temperate Southern Hemisphere, is poorly known. Although it is in some ways intermediate between the Balaenopteridae and Balaenidae, the pygmy right whale is more closely related to the Balaenidae. Much smaller than the right and bowhead whales (<7 m), it is slender, with a moderately arched mouthline. The head represents only about one-quarter of the total length, and there is a short falcate dorsal fin set behind mid-back. There is also a pair of shallow throat depressions, which have been hypothesized to be incipient throat grooves. The skull is also somewhat intermediate in form; the rostrum is moderately arched (reminiscent of balaenids), but is much wider at its base (reminiscent of balaenopterids).

Family Balaenopteridae—*Rorquals*

This family contains eight (or possibly nine) species in two genera of the largest animals ever to live; all balaenopterids have adult body lengths of over 7 m, and some are much larger. The rorquals are streamlined animals (the humpback whale somewhat less so than the others), with a series of long pleats extending from the snout tip to as far back as the navel on the ventral surface. Balaenopterids are generally fast and active lunge feeders; their morphology allows them to open their jaws very widely and distend their throats to take in huge mouthfuls of water during feeding. The baleen plates are of moderate length and fringe fineness. Density and fringe diameter vary among species and, along with plate number and width/length ratio, are diagnostic characters. Rorquals have dorsal fins (varying in size and shape) set behind the midpoint of the back. The upper jaw has a relatively flat profile, a feature reflecting the structure of the skull. Within a given feature, differences among balaenopterids are often subtle variations on a theme, rather than class distinctions. Therefore, information on many features may be needed to distinguish among them and reliance on a single character for identification is strongly discouraged.

Family Eschrichtiidae—*Gray whale*

The gray whale was once present in both the North Atlantic and North Pacific oceans, but has been exterminated in the Atlantic in the last few hundred years. This monospecific family is in some ways intermediate between the Balaenidae and the Balaenopteridae. The gray whale is stocky and has an arched jaw, but neither of these characters is as pronounced as in the right whales. Gray whales are slow-moving coastal animals that suck prey from the bottom sediments. Gray whales have the shortest and coarsest baleen of all species, a feature that probably reflects both the size of their prey and their tendency to take in gravel, sand, and other debris during feeding. There are 2–5 short throat creases, a dorsal hump followed by a series of knobs or knuckles along the dorsal surface of the tail stock, and only four digits in the flipper. The bodies of adults are usually covered with barnacles and whale lice.

Suborder Odontoceti—*Toothed whales*

With the exception of the sperm whale (males of which can reach lengths of at least 18 m), odontocetes are small to medium-sized cetaceans. Sexual dimorphism is the rule. Toothed whales are characterized by the presence of homodont teeth throughout life[1] (although teeth are buried in the gum or jawbone in some species, worn or lost in others, and take peculiar shapes in still others), a single blowhole, an asymmetrical skull (generally with a concave profile), presence of antorbital notches, a thin-walled "pan bone" at the posterior end of the mandible, a sternum with three or more parts, a complex system of nasal sacs, and a fatty organ in the forehead area called the melon. All are hypothesized to be capable of echolocation (i.e., producing specialized sounds, and receiving and processing the echoes from these sounds to navigate, find food, avoid predators, etc.), although this ability has been experimentally verified for only a handful of species held successfully in captivity. Odontocetes capture individual prey, which consists largely of various species of fishes and squids. There are 72 species in 33 genera.

Family Physeteridae—*Sperm whale*

The single species of sperm whale is the largest toothed cetacean and has the highest degree of sexual dimor-

---

[1] Tooth counts of toothed whales given in this guide are for each tooth row (the upper and lower jaws each have two tooth rows), unless otherwise indicated.

phism. There is a low dorsal hump, followed by a series of crenulations. It has a large head with a squarish profile, narrow underslung lower jaw, and functional teeth only in the lower jaw (these fit into sockets in the upper jaw). The blowhole is located at the left front of the head. The head is highly modified, and is divided into sections called the "junk" and the spermaceti organ, or "case." The spermaceti organ is a large oil-filled reservoir, the function of which is controversial. There is a dish shape to the facial area of the skull, extreme cranial asymmetry, and a long rostrum. Sperm whales are known to be capable of very deep, long dives of over 3,200 meters.

Family Kogiidae—*Pygmy and dwarf sperm whales*

This family contains two species in a single genus. The pygmy and dwarf sperm whales are much smaller and share only a slight resemblance to the great sperm whale. They have blunt squarish heads, with underslung lower jaws (like their larger counterparts), but the head is much smaller than in the sperm whale, and the blowhole is not located at the front of the head as it is in the sperm whale. The skull structure is curious: it shares a basin-like facial area and great asymmetry with the sperm whale, but is much shorter. The dorsal fin in both species is relatively larger than that of the sperm whale, but is similarly followed by a series of small crenulations. Both species are characterized by a pigmentation mark on the side of the neck, similar in appearance to a shark's gill slit, a feature totally unique among cetaceans. The biology of these animals is very poorly known.

Family Monodontidae—*Narwhal and beluga whale*

This is a family of small whales (less than 6 m in length), with stocky bodies, blunt bulbous heads, broad rounded flippers, and no dorsal fins. There are two species in two genera. Both species are inhabitants of high arctic areas of the Northern Hemisphere. The skull is unique in that, in profile, it is very flat, with little or no rise in the area of the nares. Unlike the situation in most cetaceans, the cervical vertebrae are generally not fused, allowing monodontids a great range of neck flexibility. The two species are both restricted to high-latitude arctic waters, often living among the ice.

Family Ziphiidae—*Beaked whales*

The beaked whales (a large family, with 21 species in six genera) are medium-sized cetaceans (4–13 m long), which as a rule, have reverse sexual dimorphism (females larger than males). In general, beaked whales have a pronounced beak, relatively small dorsal fin set far back on the body, small flippers that fit into depressions on the sides, two short throat grooves, flukes lacking a median notch, and no more than 1–2 pairs of functional teeth in the lower jaw of males only (major exceptions of the latter are *Berardius*, in which females also have two pairs of exposed teeth, and *Tasmacetus*, in which both sexes have long rows of slender functional teeth). Beaked whales are poorly-known as a rule; however, most are thought to be deep-diving squid eaters. They generally travel in small groups.

Family Delphinidae—*Marine dolphins*

The family Delphinidae has been called a "taxonomic trash basket," because many small to medium-sized odontocetes of various forms have been lumped together in this group for centuries. It is the largest marine mammal family, with 36 species in 17 genera. Needless to say, then, the so-called delphinids are extremely diverse in form. They range in size from the 1–1.8 m dolphins of the genera *Sotalia* and *Cephalorhynchus* to the killer whale, in which males can reach lengths of at least 9.8 m. Most delphinids, however, share the following characteristics: a marine habitat, a noticeable beak, conical teeth, and a large falcate dorsal fin set near the middle of the back. There are exceptions to every one of these rules, except the presence of basically conical teeth, however. Generally, delphinids have a complex social organization, and they form the largest groups of any marine mammal (sometimes in the thousands or even tens of thousands).

Family Phocoenidae—*Porpoises*

Porpoises (6 species in 3 genera) are small cetaceans (all less than 2.5 m) that some taxonomists in the past have classified with the delphinids. They tend to be coastal in distribution, rather stocky in form, with either a short, indistinct beak or no beak at all. Most have a short triangular dorsal fin; all have spade-shaped teeth, and bony protuberances on the skull in front of the bony nares. In some species, females are larger than males. Phocoenids appear to live in smaller groups and have a simpler social structure than do most delphinids.

Family Platanistidae—*South Asian river dolphin*

This family includes the susu and bhulan of the Ganges and Indus rivers, which were previously classified as separate species, but are now recognized as subspecies of *Platanista gangetica*. Animals in this family are nearly blind, and apparently rely largely on echolocation to navigate and find food. The body is fairly small (to about 2.6 m) and is soft and "mushy." There is a long forceps-like beak, with front teeth that can extend outside the closed mouth. The blowhole is a longitudinal slit. The susu and bhulan have no true dorsal fin, only a low dorsal ridge. The most characteristic feature of the skull is a pair of enlarged maxillary crests that overhang the rostrum. Distribution is restricted to several large river systems of South Asia. Some evidence suggests that this may be the most closely-related odontocete group to the mysticetes.

Family Iniidae—*Boto*

The single species in this family, the boto of the Amazon and Orinoco drainages in South America, is unique in several ways. It is a large river dolphin, with a moderately long, thick beak dotted with sparse hairs. The dorsal ridge is very low and usually indistinct. Many adults are nearly totally pink in color. The rear teeth are flattened and the zygomatic arches of the skull are incomplete.

Family Lipotidae—*Baiji*

This family contains a single extant species, the baiji of the Yangtze River in China. It is a mid-sized river dolphin. The dorsal fin is reduced to a low structure, with a short base. The rostrum is upturned, and there is a distinct constriction at its base. The baiji is the most endangered cetacean in the world today, and may already be extinct.

Family Pontoporiidae—*Franciscana*

This family also contains only one species, a coastal marine species of the east coast of South America, known as the franciscana. This is the smallest of the platanistoids (true river dolphins), rarely reaching 1.8 m in length. Females are larger than males in this species. Franciscanas have extremely long beaks (proportionately the longest of any cetacean) and rather low, triangular dorsal fins.

Order Sirenia—*Manatees and dugongs*

There are four living species of sirenians: three manatees and the dugong. A fifth species, Steller's sea cow of the North Pacific and Bering Sea, was exterminated by overhunting in the 1700s. Sirenians, like cetaceans, are totally aquatic. They are the only marine mammalian herbivores. As a consequence, even the most marine species, the dugong, tends to be less oceanic than members of other marine mammal groups. In fact, most manatees spend much or all of their lives in fresh or brackish water. All four living species are restricted to a tropical/subtropical habitat. Steller's sea cow was unique. It inhabited cold temperate to subarctic waters of the North Pacific.

Sirenians have the following morphological characteristics in common: robust body; tough, thick skin with little hair; two nostrils on top or at the front of a thick muzzle; no ear pinnae; no hind limbs; mammary nipples located near the axillae; forelimbs modified into flippers; horizontally flattened tail; and dense, swollen (pachyostotic) bones.

Family Trichechidae—*Manatees*

The three species of manatees (all in a single genus) are found in tropical/subtropical areas of the Atlantic Ocean (and appended freshwater systems) and are very sensitive to cold. They are characterized by a horizontally flattened, rounded tail (as opposed to the whale-like flukes of dugongs). With only six cervical vertebrae, manatees are among the few groups of mammals that diverge from the normal mammalian number of seven. They are also unusual in that their teeth are replaced throughout life with new ones from the rear of the mouth. The external auditory meatus (external ear) is very broad and shallow.

Family Dugongidae—*Dugong*

There is only one living species in the family Dugongidae. The other recent member, Steller's sea cow (*Hydrodamalis gigas*), was exterminated by overhunting in 1768. The dugong is a tropical/subtropical inhabitant of the Indo-Pacific, but Steller's sea cow was an inhabitant of cold temperate to subarctic waters. In members of this family, the flattened tail is expanded into flukes, similar to those of cetaceans. Other characteristics include a rostrum that is deflected downwards, the presence of erupted tusks in males (dugong only; Steller's sea cow had no functional teeth), a more streamlined body than those of manatees, and the absence of nails on the flippers.

Order Carnivora—*Carnivorous mammals*

(including pinnipeds, marine otters, and polar bears)

By far, most carnivores are terrestrial mammals. Besides pinnipeds, the Order Carnivora contains seven families of largely meat-eating mammals, including cats, dogs, bears, raccoons, weasels, otters, civets, and hyenas. Of these, only two families contain marine mammal representatives, the Mustelidae (otters and weasels) and the Ursidae (bears). As only 3 of these 200+ non-pinniped species of carnivores are marine mammals, we will not present the detailed characteristics of members of this order.

Family Mustelidae—*Otters*

The mustelids are the otters, weasels, and their kin. Other mustelids include the minks, polecats, martens, wolverines, skunks, and badgers. Although four other species of freshwater otters may obtain some of their food from the sea, only two of the approximately 67 species in this family are truly marine, the sea otter and the marine otter. Thus, we restrict our treatment to these two species usually considered among marine mammals. Otters are often classified in their own subfamily, the Lutrinae (containing about 13 species). Marine and sea otters are largely restricted to the Pacific Ocean (two marine species in two genera).

Family Ursidae—*Bears*

There are seven species of bears in the world; six are wholly terrestrial and only one qualifies as a marine mammal. Bears are very familiar animals to many people; in particular, the grizzly/brown and black bears of the Northern Hemisphere are often exhibited in zoos and are well known (grizzly/brown bears are most closely related to the polar bear). The single marine species, the polar bear, ranks as the least aquatic and least derived of all marine mammals. Polar bears may spend long periods of time on shore. They are restricted in distribution to arctic regions of the Northern Hemisphere.

Suborder Pinnipedia—*Seals, sea lions, and walruses*

There are 36 species of pinnipeds (Suborder Pinnipedia), all of which are assigned to three families of the mammalian order Carnivora: the Otariidae, Phocidae, and Odobenidae. Although technically the taxonomic suborder Pinnipedia is not recognized by many marine mammal biologists anymore, we will make use of this grouping in this book, for clarity of presentation. The otariids are the 16 species of sea lions and fur seals, sometimes referred to as the eared seals. The phocids are the 19 species of true seals, sometimes referred to as the earless seals. Odobenids are reduced to just a single living species, the walrus. There has been controversy as to whether the pinnipeds are monophyletic (i.e., evolved from a single ancestor) or biphyletic (from two separate ancestors). However, recent evidence seems to make it clear that they are monophyletic.

Pinnipeds are highly specialized aquatic carnivores that live in a diversity of marine habitats, and some freshwater ones as well. One unifying feature of the group is that all must return to a solid substrate, such as land or ice, to bear their pups. Almost without exception, females give birth to a single offspring per reproductive effort. All species are amphibious, though the otariids are the most agile and mobile on land. In general, phocids are more capable divers and breath-holders, although there is overlap in the capabilities of some otariids and phocids. In many ways, the walrus is intermediate between the phocids and otariids.

Pinnipeds all have fur (but also use blubber for thermoregulation), two sets of limbs (called foreflippers and hindflippers), long whiskers, nasal openings at the tip of the snout, and strongly reduced or lost ear flaps. Pinnipeds molt every year, some gradually over several weeks or months, others dramatically in a short time. In the species accounts, pinniped coloration is described in somewhat more detail than for cetaceans, because for identification, there is often more of an emphasis on the subtle shading often visible on hauled-out pinnipeds.

Family Otariidae—*Eared seals*

All 16 species (in seven genera) of sea lions and fur seals have a polygynous mating system and pronounced sexual dimorphism. Characteristics of this family are: small external ear flaps (pinnae), smooth vibrissae, light skin, a double layer of fur with short underfur and longer guard hairs, hairless hindflippers, four teats in females, scrotal testes, and skulls with shelf-like supraorbital processes and sagittal crests (the latter enlarged in adult males only). Eared seals swim with their large foreflippers and can rotate their hindflippers forward to walk on all fours on land. Southern Hemisphere fur seals rest in a characteristic posture, with head down and flippers swaying gently.

Family Odobenidae—*Walrus*

While there were multiple species in the past, today only a single walrus species persists. Walruses are enormous animals that combine features of both otariids (e.g., moderately long foreflippers that can lift the body off the ground) and phocids (e.g., lack of ear pinnae). The neck is long and the hindflippers can rotate under the body and permit walking, although walruses are so bulky they cannot walk as easily as most otariids can. The tail is sheathed in skin and not readily visible or free, as in other pinnipeds. The tusks are a unique feature, and are important in fighting and assisting with hauling out. The walrus skull is very dense (pachyostotic) and has antorbital processes that are composed of both frontal and maxilla bones. Walruses have numerous short, smooth vibrissae on their thick fleshy mystacial ("moustache") pads. The testes of walruses are internal, not scrotal, and females have four retractable mammary teats. The skin is dark in younger animals and lightens with age. Walruses swim with phocid-like side-to-side strokes of the hindflippers, with assistance from the foreflippers. They only occur in high latitudes of the Northern Hemisphere.

Family Phocidae—*True seals*

This is the largest family of the pinnipeds, with 19 species in 13 genera (one species is extinct). The true, or earless, seals include the largest of the pinnipeds, the elephant seals. Species within the group have variable degrees of sexual dimorphism (in some species, females are the larger sex). Phocids are characterized by the absence of external ear pinnae, a short muzzle, beaded vibrissae, dark skin, short fur, generally two teats in females, internal testes, furred hindflippers, inflated tympanoperiotic bones, and the absence of supraorbital processes or an enlarged sagittal crest on the skull. Propulsion in water is provided by figure-eight movements of the hindflippers, and movement on land is provided by inch-worming or "galumphing," without much help from the relatively small foreflippers. They lack the ability to draw the hindflippers under the body to lift themselves off the ground. As a rule, true seals are more aquatic than eared seals, spending proportionately less time on land or ice.

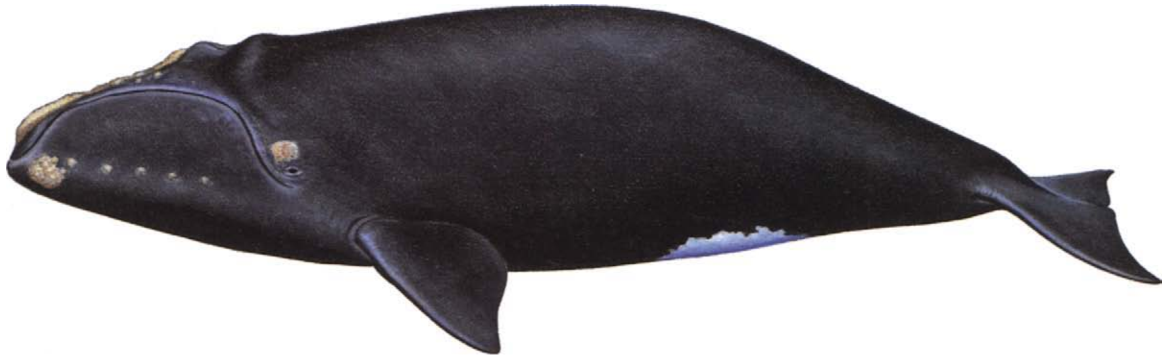
North Atlantic Right Whale—*Eubalaena glacialis*

(Müller, 1776)



Recently-used synonyms None.

Common names En.–North Atlantic right whale; Sp.–*ballena franca*; Fr.–*baleine de Biscaye*.

Taxonomic information Order Cetacea, Suborder Mysticeti, Family Balaenidae. A recent study has demonstrated that right whales in the three major ocean basins where they occur (North Pacific, North Atlantic, and Southern Ocean) represent separate lineages. As such, three species of right whales are now recognized: *E. japonica*, *E. glacialis*, and *E. australis*, respectively.

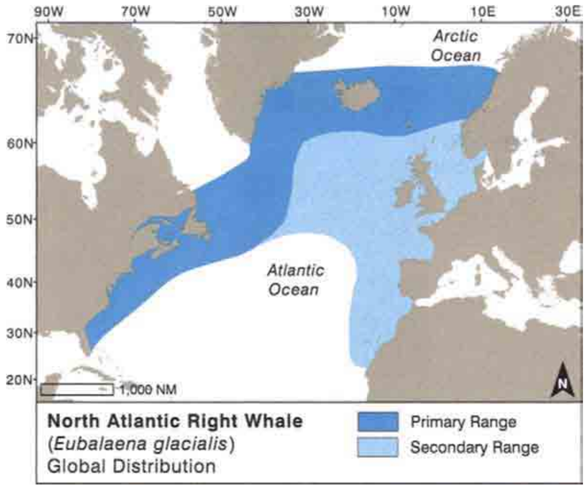
Species characteristics The right whales are among the stockiest of all whales. The axillary girth may be more than half the total length. The North Atlantic right whale has a massive head that can be one-fourth to one-third of its body length. The jawline is arched and the upper jaw is very narrow in dorsal view. It is narrowest near the middle and it widens slightly toward the tip. The upper edges of the lips are often scalloped. The eyes are located just above the corners of the mouth, and the blowholes are located at the highest point of the rear part of the head; they point slightly to the sides. The flippers are broad and are more paddle-shaped than the pointed flippers of most other cetaceans. They may be up to 1.7 m long. There is no dorsal fin or dorsal ridge on the broad back. The back is smooth and wide. The flukes are very wide (up to 35% or more of total length) and gracefully tapered, with a smooth trailing edge and a deep notch.

Most North Atlantic right whales are predominantly black, but there may be large white splotches of varying extent on the underside of the belly and the chin (about 20–30% of whales have them) and sometimes elsewhere on the body (not as extensive as in the southern right whale, however). Some individuals may appear mottled, which is caused by uneven sloughing of patches of skin. The head is covered with callosities, areas of roughened skin to which whale lice attach. The largest of these callosities, on the top of the rostrum, is called the bonnet. The upper jaw callosities tend to be more continuous than in the southern species. There are generally few or no callosities on the upper margin of the lower lips (however, these are fairly common in southern right whales). The skin of the callosity areas is more smooth on young animals, and it becomes more roughened with age. The patterns of the callosities are individually-distinctive, and these are used, together with prominent scarring, to identify individual whales.

The flukes of a North Atlantic right whale beginning a dive. They often fluke-up before a deep dive. Cape Cod Bay, Massachussetts. PHOTO: R. W. BAIRD.

The widely-separated blowholes produce a bushy V-shaped blow up to 5 m high. Inside the mouth are 200–270 (average 250) long, thin baleen plates, which may reach nearly 3 m in length. They are brownish-gray to black in color. The fringes of these plates are very fine, reflecting the small prey taken by this species.

Adult North Atlantic right whales range in length to 17 m, but may occasionally exceed 18 m. Females reach slightly larger sizes than males.



Adults may reach weights of 90,000 kg. Newborns are 4.0–4.5 m long.

Recognizable geographic forms None.

Can be confused with Although it is nearly impossible to distinguish the three right whale species from observations at sea, their distributions are widely separated, and they can be attributed to species based on their location. The North Atlantic right whale can be easily distinguished from other large whale species that occur in the Atlantic Ocean (primarily rorquals and sperm whales) by its robust body, large head, arched mouthline, long baleen plates, and V-shaped blow. North Atlantic right and bowhead whales once overlapped in distribution, and may again if populations recover. The presence/absence of callosities and coloration differences should make it easy to distinguish them.

Distribution North Atlantic right whales from two populations primarily inhabit temperate and subpolar waters of the North Atlantic Ocean. Historically, the two populations were presumably largely isolated from each other, and the eastern stock is now thought to be functionally extinct. The western North Atlantic stock breeds off the southeastern U.S. (Florida and Georgia) and feeds in the Gulf of Maine and off eastern Canada, as far north as Nova Scotia. The eastern Atlantic stock occurred in northern European waters, from Spain to Norway and Iceland, and probably moved south to waters off West Africa to breed. There are a few extralimital records from the Mediterranean. However, records in most parts of the eastern North Atlantic in recent years have been extremely rare. The population identity of right whales seen on rare occasions off Iceland and Greenland is unclear.

Ecology and behavior Right whales in the North Atlantic are mostly seen in groups of less than 12 (most

A North Atlantic right whale skims the surface, filtering prey out of the water; water passing out through the baleen forces the arched lip away from the upper jaw. PHOTO: R. W. BAIRD

As this North Atlantic right whale swims toward the photographer with its mouth open, it is skimming the surface and probably feeding on copepods; the pink tongue is visible between the baleen plates on either side of the rostrum. PHOTO: M. MOORE

North Atlantic right whales are skim-feeders—they swim along slowly with their mouth slightly agape, filtering out small invertebrates such as copepods from the water. They only occasionally do this at the surface, as in this photo. Western North Atlantic. PHOTO: C. FAIRFIELD

often singles or pairs). Larger groups may form in areas of aggregation for feeding and breeding. They are generally larger and more slow moving than their rorqual relatives. They can be aerially active, sometimes fluke-slapping and breaching repeatedly, and they generally raise their flukes before a deep dive. Right whale individuals can be identified by the patterns of scars and callosities (mainly on the head and back).

The mating system appears to involve sperm competition (males competing to inseminate females, not so much by physical aggression as by delivering large loads of sperm, thereby displacing that of other males). Male right whales have the largest testes in the animal kingdom. Groups of males are often seen surrounding a female, and mating with multiple males in these groups appears to be common. Interestingly, mating appears to occur throughout the year, but calving is seasonal. Young are born after a pregnancy of about a year in winter (mostly from December to March) on subtropical breeding grounds, nowadays primarily off the coasts of Florida and Georgia. The inter-calving interval averages about three years in this species, longer than for most other species of whales.

The functions of the callosities, which only right whales have, are unknown. It has been suggested that they are used by males in sexual selection for access to females. The evidence appears to support this hypothesis, although other functions cannot be ruled out. North Atlantic right whales may live to be at least 70 years of age.

Feeding and prey Right whales feed on calanoid copepods and other small invertebrates (smaller copepods, krill, pteropods, and larval barnacles), generally by slowly skimming through patches of concentrated prey at or below the surface. The most common prey species throughout most of the North Atlantic range is the copepod *Calanus finmarchicus*.

Threats and status This was the first species of whale to be commercially hunted, starting in the 11th century with a Basque fishery in the Bay of Biscay. It was slow, yielded large amounts of oil and baleen, and floated when dead, thus making it the "right" whale to kill. Heavy hunting left it severely depleted by the late 1600s, but some direct exploitation continued into the 20th century. Right whales are now fully protected, but current known threats include vessel collisions and entanglement in fishing gear. More than 60% of living North Atlantic right whales bear scars from fishing gear, and about 6% have injuries from vessel collisions. In addition, habitat destruction, pollution, and disturbance by vessel traffic may also be factors. This is one of the world's most endangered large whales, with only 300–350 whales thought to remain. Although the population was apparently growing in the 1980s and early 1990s, it began to drop in the late 1990s. It is now thought to be declining, due to anthropogenic mortality, and is clearly in very real danger of extinction.

IUCN status Endangered.

North Pacific Right Whale—*Eubalaena japonica*

(Lacépède, 1818)

Recently-used synonyms *Balaena seiboldii.*

Common names En.–North Pacific right whale; Sp.–*ballena franca*?; Fr.–*baleine franche*?.

Taxonomic information Order Cetacea, Suborder Mysticeti, Family Balaenidae. This species was only recently split off from *E. glacialis*, due to indications of its genetic distinctness. There are few known morphological differences between the two Northern Hemisphere species.

Species characteristics Right whales in the North Atlantic and North Pacific are not known to differ significantly in their external morphology or coloration. North Pacific right whales are extremely stocky animals; the maximum girth is about 75% of the total length. They have massive heads that can be up to nearly one-third of their body length. The eyes are set just above the corners of the mouth. The jawline is strongly arched and the upper jaw is very narrow in dorsal view, although it widens somewhat toward the tip. The upper margin of the lower jaw is generally somewhat serrated. The flippers are broad and tend to be more paddle-shaped than the pointed flippers of most other cetaceans, and they may be up to 1.7 m long. There is no hint of a dorsal fin or dorsal ridge on the broad back. The flukes are very wide (up to 35% or more of total length) and gently tapered, with a smooth trailing edge and a deep median notch.

Most North Pacific right whales are predominantly black, but there may be large white splotches of varying extent on the underside and sometimes elsewhere on the body (not as extensive as in the southern right whale, however). The head is covered with callosities, areas of roughened skin to which whale lice attach. The largest of these callosities, on the tip of the rostrum, is called the bonnet. The upper jaw callosities tend to be more continuous than in the southern species. There are generally few or no callosities on the upper margin of the lower lips (however these are fairly common in southern right whales). The widely separated blowholes produce a bushy, V-shaped blow up to 5 m high. Inside the mouth are 200–270 long, thin baleen plates, which may reach nearly 3 m in length. They are brownish-gray to black in color. The fringes of these plates are very fine, reflecting the small prey taken by this species.

This appears to be the largest of the three right whales species. Adults range in length to over 17 m, with females larger than males. Based on data from the North Atlantic species, newborns are thought to be 4.0–4.5 m long and adults may weigh up to 90,000 kg.

Recognizable geographic forms None.

Can be confused with In the northern extremes of their range, especially in the Bering and Okhotsk seas, North Pacific right whales may be readily confused with bowhead whales from a distance. A closer look will provide the means to distinguish them. Bowhead whales lack callosities and right whales generally have white patches only on the belly. North Pacific right whales may also be confused with humpback whales, but only from a great distance.

Distribution Right whales are now extremely rare in the North Pacific and little is understood of their current distribution there. Most of what is known of their historical range is based on whaling records. They previously had an extensive distribution in offshore waters (some > 2,000 m water depth). There was evidence of a general northward migration in spring and a southward shift in autumn. However, records anywhere in winter are sparse and the breeding grounds are not known. The only area where North Pacific right whales are seen reliably today is on the southeastern Bering Sea shelf in April to September. Sightings and whaling catches have occurred in the Okhotsk and Bering seas, Gulf of Alaska, and around the Kuril and Aleutian islands. There have also been recent reports further south off Japan, the western U.S., and Baja California, Mexico. A few sightings have been reported from Hawaiian waters. The absence of evidence for coastal winter breeding grounds suggests that (unlike their congeners) North Pacific right whales may breed in offshore areas.

Ecology and behavior Not much is known of the ecology and behavior of the North Pacific right whale, since these animals have been rarely observed alive in the last few decades. Much of what is known comes from whaling records. These whales generally occur most often as singles or pairs. Larger groups or aggregations may form on feeding or breeding grounds. They perform breaches and other aerial behaviors and generally raise their flukes before a long dive. Interestingly, sightings in Hawaiian waters have mostly involved single animals in close proximity to groups of wintering humpback whales.

As in the North Atlantic species, the mating system appears to involve sperm competition. Calving areas have not yet been identified in the North Pacific; the absence of many records from coastal areas in winter may suggest that they breed offshore. Feeding areas are most often in shallow coastal regions of the temperate to subpolar zones. In general, this species appears to have a more oceanic distribution than does the North Atlantic right whale, which may have to do with the different availability of prey resources between the two ocean basins. There is good evidence to suggest the existence of two separate stocks of North Pacific right whales in the eastern and western Pacific. Based on information from the North Atlantic, these whales may live to be over 70 years old. The sighting of three cow/calf pairs in the Bering Sea in 2004 provides some renewed hope for the recovery of this species.

A North Pacific right whale moving rapidly at the surface in the Bering Sea; water coming out of the mouth outlines the arched lower lip. PHOTO: J. DURBAN

Feeding and prey Right whales feed on calanoid copepods and other small invertebrates (smaller copepods, krill, pteropods, and larval barnacles), generally by slowly skimming through patches of prey concentrated at or near the surface.

A close-up of the head of a North Pacific right whale, showing the arched mouthline and callosities. PHOTO: J. DURBAN

Threats and status Hunting by the Japanese began as early as the late 1500s, and by Europeans and Americans in 1835. North Pacific right whales were heavily exploited in the 1800s, and any recovery was impeded by large illegal Soviet catches (see below). They have been protected for over 65 years, but illegal hunting continued into the 1970s. Russian whalers illegally killed at least 372 right whales in the eastern North Pacific in the 1960s, which may have been the bulk of the remaining population. With the exception of a small area in Alaskan waters, sightings are now rare, and major threats are largely the same as for *E. glacialis* (primarily fishing gear entanglements and vessel strikes). Climate change is another issue that may be affecting the ability of this population to recover. There were once probably over 11,000 North Pacific right whales. Although there are no reliable population estimates, it is thought that there are almost certainly no more than a few hundred North Pacific right whales alive today, and these are mostly found in the western Pacific. The eastern population was devastated by the Soviet catches and likely numbers fewer than 100 whales—it is critically endangered. Population trends are not known with any certainty, although there is little evidence for a significant recovery of numbers in the last few decades and until recently, sightings of young calves have been virtually non-existent.

IUCN status Endangered.

Southern Right Whale—*Eubalaena australis*

(Desmoulins, 1822)

Recently-used synonyms None.

Common names En.–southern right whale; Sp.–*ballena franca austral*; Fr.–*baleine australe*.

Taxonomic information Order Cetacea, Suborder Mysticeti, Family Balaenidae.

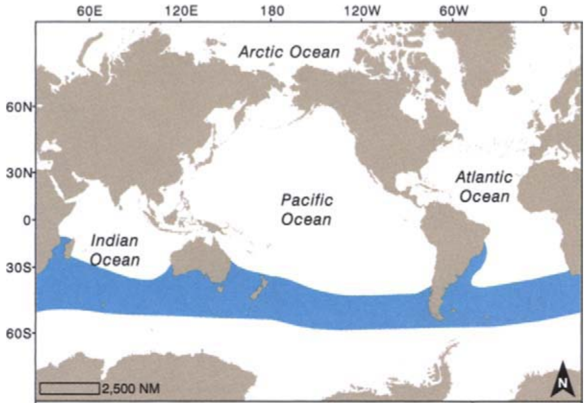
Species characteristics Southern right whales are enormous animals. These stocky whales have extremely large heads, which can be one-fourth to one-third of the body length. The mouthline is strongly bowed and the rostrum is arched and very narrow when viewed from above. As is true for all right and bowhead whales, there is no trace of a dorsal fin or ridge in the southern right whale. The back is smooth and broad. The flippers are fan- or paddle-shaped and large (up to 1.7 m long), and the flukes are broad with smooth contours. All right whales have callosities on their heads, the largest of which is called the bonnet. These upper jaw callosities tend to be more discontinuous in this species than in their Northern Hemisphere counterparts. In addition, callosities often appear on the upper margin of the lower lips in southern right whales. The callosity patterns are individually distinctive and are used by researchers to identify individuals.

Southern right whales are black over most of the body, but most have white patches of variable shape and size on the belly and sometimes on the chin. They sometimes appear to have light mottling (generally caused by uneven sloughing of skin) and about 3–6% of animals have white or light gray blazes on the back (the latter are uncommon in the northern species). Color variants have been noted; these include blue-black, light brown, and partially white/gray individuals (the latter are generally heavily mottled). In addition to those on the callosities, whale lice are common in creases and folds on the bodies of southern right whales.

The head of a southern right whale, showing the 'bonnet' and other callosities. The size and placement of these white patches can be used to identify individual animals in long term studies. Peninsula Valdes, Argentina. PHOTO: S. HEINRICH

Southern right whale adults reach up to 17 m in length; as in the other species in the genus, females grow larger than males. They tend to be slightly smaller than those in the Northern Hemisphere. These animals can reach weights of at least 80,000 kg. Newborn animals are 4–5 m long.

The 200–270 baleen plates per side are narrow and long, up to 3 m in length. The plates tend to be dark gray to black (although some can be nearly white) and have fine gray to black fringes. The blow of the southern right whale is relatively



Southern Right Whale
(*Eubalaena australis*)
Global Distribution

short and V-shaped, making this species identifiable at a distance, especially if seen from ahead or behind.

Recognizable geographic forms None.

Can be confused with The southern right whale is the only whale in its range with a smooth, finless back and callosities; this should make misidentifications unlikely. From a distance the bushy, somewhat V-shaped, blows of humpback whales can be mistaken for those of right whales. At close range, however, the two species are unmistakable.

Distribution Southern right whales have a circumpolar distribution in the Southern Hemisphere, from approximately 20°S to 55°S, although they have been observed as far south as 65°S. They are migratory, moving south to feed in summer months. For winter, they migrate north and much of the distribution is concentrated near coastlines. Major mating and breeding areas are nearshore off southern Australia (including Tasmania), southern New Zealand/Campbell Island, southern South America, and South Africa/Mozambique/Madagascar, as well as around several subantarctic islands. Multiple stocks are considered to exist. A few southern right whales have been sighted in Antarctic waters in summer.

Ecology and behavior Southern right whales have been well-studied on their winter breeding grounds, especially at Peninsula Valdes, Argentina, and in Australia and South Africa. The Argentine study has been

Most southern right whales are shiny black, but some are mottled black and white, like this individual. Peninsula Valdes, Argentina. PHOTO: L. MORSE

All three right whale species have a V-shaped blow, with widely divergent jets of vapor. South Atlantic, south of Africa. PHOTO: P. OLSON

ongoing since the early 1970s and is one of the longest-running behavioral studies of any cetacean population. Researchers have used callosity patterns to identify individuals on these grounds, and have learned much about the right whale's behavior, communication, and reproduction. Southern right whales often seem slow and lumbering, but at times can be surprisingly quick and active. They often breach, and slap their flippers and flukes on the surface. Southern right whales often raise their flukes on a dive. They have even been seen apparently "sailing" by catching the wind with their raised flukes. Typical feeding dives last 10–20 minutes.

Most of the breeding in Argentina takes place in August and September, but mating has been observed in most months of the year. Male right whales have huge testes (up to 2 m and 500 kg each) and long penises, two characteristics predicted in species in which males compete for females primarily through sperm competition, rather than by direct aggression. In fact, observations of mating right whales often appear to support this hypothesis, with one female often engaging in sequential mating with multiple males, which do not appear to show much overt aggression.

Feeding and prey Surface and subsurface skim-feeding is the rule in this species. They move forward through patches of prey with the mouth open, allowing water to move through and catching the prey items on the finely fringed inner surfaces of the baleen plates. Southern right whales prey mostly on copepods and krill, apparently sometimes feeding near the bottom.

Threats and status After North Atlantic right whale stocks began to be reduced, European and American whaling activity shifted to the Southern Hemisphere. Heavy exploitation there left stocks badly depleted. Unauthorized catches by the Soviets of more than 3,000 right whales in the 20th century added to the depletion.

A female southern right whale and her young calf seeking protection in the shallows; their individually identifiable callosity patterns are clearly visible. Peninsula Valdes, Argentina. PHOTO: G. JOHNSON

Fisheries interactions, as well as potential vessel disturbance and collisions, continue to threaten southern right whale populations today. Although there are thought to be only about 8,000 animals remaining, the southern right whale is not as seriously endangered as the northern species. Some populations appear to be recovering, such as those that breed off Argentina, South Africa, and western Australia. All three of these appear to be increasing at 7–8% per year, and clearly this means the prospects of long-term survival are much better for this species than for either of the Northern Hemisphere species.

IUCN status Lower Risk/Conservation Dependent.

Bowhead Whale—*Balaena mysticetus*

Linnaeus, 1758

Calf

Adult

Recently-used synonyms None.

Common names En.–bowhead whale or Greenland right whale; Sp.–*ballena de cabeza arqueada*; Fr.–*baleine du Groenland*.

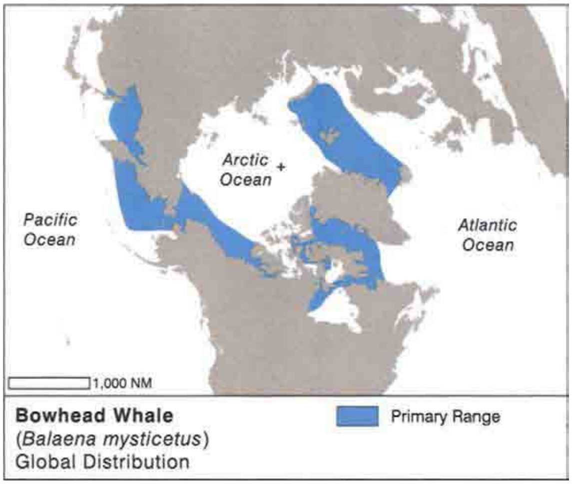
Taxonomic information Order Cetacea, Suborder Mysticeti, Family Balaenidae.

Species characteristics Bowhead whales superficially resemble their close relatives, the right whales. They are extremely rotund overall, but usually have a distinct "neck" region. The head is large (up to two-fifths of the body length); the upper jaw is arched (thus the name, bowhead) and narrow when viewed from above. There is a prominent muscular bulge in the blowhole area (sometimes called the "crown" or "stack" by whalers), with a distinct depression behind. The mouthline is strongly bowed, and the eye is placed just above the corner of the mouth. There is no dorsal fin or ridge, and the back is very broad and smooth. The flippers are large and fan-shaped, and have blunt tips. The flukes are wide (2–6 m across) and tapered toward the tips, with smooth contours. Bowheads have extremely thick skin (up to 2.5 cm) and blubber (up to 28 cm) layers.

Predominantly black in color (although some lighter-colored animals are occasionally seen), bowheads have varying amounts of white beneath, usually showing dorsally as a white patch at the front of the lower jaw. This patch often has several dark gray to black spots, each indicating the position of a chin hair. There is also often a light gray to white band around the tail stock, just in front of the flukes, and sometimes other white or light gray areas on the body (such as on the belly and flukes). The white on the tail expands with age, and very large, old bowheads may have an almost completely white tail.

Bowheads have the longest baleen plates of any whale. The 230–360 plates in each side of the jaw can reach lengths of 5.2 m; they have long, fine fringes. The plates are dark gray to brownish-black, generally with slightly lighter fringes.

An aerial photograph of a female bowhead whale and her newborn calf. The lack of callosities on the head and the white chin separate it from the similar right whale. Notice also the light band around the tail stock. PHOTO: D. RUGH



As is true for the closely-related right whales, the blow is V-shaped and bushy.

Females grow somewhat larger than males. Male bowhead whales range to 18 m in length, females to 20 m. Weights of large individuals have been estimated at about 90,000 kg. Calves are about 4.0–4.5 m long at birth.

Recognizable geographic forms None.

Can be confused with Bowheads should be very easy to identify, as the only other large whales with a smooth back are the right whales, which are rare in the bowhead's northern haunts. The right whales' callosities and absence of white on the chin and peduncle will allow them to be distinguished from bowheads. Gray whales use some of the same summer range as bowheads, but the gray whale's dorsal hump and knuckles, weakly-arched lower jaw, and more slender body shape and lighter coloration should make them distinguishable in most circumstances.

Distribution Bowheads are the most boreal of all great whale species, and are found only in arctic and subarctic regions generally between about 55° and 85°N. Once there might have been a single panarctic population. Currently, there are five stocks recognized in the North Atlantic Ocean, and the Bering, Beaufort, Chukchi, and Okhotsk seas. These animals live much of their lives in and near sea ice, migrating to the high arctic in summer, but retreating southward in autumn with the advancing ice edge.

Ecology and behavior Bowhead whales are usually seen in groups of three or fewer, but larger aggregations form during migrations and on the feeding grounds. Although often slow-moving, bowheads do breach, fluke slap, and engage in other aerial behavior, sometimes for extended periods. They lift their flukes before a steep dive, but not as often as some other great whales. Complex low frequency calls (some arranged into songs) are common, at least during migration. Bowheads are closely associated with ice for most of the year. They are adapted to living among the arctic ice, and they can break through ice as thick at 60 cm. Their diving abilities, while not as well-studied as for many other species of large whales, are thought to be exceptional—they can possibly stay submerged for over an hour.

Bowhead whales probably mate in late winter or early spring. Calves are born mainly the following spring (about 13–14 months later), as whales migrate toward their summering grounds. The breeding system is thought to be similar to that of the right whale, with males using a form of sperm competition. Mating groups often

A bowhead whale (swimming left) exposes its massively arched lower lip; it has no callosities, which rules out identification as a right whale. PHOTO: K. LAIDRE

Bowhead whales lack callosities, but they do have mounded blowholes; this "stack" is used to break through ice when surfacing. PHOTO: K. LAIDRE

are composed of the female and multiple male suitors, similar to the situation in right whales.

Bowheads may be among the longest-lived of all mammals. There is some evidence from aspartic acid physiology and harpoon head recovery records to suggest that some individuals may live for more than a century (possibly even over 200 years)! Their major natural predator is the killer whale. Between 4 and 8% of Alaskan bowheads killed by Eskimos bore scars from killer whale attacks.

Feeding and prey Small to medium-sized (mostly 3–30 mm long) crustaceans, especially krill and copepods, form the bulk of the bowhead's diet. They also feed on mysids and gammarid amphipods; their diet includes at least 60 species. Bowheads skim-feed at the surface and in the water column. It has recently been suggested that they also feed near the bottom, but probably do not directly ingest benthic sediments, as gray whales routinely do. During surface skim-feeding, coordinated group patterns have been observed, including whales feeding in echelon (V-shaped) formation.

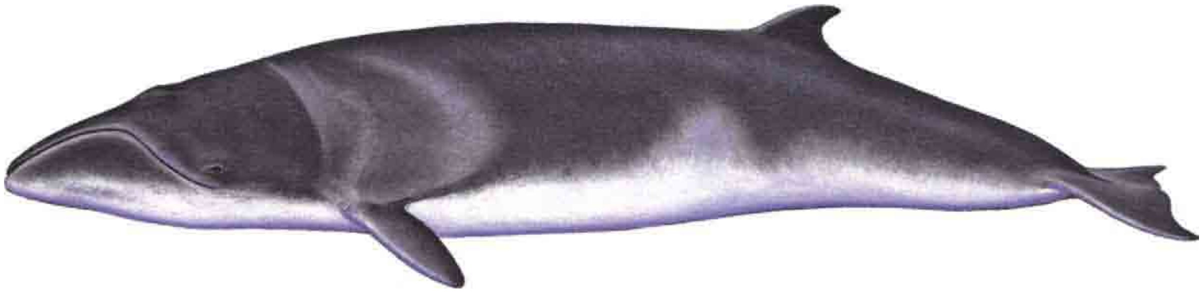
Threats and status All bowhead whale stocks were depleted by commercial hunting, which began in the 1500s, but was most intense in the 1800s and early 1900s. Heavy hunting has left four of the five recognized bowhead stocks highly endangered (less than a few hundred animals each). However, the Bering-Chukchi-Beaufort stock (also known as the Western Arctic stock) is thought to number over 10,000 animals, and is apparently increasing at about 3% per year. Limited whaling by Eskimos in Alaskan and Russian waters is allowed under a quota system set and overseen by the International Whaling Commission and the U.S. Government. This, along with small (but not insignificant) kills by the Russians and Canadians may be factors in the recovery abilities of the affected stocks. The major non-direct threats to these animals are disturbance from oil and gas exploration and extraction activities in the arctic and subarctic regions, along with entanglement in fishing gear and pollution. Climate change (i.e., warming of polar regions) may also be a factor in their recovery.

IUCN status Critically Endangered (Spitzbergen stock), Endangered (Okhotsk Sea and Baffin Bay/Davis Strait stocks), Vulnerable (Hudson Bay/Foxe Basin stock), Lower Risk/Conservation Dependent (all other stocks).

References Angliss and Lodge 2004; Burns et al. 1993; Reeves and Cosens 2003; Reeves and Leatherwood 1985; Rugh and Shelden 2002; Rugh et al. 2003.

Pygmy Right Whale—*Caperea marginata*

(Gray, 1846)



Recently-used synonyms *Neobalaena marginata*.

Common names En.–pygmy right whale; Sp.– *ballena franca pigmea*; Fr.–*baleine pygmée*.

Taxonomic information Order Cetacea, Suborder Mysticeti, Family Neobalaenidae.

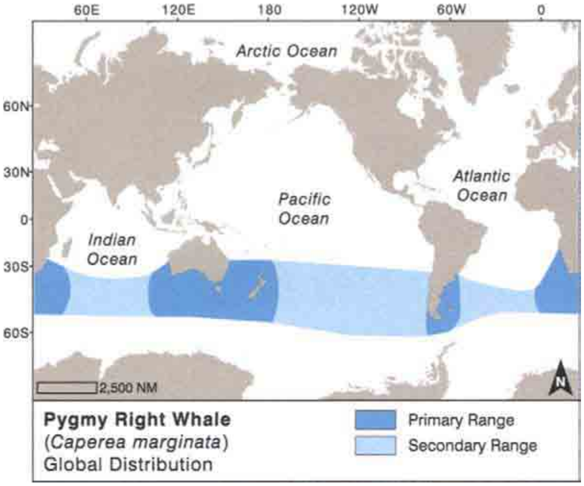
Species characteristics Although its name might imply that it is a "right whale", the pygmy right whale is actually now placed in a separate family and is not commonly regarded as one of the right whales. The falcate dorsal fin is set about 70–75% of the way back from the snout tip. This species is rather slender, resembling more the streamlined rorquals than the chunky right and bowhead whales, and the head is not large (less than one-quarter of the body length). The pygmy right whale is like the right whales in that it has an arched jaw line; also the upper jaw curves downward toward the tip, although not as much as in right and bowhead whales. There is a single mid-dorsal ridge extending down the top of the head from the blowholes to the rostrum tip. The flippers are small and slender with rounded tips. The flukes are broad, with a deep median notch. There are two shallow throat creases, reminiscent of those in gray whales.

The color of the body is dark gray above, shading to white below. Large adults may have a brownish tinge. There are typically white to light gray streaks and bands sweeping up from the belly onto the back. Most animals possess a chevron of light color at around the level of the flippers, and some may have a second chevron further back. The flippers and flukes are dark gray. Light-colored, concave healed scars (possibly caused by cookie-cutter sharks) are common on the body.

The baleen plates in this species number about 213–230 in each side of the upper jaw. They are up to 68 cm long and are very flexible and tough. The color of the plates is yellowish-white. The fringes are the finest and densest among all whales. The blow ranges from thin and columnar, to shorter and puffier, and may even be inconspicuous.

At sea, the rare pygmy right whale can appear quite similar to a minke whale, and care must be taken to distinguish the two in the Southern Hemisphere. Notice the prominent dorsal fin and pale chevron. PHOTO: R. L. PITMAN

A pygmy right whale showing the moderately arched jawline and a strong central ridge on the rostrum. This animal also has numerous oval cookie-cutter shark bite scars and a pale chevron on the upper back. PHOTO: R. L. PITMAN



This is the smallest baleen whale. The maximum length recorded for a male is 6.1 m and that for a female is 6.5 m. They reach weights of at least 3,400 kg. At birth, pygmy right whales are about 2 m long.

Recognizable geographic forms None.

Can be confused with This species can easily be confused with common and Antarctic minke whales, but the differences in head shape (particularly the blunter rostrum and arched lower jaw of the pygmy right whale) and the white flipper bands present in dwarf minke whales will allow differentiation when specimens are seen clearly. From a distance, the back and dorsal fin could be confused with those of a beaked whale; however, beaked whales have very different head shapes.

Distribution The pygmy right whale has a presumed circumpolar distribution in both coastal and oceanic waters, and is known only from a small number of records in the Southern Hemisphere, between about 30°S and 55°S (north of the Antarctic Convergence). There appear to be concentrations in plankton-rich waters around continents and islands, and also at the subtropical convergence in summer. There may be seasonal shifts in abundance, but this species does not appear to undergo a large-scale migration, as most of the larger baleen whales do.

Ecology and behavior This is the least known of all the baleen whales, as it is rarely sighted and has never been a primary target of commercial whalers. Groups of up to 14 individuals have been seen, but singles or pairs are most common. Recently, a large aggregation of about 80 whales was observed in the southeast Indian Ocean, but groups this large may be uncommon. They are sometimes seen with other species of whales and dolphins.

The inconspicuous small blow and quick shallow surfacings of the pygmy right whale make it difficult to spot and observe at sea. The head and blowholes usually appear before the dorsal fin is exposed. Often, these animals bring their snout tips out of the water upon surfacing, making it possible to see the arched mouthline. They are capable of swimming surprising fast (>6–8 knots without apparent effort). They typically dive for periods of about 4 minutes.

Very little is known about reproduction in this species, but the breeding season is thought to be protracted and may occur year-round. Sexual maturity is thought to occur at lengths greater than 5 m.

Feeding and prey Although there is little information on the diet, pygmy right whales are known to feed on calanoid and cyclopoid copepods, small euphausiids, and other small invertebrates (such as amphipods).

Threats and status This poorly-known species has never been commercially hunted (a few opportunistic takes have been recorded). Although there is essentially nothing known of its status, there is no evidence that it is seriously threatened. It may be naturally rare, or perhaps its areas of concentration have not yet been discovered. There are no available estimates of abundance.

IUCN status Least Concern.

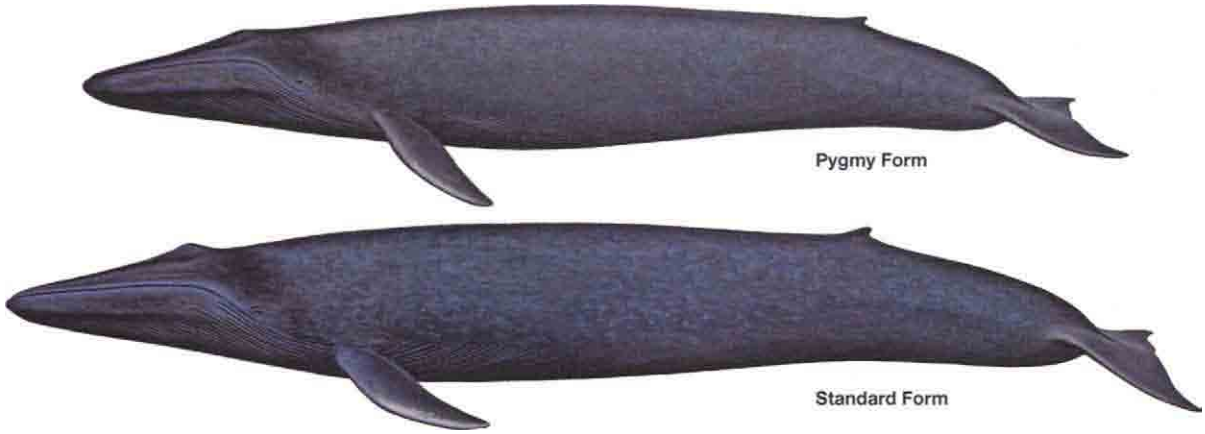
Blue Whale—*Balaenoptera musculus*
(Linnaeus, 1758)



Recently-used synonyms *Sibbaldus musculus*.

Common names En.–blue whale; Sp.–*ballena azul*; Fr.–*rorqual bleu*.

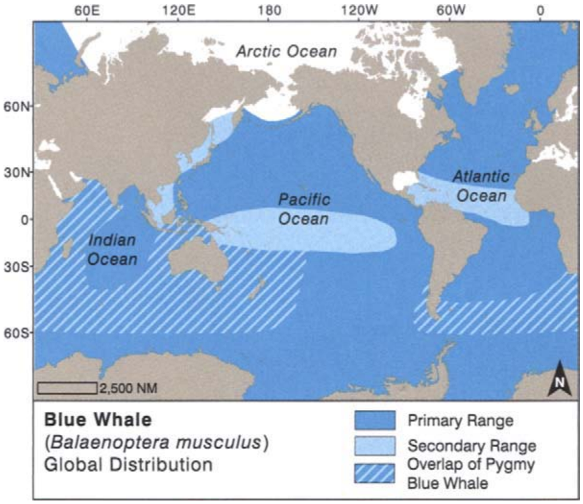
Taxonomic information Order Cetacea, Suborder Mysticeti, Family Balaenopteridae. Four subspecies are tentatively recognized: the blue whale of the North Atlantic and North Pacific (*B. m. musculus*), the blue whale of the northern Indian Ocean (*B. m. indica*), the blue whale (Antarctic blue whale) of the Southern Hemisphere (*B. m. intermedia*), and the pygmy blue whale (*B. m. brevicauda*) of the Southern Hemisphere and northern Indian Ocean. The first three subspecies are collectively known as "true blue whales." The validity of the subspecies *B. m. indica* is in doubt. Hybrids between blue and fin whales have been described from nature.

Species characteristics The blue whale is the largest animal ever known; however, size alone is not enough to distinguish it from other rorquals, as its size substantially overlaps with that of adult fin and sei whales. Like all rorquals, the blue whale is slender and streamlined. The head is broad and U-shaped (like a gothic arch), when viewed from above and relatively flat, when viewed from the side. Along the center of the rostrum, there is a single prominent ridge, which ends in an impressive "splash guard" around the blowholes. The flippers are long and pointed, and the dorsal fin is relatively small, variably shaped (sometimes reduced to just a nubbin), and placed about three-quarters of the way back from the rostrum tip. The broad, tapered flukes have a relatively smooth trailing edge and a prominent median notch. Of the four subspecies recognized, only the pygmy blue whale is known to have a significantly different body shape (see below).

Blue whales are bluish-gray dorsally and somewhat lighter underneath. The head is uniformly blue, but the back and sides are mottled blue and light gray. When viewed through the water surface they may appear dappled or uniformly light blue. There is light to extensive mottling on the sides, back, and belly, generally in the form of dark spots on a lighter surface, but sometimes the reverse. These patterns of mottling are used by researchers to identify individuals. Diatom films on the lower surface may be seen as an orangish-brown or yellow film, a characteristic which gave rise to the alternative name "sulphur-bottom" whale. There is generally a thin, white border around the flippers, on both the dorsal and ventral surfaces. The tail flukes often have light striations ventrally.

On the throat, there are 60–88 long pleats extending to or near the navel. The mouth contains 260–400

The galvanized blue and grey coloration seen here is diagnostic for blue whales. The white spots are recent cookie-cutter shark bites; blue whales encounter these sharks when they visit warmer waters. Eastern Pacific. PHOTO: NOAA FISHERIES/SWFSC



pairs of black, broad-based baleen plates, each less than 1 m long. The bristles are quite coarse. The blow is tall and slender, reaching 10–12 m in height.

Most adults of the Northern Hemisphere subspecies (*B. m. musculus*) are 23–27 m long (with females growing larger than males). The Antarctic blue whale (*B. m. intermedia*) is larger, and generally measures up to 29 m, although a specimen over 33 m was once taken by whalers. Newborn blue whales are about 7–8 m long. Adults can weigh up to 180,000 kg, but most adults weigh between 72,000 and 135,000 kg.

Recognizable geographic forms

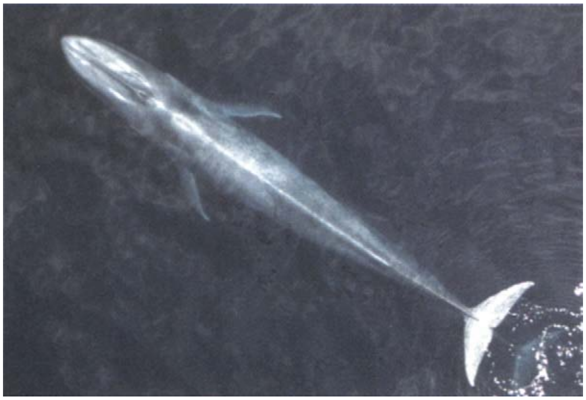
Standard-form blue whale (*B. m. musculus/indica/intermedia*)—Three of the four subspecies of blue whales share a similar external form (but differ from the pygmy blue, described below). They occur in the Pacific, Atlantic, Southern, and portions of the Indian Ocean. They are blue steel-gray in color. They are also somewhat longer than the pygmy blue, reaching lengths of up to 33 m. Compared to pygmy blues, these animals possess a relatively smaller head (i.e., a longer tail), slightly more ventral grooves, and longer baleen. The shape of the body has been described as 'torpedo-shaped' (with a relatively narrower head than the pygmy blue).

Pygmy blue whale (*B. m. brevicauda*)—The pygmy blue whale is found in the Indian and southeastern South Atlantic oceans (suggestions that they also occur off Baja California, Mexico, are erroneous). It is more silvery gray than the blue steel-gray of true blue whales. It has a relatively larger head (i.e., a shorter tail), slightly fewer ventral grooves, and shorter baleen. The shape of the body has been described as relatively 'tadpole-shaped' (reflecting the relatively wider head). These differences are subtle. If a good view is obtained, it might be possible to distinguish pygmy blue whales from other blue whales at sea, but only by highly-experienced observers. Pygmy blue whales are smaller than true blue whales, with a maximum length of only about 25 m. However, they tend to be heavier than true blue whales.

The blow of a blue whale is column of spray, sometimes up to 12 m tall—the highest of any whale. Monterey Bay, California. PHOTO: T. A. JEFFERSON

Can be confused with When seen well, blue whales are easy to distinguish from other large whale species. At a distance, however, blue whales can be confused with the other large rorquals: primarily fin and sei whales. Although the great size of blue whale adults may aid in identification, the best clues for differentiating blue whales from fin or sei whales are careful attention to color pattern, head shape, and dorsal fin shape and position. Blow shape and height can also be useful, but the variability within species must be kept in mind.

The blue whale has a dorsal fin that is relatively much smaller than in any other rorqual species, but the shape is quite variable. A nubbin such as this may be congenital, or a killer whale may have bitten off the fin. Eastern Pacific. PHOTO: C. OEDEKOVEN/NOAA FISHERIES/SWFSC



The sleek form of the blue whale is clearly evident only from the air. The pale, blue-gray color with individually-identifiable mottling is diagnostic. West coast of the United States. PHOTO: SOUTHWEST FISHERIES SCIENCE CENTER PHOTOGRAMMETRY LAB

The massive rostrum of the blue whale is nearly flat, with a single prominent median ridge. When viewed from above, it is rounded in front, a shape that has been likened to a "gothic arch." Eastern Pacific. PHOTO: H. FEARNBACH/NOAA FISHERIES/SWFSC

Distribution Blue whales tend to be open-ocean animals, but they do come close to shore to feed, and possibly to breed, in some areas. Blue whales can be seen from tropical waters to the pack ice edges in both hemispheres, but they tend to avoid most equatorial waters. Some blue whales are resident, others are migratory, moving poleward to feed in the summer and toward the tropics to breed in the winter. The breeding grounds do not appear to be as well defined as are those of humpback, right, and gray whales. The exact distribution of the pygmy blue whale is not completely known, although it occurs in the northern Indian Ocean and throughout much of the Southern Hemisphere. In the Antarctic, the pygmy blue tends to prefer more northern waters than the true blue whale does. The two forms do overlap in distribution in some areas.

Ecology and behavior Blue whales are usually seen alone or in pairs. However, scattered aggregations of a dozen or more may develop on prime feeding grounds. Although shorter dives are most common, dives of up to 30 min, generally interspersed with long series of shorter surfacings (at 15–20 sec intervals), have been recorded (the longest dive documented was 36 min). Fluking-up is not uncommon upon beginning a dive, although not all blue whales are "flukers." Remarkably, some blue whales have been observed breaching, bringing nearly all of their bulk out of the water. Some researchers believe that pygmy blue whales have a tendency to surface without showing the dorsal fin or keel (unlike the standard blue whale, which usually does). However, this is probably not a very reliable character to use for identification. Their major natural predator is the killer whale.

Calves are born in winter, apparently in tropical/subtropical breeding areas (the specific locations of which are not known for most populations). Nursing calves may gain 90 kg per day, and appear to be weaned by the age of about 8 months. Not much is known of the mating system of the blue whale, but they are known occasionally to hybridize with other large whale species (such as

A probable 'pygmy' blue whale from the Maldive Islands in the tropical Indian Ocean. PHOTO: L. BALLANCE

A blue whale from the Maldives, thought to be a pygmy blue whale, which has a proportionately larger head than the nominal subspecies. This animal may have been feeding—notice the water draining out of the mouth; there is also a large remora on the tip of the rostrum. PHOTO: L. T. BALLANCE

fin and humpback whales). Blue whales are thought to live for over 80–90 years. The role that acoustics play in the mating system is not known, but blue whales make some of the loudest sounds known in nature.

Feeding and prey Various species of krill (euphausiids) form the major part of the blue whale's diet, and on their feeding grounds, blue whales can be observed lunging, often on their sides or upside-down, through great clouds of these invertebrates. The throat pleats become greatly distended when the whales lunge-feed, giving them a tadpole shape.

Threats and status Blue whales were heavily hunted after the invention of the exploding harpoon and steam catcher boats made them accessible to whalers in the early part of the twentieth century. This was the first species of rorqual to be depleted by whalers; it was highly desirable due to its large size. Blue whales were hunted in the North Pacific, North Atlantic and Southern oceans. There were illegal catches by the Soviets in the northern Indian Ocean, and possibly elsewhere. The Soviets took over 10,000 pygmy blues in the 1960s. Nearly all populations were severely depleted and the species was once thought to be on its way to extinction. This species is currently protected (since 1966), with a zero catch limit imposed by the International Whaling Commission. While some populations were wiped-out, at least some blue whale stocks (such as those in the eastern North Pacific) appear to be showing signs of recovery. The major concerns now are vessel collisions and noise disturbance by human activities (in particular offshore oil and gas exploration and extraction). The blue whale is currently thought to number about 8,000–9,000 individuals globally. There were thought to be about 4,000 pygmy blue whales in the early 1970s, but more recent estimates are not available.

IUCN status Vulnerable (North Atlantic stock); Lower Risk/Conservation Dependent (North Pacific stock); Endangered (Antarctic stock); Data Deficient (pygmy blue whale).

Fin Whale—*Balaenoptera physalus*
(Linnaeus, 1758)

Recently-used synonyms None.

Common names En.–fin whale; Sp.–*rorcual común* or *ballena de aleta*; Fr.–*rorqual commun*.

Taxonomic information Order Cetacea, Suborder Mysticeti, Family Balaenopteridae. Some authors recognize two subspecies, one in the Northern Hemisphere and one in the Southern. However, this subspecies designation is not widely used. A recently-described new species of rorqual, *Balaenoptera omurai*, may be closely related to the fin whale. There are reported hybrids between blue and fin whales.

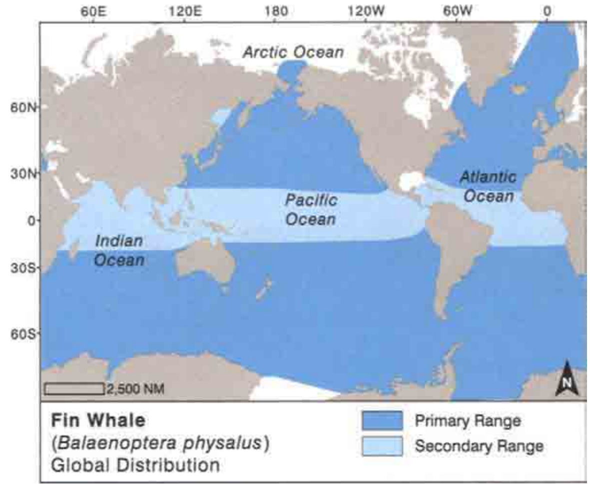
Species characteristics Fin whales are large (the second largest species of whale), but very sleek and streamlined. From above, the head is more V-shaped and pointed than that of the blue whale, and there is a single medial ridge on the upper surface of the rostrum. The dorsal fin tends to be taller, more falcate, and set farther forward on the tail stock than in the blue whale. The dorsal fin rises at a shallow angle from the animal's back (unlike in the other rorquals with prominent fins), and there is a prominent ridge along the tail stock between the dorsal fin and the flukes. The flippers are long and tapered.

The most distinctive feature of the fin whale, however, is its coloration. The body is black or dark brownish-gray above and on the sides, shading to white below, but the head color is asymmetrical. The left lower jaw is mostly dark, while the right jaw is largely white. There tend to be several light-gray V-shaped "chevrons" (pointing forward) on the back behind the head. There are also typically other streaks or swirls of light coloring extending up from the belly (in particular over the right flipper). The undersides of the flukes are white, but have a gray border. The posterior portion of the body often has white, circular scars caused by bites of lampreys or cookie-cutter sharks. The bellies of fin whales may have a yellowish diatom film.

Fin whales have 260–480 baleen plates per side; the plates are dark gray to black, often striated with bands of gray and fringed with horizontal lines of yellowish-white to olive-green. Usually, the front one-half to one-third of the right side plates have much more light color than those on the left. The 50–100 throat pleats are long, and reach to the umbilicus. The slender blow is 4–6 m tall.

Length at birth is 6–6.5 m. Adults can reach a maximum of 27 m in the Southern Hemisphere, but most Northern Hemisphere adults are less than 24 m

This view would be identifiable as a fin whale at least 4–5 km away, because of the very dark color and distinctive dorsal fin—prominent, very swept-back, and emerging from the back at a shallow angle. Eastern Pacific. PHOTO: NOAA FISHERIES/SWFSC



From the air, the darker overall color separates this fin whale from the much paler blue whale. The white right lip and chevron pattern on the back between the flippers separates it from all other rorquals, except possibly the much smaller Omura's whale. US west coast. PHOTO: SOUTHWEST FISHERIES SCIENCE CENTER PHOTOGRAMMETRY LAB.

A fin whale underwater showing asymmetrical coloration, with the right side of the head much lighter than the left. Notice also the black stripe that travels up and back from the right eye. Mediterranean Sea. PHOTO: A. GANNIER

long. Females are about 5–10% longer than males. Large animals may attain reported weights of up to 120,000 kg, but most probably weigh much less (< 90,000 kg). Body weight varies seasonally.

Recognizable geographic forms None.

Can be confused with The other species of medium to large balaenopterids (blue, sei, Bryde's, and Omura's whales) are likely to be confused with fin whales at a distance. Size alone may be quite useful for large fin whales, but care must be taken to distinguish small blue whales. Careful attention to color pattern, head shape, and dorsal fin shape and position will help to distinguish the various species. For instance, the color pattern of the fin whale (dark back, asymmetrical lower jaw, and light chevron and streaks in the thoracic area) is different from that of all other species, except apparently the newly-discovered Omura's whale. Head shape of fin whales is much more slender and streamlined (and more pointed from above) than in the blue whale, but is otherwise similar to the other species. Fin whales do not have accessory rostral ridges, as Bryde's and perhaps Omura's whales do. Dorsal fin shape is one of the best clues—fin whales have a prominent dorsal fin that is usually falcate and rises out of the back at a very shallow angle (blue whales tend to have much smaller nubbin-like dorsal fins, and the other species generally have fins with a steeper rise from the back). The size and shape of the blow can also be helpful (generally shorter than in blue whales, but taller and more prominent than in the other species), but it should not be used for identification without other information. Clearly, a multitude of characters will be required to confirm an identification as a fin whale.

Distribution Surprisingly, for such a large and once commercially-important animal, the overall range and distribution of the fin whale is not well-known. Fin whales inhabit primarily oceanic waters of both hemispheres. They are cosmopolitan, inhabiting all major oceans. When they are seen near shore, it is most commonly where deep water approaches the coast. Fin whales can be seen in tropical, temperate, and polar zones of all oceans. Most populations are apparently migratory (a general poleward shift for feeding in the summer and a shift towards the tropics for breeding in the winter), but their movements are complex and do not follow a simple pattern. In fact, there appear to be resident groups in some areas (such as the Gulf of California, the East China Sea, and perhaps the Mediterranean Sea, where they also show limited north/south movements).

Ecology and behavior Fin whales are capable of attaining high speeds, possibly as high as 37 km/h, making them one of the fastest great whales. They rarely raise

Fin whales normally appear all dark in the distance, although a pale chevron pattern is quite often visible. This photo shows some of the complex, swirled patterning that is evident at close range in good light. In this animal, the white right lip, the eye and the black eye stripe are plainly visible. their flukes on a dive, but they do occasionally breach. When fin whales surface, typically the blowholes appear briefly before the dorsal fin shows. Fin whales tend to be more social than other rorquals, sometimes gathering in pods of 2–7 whales, or more. In the North Atlantic, fin whales are often seen in large feeding aggregations, generally with humpback whales, minke whales, and Atlantic white-sided dolphins. Fin whales also sometimes associate with blue whales, and hybrids have been documented. Individual fin whales are identified by the pattern of the light streaks and chevrons on the back, along with the size and shape of the dorsal fin.

Not much is known of the social and mating system of fin whales. Calving does not appear to take place in distinct nearshore areas (as it does, for instance, in gray and humpback whales). However, they appear to be typical of other baleen whales, in that long-term bonds between individuals are rare. Young fin whales are born on dispersed breeding grounds in tropical and subtropical areas in midwinter. Gestation is 11–12 months. Sexual maturity occurs at ages of 6–10 years in males and 7–12 years in females, depending on the population and time period. Fin whales can live to be up to 80–90 years of age. The only known natural predator is the killer whale.

Fin whales make a variety of low-frequency vocalizations, including the famous 20-Hz calls, which can be detected hundreds of kilometers away. Although these calls are produced throughout the year, they are emitted in patterns during the breeding season, suggesting that they may be used in breeding displays.

Feeding and prey Fin whales feed on small invertebrates (euphausiids and copepods), schooling fishes (such as capelin, herring, mackerel, sandlance, and blue whiting), and squid. They are active lunge feeders (often lunging on their sides), gulping in huge volumes of food and water with the aid of their distended throat pleats, and then using the baleen to filter the food particles out.

Threats and status The introduction of the explosive harpoon and steam-powered catcher boat in 1864 meant doom for large rorqual whales, which had previously been largely unobtainable for whalers. After depleting the blue whale, the fin whale was next in the line of fire, and this species was hunted relentlessly in all major oceans between the 1930s and 1960s. Tens of thousands of animals were taken in the Northern Hemisphere, and 725,000 were killed in the Southern Hemisphere. Small numbers of fin whales have been killed in recent years by Iceland in the North Atlantic. Fin whales occasionally get caught in fishing nets in the North Atlantic, but vessel strikes and disturbance by human-caused noise sources are more of a concern. Despite their history of heavy exploitation, there may be as many as 140,000 fin whales alive today (at least 600 or so apparently occur in the Gulf of California, Mexico). They are considered to be relatively abundant in both the North Pacific and North Atlantic. Southern Hemisphere stocks are not as healthy.

IUCN status Endangered.

Sei Whale—*Balaenoptera borealis*

Lesson, 1828

Recently-used synonyms None.

Common names En.–sei whale; Sp.–*rorcual sei* or *ballena sei*; Fr.–*rorqual de Rudolphi*.

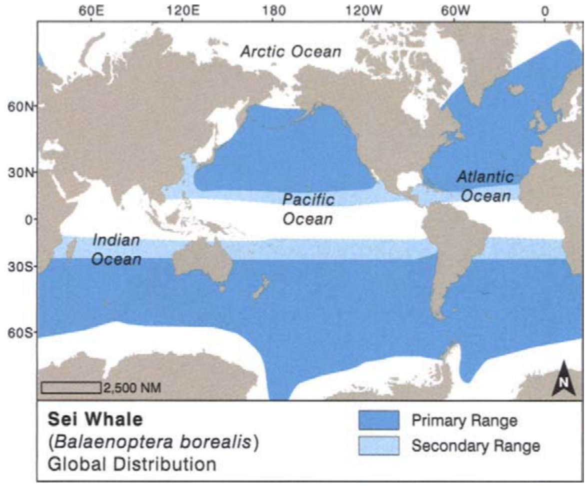
Taxonomic information Order Cetacea, Suborder Mysticeti, Family Balaenopteridae. Some authors recognize two subspecies of sei whales, one in the Northern Hemisphere (*B. b. borealis*) and one in the Southern (*B. b. schlegellii*). However, these subspecies designations are not widely used. The dwarf Bryde's whale (see below) may actually be genetically closer to the sei whale than to the common Bryde's whale.

Species characteristics Sei whales are very similar in external appearance to fin and Bryde's whales, both of which also have a prominent falcate dorsal fin. All three have typical rorqual body shapes, which means they are very sleek and streamlined. In sei whales, the dorsal fin rises at a steep angle from the back. Sei whales have a pointed rostrum (when viewed from above) and only a single prominent longitudinal ridge on the rostrum (Bryde's whales tend to have three), and a slightly arched head with a downturned tip (when viewed from the side). Unless the head can be seen at close quarters, however, Bryde's and sei whales can be especially difficult to distinguish at sea, and this has impeded our knowledge of the biology of this species. The dorsal fin is prominent.

Coloration is mostly dark gray or brown (it can be almost black), except for a whitish area on the belly. The back is often mottled with scars (probably from cookie-cutter shark and lamprey bites), and the skin surface often resembles galvanized metal.

The 32–65 (average about 50) ventral pleats are short for rorquals, ending far ahead of the navel. The 219–402 (average about 350) baleen plates on each side are black with very fine fringes of light smoky-gray to white. They are less than 80 cm long, and they tend to be more narrow than in the other large rorquals. A few nearly white plates may occur. Sei whales produce a blow up to

A sei whale photographed near the Azores. The dorsal fin is distinctive—it juts up and then back, as if it was jointed. The pockmarks on the belly and sides are from cookie-cutter shark bites. PHOTO: D. PERRINE



3 m tall, which is high and columnar.

Adult sei whales can be up to 18 m in length, although 12–17 m is a more typical length for adults. Females are slightly larger than males. Large adults may weigh 45,000 kg. At birth, sei whales are 4.5–4.8 m long.

Recognizable geographic forms None.

Can be confused with Sei whales are most likely to be confused with Bryde's whales, and less likely with fin and Omura's whales. Careful attention to body size, dorsal fin shape and position, head shape, and color pattern will help to distinguish among the four. The three head ridges of Bryde's whales (sei and fin whales always appear to have just one medial ridge), and larger size and asymmetrical head coloration of fin whales will help make them distinguishable from seis. Also, pay particular attention to the tip of the upper jaw, which has a strong tendency to be downturned in sei whales (but not in the other three). Despite the differences, sei and Bryde's whales are still frequently confused, and in fact the two species can be frustratingly difficult to tell apart in typical situations. The classic character is the number of head ridges—three in Bryde's whales and only one in sei whales; but this can be very difficult to see on distant sightings and care must be taken to avoid getting confused by rippling water and glare on top of the head. Much of the literature on the two species still to this day contains identification errors. Finally, until the external appearance of the recently-described Omura's whale is better known, one should be very aware of the possibility of this species in the Indo-Pacific. Clearly, a multitude of characters will be required to confirm an identification as a sei whale.

Distribution The distribution of the sei whale is poorly understood for a number of reasons, not the least of which is their long-standing confusion with Bryde's whales. Another reason is that the species appears to occur largely in unpredictable patterns, being seen regularly in an area for several years, after which it may largely disappear. Sei whales are largely open ocean whales, not often seen near the coast. They occur from the tropics to polar zones in both hemispheres and in all three major oceans, but are more restricted to mid-latitude temperate zones than are other rorquals. They do undergo seasonal migrations, although they apparently are not as extensive as those of some other large whales. They are very rare in the Mediterranean.

Ecology and behavior The sei whale is one of the least-known of the rorqual species. Groups of two to five individuals are most commonly seen, although not much is known of their social behavior. Sei whales are fast swimmers (reaching speeds of well over 25 km/hr), possibly the fastest of all cetaceans. They tend to arch their backs less than other rorquals when surfacing, and often sink below the surface. When slow moving, sei whales surface with their blowholes and dorsal fin often visible above the water at the same time. Feeding sei whales

This sei whale from near Hawaii would be difficult to distinguish from a Bryde's whale, although the dorsal fin has the up-and-back shape commonly seen only on sei whales. PHOTO: D. PERRINE

The tip of the sei whale rostrum is downturned, and the jawline is slightly arched, but this is often quite difficult to see under normal field conditions. PHOTO: L. STEINER/WHALE WATCH AZORES

When a view such as this is obtained, sei whales can generally be distinguished from Bryde's whales by their absence of accessory rostral ridges. Near the Mariana Islands, western Pacific. PHOTO: J. COTTON

tend to dive and surface in very predictable series, often remaining visible just below the surface between breaths. Sei whales virtually never lift their flukes upon diving. They apparently prefer to feed near dawn.

Calving occurs in midwinter, in low latitude portions of the species' range. Gestation lasts 10–12 months, and weaning is thought to occur at about 6–9 months. Sei whales may hybridize with fin whales on occasion. They produce sounds similar to other rorquals, but there is much less known about their vocal behavior than for other species in the family. Sei whales probably live to be more than 50 years of age. Their primary natural predator is the killer whale.

Feeding and prey Sei whales have more flexibility in their feeding behavior than other baleen whales. They generally skim copepods and other small prey types, rather than lunging and gulping, as other rorquals do. This may largely explain the relative fineness of the baleen fringes and the shortness of the throat pleats in this species. They do lunge feed on occasion, however. Other prey types taken when lunge-feeding include krill, cephalopods, sardines, and anchovies.

These are identified as sei whales because of their relatively small size and slightly arched rostrum without ancillary ridges. The latter eliminates the similar-looking Bryde's whale. Azores. PHOTO: D. PERRINE

Threats and status After blue and fin whales, the sei whale was next in the line of fire of the modern whaler's harpoon. It appears to be the preferred species among many whale-eating cultures. The heaviest period of exploitation of this fast species of whale was between the 1950s and 1970s. Whaling took place in the North Pacific (where at least 74,000 were taken) and North Atlantic (14,000 whales taken) oceans, but most hunting was in the Southern Hemisphere (about 200,000, with at least 110,000 taken in the 1960s alone). Although fully protected by the International Whaling Commission since 1985, a few were taken in the North Atlantic by Iceland in the last few decades of the 20th century (70 whales in 1986–1988). Sources of mortality other than direct exploitation include probable vessel strikes and some entanglement in fishing gear, but in general these do not appear to be severe problems for sei whales. Populations in all areas were depleted by commercial whaling, although they currently appear to be doing quite well in the Northern Hemisphere. Current global abundance of the sei whale is not well-known, but is considered to be at least 80,000 individuals.

IUCN status Endangered.

References Horwood 1987; 2002; Mizroch et al. 1984; Perry et al. 1999.

Bryde's Whale—*Balaenoptera brydei*

Olsen, 1913 and/or *B. edeni* Anderson, 1879
(two or more species may be involved and nomenclature unresolved)

Recently-used synonyms None.

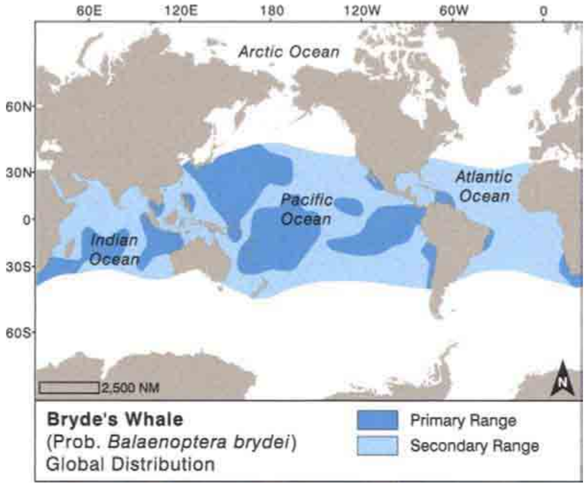
Common names En.–Bryde's whale; Sp.–*rorcual tropical* or *ballena de Bryde*; Fr.–*rorqual de Bryde*.

Taxonomic information Order Cetacea, Suborder Mysticeti, Family Balaenopteridae. Until recently, all medium-sized rorquals were thought to be members of one of two species, *B. edeni* (Bryde's whale) or *B. borealis* (sei whale). However, we now know that there are at least three genetically-distinct types of these whales, including what have been called pygmy or dwarf Bryde's whales. Their formal redescription awaits further taxonomic work and determination of the affinities of type specimens of the two relevant scientific names, *B. edeni* and *B. brydei*. The International Whaling Commission continues to use the name *B. edeni* for all Bryde's-like whales, despite recognizing that there are at least two species. To make matters even more complicated, in the past, the term "pygmy Bryde's whale" had also erroneously been used for specimens of what are now known to be a new species (*Balaenoptera omurai*), which was only described in 2003.

Species characteristics For many years, whalers and field observers did not distinguish between Bryde's and sei whales in their records. In the past few decades, however, whales of the two species have been able to be distinguished, even at sea. Bryde's whales have a very streamlined and sleek body shape. Most Bryde's whales have three prominent ridges on the rostrum (other rorquals generally have only one). This is perhaps the best characteristic to use for identification, although since some whales have poorly-developed ridges, and the ridges may be difficult to see on others, one is best advised to consider information on other characters as well. The shape of the head is somewhat pointed, when viewed from above. The head makes up about 25% of the body length. The Bryde's whale's dorsal fin is tall and falcate and generally rises abruptly out of the back, a feature that will help distinguish this species (and sei whales) from fin whales, in which the dorsal fin rises at a relatively shallow angle from the back. The dorsal fin is often notched on the trailing edge. The flukes are broad with a relatively straight trailing edge. Bryde's whales often exhale underwater, then surface with little or no visible blow. When visible, the blow can be either columnar or bushy. The height of the blow is variable.

A Bryde's whale using its flippers to steer. The three rostral ridges eliminate confusion with other rorquals. Canary Islands. PHOTO: S. HANQUET

Bryde's whales have a relatively simple, countershaded color pattern, and are dark gray dorsally and lighter ventrally. There is often a pinkish tinge on the lower white areas, and the body may be covered in circular scars made by lampreys or cookie-cutter sharks. The upper jaw and lips



are typically uniformly dark. The 40–70 throat pleats reach to or past the navel. The 250–370 pairs of gray baleen plates have light gray fringes, which are relatively coarse. The longest plates reach about 40 cm.

Adults of this species can be up to 15.0 m long in males and 16.5 m long in females (females do reach greater lengths than males); newborns are about 4 m long. Maximum weight is about 40,000 kg.

Recognizable geographic forms There are one or more small forms of this species (for instance, off South Africa, southwestern Japan, Hong Kong/Macau, and Australia), which at this time cannot be reliably distinguished from common Bryde's whales in the field. These forms generally have a number of slight differences in their morphology and ecology, but have not been adequately described.

Can be confused with Bryde's whales are most likely to be confused with sei whales, and less likely with fin and Omura's whales. Careful attention to body size, dorsal fin shape and position, head shape, and color pattern will help to distinguish among the four. The three head ridges of Bryde's whales (sei and fin whales always appear to have just one medial ridge), and much larger size and asymmetrical head coloration of fin whales will help make them distinguishable from Bryde's. Also, pay particular attention to the tip of the upper jaw, which is generally quite flat in Bryde's whales (but has a strong tendency to be downturned in sei whales). Despite the differences, sei and Bryde's whales are still frequently confused, and in fact the two species can be frustratingly difficult to tell apart in typical situations. The classic character is the number of head ridges—three in Bryde's whales and only one in sei whales; but this can be very difficult to see on distant sightings and care must be taken to avoid getting confused by rippling water and glare on top of the head. Much of the literature on the two species still to this day contains identification errors. Finally, until the external appearance of the recently-described Omura's whale is better known, one should be very aware of the possibility of this species in the Indo-Pacific. Sizes of Bryde's and Omura's whales are similar, but Omura's whales appear to have an assymetrical head color pattern very similar to that of the fin whale. Clearly, a multitude of characters will be required to confirm an identification as a Bryde's whale.

Distribution This species has a circumglobal distribution and is found in the Atlantic, Pacific, and Indian oceans. Bryde's whales are largely creatures of the tropical and subtropical zones (inhabiting waters about 16°C or warmer) and generally do not move poleward of 40° in either hemisphere. They are found both offshore and near the coast in many areas, and tend to inhabit areas of unusually high productivity. They extend into some enclosed seas, such as the Persian Gulf and Red Sea. Whales of

The rostral ridges of Bryde's whales are diagnostic, but are often difficult to discern; generally it is best to take photographs to study later. PHOTO: E. FAHRNI-MANSUR

Bryde's whales typically have a conspicuous blow, but they can make it almost invisible if they are approached too close by vessels or killer whales; sometimes they may even blow underwater. PHOTO: G. CRESSWELL

this species are not known to make extensive north/south migrations, as do other species of baleen whale, although short migrations have been documented in some areas (especially among the offshore forms). Resident populations occur in certain areas, such as the Gulf of California.

Ecology and behavior Not much is known of the ecology of the Bryde's whale. Although generally seen alone or in pairs, Bryde's whales do aggregate into groups of up to 10–20 on feeding grounds. Unlike other rorquals, Bryde's whales often do not produce a visible blow. Breaching occurs occasionally. Bryde's whales generally arch their backs when diving, but virtually never fluke up on a dive. They are capable of swimming at speeds up to 25 km/hr, and can dive to about 300 m.

Sexual maturity occurs at lengths generally greater than 11.2 m in the common form, but the dwarf/pygmy forms mature at much shorter lengths. Unlike other rorquals, the warm-water Bryde's whale does not have a well-defined breeding season in many areas, and births can occur throughout the year. Bryde's whales produce low-frequency moans, the structure of which is just beginning to be investigated.

Feeding and prey Bryde's whales are primarily schooling-fish eaters (common prey species include pilchard, anchovy, sardine, mackerel, and herring), but they also take squid, krill, pelagic red crabs, and other invertebrates. They are very active lunge feeders, often changing direction abruptly when going after mobile fish prey. They have also been observed using bubble nets to corral prey.

Threats and status Bryde's whales were never hunted as heavily as their larger cousins, the blue, fin, and sei whales. Fewer than 8,000 were killed in the Southern Hemisphere in the 1900s. Due to this fact, most populations of the Bryde's whale have not been seriously depleted. In recent years, some Bryde's whales have been taken by the Japanese in the North Pacific, and low numbers of small whales have been killed by artisanal whalers from villages in Indonesia (although at least some of these may be Omura's whales—see below). There are no estimates of global abundance, although there are probably about 20,000–30,000 Bryde's whales in the North Pacific, and about 10,000 in the eastern tropical Pacific. The species is not considered to be endangered or threatened, and at least the western North Pacific stock is thought to be increasing. Habitat modification and noise disturbance may be additional human-caused threats.

IUCN status Data Deficient.

Omura's Whale—*Balaenoptera* cf. *B. omurai*

Wada, Oishi, and Yamada, 2003 (nomenclature unresolved)

Recently-used synonyms None.

Common names En.–Omura's whale; Sp.—*ballena de Omura*; Fr.—*rorqual de Omura*.

Taxonomic information Order Cetacea, Suborder Mysticeti, Family Balaenopteridae. This species was described in 2003, and there is now abundant evidence from molecular genetic studies to confirm that it is a valid species, different from and not closely related to the Bryde's whale. The confirmation of the nomenclature awaits determination of the affinities of a type specimen in the Calcutta Museum. In the past, some specimens of this species were included among "pygmy/dwarf Bryde's whales" in various studies, but we now know it to be an early offshoot of the rorqual lineage, perhaps more closely related to the blue whale.

Species characteristics Omura's whales have a streamlined and sleek body shape. Although not much is known of their external appearance, they apparently only have one prominent ridge on the rostrum (most Bryde's whales have three). The shape of the dorsal fin is not well known, but it is suspected to be like that of Bryde's and sei whales, i.e., tall and falcate and rising abruptly out of the back. Some preliminary evidence suggests that it may be very falcate. The flukes are broad, with a relatively straight trailing edge.

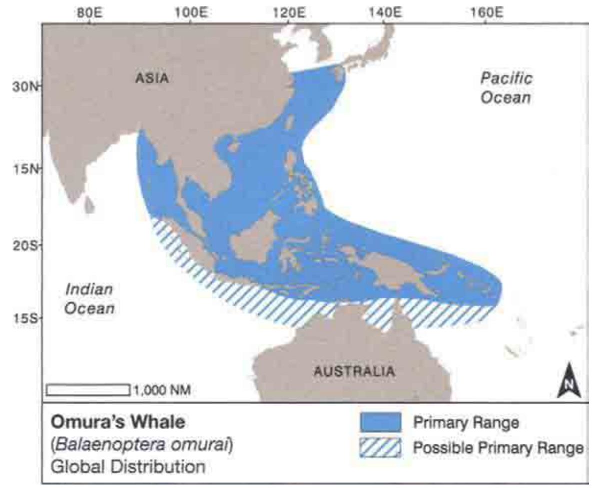
The color pattern of this species is not completely known. However, it most closely resembles that of the fin whale—with an asymmetrical lower jaw (white on the right and dark on the left). Also, at least some animals have light streaks and blazes that extend up from the light ventral side onto the darker back. The anterior edges and inner surfaces of the flippers are white, as is the ventral surface of the flukes (they have a black margin). The 80–90 throat pleats reach to beyond the navel. The 180–210 pairs of baleen plates are short and broad, and are yellowish-white to black in color (some may be two-tone).

Adults of Omura's whales are generally no longer than about 11.5 m (although some may reach close to 12 m). Females presumably grow slightly larger than males, as in other rorquals. Physical maturity may occur at lengths as short as 9.0 m. Maximum weight is not known (but is probably not over 20,000 kg).

Recognizable geographic forms None.

Can be confused with Omura's whale has only recently been described, and its external appearance is not yet well-documented. For these reasons, special care must be taken in identifying this species and in ruling out other small to medium-sized balaenopterids (small fin, sei, Bryde's, and minke whales). When observed clearly, the complex color pattern of Omura's whale (with an assymetrical lower jaw and light streaks and chevrons on the back) should make it relatively easy to distinguish these animals from all but small fin whales in the field. The dor-

A mid-sized rorqual, possibly an Omura's whale, observed off Indonesia. However, the accessory ridges on the rostrum suggest that it could in fact be a Bryde's whale. PHOTO: B. KAHN/ APEX ENVIRONMENTAL



A whale, identified as an Omura's whale based on genetic profiling, surfaces in waters off Komodo National Park, Indonesia. The coloration visible in this photo is very similar to that of the fin whale, even sharing the asymmetrical color of the head. PHOTO: B. KAHN/APEX ENVIRONMENTAL

Very little is known about the external physical features of the recently-described Omura's whale. However, if this turns out to be a typical dorsal fin for the species, it might be fairly easy to identify at sea. PHOTO: T. YAMADA

sal fin may help here, as Omura's whales appear to have a very hooked fin rising at a steep angle, and fin whales almost always have fins rising at a shallow angle. The presence of three head ridges has for many years been taken to confirm a whale's identity as a Bryde's whale, but there is some suggestion that Omura's whales may also have accessory head ridges, at least sometimes (and be aware that rippling water on the head of other species can be mistaken for accessory head ridges). Both species of minke whales can also cause some confusion, but minke whales are generally slightly smaller, with a much sharper point to the head when viewed from above, and white bands on the flippers are diagnostic of common minkes. Also, minkes have symmetrical head coloration, unlike that of Omura's whale. Clearly, a multitude of characters will be required to confirm an identification as an Omura's whale. Genetic samples may be required in some cases for confirmation.

Distribution This species appears to be restricted to the western Pacific and eastern Indian oceans, although the exact limits of its range are not well-established. It is apparently restricted to tropical and subtropical waters, and mostly occurs over the continental shelf in relatively nearshore waters. The records available are mostly from the eastern Indian Ocean (off the Cocos Islands), Indonesian waters, the Philippines, Sea of Japan, and the Solomon Islands.

Ecology and behavior Very little is known of the ecology of this species. Although generally seen alone or in pairs, they may well aggregate into larger groups on feeding grounds. In the few confirmed sightings of these animals, they generally have not fluked-up on a dive.

Unlike most other rorquals, it is suspected that the warm-water Omura's whale probably does not have a well-defined breeding season. Virtually nothing is known of its reproductive biology.

Feeding and prey While there is little information on specific prey species, Omura's whales are probably primarily schooling-fish eaters. They are lunge feeders, like most other rorquals.

Threats and status Omura's whales were probably never hunted as heavily as their larger cousins, the blue, fin, sei, and Bryde's whales. Due to this fact, the Omura's whale has probably not been seriously depleted, except possibly in the Philippines. They have been hunted during "scientific whaling" by the Japanese in the Solomon Sea, and near the Cocos Islands in the Indian Ocean. Omura's whales have also been killed by artisanal whalers from villages in the Philippines (and probably Indonesia). There are no estimates of abundance available for this species. Habitat modification and noise disturbance are probably among the human-caused threats.

IUCN status Not Listed.

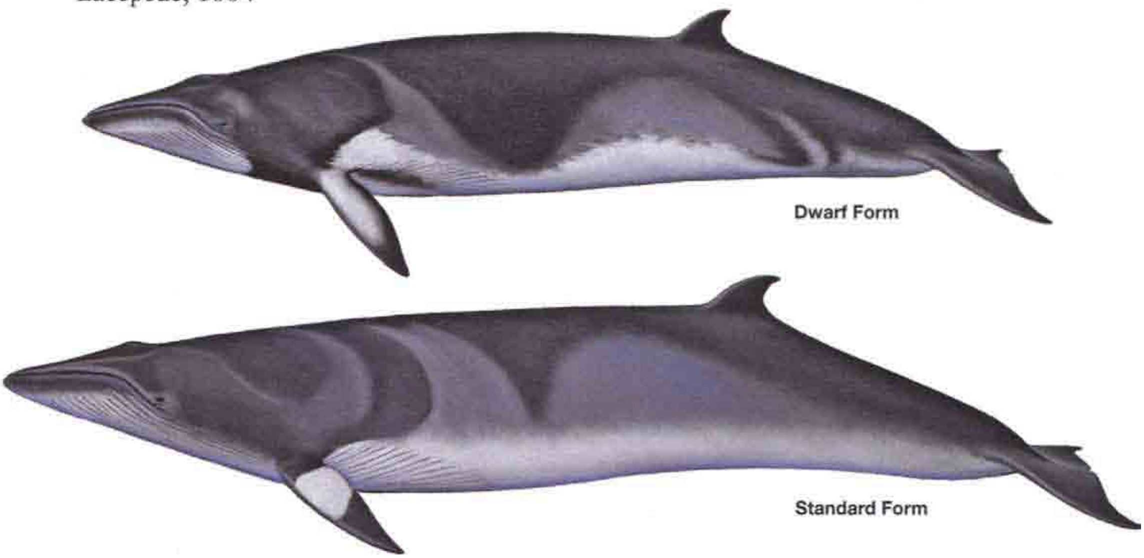
Common Minke Whale—*Balaenoptera acutorostrata*

Lacépède, 1804



Recently-used synonyms *Balaenoptera davidsoni*

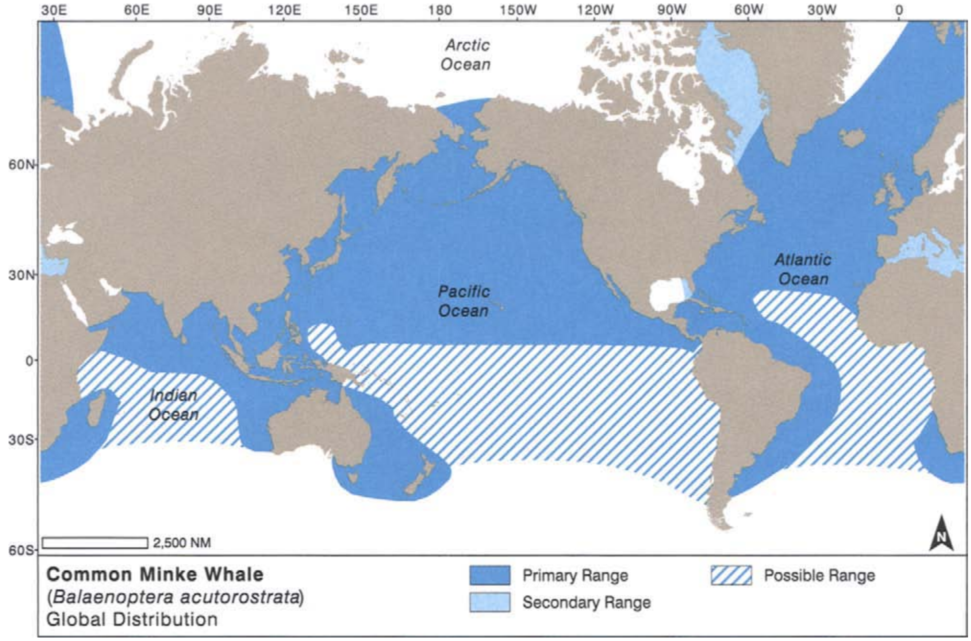
Common names En.–common minke whale; Sp.–*rorcual enano* or *ballena minke*; Fr.–*petit rorqual*.

Taxonomic information Order Cetacea, Suborder Mysticeti, Family Balaenopteridae. The minke whales have long been considered to comprise only one species (*B. acutorostrata*), but in recent years the distinctness of the Antarctic minke whale (*B. bonaerensis*) has become clear, and it has now been split-off as a separate species (see below). Three subspecies of the common minke whale are currently recognized: *B. a. acutorostrata* (in the North Atlantic), *B. a. scammoni* (in the North Pacific), and a third unnamed subspecies (the dwarf minke whale, mostly occurring in the Southern Hemisphere).

Species characteristics Minke whales are generally easy to distinguish from the larger rorquals. The body is quite sleek. The head is sharply pointed and V-shaped, viewed both from the side and from above, and the median head ridge is very prominent. The dorsal fin is tall (for a rorqual), recurved, and located about two-thirds of the way back from the snout tip. The flippers are narrow with pointed tips. There are 50–70 moderately short throat pleats (often extending just past the flippers) and 231–285 pairs of white to cream-colored baleen plates (however, some may be dark in color).

The minke whale's coloration is distinctive. It is dark gray dorsally and white beneath, with streaks and/or lobes of intermediate shades on the sides. Some of the streaks may extend onto the back behind the head. The most distinctive light marking is a brilliant white patch

Typical surfacing profile of the common minke whale, showing the relatively tall dorsal fin, rising at a steep angle from the back. This species is small enough that the blow is not usually visible. Eastern Canada. PHOTO: BLIND BAY CETACEAN STUDIES, COURTESY S. GOWANS



on each flipper, which varies in extent between the dwarf and standard-form minkes (the white is not usually present on Antarctic minke whales). This band is generally visible through the surface when animals are swimming near the surface. The blow tends to be diffuse and is often not visible at all.

Adult length ranges from about 6.5–8.8 m. No significant external differences between the two Northern Hemisphere subspecies are known, but the dwarf minke is somewhat smaller. Females are longer than males in all forms. Length at birth for common minke whales is 2.0–2.8 m. Maximum body weight is about 9,200 kg.

Recognizable geographic forms

Standard minke whale *(B. a. acutorostrata/scammoni)*—Standard-form minke whales occur throughout the North Pacific and North Atlantic oceans. They may show varying amounts of mottling on the sides, belly, and back. The flippers are completely dark gray to black, except for a brilliant white band that runs across the middle half of each one. The shoulder area just above the flipper is generally dark. There may be a light gray rostral 'saddle' in some individuals. The standard form of minke whale averages about 8.0 m for adult males and 8.5–8.8 m for adult females. Maximum body weight is about 9,200 kg.

A common minke whale surfaces alongside a research vessel in Southeast Alaska. The pointed snout and brilliant white flipper bands can be clearly seen. PHOTO: T. A. JEFFERSON

Dwarf minke whale *(B. a. subsp.)*—The dwarf minke whale (an unnamed subspecies) occurs in the Southern Hemisphere, but may sometimes move north of the equator. It is distinguished from the standard-form minke mainly by coloration differences. Some of the streaks on the sides typically extend onto the back behind the head, and form a chevron pattern. The white blaze on the flipper extends up onto the shoulder area just above the flipper, and extends back to join light patches on the belly and thorax. The axilla is dark. There is also a well-developed light gray rostral 'saddle'. The baleen plates of the dwarf minke whale tend to have a narrow, dark fringe, and about half of the plates may be dark in color. The dorsal fin is slightly larger and the tail is slightly longer than in the common minke whale. This subspecies is somewhat smaller than the Northern Hemisphere ones, averaging about 6.5–7.0 m as adults. They reach a known maximum of 7.8 m and weights of up to only about 6,400 kg.

Can be confused with When seen well, common minkes are among the easiest to distinguish of the whales of the genus *Balaenoptera*, by a combination of their small size, usual absence of a visible blow, unique

head shape, and distinctive color patterns (especially the white flipper bands). The Antarctic minke whale overlaps the dwarf minke in distribution in the southern summer, and can be difficult to distinguish. The best way to distinguish them is by the presence/absence of the white flipper patch (Antarctic minkes generally do not have the patch). The pygmy right whale may also present identification problems, but a good look at the head and color pattern will allow accurate identifications. Sei and Bryde's whales, and some beaked whales, may also present confusion, but generally only if the animals are seen at a distance.

Distribution Common minke whales are widely distributed from the tropics and subtropics to the ice edges in both hemispheres. The specific distribution, especially in the Southern Hemisphere, is not well-known, due to lumping of all minke whales into one species in the past. Although they can be seen offshore as well, common minkes are more often seen in coastal and inshore areas. Minke whales are very rare in some tropical oceanic areas, such as the eastern tropical Pacific. They occur at least occasionally in the Mediterranean Sea. At least some populations migrate from high latitude summer feeding grounds to lower latitude winter breeding areas. Dwarf minke whales are found only in the Southern Hemisphere, as far south as 65°S. They may have a circumpolar distribution, although this is not well-established.

Ecology and behavior Common minke whales sometimes aggregate for feeding in coastal and inshore areas of cold temperate to polar seas. Group sizes are generally small (singles, pairs, and trios), although larger groups of animals may aggregate on productive feeding grounds. They are often segregated by age, sex, and/or reproductive class, and appear to have a complex social structure. Minke whales do not fluke-up on a dive, but they do sometimes breach and perform other aerial behaviors. They often approach and swim around stationary vessels. Upon surfacing, the dorsal fin generally appears simultaneously with the blowholes. Minkes in Puget Sound, Washington, have exclusive, adjoining home ranges, something that may be unique to baleen whales.

Calving probably occurs in dispersed low latitude areas (although the migrations of minkes are not as well-defined as those of larger rorquals) in winter months. Some females may give birth annually, and gestation lasts about 10–11 months. Minke whales have recently been

Minke whales have a series of light streaks and blazes that extend onto their backs from below. North Atlantic, off Norway. PHOTO: P. OLSON

found to make a number of unique vocalization types, although the functions of these are not well-known. Longevity is unknown, but probably reaches about 50 years. Killer whales appear to be a significant predator of this small rorqual.

Feeding and prey The diversity of prey types of common minke whales primarily consist of small invertebrates (euphausiids and copepods) and small schooling fishes (sand lance, sand eel, salmon, capelin, mackerel, cod, coal fish, whiting, sprat, pollack, haddock, herring, anchovy, saury, walleye pollack, and lanternfish), which they capture by lunging into large prey aggregations. They also take larger fish species (such as wolfish and dogfish).

Threats and status Until the latter half of the 1900s, common minke whales were often considered too small to hunt, and were generally passed up. However, with the depletion of the larger rorquals, common minke whales have been heavily hunted in recent years (> 100,000 in the North Atlantic alone), and this is now the species of whale most commonly taken by commercial and "scientific" whalers (at least in the Northern Hemisphere). It is still hunted by Norway in the North Atlantic and by Japan and Korea in the North Pacific and Antarctic. Despite this exploitation, the common minke whale generally remains abundant in most areas of its range (over 180,000 are thought to occur in the Northern Hemisphere, although accurate numbers are hard to come by). Some are caught in fishing gear and suffer from vessel strikes and habitat disturbance.

IUCN status Lower Risk/Near Threatened.

Antarctic Minke Whale—*Balaenoptera bonaerensis*

Burmeister, 1867

Recently-used synonyms None.

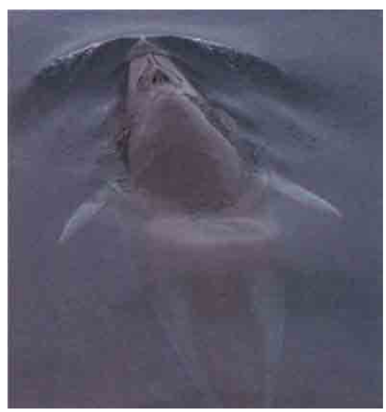
Common names En.–Antarctic minke whale; Sp.–*rorcual enano or ballena minke*; Fr.–*petit rorqual*.

Taxonomic information Order Cetacea, Suborder Mysticeti, Family Balaenopteridae. Until recently, all minke whales were classified as *B. acutorostrata*, but the distinctiveness of the Antarctic minke whale is now well-established, and it has been designated its own species as of the late 1990s. This species is actually more closely related to the sei and Bryde's whales than to the common minke whale. Due to its tangled history with the common minke whale, our knowledge of the Antarctic minke's biology is limited.

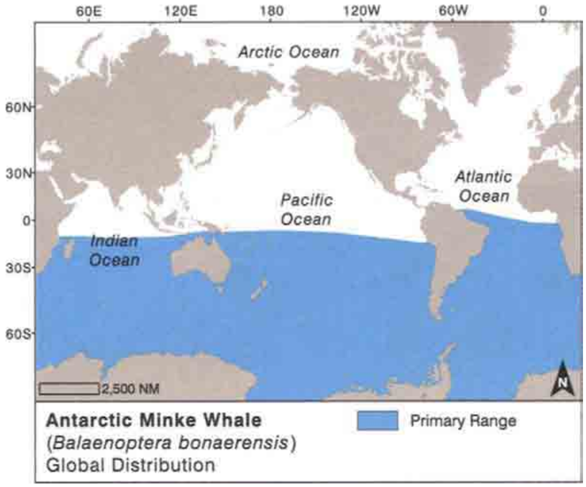
Species characteristics As in the common minke whale, the body is sleek and streamlined, the head is pointed, and there is a single prominent median ridge on top of the rostrum. The dorsal fin, situated about two-thirds of the way back from the snout tip, is quite tall and falcate (for a rorqual). There are 22–38 short throat pleats, which extend just past the flippers (almost to the umbilicus) and 200–300 pairs of baleen plates, most of which are black. The color of the baleen is asymmetrical, and some of the anterior plates are white (more so on the right side).

Antarctic minke whales are dark gray dorsally and white ventrally, with streaks and/or lobes of grayish color on the lateral surface. Some of the streaks may even extend onto the back behind the head, forming a chevron. The distinctive white band on the flipper of Northern Hemisphere and dwarf minke whales is not present on Antarctic minke whales, and flippers are relatively uniformly colored. However, the flippers are not particularly dark in color—they are usually light gray, often with a distinct dark border. The short blow is generally conspicuous in Antarctic waters, but can be more faint at times, and may even be invisible.

Antarctic minke whales do not have the brilliant white flipper bands that are found in the common minke whales. They do often have a visible blow though, as shown here. PHOTO: K. SEKIGUCHI



Although Antarctic minke whales lack the white flipper bands of common minke whales, their flippers are paler than the rest of the body; notice the asymmetric chevron on the back. PHOTO: P. OLSON



The dorsal fin of the Antarctic minke whale is sometimes very strongly hooked. PHOTO: S. HEINRICH

Adult Antarctic minke whales average about 8.5–9.0 m, and can reach 10.7 m in length. Length at birth is about 2.8 m. Maximum body weight is about 9,100 kg.

Recognizable geographic forms None.

Can be confused with Antarctic minke whales are generally easy to distinguish from the larger rorquals that occur in the Antarctic (blue, fin, and sei whales), due to their small size, pointed head, specifics of the color pattern, and quicker movements. Although they are generally about 2 m longer, they can be quite difficult to distinguish from dwarf minke whales. When the flippers are seen, the best feature is the lack of distinct white flipper patches on Antarctic minkes. Pygmy right whales and some beaked whales may also cause some confusion at a distance, but a good look at the head and color pattern should make distinction possible.

Distribution Antarctic minke whales occur widely in coastal and offshore areas of the Southern Hemisphere, and are found from at least 7°S south to the ice edges. Some may cross the equator into the Northern Hemisphere. The range is thought to be circumpolar, and in general they are more oceanic than dwarf minke whales. Although there is a general shift northward for breeding in the winter months (known breeding grounds are off Australia, South Africa, and Brazil), not all Antarctic minke whales migrate. They tend to be more polar than common minke whales, and most spend their summers in waters around the Antarctic continent. Some may even overwinter in the Antarctic.

Ecology and behavior The biology of the Antarctic minke whale is not well-understood, at least partially due to a long-standing lack of distinction from common minke whales. Singles and pairs are not uncommon. Although groups elsewhere are generally much smaller, feeding aggregations in the Antarctic may contain hundreds of animals. Antarctic minke whales migrate to the Antarctic for the summer for feeding, and to more moderate climates in the winter for breeding. Although they are not as aerially active as some other whales, Antarctic minke whales do occasionally breach and spyhop. They often

Antarctic minke whales sometimes get trapped in the ice and can spend the winter at a breathing hole, such as this one near McMurdo Station in the Ross Sea. PHOTO: COURTESY R. L. PITMAN

Antarctic minke whales are sometimes curious around vessels and will occasionally come over to take a look. Atlantic part of Southern Ocean, near the ice edge. PHOTO: P. OLSON.

approach vessels, and are easily approachable when feeding. They do not fluke-up upon diving. Antarctic minke whales are often seen among the ice floes in the Antarctic summer months.

Antarctic minke whales exhibit similar life history parameters to those of Northern Hemisphere minkes. Annual and biennial breeding may be the norm, and peak calving occurs in July and August after a gestation of about 10 months. Attainment of sexual maturity occurs at average ages of 7–8 years for females and 8 years in males. Whales may segregate by age, sex, and reproductive status during migrations. Unique, species-specific vocalizations have been described. Killer whales appear to be important predators of this species.

Antarctic minke whales often travel in groups; the lead animal here in Antarctic waters shows a typical dorsal fin; the trailing animal shows details of complex, but subtle color patterning. Atlantic part of Southern Ocean, near the Antarctic Circle. PHOTO: P. OLSON

Feeding and prey Antarctic minke whales eat mostly krill, although they do occasionally feed on small schooling fishes. They are lunge feeders, often actively plunging through patches of euphausiids with throat pleats distended.

Antarctic minke whales create a "roostertail" of spray when they travel fast. The white spots on this animal are cookie-cutter shark bites, which they acquire in lower latitudes during the winter. The all-gray flipper distinguishes it from other minkes. Atlantic part of Southern Ocean, near the Antarctic Circle. PHOTO: P. OLSON

Threats and status Large numbers of minke whales of both species (>100,000, mostly Antarctic minkes) have been killed in Antarctic waters in the past century. Japan's so-called "scientific whaling" focuses mainly on this species, which is still quite abundant in Southern Hemisphere waters. Japan currently takes several hundred Antarctic minkes each year under special scientific permit, but the meat is marketed, and many conservationists see this program as simply a ploy to get around the International Whaling Commission's moratorium on commercial whaling. There is much controversy about their current abundance, but they clearly number several hundred thousand.

IUCN status Lower Risk/Conservation Dependent.

Balaenopteridae

Antarctic Minke Whale

Humpback Whale—*Megaptera novaeangliae*

(Borowski, 1781)

Recently-used synonyms *Megaptera nodosa.*

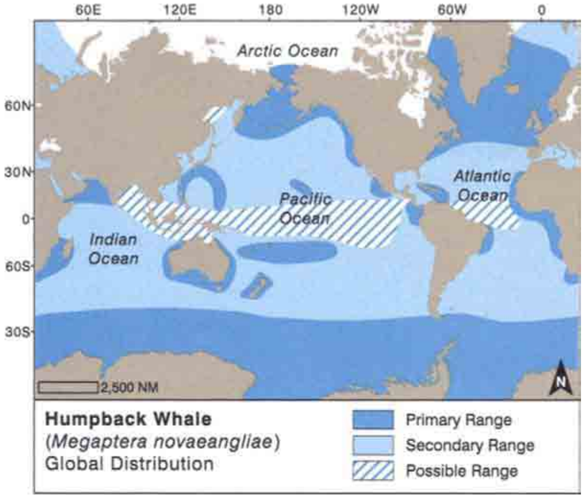
Common names En.–humpback whale; Sp.–*rorcual jorobado* or *ballena jorobada*; Fr.–*baleine a bosse* or *mégaptere* or *jubarte.*

Taxonomic information Order Cetacea, Suborder Mysticeti, Family Balaenopteridae.

Species characteristics The humpback whale differs substantially from the general rorqual body plan. The body is more robust; the flippers are extremely long (up to one-third of the body length) with a series of bumps (known as tubercles), including two more prominent ones in consistent positions on the leading edge, which more-or-less divide the margin into thirds. The tail flukes have a serrated trailing edge. The dorsal fin is located approximately two-thirds of the way back from the rostrum tip, and is low and broad-based (often sitting on a raised hump of tissue, which is most obvious when whales arch their backs to dive). It is highly variable in shape, ranging from a small nubbin to a prominent falcate fin—researchers use these variations to aid in identifying individual humpbacks. The head has a single low median ridge, which is lined with a series of tubercles. The anterior portion of the head also has several tubercles (each containing a single sensory hair). The tubercles are most prominent near the lips and on the chin.

The body is black or dark gray dorsally and generally has significant amounts of white ventrally (although largely black animals are known). The borderline between dark and light is highly variable and seems to differ by population (the white extends up onto the sides and back in many Southern Hemisphere humpbacks).

Typical features of humpback whales include a broad head with a series of tubercles (knobs) and the dorsal fin on a step. PHOTO: M. W. NEWCOMER



The flippers are white on the ventral side and vary from all-white to mostly black on the dorsal surface—again this is variable among different populations. The ventral side of the flukes also varies from all-black to all-white, with individually distinctive patterns of white and black. This patterning, along with the serrations on the trailing edges of the flukes, are the primary means that biologists use to identify individual humpback whales. Anomalously-white (possibly albino) individuals have been observed.

There are 270–400 black to olive baleen plates on each side of the upper jaw (although the anterior-most plates may be lighter in color), and 14–35 ventral pleats extending back to the navel or beyond. The blow is often rather low and bushy, reaching only 3 m; however, in large animals it can be quite tall and columnar. It may sometimes appear V-shaped.

Adult humpback whales are 11–17 m long (females are about 1–1.5 m longer than males) and newborns are about 4.3 m in length and weigh about 680 kg. Weights of at least 40,000 kg are attained by adults.

Recognizable geographic forms Distinct geographic forms of the humpback whale are not widely-recognized. However, Southern Hemisphere humpback whale populations generally have more extensive white on the lower part of the body, which may even extend up onto the back. They also typically have more extensive white on the flippers than their Northern Hemisphere counterparts.

Can be confused with At close range, the humpback is very distinctive, and is one of the easiest whales to identify. At a distance, however, there can be some confusion with other large whales, especially right, gray, and sperm whales. This is largely due to the similarity in their bushy blows and the absence of a large dorsal fin. When a closer look is obtained, humpbacks are gener-

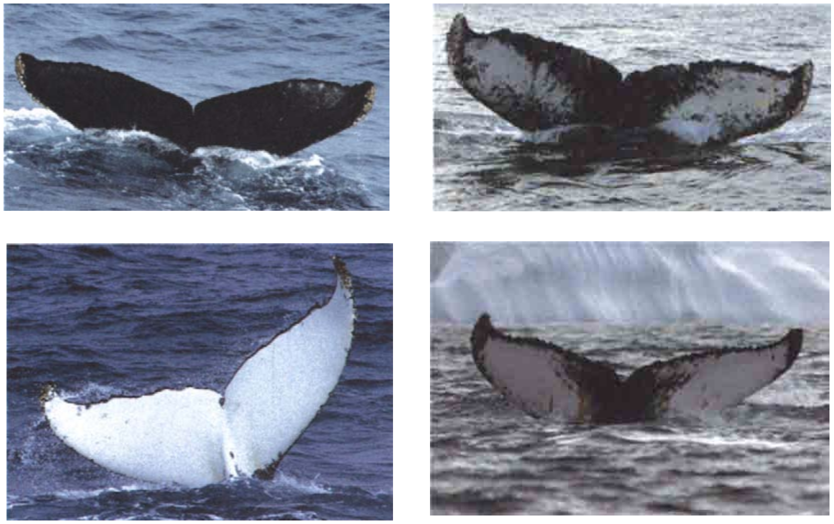
ally easily distinguished by the combination of head and body shape, dorsal fin shape, and size and shape of the flippers.

Distribution The humpback whale is a cosmopolitan species. The only places where they are clearly absent are in some equatorial regions, a few enclosed seas, and some parts of the high Arctic. Humpbacks do most of their feeding and breeding in coastal waters over continental shelves of all the continents, often near human population centers. This helps make them one of the most familiar of the large whales. They migrate from winter grounds in the tropics (breeding areas) to temperate and polar summer grounds, reaching the ice edges in both hemispheres (feeding areas). Their migrations often take them through oceanic zones, but in general, their migratory routes are not well-known. Humpbacks congregate in certain well-known "grounds" (many of these were first discovered by whalers), but they may also occur at lower densities in other areas outside these regions of concentration. Humpback whales in the Arabian Sea are unusual, in that they appear to remain there year-round. They are rare in the Mediterranean, and the few records from the Persian Gulf are considered extralimital.

Ecology and behavior Humpback whales have been studied extensively on many of their feeding and breeding grounds, and as a result they are one of the best known of all the large whales. Although they generally occur singly or in small groups, larger aggregations develop in feeding and breeding areas. Sometimes humpbacks gather into coordinated groups of up to 20 or more whales, which appear to work together to herd and capture prey. The only long-term bonds that are known are those of mothers and calves, although some whales do associate more frequently on feeding grounds. Humpbacks are probably the most acrobatic of all the great whales, sometimes performing full breaches that bring their entire bulk out of the water. Flipper and fluke slapping behavior is also common.

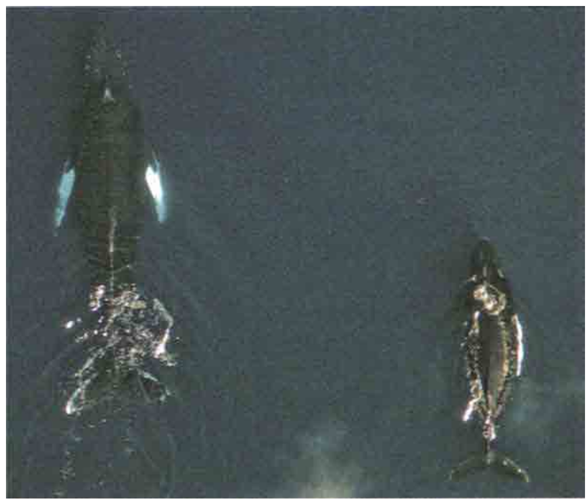
Humpback whale migrations are among the longest known for any mammal species, and can reach 8,000 km one-way. The specific reasons for the migration are often debated by scientists, but it is generally agreed that one reason is to take advantage of both the highly productive summer blooms of high latitudes and the energy-conserving properties of warm tropical areas in winter. On the breeding grounds, males compete for access to estrous females, apparently using their well-known, complex songs as part of the breeding display. Males also compete physically, and (sometimes violent) male/male aggression is commonly observed on the wintering grounds. Calves are born on wintering grounds in tropical and subtropical regions, and most calves are weaned and independent from their mothers by the time they are one year old.

When diving, humpback whales frequently lift their flukes high out of the water, exposing the lower surface. Individual humpback whales can be identified using photographs of the distinctive markings on the undersides of their flukes. Such photos can be of great help in defining movements and migrations of this and other species. Humpback whales are heavily parasitized, and the external surfaces of their bodies are often dotted with whale lice and barnacles (the latter especially tend to attach to the tubercles). Killer whales (and occasionally false killer whales) are known predators, and it is not uncommon to see killer whale tooth rake scars on their bodies and appendages. Longevity is not well-known, but probably exceeds 50 years.



The underside of the flukes of humpback whales can range from virtually all-black, to combinations of black and white, to all-white. The sculpted trailing edge of this species is very distinctive. PHOTOS: C. OEDEKOVEN; H. FEARNBACH BOTH NOAA FISHERIES/SWFSC; F. UGARTE; R. L. PITMAN.

Feeding and prey Humpback whales have a diverse diet for a baleen whale, feeding largely on krill and a wide variety of small schooling fish (such as herring, sand lance, mackerel, sardines, anchovies, and capelin). They are adaptable lunge-feeders, which use bubble nets, bubble clouds, tail flicks, and other techniques to help concentrate prey for easier feeding. They are also one of the few species of baleen whales that appear to use cooperative feeding techniques.



Humpback whales are unmistakable from the air—their knob-covered heads and extremely long flippers are unlike those of any other whale species. Eastern Pacific. PHOTO: SWFSC PHOTOGRAMMETRY LAB

Threats and status Humpback whales have been hunted by commercial whalers in all major oceans, and many stocks have been seriously depleted by whaling that took place mostly in the 1900s. They were taken both by coastal and oceanic whaling operations, and some have continued to be taken by artisanal whalers in the Caribbean and the South Pacific in the past few decades. About 200,000 were killed in the Southern Hemisphere in the twentieth century. The species has been fully protected by the International Whaling Commission since 1965, but the Soviets illegally killed almost 50,000 humpbacks until 1973. Additional threats include entanglement in fishing gear, vessel collisions, disturbance by human-caused noise and traffic, coastal habitat destruction, and climate change effects. Globally, there may be about 35,000–40,000 humpback whales (about 12,000 in the North Atlantic, 6,000–8,000 in the North Pacific, and over 17,000 in the Southern Hemisphere), and while some stocks are still depleted, most are showing evidence of strong recovery. As a species, the humpback whale clearly is in no immediate danger of extinction.

IUCN status Vulnerable.

Gray Whale—*Eschrichtius robustus*

(Lilljeborg, 1861)

Recently-used synonym *Eschrichtius gibbosus*, *Rhachianectes (Eschrichtius) glaucus*.

Common names En.–gray whale; Sp.–*ballena gris*; Fr.–*baleine grise*.

Taxonomic information Order Cetacea, Suborder Mysticeti, Family Eschrichtiidae.

Species characteristics Gray whales are easy to distinguish from other whale species. They are intermediate in robustness between right whales and rorquals. The upper jaw is moderately arched, and the head is acutely triangular in top view and slopes downward toward the tip in side view. The small eyes are located just above the corners of the mouth. The flippers are broad and paddle-shaped, with pointed tips. The flukes are wide (> 3 m in adults), and have smooth S-shaped trailing edges, with a deep median notch. There is a dorsal hump about two-thirds of the way back from the snout tip, followed by a series of 8–14 smaller "knuckles" on the dorsal ridge of the tail stock. There may be several (generally 2–7) short, but deep, creases on the throat that allow some expansion of the throat during suction feeding.

Gray whales often fluke when they dive, showing the "knuckles" along the tail stock as they do. Monterey Bay, California. PHOTO: M. KINZEL

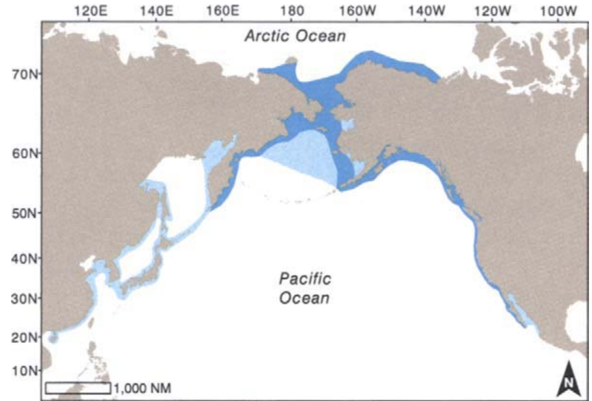
Although young calves are dark charcoal gray, all other gray whales are brownish-gray to light gray in color. They are nearly covered with light blotches and white to orangish patches consisting of whale lice and barnacles, especially on the head and tail. These patches of ectoparasites are very helpful in distinguishing this species, and gray whales may appear quite light-colored when viewed through the water's surface. The flippers and flukes of gray whales are often scarred by marks from killer whale bites.

The mouth contains 130–180 pairs of short (5–40 cm) yellowish baleen plates, with very coarse bristles. The blow is bushy, heart-shaped when viewed from ahead or behind, and rises less than 3–4 m. In some conditions it can appear a bit more columnar.

At birth, gray whales are about 4.6–4.9 m long and weigh about 920 kg; adults are 11–15 m in length, with females slightly larger than males. Maximum body weight is about 45,000 kg.

Recognizable geographic forms None.

Can be confused with Gray whales are unique in body shape (somewhat torpedo-shaped, when viewed



Gray Whale
(*Eschrichtius robustus*)
Global Distribution

from above) and patterning (irregular blotches of white on gray), and there is usually no problem with identification at close range. From a great distance, however, they can sometimes be confused with other whales lacking a prominent dorsal fin (e.g., right, bowhead, sperm, or humpback whales). A closer look at the body shape and coloration will generally allow them to be distinguished.

Distribution Gray whales are found only in the North Pacific Ocean and adjacent seas. There are two populations, a large eastern Pacific stock and a very small, remnant western North Pacific stock. They are primarily bottom feeders and are thus restricted to shallow continental shelf waters for feeding. In fact, they are the most coastal of all great whales, living much of their lives within a few tens of kilometers of shore (although they do feed great distances from shore on the shallow flats of the Bering and Chukchi seas). The eastern Pacific stock ranges from the southern Gulf of California, Mexico, to the Beaufort and Chukchi seas in the Arctic. The western Pacific stock ranges from the coast of southern China to the Sea of Okhotsk (however, only a portion of this historic range is currently occupied by the remnant population).

Ecology and behavior The behavior and ecology of the gray whale has been relatively well-studied, especially on the breeding lagoons in Baja California, Mexico. Most gray whale groups are small, often with no more than three individuals, but gray whales do sometimes migrate in pods of up to 16. Large aggregations are common on the feeding and breeding grounds. Although they are generally slow-moving, this is a fairly aerially-active species. Breaching, spy-hopping, and other aerial behaviors are common, especially during migration, and in and near the breeding lagoons of Baja California. The annual migrations from winter breeding grounds in Mexico to summer feeding grounds in the Bering, Chukchi, and occasionally Beaufort, seas is witnessed by tens of thousands of people each year along the west coast of North America. This is one of the longest migrations known for any mammal—some 15,000–20,000 km round trip. During migration, they generally swim at speeds of 5–9 km/hour and dive for 3–5 minutes at a time. When feeding, gray whales roll on their sides to suck up epi-

A gray whale on the feeding grounds off Sakhalin Island, Russia. Until recently, this western North Pacific population was thought to be extinct, but it is now known to number about 100 individuals. Unlike rorquals, gray whales do not have long throat pleats (though they do have short creases). PHOTO: D. WELLER

An aerial view of a feeding gray whale in Alaskan waters, showing distinctive mottling and rather pointy head. These animals feed on benthic prey in shallow waters, and they often leave mud plumes behind them as they surface to breathe between feeding dives. PHOTO: H. W. BRAHAM, COURTESY OF D. RUGH

The scalloped trailing edge of the flukes of an eastern gray whale appear above the surface as it goes down on a dive in California waters. PHOTO: M. KINZEL

benthic fauna in bottom sediments, and then surface with mud streaming out of the sides of their mouths. The unique feeding method leaves distinctive feeding pits on the shallow sea floor.

Calving of eastern Pacific grays occurs in late November to early December, during the southbound migration (before animals have reached the lagoons of Baja California). Sperm competition is thought to be important in the mating system. Apparent mating behavior has been seen throughout the year. The location of the western gray whale's wintering grounds are a mystery, although there is evidence that the southern coast of China was used in the past. Gray whales were known as "devilfish" by American whalers, due to their tendency to ferociously fight back when attacked. This is in contrast to the gentleness (termed "friendly" behavior) that they usually show to modern-day "whale-huggers", who approach and pet them in the wintering lagoons. Gray whales may routinely live to be over 40 years old, and one was aged at 75–80 years.

Feeding and prey Gray whales are suckers, using suction to take in food, water, and sediments in shallow waters—then expelling the water and sediment, while trapping the prey on the inside of their baleen plates. They feed primarily on swarming mysids, amphipods, and polychaete tube worms in the northern parts of their range, but are also known to opportunistically take red crabs, baitfish, and other food (crab larvae, mobile amphipods, herring eggs and larvae, cephalopods, and megalops).

Threats and status Gray whales were one of the first of the great whale species to be targeted by whalers in the Pacific. They are relatively large and slow-moving, and nearly their entire lives are spent in nearshore areas, with easy access from the shoreline. In these respects, they were ideal targets, however gray whales can also be aggressive when attacked (earning them the nickname 'devilfish'), and many whalers lost their lives at the hands of a thrashing gray whale. The North Atlantic population was wiped-out by whalers, apparently sometime in the late 1600s or 1700s.

Until recently, the western North Pacific (Korean-Okhotsk) stock was thought to have followed the North Atlantic group into extirpation. However, a small remnant group (about 100 whales) was recently found to be spending its summers feeding off Sakhalin Island, Russia. It is not known if there are other such groups, but at least the population appears to be surviving.

The eastern North Pacific (California-Chukchi) stock was twice reduced to near extinction in the last 150 years. Since its protection after World War II, the

This 'friendly' gray whale calf is young enough that it still has hairs present along the end of its rostrum and very few of the barnacles and whale lice that will infest it as an adult. PHOTO: M. KINZEL

Gray whales are mostly benthic feeders, but they occasionally surface skim, as shown here. The baleen plates are short with coarse bristles for filtering relatively large prey from the mud. Monterey Bay, California. PHOTO: T. PUSSER

"California" gray whale has rebounded to numbers thought to be near pre-exploitation levels. In 1997/98, there were about 30,000 whales, but the numbers have dropped recently to under 20,000, as the population reaches an equilibrium with its environment. Climate change (especially warming of arctic waters) may have severe ramifications for food resource availability. Exploration and extraction of petroleum reserves may also have important implications for the viability of the species, especially in the Okhotsk Sea, where a large effort is underway to extract oil from an area within the only known feeding area of the western gray whale.

IUCN status Critically Endangered (western Pacific stock), Lower Risk/Conservation Dependent (eastern Pacific stock).

Sperm Whale—*Physeter macrocephalus*

Linnaeus, 1758

Recently-used synonyms *Physeter catodon.*

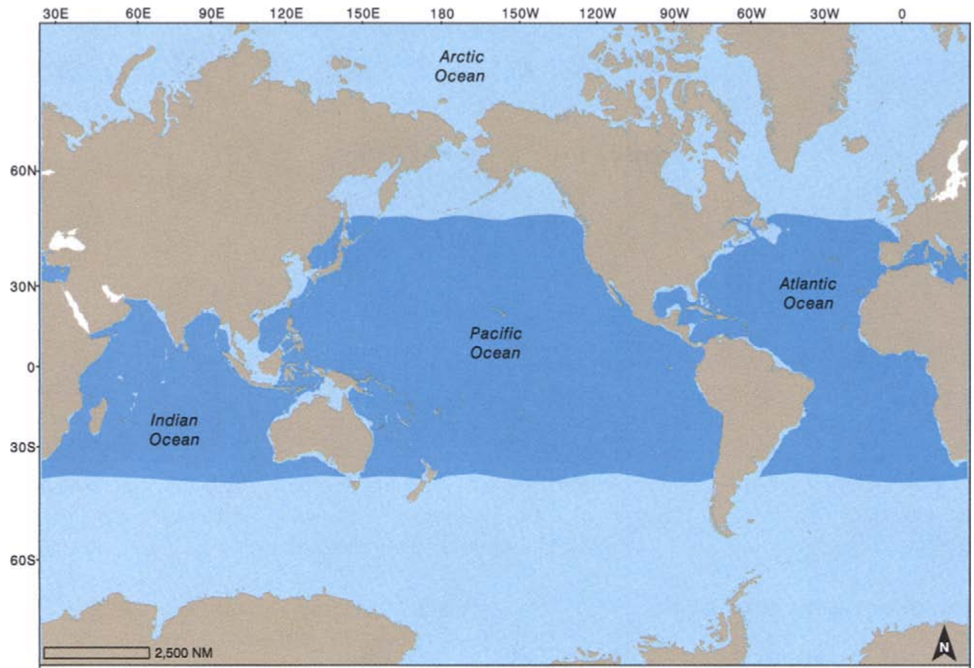
Common names En.–sperm whale; Sp.–*cachalote*; Fr.–*cachalot*.

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Physeteridae. Great controversy has existed in recent years about whether *Physeter macrocephalus* or *P. catodon* is the correct scientific name for the species. The former seems to have won-out, and this name is now almost universally used. There has also been some disagreement about whether the sperm whale is most closely related to other toothed whales or to baleen whales. It now appears that the genetic data supporting a relationship with baleen whales were misinterpreted, and sperm whales are now considered to be perfectly good odontocetes.

Species characteristics As the largest toothed cetacean, the sperm whale, is unlikely to be confused with any other species. The body is somewhat laterally compressed and the head is huge (one-quarter to one-third of the total length, and an even greater proportion of the total bulk) and squarish, when viewed from the side. The lower jaw is much narrower than the upper, and is underslung, making it barely visible from the side. There are 2–10 short, deep throat grooves. The single S-shaped blowhole is set at the front of the head and is offset to the left. The flippers are short, but wide and spatulate. The flukes are broad and triangular with a nearly straight trailing edge (often with various nicks and notches), rounded tips, and a deep notch. The caudal peduncle is very deep, and may have a post-anal keel. There is a thick, low, rounded dorsal hump and a series of bumps, or crenulations, on the dorsal ridge of the tail stock. The body surface tends to be wrinkled behind the head and on the sides. Many (about 75%) adult females and some young males (about 30%) have white to yellowish calluses on the dorsal hump, whereas bulls almost never have them.

Sperm whales are predominantly black to brownish-gray, with white areas around the mouth and often on the belly. The white areas are

A sperm whale mother and calf. The corrugated appearance of the body is characteristic of all age and sex classes. The pectoral flippers lie flush to the body—perhaps as protection from predators. North Atlantic. PHOTO: D. PERRINE



Sperm Whale
(*Physeter macrocephalus*)
Global Distribution

Primary Range
Secondary Range

of highly variable extent and pattern. White scratches and scars are common on the bodies (especially the heads) of some large adults. These are presumably caused mostly by other sperm whales and the beaks of their cephalopod prey. Anomalously-white individuals have been observed (in at least one case, this was an albino).

Functional teeth (18–26 pairs that fit into sockets in the upper jaw) are present in the lower jaw only. The teeth are large and may range from sharply pointed in young animals to rounded stumps in old individuals. The bushy blow projects up to 5 m and, because of the position of the blowhole, is directed forward and to the left. On windless days, such an angled blow originating from the most forward part of the head is diagnostic.

Newborn sperm whales are 3.5–4.5 m long and weigh about 1,000 kg. Adult females are up to 12 m and adult males are up to 18.3 m in length. Weights of up to 57,000 kg have been recorded. Sperm whales are the most sexually dimorphic of all cetacean species, with males weighing nearly three times as much as females.

Calf—Length < $^1/_2$ of adult length, color pattern somewhat faded, mouthline relatively short, flukes very broad (anterior–posterior).

Subadult—Medium-sized (slightly smaller than adult females), dorsal fin callus may be present in some individuals.

Adult female—Relatively large size, pale dorsal fin callus usually present (although sometimes difficult to see), dorsal fin more anterior than in adult males.

Adult male—Large body size (up to about 50% larger than females), often with extensive scarring on head, head proportionately large (up to $^1/_3$ body length), upper jaw tends to overhang tip of lower jaw, dorsal fin more posterior than in adult females, callus rarely present on dorsal fin, trailing edges of flukes somewhat convex.

A sperm whale photographed underwater. The large, overhanging upper jaw, and extensive scarring on the head clearly indicate that this is an adult male. PHOTO: B. KAHN

Sperm whales at the surface often expose the tip of the head at a 45° angle like this; the animal is facing left and slightly toward the photographer, exposing its flat 'forehead' and single blowhole. PHOTO: C. JOHNSON

Sperm whales, especially groups of mothers and their young, are highly social creatures with strongly synchronized diving and surfacing patterns; when resting, they often log at the surface in tight groups. Maldives. PHOTO: T. A. JEFFERSON

Recognizable geographic forms None.

Can be confused with Sperm whales are generally easy to distinguish from other large whales at sea, even at a great distance. The uniquely-angled blow is diagnostic, but one must be careful to take into account the effects of wind on a whale's blow. Only humpbacks, and possibly gray whales would be likely to be confused with sperm whales, and this only at a great distance. Once a closer look is obtained, the unique body shape, and exhalation patterns of sperm whales will make them distinguishable.

Distribution Perhaps only killer whales and humans are more widely distributed than the sperm whale. Sperm whales are somewhat migratory and are distributed in a cosmopolitan fashion from the tropics to the pack ice edges in both hemispheres, although generally only large males venture to the extreme northern and southern portions of the range (poleward of about 40–50° latitude). Deep divers, sperm whales tend to inhabit continental slope and oceanic waters deeper than about 1,000 m, but some (especially adult males) do come closer to shore, especially where submarine canyons or other physical features bring deep water near the coast. They may even occasionally be seen over the continental shelf in specific areas (such as in the Gulf of California and off Long Island, New York). Their migrations are not as clear-cut as they are in most baleen whales, and in some tropical areas sperm whales appear to be largely resident. The distribution includes semi-enclosed seas with deep entrances, like the Gulf of Mexico, Caribbean Sea, Gulf of California, Sea of Japan, and Mediterranean Sea. However, it excludes seas with shallow, narrow entrances, like the Black Sea and Persian Gulf (there are also some records from the Red Sea, probably extralimital). Sperm whales occur in higher densities in certain areas of high productivity, often near steep drop-offs and areas with strong currents – many of these areas were discovered by Yankee whalers and are thus called the "grounds."

A diving sperm whale in Indonesian waters, showing the squarish head, wrinkled skin and triangular dorsal hump—it has been said to resemble a swimming boxcar. PHOTO: B. KAHN

A sperm whale, with mouth agape, showing the very narrow, underslung lower jaw and peg-like teeth. Only the lower jaw has teeth, which fit into sockets in the upper jaw. PHOTO: B. KAHN

Ecology and behavior Although bulls are sometimes seen singly (especially above 40° latitude), sperm whales are more often found in medium to large groups of 20–30, but can occur in groups of up to 50 or so whales (generally with only one bull per breeding group). In the past twenty years or so, the social system of sperm whales has been relatively well-studied. They are polygynous;

The sperm whale's characteristic blow is angled forward and to the left, as shown here. Because they are deep divers, they often appear to be hyperventilating as they catch their breath at the surface. PHOTO: R. W. BAIRD

The single blowhole of the sperm whale is situated at the very front of the blunt head, and to the left of center. PHOTO: R. L. PITMAN

adult males seem to employ a "searching" strategy for mating, associating with nursery groups of the much more social adult females and their offspring for only short periods of time. The female groups are characterized by some long-term stability. Sperm whales range widely, and adult males may move across and even between ocean basins. Although fights between males have seldom been observed, the evidence indicates that males compete for access to nursery groups. Sexually-mature, but non-breeding, males that have left their natal pods may form bachelor herds. Most births occur in summer and fall, but reproductive rates are very low. Whales of this species can live to be at least 70 years old, and possibly much older. Sperm whales are sometimes attacked by killer whales (and very occasionally other odontocetes), but these rarely appear to be fatal. When attacked by killer whales or other predators, sperm whales may gather into a circle, with heads pointing inwards, and calves protected in the middle. This is known as a "marguerite" formation.

The two principal activities are foraging (in which whales gather in small clusters, fluking-up and diving consistently) and socializing (in which they gather into larger surface-active groups). Sperm whales may raft at the surface between bouts of diving. They are extremely deep and long divers, apparently capable of reaching depths of 3,200 m or more for well over one hour. Most commonly, during foraging they dive to about 400 m and for 30–45 minutes. Groups of females may spread out over distances of more than 1 km when foraging, but adult males tend to be solitary when foraging. Some dives of bulls, which are longer than those of the smaller cows, last as long as two hours. Fluking-up is common before a long dive, and rafting (whales lying nearly motionless at the surface) is common afterwards. The most common aerial behaviors are breaching and fluke-slapping.

Low-frequency, stereotyped, clicked vocalizations, some of which are termed "codas," are apparently distinct to groups of sperm whales and may act as acoustic signatures. Some clicks are also probably used in echolocation. In addition, sperm whales also produce occasional "squeals" and "trumpets." Some scientists studying sperm whales argue that their complex social organization and behavior patterns fit the definition of 'culture.'

Feeding and prey An amazing variety of cephalopods and other invertebrates, deep-sea fish, and non-food items have been found in the stomachs of sperm whales from around the world. Cephalopods (squid and octopuses), however, are considered to be the major prey items. Primary prey species include squids of the genera *Architeuthis* (the giant squid), *Moroteuthis*, *Gonatopsis*, *Histioteuthis*, and *Galiteuthis*, as well as fishes like lumpsuckers and redfishes. Like all odontocetes, they

Sperm whales show their flukes prior to a deep dive, holding them high and perpendicular. The flukes are straight across the trailing edge (but with notches that allow individuals to be identified), and are very triangular overall, with rounded tips. Maldives. PHOTO: T. A. JEFFERSON

seize individual prey items. Males eat larger prey than females and young. In some areas, sperm whales take fish from longlines.

Threats and status Sperm whales were the primary targets of Yankee whalers, based on the northeast coast of the U.S. from the mid-18th to the mid-19th centuries. Their primary goal was to obtain oil (extracted from boiled down blubber and from the inside of the head), which was a prime commodity at the time. Later, a second major phase of exploitation occurred, and sperm whales were taken by pelagic and land-based whaling operations in many parts of the world, mostly from 1945 to 1980. This continued until recent decades, although sperm whales are still occasionally killed, primarily in native, non-commercial hunts. The sperm whale has not been depleted to the level of some of the baleen whales (it is estimated that current abundance is about one-third of original levels), nevertheless some populations were severely reduced. In 1988, the International Whaling Commission banned the hunting of sperm whales, but some may still be taken (generally in small numbers) by aboriginal whalers in the Caribbean and in some of the eastern islands of Indonesia. In addition, Japan still hunts some under its "scientific" whaling program.

While sperm whaling today is but a small remnant of what it once was, the effects of whaling appear to be continuing. Especially in the southeast Pacific, populations are not showing strong signs of recovery. In other areas, sperm whales are relatively numerous, and these animals are very commonly seen in many tropical zones. There are at least 14,000 in the North Atlantic, 80,000 in the North Pacific (including at least 4,000 in the eastern tropical Pacific), and 9,500 in the Antarctic. Global abundance is not known, but is broadly estimated to be about 360,000, making it probably the most abundant of all the great whales. Today the threat from commercial whaling has largely been replaced by concerns about impacts of vessel strikes, fishing gear interactions, human-induced noise, chemical pollution and climate change.

IUCN status Vulnerable.

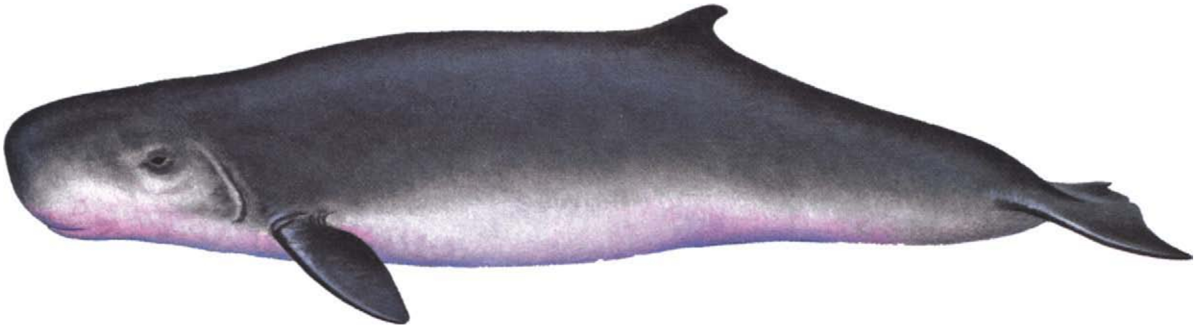
Pygmy Sperm Whale—*Kogia breviceps*
(Blainville, 1838)



Recently-used synonyms None.

Common names En.–pygmy sperm whale; Sp.–*cachalote pigmeo*; Fr.–*cachalot pygmée*.

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Kogiidae. Only one species (*K. breviceps*) was recognized in this genus until 1966, when studies clearly showed the pygmy and dwarf sperm whales to be distinct species.

Species characteristics Pygmy sperm whales are very difficult to detect, except in extremely calm seas. These animals have a very unusual body shape, which in some ways, looks like that of a small sperm whale. They are quite robust, and are not as streamlined as most other odontocetes. Pygmy sperm whales have a shark-like head with a narrow underslung lower jaw. The head becomes more squarish in older individuals. The small flippers are set far forward on the sides near the head. The small dorsal fin (< 5% of the body length) is usually set well behind the midpoint of the back. The dorsal fin is typically strongly falcate, with the tip well below the highest point. There is often the appearance of a hump on the back (between the blowhole and dorsal fin) in this species, especially when the animals are rafting at the surface. In pygmy sperm whales, the blowhole is positioned >10% of the way back from the snout tip. The ratio of the height of the dorsal fin, divided by the distance from the tip of the forehead to the anterior insertion of the dorsal fin is usually < 8%.

Pygmy sperm whales are countershaded, ranging from dark brownish gray or black on the back to white below. Usually a somewhat darker patch encircles the eye. Often the belly has a pinkish tone. There is a light colored bracket mark, dubbed the "false gill," along the side of the head between the eye and the flipper. This is thought to be an adaptation related to mimicry of their shark predators.

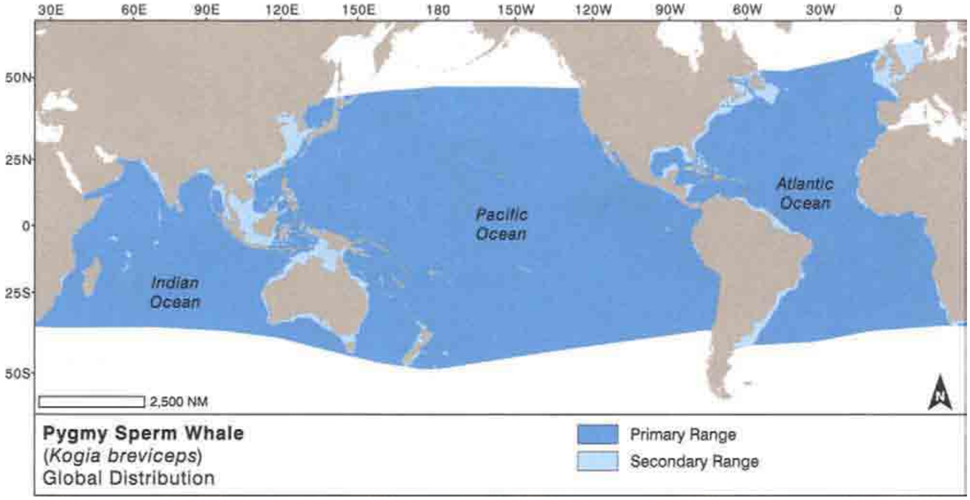
The lower jaw contains 12–16 (sometimes 10 or 11) pairs of long, sharp, fang-like teeth that fit into sockets in the upper jaw. There are usually no teeth in the upper jaw.

Adult pygmy sperm whales are 2.7–3.8 m long. Females are somewhat larger than males. Adults may weigh as much as 450 kg. Newborns are about 1.2 m and weigh around 53 kg.

Recognizable geographic forms None.

Can be confused with Pygmy and dwarf sperm whales can be rather difficult to distinguish at sea. Pygmy sperm whales grow to somewhat greater total lengths,

A pygmy sperm whale mother and calf lie motionless at the surface off Baja California, Mexico. This logging behavior is typical of both species of *Kogia*; the rounded arch in the back and the low, rounded dorsal fin distinguish this species.
PHOTO: M. W. NEWCOMER



and have smaller, more rounded dorsal fins, generally set farther back on the body. The position of the blowhole is another good indicator (>10% of the way back from the snout tip in pygmy sperm whales). There is some degree of overlap in most characteristics of these two species, and identifications must be made cautiously, even with a specimen "in hand." It is probably best to leave confirmed identifications up to experts who have a great deal of experience with both species in the genus. For stranded animals, genetic or biochemical analyses may be needed to distinguish the two species of *Kogia*.

Distribution Pygmy sperm whales are known from deep waters (outer continental shelf and beyond) in tropical to warm temperate zones of all oceans. They appear to be more common over and near the continental slope, although they also occur in very deep oceanic regions. This species appears to prefer somewhat more temperate waters than does the dwarf sperm whale. The frequency with which they strand in some areas (such as Florida and South Africa) suggests that they may not always be as uncommon as sightings would suggest.

Ecology and behavior Most sightings of pygmy sperm whales are of small groups of less than five or six individuals. Almost nothing is known of the behavior and ecology of this species, other than what has been learned from brief sightings during research cruises. They are generally not commonly seen alive at sea, but they are among the most frequently-stranded small whales in some areas. This may be due to the fact that they are easily missed at sea, and are rarely seen in anything except calm seas. When seen at sea, they usually appear slow and sluggish, and often raft montionless at the surface with no visible blow. They may simply sink out of sight, or may roll to dive (especially if startled). However, captive animals have sometimes shown intense levels of activity. Pygmy sperm whales may also emit a reddish-brown fluid from the anal area when startled. They do not show their flukes on diving. They are at least occasionally preyed upon by sharks and killer whales.

A pygmy sperm whale, which stranded in Florida, in an oceanarium tank. Notice the "false gill" marking on the side of the head, behind the eye; its purpose is unknown, but may be an example of shark mimicry. PHOTO: D. PERRINE

The vast majority of information available on this species comes from strandings, including several live-strandings. Very little is known of the reproductive biology of the pygmy sperm whale. Sexual maturity in South Africa appears to be reached at ages between 2.5 and 5 years. Births mostly occur from March to August, and females may reproduce annually. Some evidence suggests that sperm competition

A young pygmy sperm whale that stranded alive, showing the body shape and coloration typical of the species. PHOTO: COURTESY S. LEATHERWOOD

may be important in male reproductive success. In some areas, such as the southeastern United States (especially Florida) and South Africa, *Kogia* whales are among the most commonly stranded marine mammals. This indicates that they may be more common than their low sighting frequency suggests. From studies in South Africa, it appears that these are not long-lived animals, and maximum known longevity is only 23 years. Recent genetic studies suggest that there is some gene flow between the Atlantic and Indian oceans.

Feeding and prey Studies of feeding habits, based on stomach contents of stranded animals, suggest that this species feeds in deep water, primarily on cephalopods and, less often, on deep-sea fishes and shrimps. In South Africa, they take at least 67 different prey species, and appear to feed in deeper waters than do dwarf sperm whales.

Threats and status Although they have never been taken in large numbers, either directly or incidentally in fisheries, pygmy sperm whales have been occasional victims of dolphin and small whale fisheries, as well as gillnet and purse seine operations. Other potential threats include plastic debris ingestion (and associated gut-blockage) and ship strikes. There are no estimates of global abundance, but there are thought to be at least 3,000 of them off California.

IUCN status Least Concern.

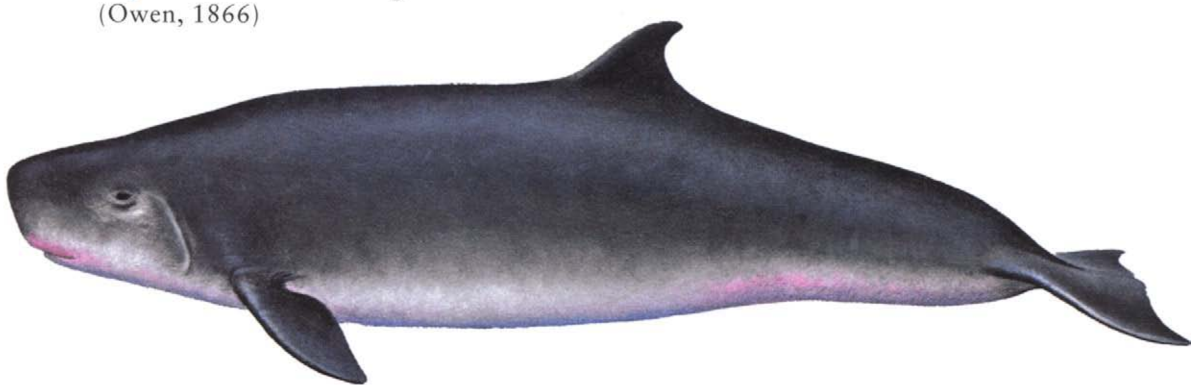
Dwarf Sperm Whale—*Kogia sima*
(Owen, 1866)



Recently-used synonyms *Kogia simus*.

Common names En.–dwarf sperm whale; Sp.–*cachalote enano*; Fr.–*cachalot nain*.

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Kogiidae. Because this species was not generally recognized until the mid-1960s, there is still some confusion in the older literature about which species is represented. The specific name, *simus*, was changed to *sima* to reflect proper nomenclatural gender. A recent study of molecular genetic variation suggests that there may be two separate species of dwarf sperm whales, one in the Atlantic and one in the Indo-Pacific.

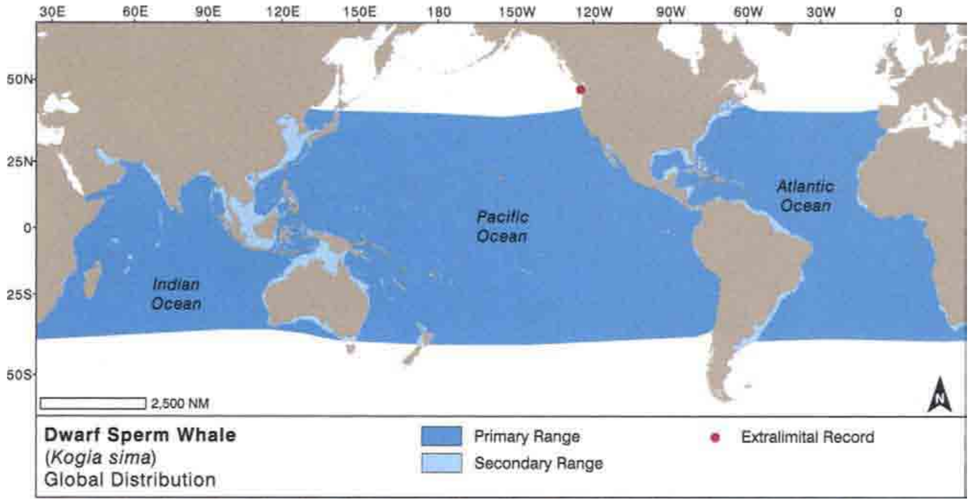
Species characteristics The dwarf sperm whale is similar in appearance to the pygmy sperm whale, with a robust body that tapers rapidly behind the dorsal fin. It has a rather triangular or squarish (more so in older animals) head profile and a narrow, underslung lower jaw. The head shape and light-colored false gill slit give the animal a somewhat shark-like appearance, like its congener (and this may be an example of adaptive mimicry). However, it has a larger dorsal fin (> 5% of the body length), with the tip usually at the highest point. The dorsal fin is generally set near the middle of the back. The ratio of the height of the dorsal fin, divided by the distance from the tip of the forehead to the anterior insertion of the dorsal fin is usually > 11%. The flippers are small, with somewhat blunt tips, and are positioned near the head. The dwarf sperm whale's blowhole is also positioned further forward (generally < 10% of the way back from the snout tip). Generally, a pair of short grooves, similar to those in beaked whales, is present on the throat. The overall appearance of this species is more dolphin-like than in the pygmy sperm whale.

Like its congener, the dwarf sperm whale is countershaded, with a brownish-gray (dorsal) to white (ventral) coloration. There is also a white bracket marking shaped like a shark's gill slit on the side of its head. A ring of darker color surrounds each eye. The belly often has a pinkish tinge.

There are 7–12 (rarely up to 13) pairs of teeth in the lower jaw; sometimes up to three pairs of teeth are present in the upper jaw as well. The teeth are extremely sharp and fang-like. There is generally no visible blow.

Adults of this species are up to 2.7 m long (although at least in the northwestern North Atlantic they generally do not exceed 2.5 m) and may weigh up to 272 kg. Males may be slightly larger than females. Length and weight at birth are about 1 m and 14 kg.

Both the pygmy and this dwarf sperm whale show a low profile at the surface, and are therefore extremely difficult to observe in anything but very calm conditions. Taiwan. PHOTO: J. Y. WANG



Recognizable geographic forms None.

Can be confused with Dwarf sperm whales are most likely to be confused with pygmy sperm whales, which are very similar in appearance. Besides reaching smaller maximum lengths, dwarf sperm whales have taller, more dolphin-like dorsal fins, usually set more toward the middle of the back. Also, the position of the blowhole can help (>10% of the way back from the snout tip in pygmy sperm whales, and <10% in dwarf sperm whales). However, because sizes overlap and dorsal fins are variable in size and position, many at-sea sightings of *Kogia* whales may not be identifiable to species. Generally, it is difficult for non-experts to reliably distinguish the two species, especially in sightings as sea. For stranded specimens, genetic or biochemical means may be needed to confirm identifications.

Distribution The dwarf sperm whale, like the pygmy sperm whale, is known mostly from strandings. It is generally not a commonly-seen species at sea, although this may have more to do with its cryptic appearance than actual rarity. It appears to be distributed widely in tropical to warm temperate zones, apparently largely offshore. Its distribution shows somewhat more of a preference for warmer waters than that of the pygmy sperm whale, and this species probably does not range as far into high-latitude waters. There is no evidence of migrations. There are records for some enclosed seas, such as the Persian Gulf. A single record exists for the Mediterranean, where the species is considered extralimital.

Ecology and behavior There is very little known of the ecology of this species. Much of what is known comes from records of dead- and live-strandings (one animal survived well over a year in rehabilitation). Group sizes tend to be small, most often less than about six individuals (although groups of up to 10 have been recorded). This species (like the pygmy sperm whale) is also typically shy and undemonstrative when observed at sea. They don't generally lift their flukes when they dive. Aerial behavior is very rarely seen, although they do sometimes breach. They often float motionless at the surface, and may be mistaken for a piece of driftwood or flotsam at a distance. They tend to be difficult to approach, and may sink slowly below the surface or arch their backs to begin a dive. When startled, dwarf sperm whales may leave a large rust-colored cloud of fecal material behind as they dive.

The relatively large and erect dorsal fin, and the short, straight back of the dwarf sperm whale distinguish it from the pygmy sperm whale. They rarely swim at the surface, preferring instead to lie motionless. Baja California, Mexico. PHOTO: B. TAYLOR

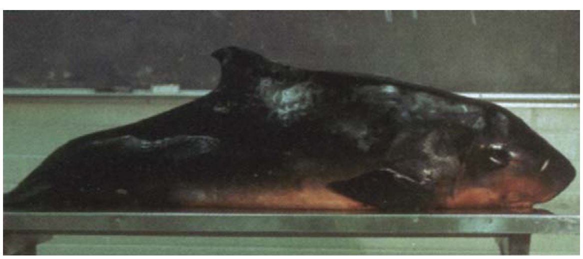
An aerial view of a dwarf sperm whale, easily identified by its tall dorsal fin; note the pointy head when viewed from above. Eastern tropical Pacific Ocean. PHOTO: NOAA FISHERIES/SWFSC

In at least one area where detailed studies have been done (South Africa), there appears to be a calving peak in summer (December to March). Females may give birth annually, after a gestation period of about one year. Longevity does not appear to be long; the oldest known aged individual was just 22 years old. Sexual maturity is apparently attained at 2.5–5.0 years of age. Rather than direct male/male aggression, males may compete largely by sperm competition.

Feeding and prey Dwarf sperm whales appear to feed primarily on deep-water cephalopods, but also take other prey types. About 38 different prey species are known from South African waters, where this species is thought to feed in shallower water than does *K. breviceps*. They may also do some of their foraging near the sea bottom.

Threats and status Although never hunted commercially, these animals were sometimes harpooned by 19th-century whalers. Dwarf sperm whales are sometimes killed in directed fisheries in the Caribbean and Indo-Pacific regions, and a few are known to have died incidentally in fisheries throughout their range. Dwarf sperm whales have a habit of eating plastic discarded or lost at sea, and their tendency to lay quietly at the surface may make them vulnerable to vessel strikes. In general, there are not known to be any serious human impacts, and populations are probably relatively less affected by human activities than are those of most other cetaceans. No estimates of total abundance exist, but about 11,000 occur in the eastern tropical Pacific, and a few hundred exist in the northern Gulf of Mexico.



A dwarf sperm whale that stranded in Texas. This photo provides a good look at the characteristic body shape of the species. PHOTO: TEXAS MARINE MAMMAL STRANDING NETWORK, COURTESY T. A. JEFFERSON

IUCN status Least Concern.

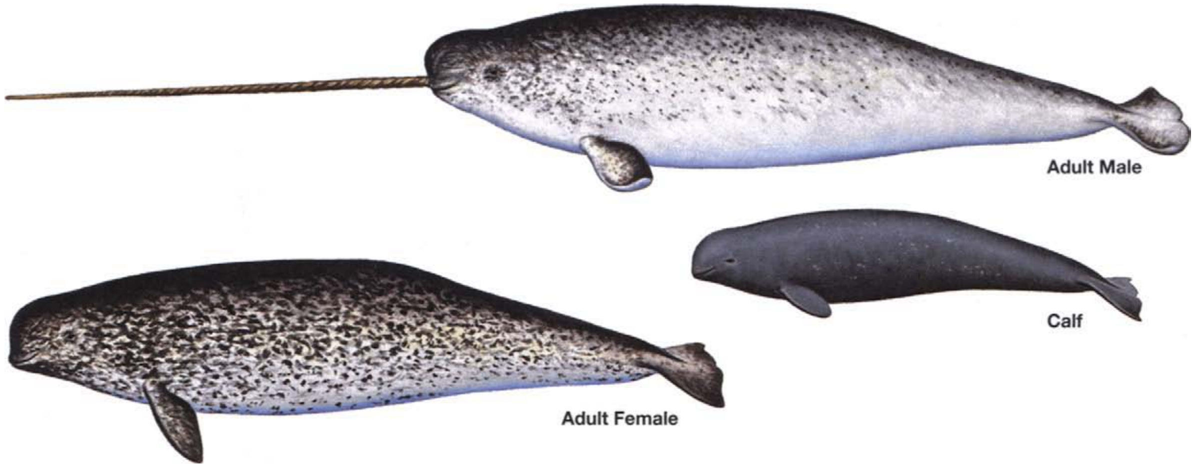
Narwhal—*Monodon monoceros*

Linnaeus, 1758



Recently-used synonyms None.

Common names En.–narwhal; Sp.–*narval*; Fr.–*narval*.

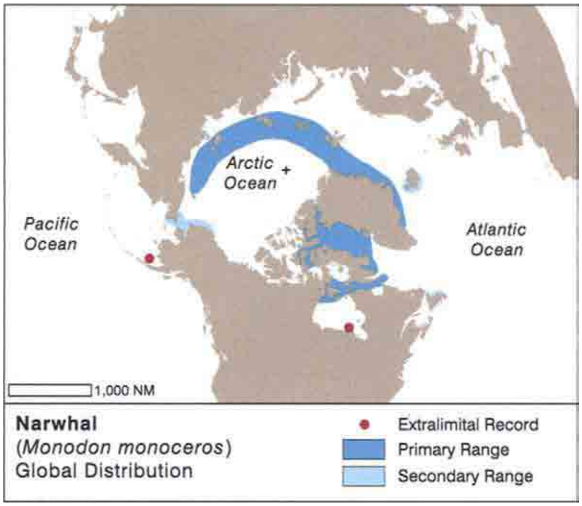
Taxonomic information Order Cetacea, Suborder Odontoceti, Family Monodontidae. Specimens that appear to be hybrids between narwhals and belugas have been described.

Species characteristics Narwhals are characterized by a robust body, relatively small, bulbous head with little or no beak, short blunt flippers that curl up at the tips in adults, absence of a dorsal fin (however, a low fleshy dorsal ridge is present on the posterior half of the back), and unusually-shaped flukes. The flukes of adults become straight to concave on the leading edge, and convex on the trailing edge. They are deeply notched and the tips tend to curl upwards, especially in older animals. This tendency is exaggerated in adult males. The mouthline is short and upturned.

Young narwhals are uniformly gray to brownish-gray. As the animals age, they darken to all black and then white mottling develops. At this stage they appear spotted and the belly becomes light gray to white (with some dark mottling). Lightening continues as the animal ages. Older animals often appear nearly white, with some black mottling still remaining on the upper surfaces (especially the top and front of the head and along the dorsal ridge) and appendages (often as dark borders on the flukes and flippers).

The narwhal's most remarkable feature, however, is its teeth. There are only two teeth, both in the upper jaw. In females, these almost always remain embedded in the upper jaw bones, but in males the left tooth nor-

A group of traveling narwhals; the lead animal is a young male with a partially grown tusk. The mottled coloration distinguishes this species from the partially-sympatric beluga. PHOTO: K. LAIDRE



mally grows out through the front of the head (starting at the age of about 2–3 years) and becomes a left-hand spiraled tusk up to 2.7 m long. Occasionally, females with a tusk or males with two developed tusks (double tuskers) are seen. Narwhals are the only cetaceans with such a tusk protruding from the front of the head, and the myth of unicorn is thought to have derived from stories woven around narwhal tusks.

Adult females can be up to 4.2 m and males up to 4.8 m long (without tusk). Large male narwhals can reach weights of over 1,600 kg, although females generally don't get over 1,000 kg. Narwhals are about 1.6 m long and 80 kg at birth.

Calf—Length < 1/2 of adult length, color pattern uniform gray to nearly black with no spots, slight beak may be visible, no tusk.

When seen from the air, male narwhals, with their mottled coloration and "unicorn" tusk, are unmistakable. PHOTO: K. LAIDRE

Juvenile—Medium-sized (slightly smaller than adult females), body color dark gray to black with white spots on belly and sides, small tusk may be present in males.

Adult female—Relatively large size, ventral side largely white with varying amounts of black spotting (sometimes heavy) on sides and back, forehead bulbous, usually no tusk present.

Adult male—Large body size, lower body mostly white with varying amounts of black spotting especially in area around head and dorsal ridge, flipper tips generally curled up, flukes with convex trailing edge, head bulbous and often with overhanging melon, tusk present. Scarring on the head is fairly common.

Recognizable geographic forms None.

Can be confused with Because of their arctic distribution and unique appearance, the narwhal is likely to be confused only with the beluga whale. Young belugas, especially, can look like narwhals, because of the gray coloration of youngsters of both species and the absence of a tusk in young narwhals. The absence of blotching or spotting on white whales is probably the best guide, and male narwhals can be easily distinguished by their tusks.

Distribution This is a nearly panarctic species; it is found mostly above the Arctic Circle year-round. It has a largely discontinuous range, separated by the island of Greenland. Narwhals basically inhabit the Atlantic sector of the Arctic, and there are few records for the Pacific segment. The principal distribution of the narwhal is from the central Canadian Arctic (Peel Sound and northern Hudson Bay), eastward to Greenland and thence to the eastern Russian Arctic (around 180°W). They are rarely observed in the far eastern Russian Arctic, Alaska, or the western Canadian Arctic. There are annual migrations, primarily to open water in fall and back to inshore waters in spring. In summer, they follow the ice to more coastal areas. In winter, they remain in the pack ice, generally using cracks or holes. Five stocks are recognized on the basis of distribution and migration patterns.

Ecology and behavior The ecology of the narwhal has been relatively well-studied, due to the fact that it is such an important species in the culture and commerce of many northern peoples. In particular, many studies have recently been conducted on movements and diving, using satellite-linked transmitters attached to the dorsal ridge. Most pods of narwhals consist of 2–10 individuals, but there is some evidence that these groups are often parts of large dispersed herds of hundreds or even thousands of individuals, especially in summer. They scatter into smaller groups in winter, and at least in some areas, whales follow specific migratory routes (defined by sea ice formations). There is some age and sex segregation of narwhal groups, and all-male groups, as well as nursery groups, are common. Although belugas are sometimes seen in the same area as narhwhals, they generally do not form mixed herds. The average swimming speed of migrating narwhals is about 5 km/h. They occasionally lift their flukes upon diving.

The tusk of male narwhals has long been a source of scientific controversy. It now is generally agreed that the tusk is not necessary for survival. It appears to be used in male-male competition for females, perhaps primarily as a display, although male narwhals have been seen "sparring" with their tusks above water. Adult males also are often seen with broken tusks and scarring on the head, providing further evidence of the aggressive use of tusks.

Young narwhals are born mainly in summer, from July through August, after a gestation of about 13–16 months. Nursing lasts for at least a year. They live to be at least 25 years, and some may live to 50. Killer whales and polar bears are at least occasional predators.

Feeding and prey Fish, squid, and shrimp make up most of the narwhal's diet. A major component of their diet is made up of medium to large-size Arctic fish species, such as turbot, Arctic cod, and polar cod (the latter of which are often associated with undersides of ice). Narwhals feed at times in deep water and possibly at or near the bottom. Dives of up to nearly 1,200 m and 25 min. are known, and there are some seasonal differences in the depth and intensity of diving. They use suction to bring prey items into the mouth.

Threats and status Although never the targets of large-scale commercial hunting, narwhals have been hunted by native peoples of the Arctic for their valuable tusks (thought to be the source of the unicorn legend) and highly sought-after flesh, which is eaten and used for dog food. Their skin (known as "muktuk") and blubber are highly prized by Arctic native peoples. In the Middle Ages in particular, there was a large profit to be made from selling narwhal tusks as unicorn horns to naïve buyers. Hunting continues to be the major threat to these animals.

Narwhals are also prone to mortality from ice-entrapments (generally worsened by wind-driven or fast-

The upper left tooth grows with age to form the tusk of the narwhal, which is unique in the cetacean world. The lower jaw is slightly agape here. PHOTO: K. LAIDRE

Narwhals often raise their tusks out of the water and they regularly "cross swords". The tusk is rather brittle and broken tips are common, as seen here. PHOTO: J. K. B. FORD

The flukes of adult narwhals become increasingly convex on the trailing edge, so much so that some individuals may almost look like the flukes are stuck-on backwards. PHOTO: K. LAIDRE

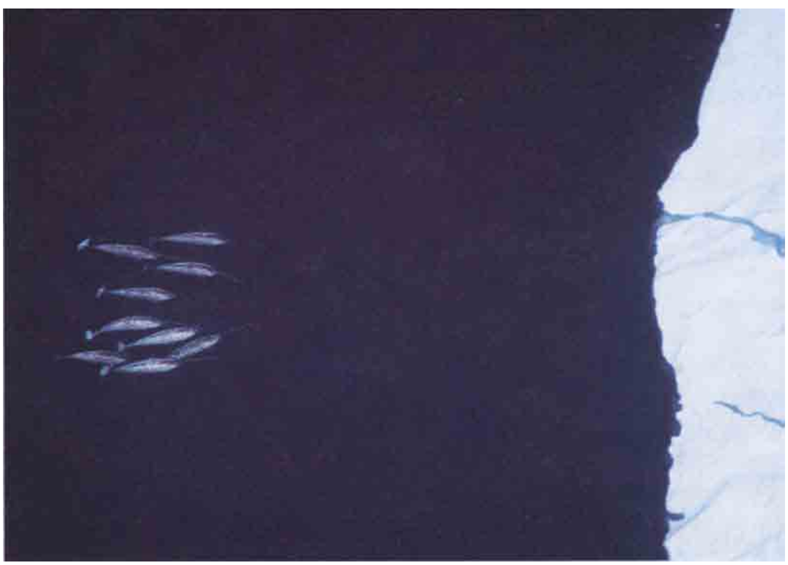
Monodontidae

Narwhal

forming ice), which may be happening more frequently these days, at least partially due to human-induced climate changes. When live, entrapped whales are discovered by Inuit hunters, they normally take advantage of the event by killing the animals (this is called a *savssat*). The tissues of narwhals contain high levels of environmental contaminants, although the specific effects of these are generally not known.

While not endangered on a global scale, some populations are clearly depleted, and continue to be subjected to unsustainable exploitation. There are probably over 50,000 narwhals throughout their range (including at least 35,000 in northern Davis Strait and Baffin Bay, 1,400 in Hudson Strait, and 300 in Scoresby Sound).

Narwhals are perhaps the most northerly of all cetaceans and are rarely found far from Arctic ice. PHOTO: K. LAIDRE



Narwhals are social animals that live among the Arctic ice—as such, they are likely to be affected by global warming more than most other species of marine mammals. PHOTO: J. K. B. FORD

IUCN status Data Deficient.

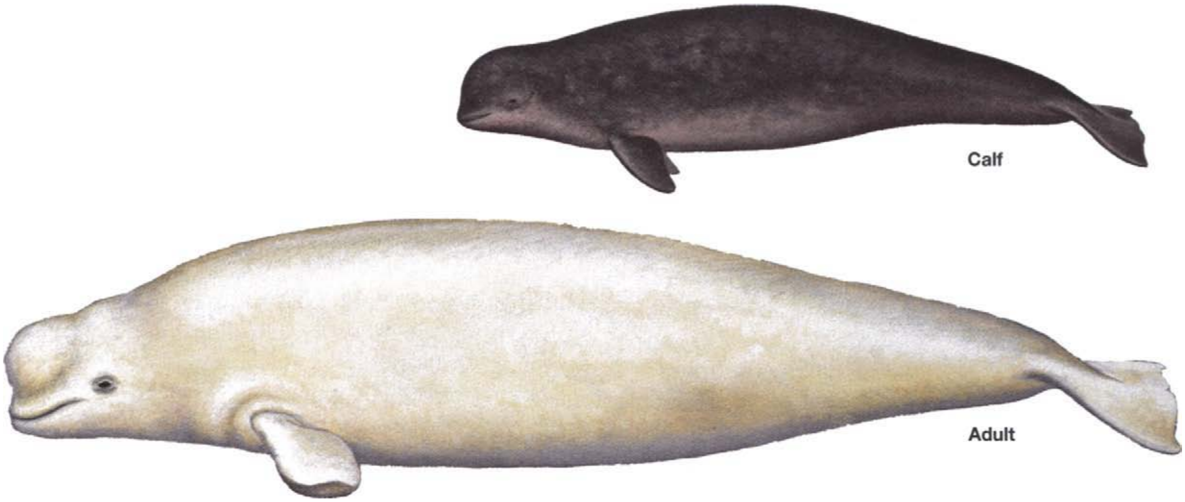
Beluga Whale—*Delphinapterus leucas*
(Pallas, 1776)



Recently-used synonyms *Delphinapterus freimani, Delphinapterus dorofeevi.*

Common names En.–white whale, beluga, or belukha; Sp.–*beluga*; Fr.–*bélouga*.

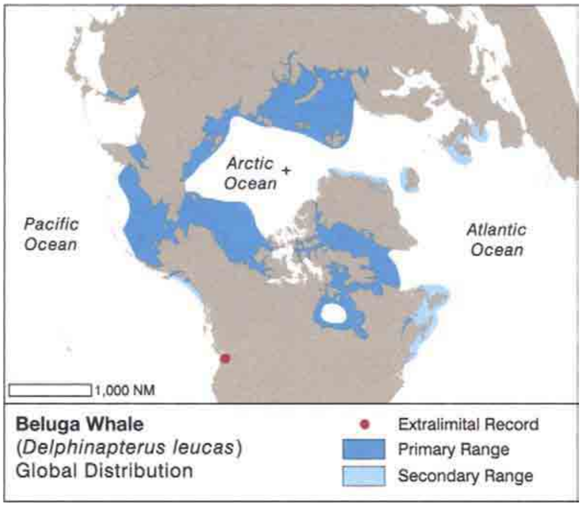
Taxonomic information Order Cetacea, Suborder Odontoceti, Family Monodontidae. Specimens that appear to be hybrids between narwhals and belugas have been described.

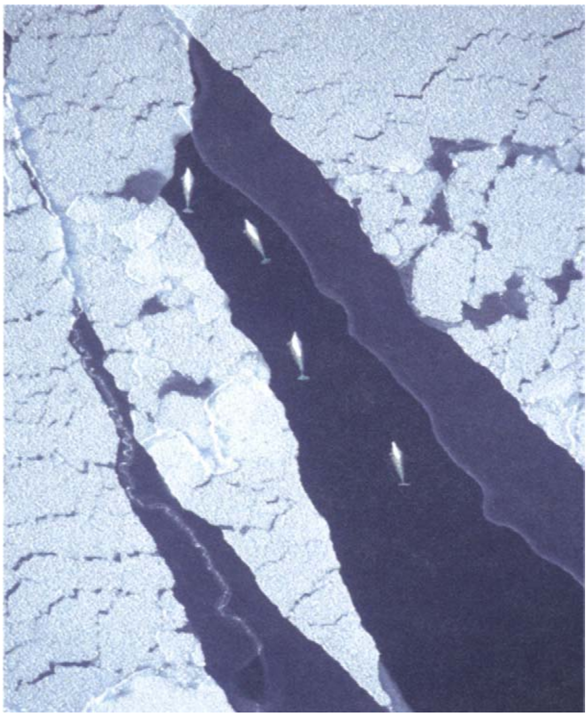
Species characteristics The beluga whale, or white whale, is a robust animal—some individuals may be truly rotund, with folds of fat along the belly and sides. Its basic body shape is much like that of the narwhal; it has a small bulbous head with only a very short beak, and a cleft upper lip. There is no dorsal fin (instead, a shallow transversely-nicked ridge runs along the midline of the back), small rounded flippers (with curled tips in adult males), and small flukes that often have a convex trailing edge. Belugas are "blubbery"; and the blubber layer may be up to 15 cm thick. Their bodies are supple and often wrinkled. There is often a visible neck, which is unusual for cetaceans. Because the cervical (neck) vertebrae are not fused, white whales can move their heads more than most other cetaceans and even have the ability to turn their heads sideways (which is very uncommon in whales and dolphins). The face and melon are also very supple (even the lips can move), and this species is capable of more "facial expressions" than any other species of whale or dolphin.

At birth, white whales are a creamy pale gray, and they rapidly turn dark gray to brownish-gray. They whiten increasingly as they age, reaching the pure white stage between five and twelve years of age. Some adults may have a yellowish tinge, especially when they congregate in estuaries in summer months. The mouth generally contains 8–9, often heavily worn, teeth in each row of the upper and lower jaws. The teeth may be worn down to the gums in some older animals.

Most beluga whales are less than 5.5 m (males) or 4.3 m (females), and males are about 25% longer than females. Large animals may weigh up to 1,600 kg. Calves average about 1.6 m and 80–100 kg at birth.

The typical surfacing profile of the beluga whale, showing the white color and lack of dorsal fin that distinguishes this high arctic species. The yellow coloration is from diatoms and the rake marks could be from killer whales or polar bears. PHOTO: N. KRUKOVA





A group of belugas swims in a lead in the Arctic ice. Getting trapped in shifting ice is an ever-present danger for this species. PHOTO: COURTESY S. LEATHERWOOD

Calf—Length 1/3–2/3 of adult length, color pattern uniform dark gray (may range from brownish to nearly black), slight beak may be visible.

Juvenile—Length 2/3–3/4 length of adults, color uniform gray (varies from dark to light gray).

Adult—Body very robust, color very light gray to white, with only some dark color on dorsal ridge and borders of appendages, flukes may be strongly convex on trailing edge, flipper tips may be curled upwards.

Recognizable geographic forms None.

Can be confused with Belugas can be confused with narwhals, which overlap in some parts of their range. The black and white spotting/blotching of narwhals, and the tusks of males of this species, should permit accurate identification in most situations. Particular care must be taken to distinguish calves of the two species, as both can be dark gray in color (and the narwhal's tusk is not yet developed). However, calves will usually be with adults, which should not be difficult to distinguish.

Distribution White whales have an almost panarctic distribution, and are found only in high latitudes of the Northern Hemisphere (mainly from 50–80°N). They are widely distributed throughout the arctic and subarctic regions, from the west coast of Greenland, west to eastern Scandanavia and Svalbard. They occur seasonally (mainly in summer) in coastal waters as shallow as 1–3 m deep; however, they often occur in deep (>800 m), offshore waters as well. Belugas enter estuaries (they are common in the lower St. Lawrence River estuary of eastern Canada), and even sometimes rivers; there are a few records of solitary individuals ranging thousands of kilometers up various rivers. The International Whaling Commission recognizes 29 management stocks of beluga whales, based on morphological, genetic, and distribution differences.

Ecology and behavior Belugas are well-studied, and much has been learned of their ecology and behavior from studies of carcasses and satellite tracking. The highly gregarious beluga is most often found in groups of up to about 15 individuals, but it is sometimes seen in aggregations of thousands (which sometimes gather in shallow estuaries). Groups are often segregated by age and sex; all-male groups and mixed aggregations, including females and young, are known. Group structure is largely fluid.

In general, white whales are not showy at the surface and they do not often leap. These animals generally swim slowly, rolling at the suface. During the summer, when they aggregate in large numbers in shallow estuaries, they can be very active, and may do quite a bit of spyhopping, tail waving or fluke-slapping. In some areas, they may have distinct foraging and resting periods throughout the day. Their extreme loquaciousness, which was heard through the hulls of old-time whaling ships, earned them the nickname "sea canary." Vocalizations can be divided into whistles and pulsed calls. Some of the descriptive names given to their vocalizations include groans, buzzes, trills, and roars.

Dives may last up to 25 minutes, and can reach depths of > 800 m. It is possible that they can dive to depths of 1,000 m or more, and they regularly appear to dive to the sea bottom. The beluga has an annual molt—something quite unusual for cetaceans. During this time, they may rub on the bottom to facilitate sloughing of dead skin and stimulate epidermal regrowth.

Sexual maturity in belugas is reached at ages of about 5 years for females and 8 for males. Calves are born in spring to summer, between April and September, depending on the population. Gestation probably lasts about 12–15 months, and lactation occurs for about 2 years. Longevity is not well-known, but is expected to be at least 40 years. Killer whales and polar bears are known predators. Bears may wait at breathing holes in the ice, and pull whales from the water as they surface to breathe.

Feeding and prey The beluga has a diverse diet, which varies greatly from area to area. Although various species of fish are considered to be the primary prey items (including salmon, herring, and Arctic cod), beluga whales also feed on a wide variety of mollusks (such as squid and octopus) and benthic crustaceans (shrimps and crabs). They may even eat marine worms and some forms of zooplankton at times. Based on stomach contents, belugas are thought to feed mostly on or near the bottom (in waters up to 300 m deep). Belugas mostly hunt individually. They use their flexible lips to create suction and pull in prey items.

Threats and status Belugas have been hunted commercially in the past, and exploitation by native Arctic peoples continues today in a number of areas. Some stocks have been badly depleted, if not extirpated, by past hunting. Their predictable migration patterns and habit of aggregating in shallow water make them relatively easy to kill, and hunters have taken advantage of these facts.

Entanglement in gillnet and other fisheries causes some mortality, and several hundred individuals have been captured alive for display and research over the past 150 years or so (in fact, this was one of the first species of cetacean to be held captive, beginning in New York in 1861). In addition, habitat degradation, behavioral disturbance (mainly by oil and gas exploration and extraction activities, as well as by hunters and fishermen), and pollution may be causing problems for these animals. The population in the St. Lawrence River is recovering more slowly than expected from past overhunting. The delay has been hypothesized to be related to the damaging effects of organochlorines and other pollutants on the health and reproduction of the animals. The status of some other populations is also being affected by environmental contamination. Abundance has been estimated for a number of the 29 recognized stocks. There is a small isolated population of approximately 350–400 belugas that occurs in Alaska's Cook Inlet—this population

is seriously threatened. The beluga is certainly not endangered at the species level, but some populations are in serious trouble. There are considered to be well over 150,000 belugas throughout their range, including about 40,000 in the Beaufort Sea, 18,000 in the Bering Sea and other Alaskan waters, 28,000 in Baffin Bay, Canada, 25,000 in western Hudson Bay, about 10,000 in other waters of eastern Canada and west Greenland, and 21,000–30,000 in waters of the former Soviet Union.

IUCN status Critically Endangered (Cook Inlet population), Vulnerable (all other stocks).

Baird's Beaked Whale—*Berardius bairdii*

Stejneger, 1883

Recently-used synonyms None.

Common names En.–Baird's beaked whale; Sp.–*zifio de Baird* or *ballena picuda de Baird*; Fr.–*baleine a bec de Baird* or *bérardien de Baird*.

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Ziphiidae. There has been some suggestion that Baird's and Arnoux's beaked whales may actually be the same species, but this does not appear to be case.

Species characteristics Baird's beaked whales are the largest whales in the ziphiid family. They are slender (maximum girth is only 50–60% of total length), with a small head. They have a long, well-defined, tube-like beak and a steep, rounded forehead (rising at a shallower angle than in bottlenose whales, *Hyperoodon* spp., but steeper than in *Ziphius* or *Mesoplodon*). When viewed from above, the beak protrudes forward from the rounded forehead. The body, however, is relatively more slender than that of the otherwise-similar bottlenose whales. There is often a visible depression on the back between the blowhole and the dorsal fin.

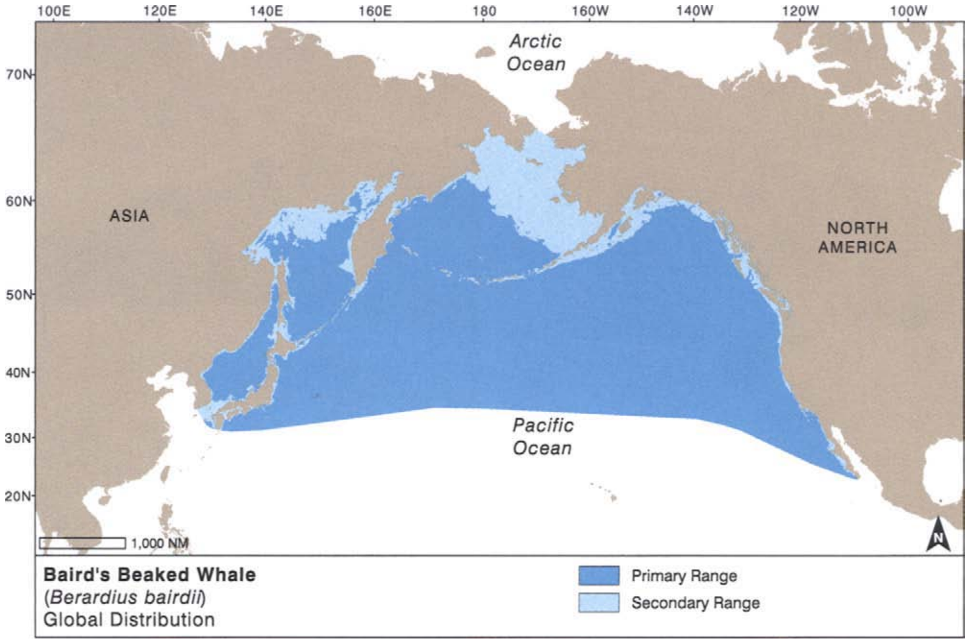
The small, but prominent, triangular dorsal fin is about two-thirds of the way along the back and is generally rounded at the tip. The tip is often curled under. The small rounded flippers fit into depressions along the sides. There is the usual V-shaped pair of throat grooves characteristic of beaked whales, and some animals have accessory throat grooves. Though some animals have a median notch on the flukes, most have no notch (and some even have a bulge). The blowhole is crescent-shaped and has the concavity pointed forward.

There are two pairs of large teeth near the tip of the lower jaw, which erupt at about the time of sexual maturity in both sexes (rather unusual for beaked whales). The forward pair of teeth in adults is visible at the tip of the protruding lower jaw, even when the mouth is closed. The tips may be rounded and heavily worn in older animals, and on some individuals the teeth are heavily infested with barnacles.

Baird's beaked whales are dark brownish-gray, with a slightly lighter belly. Larger animals are usually heavily scarred with light scratches or splotches on the back and, often, on the undersides (especially on adult males). Many of the scratches appear to be made by conspecifics, and may be quite extensive on adult males. On some animals, the forehead may appear largely white. Whale lice and diatoms may be found on the skin surface and appendages, the latter giving the body a greenish-brown tinge.

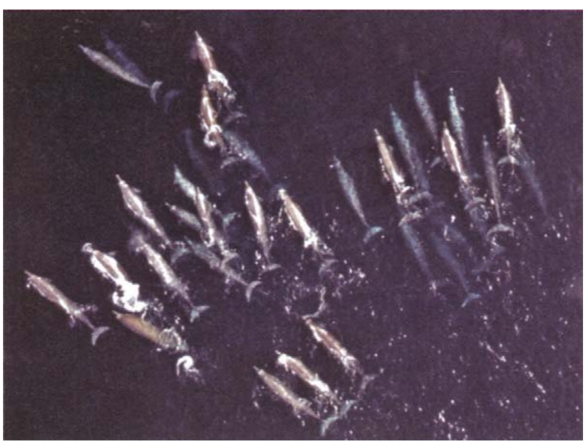
Baird's beaked whales reach lengths of 10.7 m (males) and 11.1 m (females), and weights of up to 12,000 kg. There is considered to be less sexual dimorphism in this species than in any other in the family Ziphiidae, and females are only slightly larger than males. They are about 4.6 m long at birth. The conspicuous blow is low and rounded, and is often given in rapid succession.

Baird's beaked whales are highly social and gregarious. They are often piled up in log jams, either when traveling or when resting at the surface between bouts of deep diving. Guadalupe Island, Baja California, Mexico. PHOTO: T. PUSSER



Recognizable geographic forms None.

Can be confused with Several of the other beaked whales (Cuvier's beaked whale and some species of mesoplodont) are found within the Baird's beaked whale's range, but the larger adult size and unique head and dorsal fin shape of the latter species should make them identifiable. The larger group sizes of Baird's beaked whales will also provide a good clue. Minke whales could, in some circumstances, be confused with Baird's beaked whales; when a good look is obtained, differences in dorsal fin shape, head shape, and coloration make the two easily distinguishable.



Baird's beaked whales occur in larger groups than any other species of beaked whale; often numbering in the dozens, they are always in very tight groups, practically piled on top of each other. Eastern Pacific. PHOTO: NOAA FISHERIES/SWFSC

Distribution Baird's beaked whales are found in deep oceanic waters of the North Pacific Ocean and the Japan, Okhotsk, and Bering seas. Their range extends to the southern Gulf of California in the eastern Pacific, and to the island of Kyushu, Japan, in the western Pacific. Though they may be seen close to shore where deep water approaches the coast, their primary habitats appear to be over or near the continental slope and near oceanic seamounts. There are seasonal inshore/offshore shifts in the eastern North Pacific. They may occur in the vicinity of drift ice in the northern Sea of Okhotsk. Off the Pacific coast of Japan, they migrate into waters over the continental slope from May to October, but where they go in winter is not known. Their distributional limits in oceanic waters of the mid-Pacific are also not well known.

Ecology and behavior Baird's beaked whales live in pods of 5–20 whales (average about 5.9 whales), although groups of up to 50 are occasionally seen. They often assemble in tight groups drifting along at the surface. At such times, beaks are often seen as animals slide over one another's backs. They are deep divers, capable of staying down for over an hour (67 minutes is the current record). After a dive, they stay at the surface for up to 14 minutes, and may blow almost continuously after a long dive. They do breach and perform other aerial behaviors (spyhops, fluke- and flipper-slaps) on occasion (more so than most other beaked whales).

This is an extremely long-lived species. From Japanese whaling data, it appears that males have lower mortality rates and live longer than females (up to about

Baird's beaked whales rarely lift their flukes when diving—this animal is tail-slapping. Monterey Bay, California. PHOTO: D. FRANK

Baird's beaked whales are often active at the surface and breach fairly often. A throat groove is evident on this spyhopping young animal in Monterey Bay, which appears to be curious about the photographer. PHOTO: D. FRANK

84 vs. 54 years) and that females have no post-reproductive stage; this suggests that Baird's beaked whales have an unusual life history pattern. There is a calving peak in March and April. The length of the gestation period is not known with any certainty, but is thought to be around 17 months.

Three stocks are recognized in the western North Pacific (Sea of Japan, Okhotsk Sea, and Pacific Ocean), where these whales have been exploited for centuries. Wounds thought to be caused by killer whales are common on the bodies of Baird's beaked whales, as are cookie-cutter shark bites.

Feeding and prey Baird's beaked whales feed mainly on deepwater and bottom-dwelling gadiform fishes, cephalopods, and crustaceans. The also feed on some pelagic fish, such as mackerel, sardines, and sauries. The diet off the Pacific coast of Japan consists of 82% fish and 18% cephalopods, while in the southern Sea of Okhotsk the proportions are 13% and 87%, respectively. They may do much of their feeding at depths of 800–1,200 m.

Threats and status Baird's beaked whales are one of the few species of ziphiids to be commercially hunted. Although small numbers were hunted by the Soviets, Canadians and Americans, hunts in Japan have been the only major ones. The Japanese fishery started in the early 1600s and underwent several expansions and declines. At its peak, after World War II, over 300 whales were killed annually. Now the Japanese annual quotas add up to slightly over 60 whales.

Other than hunting, and possibly occasional captures in fishing gear (especially incidental captures in drift nets), no other threats to the species are known. There are an estimated 1,100 or so Baird's beaked whales in the eastern North Pacific, including about 400 off the US west coast. Abundance in Japanese waters has been estimated at about 7,000 individuals (about 5,000 off the Pacific coast, 1,300 in the eastern Sea of Japan, and 660 for the southern Okhotsk Sea). The general consensus seems to be that the takes are sustainable, and there is no immediate concern over the future of this species.

The rounded melon and blowhole of a Baird's beaked whale in Monterey Bay, showing the scratching and scarring that occur so frequently on the adults of both sexes of this species. PHOTO: T. R. KIECKHEFER

The long, stout beak, underslung jaw and prominent melon identify these as Baird's beaked whales; the animal in the foreground has no scratches or erupted teeth and is probably a juvenile. PHOTO: P. WADE; NOAA FISHERIES/NMML

IUCN status Lower Risk/Conservation Dependent.

Arnoux's Beaked Whale—*Berardius arnuxii*

Duvernoy, 1851

Recently-used synonyms None.

Common names En.–Arnoux's beaked whale; Sp.–*ballenato de Arnoux*; Fr.–*béradien d'Arnoux*.

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Ziphiidae. Some researchers question whether Baird's and Arnoux's beaked whales are really separate species; however, the lack of known morphological differences may have more to do with lack of specimens than anything else.

Species characteristics Similar in appearance to Baird's beaked whale (in fact, there are no known body shape differences between the two species), the Arnoux's beaked whale is rather slender. This species has a small head, with a long, tube-like beak, moderately steep bulbous forehead, small rounded flippers (which fit into flipper pockets), short slightly falcate dorsal fin, and (usually) un-notched flukes. The dorsal fin is set about 2/3 of the way back from the beak tip, and is generally very rounded at the tip. A pair of V-shaped throat grooves is present, with accessory grooves present in some individuals. The blowhole is oriented with the concave side pointing forward.

Arnoux's beaked whales are slate gray to light brown in color; the head region is generally lighter than the rest of the body. The body is typically heavily scarred and scratched, and the underside tends to be lighter, and is sometimes covered with white blotches. Scars caused by conspecifics (generally long scratches, most prominent on males), killer whales (shorter scatches and scrapes), and cookie-cutter sharks (round, white scars) may be present on the body as well.

Two pairs of triangular teeth are present at the tip of the lower jaw; they erupt in both sexes and the forward pair is visible outside the closed mouth. The rearward pair is somewhat smaller. Barnacles may attach to the teeth.

Arnoux's beaked whales reach a maximum known size of 9.3 m; females are probably a bit larger than males, as is generally true in beaked whales. Length at birth is unknown, but is probably around 4 m.

Recognizable geographic forms None.

Can be confused with Arnoux's beaked whales

An Arnoux's beaked whale surfaces at a breathing hole in the Antarctic ice; notice the massive beak, underslung jaw and tusks protruding from the tip of the lower jaw. PHOTO: BRITISH ANTARCTIC SURVEY

Arnoux's Beaked Whale
(*Berardius arnuxii*)
Global Distribution

can be easily confused with southern bottlenose whales, which share much of their range and have a broadly similar body shape. Differences in coloration, head shape, dorsal fin shape, and tooth size and position should be sufficient to distinguish them, when clearly seen. Individuals of some species of *Mesoplodon* and *Indopacetus* could also be confused with this species at a distance, but they are generally much smaller. Minke whales may also be confused, at a distance, but at close range will present no identification problems.

Distribution Although this species probably has a vast circumpolar distribution in deep, cold, temperate and subpolar waters of the Southern Hemisphere, most records are from the southeast coast of South America, near the Antarctic Peninsula, South Africa, and southern Australia and New Zealand. Although the exact northern limits are not known, they clearly do not reach the tropical zones. Although most records are south of 40°S, in some areas they may reach about 34°S (and there are even some records to as far north as 24°S).

Ecology and behavior Not much is known of the biology of this species, as it lives in a part of the world where little marine mammal research has been done, and has never been hunted. Most groups number between 6 and 10 individuals, but some as large as 80 whales have been seen. Arnoux's beaked whales are reportedly shy of boats and can dive for over an hour (maximum known dive of 70 minutes), although most dives probably last less than about 25 minutes. One group that was beling followed by researchers in the Antarctic traveled more than 6 km underwater before resurfacing. Their elusive behavior and deep-diving capabilities can make observation difficult.

This species' reproductive biology is poorly known. It is unknown if it shares the unusual traits of its northern cousin, the Baird's beaked whale. Some individuals have been trapped in ice and forced to spend the winter in the Antarctic. This may be a significant cause of mortality. Killer whales are also known to attack Arnoux's beaked whales. Little is known of their longevity, but their Northern Hemisphere cousins can live to be at least 84 years old.

Feeding and prey Very little is known about the feeding habits of this species, other than that they feed on squid (based on stomach contents). The feeding habits of Arnoux's beaked whales are assumed to be similar to those of their Northern Hemisphere relatives, Baird's beaked whales, thus consisting mostly of deepwater benthic and pelagic fishes and cephalopods.

Threats and status This species has never been hunted to any significant degree, and other threats are not known at this point. No abundance estimates are available, but Arnoux's beaked whale appears to be less common than the southern bottlenose whale, which shares much of its range. Although they may be naturally rare, there is no reason to believe that the Arnoux's beaked whale is facing any serious threats to its survival.

IUCN status Lower Risk/Conservation Dependent.

Cuvier's Beaked Whale—*Ziphius cavirostris*

G. Cuvier, 1823

Recently-used synonyms None.

Common names En.–Cuvier's beaked whale or goosebeaked whale; Sp.–*zifio de Cuvier* or *ballena picuda de Cuvier*; Fr.–*ziphius* or *baleine a bec de Cuvier*.

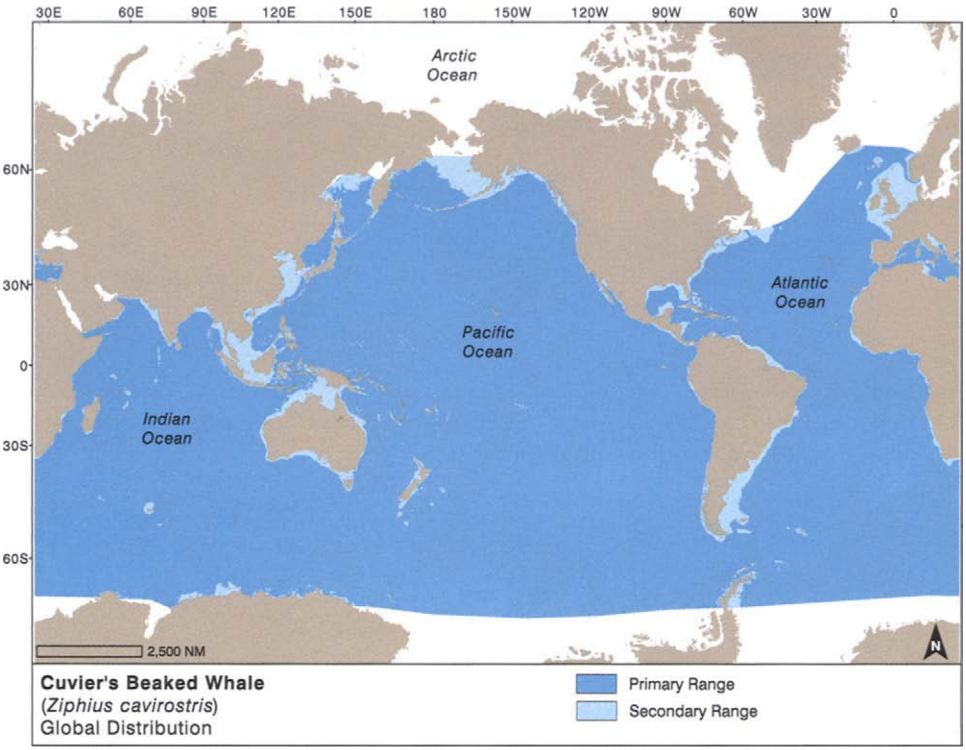
Taxonomic information Order Cetacea, Suborder Odontoceti, Family Ziphiidae.

Species characteristics Cuvier's beaked whales have a body shape broadly similar to that of other species in the family, but are relatively robust, as beaked whales go. They have a short, poorly-defined beak, a smoothly-sloping forehead (although the melon appears to become more prominent, even bulbous, in adult males), and a mouthline that is curved along most of its length, with an upturn at the rear. A pair of V-shaped throat grooves is present. A diagnostic feature is the slight concavity on the top of the head, which increases in detectability in older animals. The flukes are relatively large, and a fluke notch is only sometimes present. The dorsal fin is small and falcate, and is set about two-thirds of the way back from the snout tip. There are "flipper pockets," slight depressions into which the small, rounded flippers can be tucked to be kept flush with the body. Barnacles may be found on the flukes and dorsal fin.

The body is dark gray to light rusty brown, with lighter areas around the head and belly, although the ventral area darkens somewhat with age. Lighter color develops around the head and upper thorax with age in both sexes. The head and much of the upper back of adult males can be completely white. The eyes are usually surrounded by dark coloration, and there may be light crescent-shaped streaks around the eye area. Generally, adults are covered with white linear scratches and circular or oval marks. The latter are thought be caused by bites from lampreys or cookie-cutter sharks. There may be orangish-yellow films (from algae or diatoms) on the body. Calves are more plainly countershaded, dark above and lighter below.

There is a single pair of forward-pointing conical teeth at the tip of the lower jaw; they generally

Cuvier's beaked whale shows a stout body, a prominent melon (often with a white head), and stubby beak. This one in the Azores is probably an adult female—it has marks on the body, but not the preponderance of linear scars that males show.
PHOTO: L. STEINER/WHALE WATCH AZORES



erupt only in adult males and are exposed outside the closed mouth in large bulls. The teeth may be infested with stalked barnacles. The blow is typically low and diffuse. It is often directed slightly forward. Although lengths of up to 8.5 m (females) and 9.8 m (males) have been recorded for Cuvier's beaked whales, total length measurements over 7.0 m are considered unreliable and therefore suspect. Maximum recorded weight is nearly 3,000 kg. Newborn are about 2.7 m long and weigh about 250–300 kg.

Recognizable geographic forms None.

Can be confused with All beaked whales are prone to identification problems, but when adult males are present this species is easier to identify than most. However, Cuvier's beaked whales are likely to be confused with other beaked whales, especially various species of *Mesoplodon*. The very robust body (often visible above the surface as a broader back), blunt head (with only a very stubby beak), and lighter coloration (especially around the head, especially in adult males) may be sufficient to distinguish Cuvier's beaked whales, if visible. Whales of the genera *Hyperoodon* and *Berardius* are larger and have more bulbous foreheads and long tube-like snouts. Also, Longman's beaked whales may cause some confusion, but attention to coloration and head shape should allow distinction, if seen reasonably well.

Distribution Cuvier's beaked whales are widely distributed in offshore waters of all oceans, from the tropics to the polar regions in both hemispheres. Their range covers most marine waters of the world, with the exception of shallow water areas, and very high-latitude polar regions. They are found in many enclosed seas, such as the Gulf of California, Gulf of Mexico, Carribean Sea, Mediterranean Sea (in fact, this is the only beaked whale species that regularly occurs in the Mediterranean), and the Sea of Okhotsk. They have the most cosmopolitan

Ziphiidae

Cuvier's Beaked Whale

Older male Cuvier's beaked whales get whiter and more heavily scarred with age. In sightings at sea, the very stubby beak is often visible, but much less often are the apical teeth shown here. PHOTO: N. AGUILAR DE SOTO

The smoothly sloping forehead and stubby beak (with characteristic "self-satisfied" smile) identify Cuvier's beaked whale, but they are rarely so evident as in this photo taken off North Carolina. A pair of erupted teeth in the tip of the lower jaw, extensive white on the back, and numerous parallel tooth rake marks identify this as an adult male. Fresh gouges on the melon may have been from a recent encounter with another male. PHOTO: T. PUSSER

A surfacing Cuvier's beaked whale. As there are no tusks visible, this is probably a female or subadult male. Ligurian Sea, Mediterranean. PHOTO: COURTESY D. ALLEN

range of any beaked whale species. Although they can be found nearly anywhere in deep (>200 m) waters, they seem to prefer waters over and near the continental slope, especially those with a steep seabottom.

Ecology and behavior Due to their widespread distribution and relatively frequent stranding, Cuvier's beaked whale may be one of the most familiar of the beaked whales. They are found mostly in small groups of 2–7, but are not uncommonly seen alone. Their behavior tends to be rather elusive, and they can be difficult to approach. However, they have been seen breaching on a number of occasions. Dives of up to 40 minutes have been documented.

Seasonality of calving is not known in this species. In general, Cuvier's beaked whale life history is very poorly-known. Sexual maturity occurs at around 6.2 m. It is assumed that males fight for access to females (resulting in the long scratches seen on the bodies of most adult males), but this has never been witnessed. Strandings are relatively common (at least for beaked whales) in some areas, and this suggests that Cuvier's beaked whales are not as rare as was once thought. They sometimes come ashore in groups. Killer whales are probably predators.

This is the only widely-distributed beaked whale species for which a global assessment of genetic diversity has been conducted. The results of this study suggest that there is probably little movement of Cuvier's beaked whales among different ocean basins, and that there may even be a distinct population in the Mediterranean Sea.

Feeding and prey Cuvier's beaked whales, like all beaked whales, appear to prefer deep waters for feeding. Although few stomach contents have been examined, they appear to feed mostly on deep-sea squid, but also sometimes take fish and some crustaceans. They apparently feed both near the bottom and in the water

Cuvier's beaked whales are much more robust animals than mesoplodonts, although this specimen, stranded in La Jolla, California, has some post-mortem bloating. Notice the dorsal fin placement; short, stubby beak; and the distinctive *Ziphius* "smile." PHOTO: W. F. PERRIN

column. Suction appears to be used to draw prey items into the mouth at close range. They may sometimes ingest non-food items.

Threats and status Never the main target of commercial whalers, Cuvier's beaked whales have sometimes been taken in other fisheries, however, such as those in the Caribbean islands, Indonesia, Taiwan, Peru, and Chile. A few (3–35 per year) were taken in past years in the Baird's beaked whale fishery off the coast of Japan. Some are occasionally taken in deep water drift gillnets. The only other threat that is known is the mass mortality of Cuvier's beaked whales that has apparently resulted from Naval sonar exercises, such as those occurring recently in the Bahamas, Caribbean, Canary Islands, and the Mediterranean. This species appears to be particularly vulnerable to such events, the exact causes of which are not known. However, they may somehow result in an increase in bubbles in the blood (causing decompression sickness, or the bends) when returning to the surface from a deep dive. About 20,000 Cuvier's beaked whales are estimated to inhabit the eastern tropical Pacific. In the eastern North Pacific, over 90,000 are thought to occur, including about 1,600 in California and over 12,000 in Hawaiian waters. Off the US northeast coast, there are probably at least 25, and at least 95 are thought to inhabit the northern Gulf of Mexico. They are among the most common and abundant of all the beaked whales.

IUCN status Data Deficient.

Northern Bottlenose Whale—*Hyperoodon ampullatus*

(Forster, 1770)

Recently-used synonyms *Hyperoodon rostratus.*

Common names En.–northern bottlenose whale; Sp.–*ballena nariz de botella del norte*; Fr.–*hyperoodon boréal.*

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Ziphiidae.

Species characteristics Northern bottlenose whales are robust animals. They are appropriately named, having a moderately-long, tube-like beak that is distinct from the melon (reminiscent of the beak of some dolphins). In young animals and females, the rounded forehead slopes upward from the beak, but in adult males the forehead becomes very steep, with a nearly-squarish profile. A pair of forward-pointing grooves is found on the throat. The prominent dorsal fin (up to 30 cm tall) is falcate and pointed at the tip; it is located far back on the body. The flippers are small and blunt at the tips, and the flukes generally lack a median notch.

Calves are generally brownish-gray on the body, with complex light coloration on the head. There is some disagreement as to whether young animals are countershaded. Adults are dark grayish to chocolate brown above and somewhat lighter below. The brownish tinge is often enhanced by a covering of diatoms. Some individuals are mottled with white to yellowish splotches and oval scars, which increase in number with age. Much of the melon and face may be light gray, or in adult males, nearly white. Older females often have a white band around the neck.

At the tip of the lower jaw are two conical teeth that erupt only in bulls, and are not always visible outside the closed mouth. They lean slightly forward, and sometimes have stalked barnacles attached to them. A second pair of teeth is sometimes buried in the gums behind the first, and 10–20 additional vestigial teeth may be found in the gums of both upper and lower jaws.

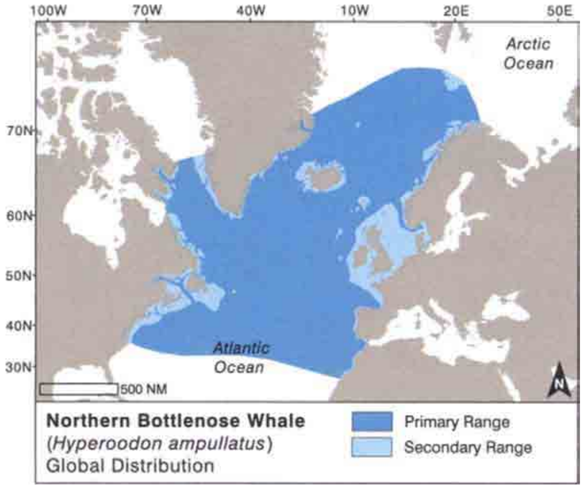
Adult females are up to 8.6 m and adult males up to 10.0 m in length (perhaps up to 11.2 m). This species is unusual for beaked whales in having males significantly larger than females. They can weigh up to 7,500 kg. At birth calves are about 3.0–3.5 m.

A cow and calf pair of northern bottlenose whales in the Gully. The calf in the foreground shows a pale melon that is relatively smaller than in the adults. PHOTO: R. W. BAIRD

Calf—Less than about 1/2 adult size, melon sloping and not bulbous. Dark eye patches and a light-colored forehead are present, body color darker than adults.

Female/subadult male— Full- or nearly adult-size, melon bulbous and gray in color, with a whitish neck collar behind the blowhole.

Adult male—Body size very large; melon extremely bulbous and often overhanging with a flattened front



The northern bottlenose whale is a very robust animal with a bulging melon, stubby beak, and very small flippers. PHOTO: G. CRESSWELL

(giving the melon a somewhat squared-off appearance), most of melon and head back to the eyes white.

Recognizable geographic forms None.

Can be confused with This is the largest beaked whale species in the North Atlantic. A good look will allow Cuvier's beaked whales to be distinguished from bottlenose whales by differences in head shape and body color. Mesoplodonts (only the Sowerby's beaked whale has a broadly-overlapping distribution) are distinguishable by their smaller size and more cone-shaped head. Northern bottlenose whales look similar to Longman's beaked whales (in fact, sightings of these animals in the past were attributed to the genus *Hyperoodon*). However, Longman's beaked whales are only found in the Indo–Pacific and thus do not overlap northern bottlenose whales in range.

Distribution Northern bottlenose whales are found only in the North Atlantic, from New England to Baffin Island and southern Greenland in the west and from the Strait of Gibraltar to Svalbard in the east. The most famous population occurs in the "Gully," off Nova Scotia, Canada. However, there have been strandings at least as far south as North Carolina in the western Atlantic. The pelagic distribution extends from the ice edges south to approximately 30°N. These cold temperate to subarctic whales are found in deep waters, mostly seaward of the continental shelf (and generally over 500–1,000 m deep) and near submarine canyons. There is some evidence from whaling records to suggest a north/south migration, but it is not clearcut. They inhabit the most northerly waters of the Barents and Greenland seas in summer (May to August). Strandings have been recorded in the Baltic Sea, but this area is probably too shallow to be regularly inhabited by this species. The northern bottlenose whale forms an antitropical species pair with the southern bottlenose whale.

Ecology and behavior The behavior and ecology of northern bottlenose whales have been better studied than that of any other species in the family Ziphiidae. Most groups contain at least four whales, sometimes with as many as 20, and there is some segregation by age and sex. There is a well-studied, resident population in the "Gully" (a large submarine canyon off the coast of Nova Scotia, Canada). Much of their movement there is defined by short-term residence in ranges of about 25 km^2. Most dives last less than 10 minutes. However, these deep divers can remain submerged for an hour, possibly as long as two, and can reach depths of well over 1,400 m. They are known for their habit of "standing by" injured companions, which permitted whalers to

Viewed from above, the beaks of these northern bottlenose whales in the Gully, eastern Canada, appear surprisingly narrow and long. However, the bulbous, sometimes overhanging, melon; large dorsal fin; and large overall size allow easy recognition of this species. PHOTO: T. WIMMER

kill large numbers of whales at the same site. Bottlenose whales are also often curious and are attracted to stationary vessels. They can travel over long distances of over 1,000 km. These whales may be curious of vessel and have been known to approach and swim around boats for some time. Whales will "stand-by" injured pod members, and whalers would often exploit this behavior to facilitate hunting of an entire group.

Northern bottlenose whale males may use their large heads to "butt" each other in male/male combat. They have a peak in calving in spring to early summer (April–June). Lengths of the gestation and lactation periods are both probably over one year. Sexual maturity is reached at about 9 years in females, slightly later in males. Indviduals in the Gully population can be identified by natural markings, and several long-term studies have been conducted on them. Their social organization is one of fission-fusion, with mostly very short-term associations (much like that of most dolphin species). Adult males, however, form long-term companionships with other males, the functions of which are unknown. Groups may be segregated by age and sex. Longevity is at least 37 years, possibly much longer.

Feeding and prey Although primarily adapted to feeding on squid (especially *Gonatus* sp.), these whales also eat fish (such as herring and redfish), sea cucumbers, starfish, and prawns. They apparently do much of their feeding on or near the bottom in very deep water (> 800 m, and as deep as 1,400 m).

Threats and status The northern bottlenose was sought after for its oil (including a form of spermaceti oil in the head) and later for pet food. This is one of only a few species of beaked whales to be hunted commercially on a large scale, largely by Canada and Norway. Whalers took advantage of the habits of whales of this species to approach vessels. Hunts occurred from the 1850s to the 1970s, and over 80,000 whales were killed (with many more struck, but lost). They have also been hunted in a drive fishery in the Faroe Islands, with over 800 taken there. Current numbers are largely unknown, although there are an estimated 5,000+ in the waters around Iceland and the Faroe Islands. An estimated 40,000 occur in the eastern North Atlantic. In the Gully, the current population numbers only about 130 (with about 230 different individuals spending some time there). Most populations are probably still depleted, due to these large kills in the past. The Gully population may be threatened by oil and gas activities, fishing, and shipping in the region.

IUCN status Lower Risk/Conservation Dependent.

Southern Bottlenose Whale—*Hyperoodon planifrons*

Flower, 1882

Recently-used synonyms None.

Common names En.–southern bottlenose whale; Sp.–*ballena nariz de botella del sur*; Fr.–*hyperoodon austral*.

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Ziphiidae. For many years, there was speculation that a species of "tropical bottlenose whale" that had been repeatedly observed at sea in the Indo–Pacific may have been a representative of this species. However, it is now known to be Longman's beaked whale *Indopacetus pacificus* (see below).

Species characteristics This species resembles the northern bottlenose whale, with a robust body. The southern bottlenose whale also has a steep forehead, bulbous melon (it may be bluff and squared-off in adult males), and tube-like, well-demarcated beak. There is a single pair of throat grooves. Along the rear half of the back is a small, but prominent, falcate dorsal fin. The small blunt flippers fit into "flipper pockets" along the sides of the animal. The flukes are wide, typically with no notch (or only a shallow one).

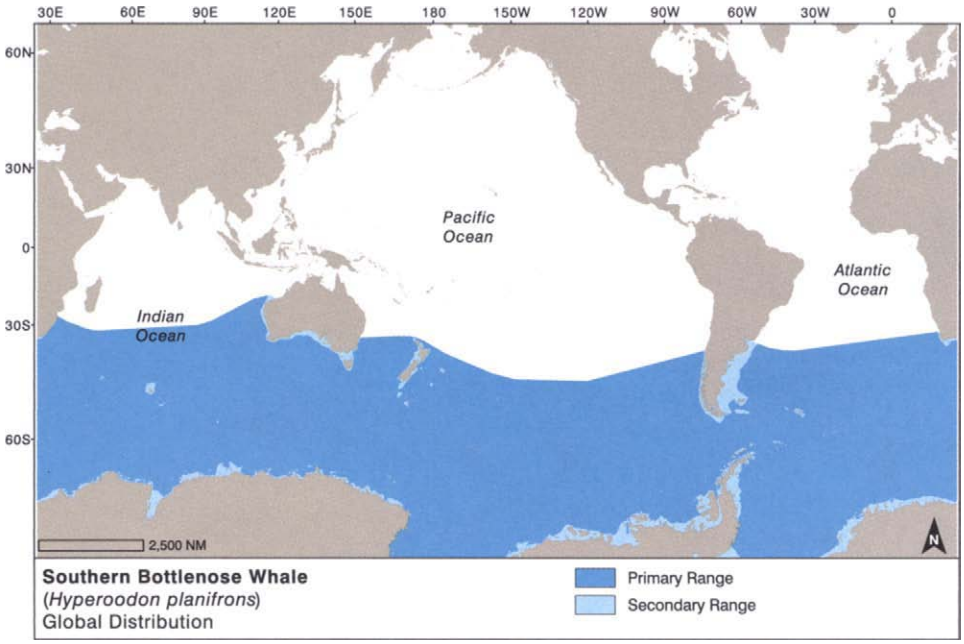
Southern bottlenose whales are light grayish-brown to dull yellow in color (diatoms have been said to be the cause of the yellowish tinge, but this is not confirmed). The belly and often much of the head are lighter. Large animals can be covered with light splotches, scratches, and scars. The color pattern of young calves and juveniles is bold and distinct (see below). The head (often back to behind the blowhole) of younger individuals is white, and distinctly demarcated from the darker back. Some adult males are very light in color along the entire back.

There is a single pair of conical teeth at the tip of the lower jaw, which erupt only in adult males, and are not visible outside the closed mouth. There is sometimes a smaller second pair. Rarely, several sets of vestigial (unerupted) teeth may be present in either jaw. The blow is short and bushy.

Maximum confirmed sizes are 7.5 m for females and about 7.0 m for males. However, specimens of up to 7.8 m have been reported. If females are, in fact, larger than males, this species would differ from its northern counterpart. However, the disparity is more likely a result of the small sample size of measured animals. Length at birth appears to be around 2–3 m.

Calf/juvenile— Less than about $^{2}/_{3}$ adult size, melon sloping and not bulbous. Dark eye patches often pres-

The beak is just visible in this southern bottlenose whale, as it pushes forward a "bow wave" with its steep forehead. Notice the light color of the head, extending back behind the blowhole and the forward-canted blow. Atlantic sector of Southern Ocean, near ice edge. PHOTO: P. OLSON



ent. Top and sides of head white to cream colored, with a dark stripe extending from the blowhole to the end of the beak. Spinal field relatively dark compared to adults.

Female/subadult male— Full or nearly adult size, melon bulbous and darker in color than in juveniles, with some remnants of the whitish head patch often still present. Spinal field lighter than in calves/juveniles.

Adult male— Body size large; melon bulbous and may be overhanging, with a flattened front. The spinal field and much of the back may be very light (almost white) in color. Usually they are heavily scarred.

A breaching southern bottlenose whale south of Madagascar, Indian Ocean; probably a young animal based on the fact that it appears to be unscarred. The paleness of the melon extends behind the constriction where the blowhole is located.
PHOTO: R. L. PITMAN

Recognizable geographic forms None.

Can be confused with Southern bottlenose whales are most likely to be confused with Arnoux's beaked whales, and there is wide overlap in the distribution of these two species. They can be distinguished by differences in dorsal fin and head shape, as well as coloration differences. Cuvier's beaked whales and various mesoplodonts may cause some identification problems from a distance. They can be differentiated primarily by attention to size, head shape, and body patterning. Southern bottlenose whales may also be confused with Longman's beaked whale, and detailed views of the animals may be needed to distinguish the species. The overlap in distribution between these two species is minimal, however, with the Longman's preferring more tropical climates.

Distribution Southern bottlenose whales have a circumpolar distribution in the Southern Hemisphere, south of about 30°S. Most sightings are from about 57°S to 70°S. There are known areas of concentration between 58°S and 62°S in the Atlantic and eastern Indian Ocean sectors of their range. They apparently migrate, and are found in Antarctic waters during the summer, where they tend to occur within about 120 km of the ice edge (sometimes reaching the edge itself). Like other beaked whales, these deep-water oceanic animals do not often stray over the continental shelf.

Ecology and behavior There is much less known about southern bottlenose whales than there is for their

This southern bottlenose whale is identifiable as an adult male by its bulbous forehead and light-colored scratches on the back and head. PHOTO: R. L. PITMAN

Northern Hemisphere counterparts. Groups of less than 10 are most common, but groups of up to 25 have been seen. Nothing is known about their social organization. They are deep divers that can remain underwater for over an hour. Southern bottlenose whales do breach and perform other aerial behaviors on occasion and they may "porpoise" away from vessels. Based on what is known of their northern cousins, they are probably capable of diving to well over 1,000 m. They may undertake long seasonal movements of over 1,000 km.

Due to the fact that it has never been commercially hunted, and there have been no ecological studies, there is virtually nothing known of the reproductive biology of this species. Sparse information suggests that births off South Africa take place in spring to early summer. Longevity is not known.

Feeding and prey Southern bottlenose whales are thought to feed on primarily squid (over 200 squid beaks were found in the stomach of one specimen stranded in New Zealand), but also eat fish (including Patagonian toothfish) and possibly some crustaceans. They may compete with sperm whales for some of the same prey species, but bottlenose whales probably take smaller individuals.

Threats and status No significant exploitation of southern bottlenose whales is known, and they have never been hunted on a large scale. Some have been incidentally killed in driftnets. These animals are not rare by any means. They are the most common beaked whales sighted in Antarctic waters, and are clearly quite abundant there. One estimate puts their numbers south of the Antarctic Convergence at around 500,000 individuals.

IUCN status Lower Risk/Conservation Dependent.

References Gowans 2002; Kasamatsu 1991; Kasamatsu and Joyce 1995; Mead 1989.

Shepherd's Beaked Whale—*Tasmacetus shepherdi*

Oliver, 1937

Recently-used synonyms None.

Common names En.–Shepherd's beaked whale; Sp.–*ballena picuda de Shepherd*; Fr.–*tasmacete*.

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Ziphiidae.

Species characteristics Shepherd's beaked whales have spindle-shaped bodies (generally similar to those of the mesoplodonts), and long pointed beaks, which are distinct from the relatively steep foreheads. However, they have rather pronounced melons, which are unusual in that they are somewhat narrow and flattened laterally. There is no evidence that the melon gets larger with age. There is a shallow pair of throat creases. The flippers are small and tapered at the tips. The dorsal fin, set far back on the body, is short (about 30–35 cm high) and falcate. Generally, the notch between the flukes (characteristic of most cetaceans) is absent.

Shepherd's beaked whales have a distinctive color pattern, perhaps the most diagnostic of all the beaked whales. It appears to be present on all age and sex classes (including calves). The back and sides are mostly dark brownish gray, and the belly is white or light gray. The light ventral field extends up onto the sides in three areas 1) on the side of the face to just below the gape and eye, 2) in a rounded patch posterior of the flippers to just past midway up the side, and 3) on the tail stock posterior to the dorsal fin to just past midway up the sides. There is usually strong contrast between the light and dark areas, but the line separating them is generally not sharp. The dorsal fin, flukes, and beak are mostly dark, but there is also a light patch on the melon. The light melon patch appears to be very prominent, when seen from the air. The color of the flippers appears to be variable, but the dark dorsal field extends onto the upper surface.

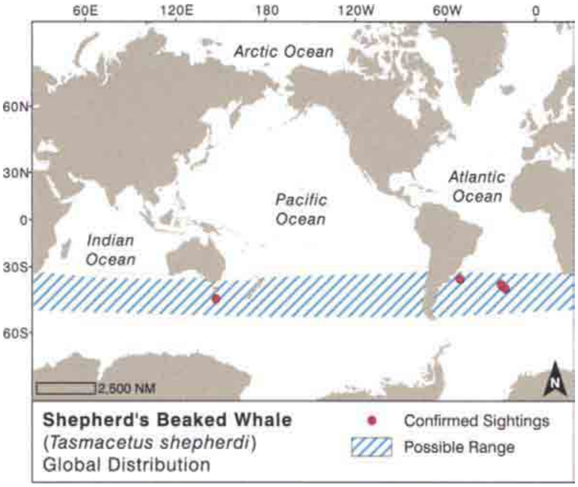
Unique to beaked whales, this species has a mouthful of sharp, functional teeth. There are 17–21 teeth per row in the upper jaw, and 18–28 in the lower. At the tip of the lower jaw is a pair of enlarged terminal teeth, which erupt only in adult males. The blow observed from vessels has been inconspicuous, although it appears that it may be more prominent when viewed from the air.

Few specimens have been measured accurately. Lengths of up to 6.6 m (females) and 7.0 m (males) have been recorded, and measurements over 7 m are considered suspect. Length at birth is unknown, but is presumed to be around 3 m (the only known calf was 3.4 m long).

Recognizable geographic forms None.

Can be confused with When seen well, Shepherd's beaked whales should be quite easy to identify, due to their unique color pattern. They can be confused with other beaked whales, especially mesoplodonts at a distance. However, they appear to be somewhat larger than most mesoplodonts, and have a sharper beak (from above) and more pronounced melon. They may also be confused with southern bottlenose and Longman's beaked whales, both of which have similarities in the shape of the head and beak, but careful attention to details of head shape and color pattern will help separate them.

Distribution Shepherd's beaked whales are primarily known from a few dozen strandings, all south of 30°S, around New Zealand, southern Australia, southern South America, the Juan Fernandez Islands, and Tristan de Cunha. There have been only a few sightings reported in the literature and the validity of most of those is suspect (or clearly erroneous). The confirmed sightings have been from south of Tasmania, near Tristan da



Cunha and in oceanic waters of the South Atlantic. It is presumed that they have a circumpolar distribution in cold temperate waters of the Southern Hemisphere. Like other members of the family, these are probably almost exclusively oceanic, deep-water animals.

Ecology and behavior Very little is known of the natural history of this species, making it one of the least-known of all cetaceans. There are no more than a few dozen records. Groups sizes reported for the four reliable sightings have been moderate (for beaked whales), ranging from 3–6 individuals. They have sometimes been observed to lift their beaks out of the water upon surfacing, but little is known of their behavior.

Many of the confirmed records are at least partially decomposed strandings. Almost all that we know of this species' biology comes from strandings. There are only a handful of fresh specimens and four confirmed sighting records.

Feeding and prey Shepherd's beaked whales are known to feed on several species of fish (primarily eelpouts), as well as squid and crabs, possibly near the bottom in deep waters. This seems somewhat unusual, as most beaked whales appear to feed almost exclusively on cephalopods.

Threats and status As is true for most of the beaked whales, this species has never been hunted (that we know of), and fisheries interactions are not known. They may sometimes ingest plastic debris, which can result in death. Shepherd's beaked whales appear to be relatively rare, but there are no estimates of abundance available.

IUCN status Data Deficient.

References Mead 1989, 2002; Pitman et al. 2006.

Note on Beaked Whales of the Genus Mesoplodon

The species of the genus *Mesoplodon* (collectively called mesoplodonts, a sort-of scientific slang term) are very poorly known, and are in fact the most poorly-known of all the families of large mammals. Several of the species are known only, or primarily, from study of skeletal material or a few stranded carcasses. Because the external appearance and behavior of most species are so poorly documented and apparently similar among species, it is often impossible, even for experts, to identify whales of the genus to species from sightings at sea. Even with a specimen in hand, museum preparation or genetic testing is often required for positive identification (except for adult males of some species). Useful field characters are overall size, beak length and shape, shape of mouthline, location and size of teeth, coloration and scarring patterns, and to a lesser extent, size and shape of the dorsal fin.

All species have the same basic body plan, with a laterally-compressed body. Because of the similarity and poor documentation of external morphology and coloration among species, genetic techniques have recently become invaluable in distinguishing species. In fact, a new species (*M. perrini*—see below) was recently discovered from genetic data.

Although data are now rapidly building up, the distribution of most species is also poorly documented, and is mostly known from stranding records. More information is available from the eastern tropical Pacific than for any other area, because of the extensive survey effort associated with the tuna fisheries there. Even for this area, however, the picture is very blurry.

There are 14 species of *Mesoplodon* currently recognized. The newest of these (*M. perrini*) was only described in 2002, and it is possible (perhaps even likely), that other undescribed species exist. All mesoplodonts have low, inconspicuous (usually invisible) blows and a small, triangular to slightly-falcate dorsal fin set about two-thirds of the way back from the beak tip. Most species are very similar in appearance, and in many cases only adult males are likely to be identifiable to species at sea.

Coloration is usually brownish-gray to olive, often with extensive white spots and scarring, especially in adult males. It should be noted, however, that the color pattern (along with its age and sex-related variation) is not well-known for many species. The patterns described below are subject to change as our knowledge increases. In fact, our knowledge has expanded greatly in the last few years, as more fresh specimens are examined, and the first studies of the ecology of these mysterious whales begin to take shape. For instance, we have found that several species (e.g., True's, Gray's, strap-toothed, pygmy, and Stejneger's beaked whales) have fairly complex color patterns, often with significant amounts of geographic, developmental, and sexual variation.

The tusks do not appear to be used in feeding, and are apparently used in male/male combat. It has been suggested that the variation in their size, shape, and placement is largely related to species recognition among multiple, sympatric species. The pattern of scarring is caused by intraspecific closed-mouth fighting among adult males, and has been suggested to act as an indicator of male 'quality' in aggressive intraspecific interactions. The exact pattern of scars may be useful in narrowing identifications to several species. For example, sets of closely-paired scratches suggest two teeth located near the tip of the lower jaw (such as in True's, Perrin's, and Hector's beaked whales), while more widely spaced parallel scratches may implicate species with more elevated, and widely-separated teeth set farther back in the jaws (e.g., Blainville's, pygmy, Stejneger's, Andrews', and Hubbs' beaked whales). On the other hand, Gervais', Sowerby's, Gray's, and ginkgo-toothed beaked whales have teeth that are somewhat removed from the tip of the jaw, and which do not project above the upper jaw. Thus, these species would not be expected to produce paired scars, and any scratches on their bodies would likely be single. The strap-toothed whale is a bit enigmatic. Although it has long tusks that rise over the middle of the upper jaw, they curve inwards and backwards, thus making it less likely that they would produce widely-separated paired scars. The newly-discovered spade-toothed beaked whale (external appearance unknown) may be similar.

In general, mesoplodonts are slow and sluggish. Most sightings are brief, as these whales do not spend much time on the surface. They are presumed to pursue mostly squid at great depths. Groups are usually small, almost always seven whales or less. Until recently, very little was known of their behavior and social organization. Recent studies on Blainville's beaked whales in the Bahamas suggest that adults may occur in harem-like groups, and other species may have similar social organization. Mesoplodonts are generally seen surfacing briefly, before disappearing on a long dive that may go down to 1,400 m or more. Breaching and other aerial behavior appears to be rare (but that may be partially due to the brevity of most sightings).

Generally, mesoplodonts are difficult to observe for more than short periods, due to their deep diving habits and apparent shyness of vessels. However, in recent years, sightings of more species at sea have been confirmed, and detailed long-term studies of populations of Blainville's beaked whales in the Bahamas and Hawaii have been undertaken. As opportunities for observing these mysterious animals accumulate, we will be in a position to review our knowledge over the next several years. We may find that much of what we know (or think we know) needs to be revised.

Blainville's Beaked Whale—*Mesoplodon densirostris*

(Blainville, 1817)

Recently-used synonyms None.

Common names En.–Blainville's beaked whale or dense-beaked whale; Sp.–*zifio de Blainville* or *ballena picuda de Blainville*; Fr.–*baleine a bec de Blainville*.

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Ziphiidae.

Species characteristics Blainville's beaked whales (like other species in the genus) are characterized by a spindle-shaped body, with a small head, small dorsal fin located about two-thirds of the way back from the snout tip, small and narrow flippers, and un-notched flukes.

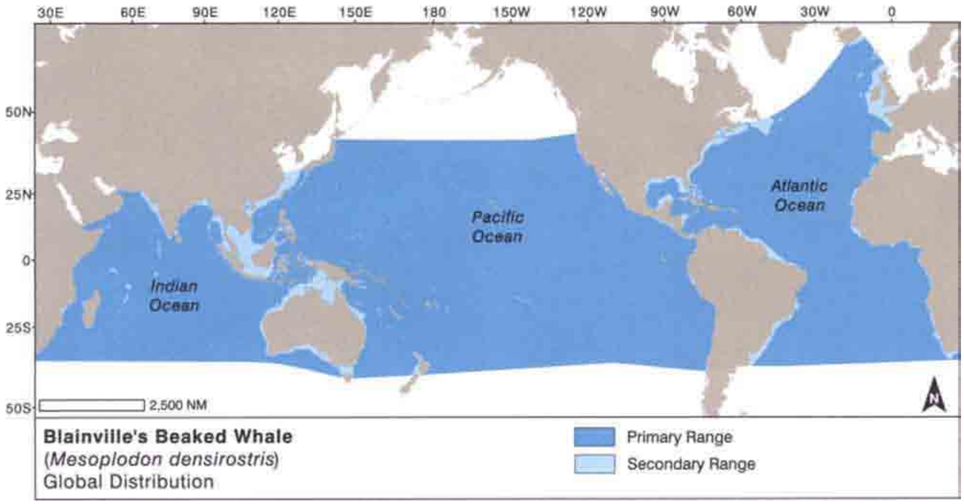
This Blainville's beaked whale is identified as an adult, because it is heavily pocked by cookie-cutter sharks, and as a female (or possibly young male), because it has no linear scars. Bahamas. PHOTO: T. PUSSER

There is also a single pair of shallow throat grooves, and the blowhole is a crescent with the ends pointing forward. The beak is moderately long in adults, but much shorter and stubbier in younger animals.

This is one of the most distinctive of the mesoplodont beaked whales. The posterior half of the lower jaw of this species is highly arched, even in females and calves. In adult males, the arches are massive and very wide; flattened tusks erupt from the top of these arches (angled forward at about 45°), and the tips extend above the top of the upper jaw. In some individuals, the tusks may be covered by a tassel of barnacles. The "cheeks" of the lower jaw arches rise up along the melon, and the melon looks relatively flat in comparison. The "cheeks" are quite wide, especially when viewed from above, and they may have a "squared-off" top.

Coloration is relatively non-descript in this species. Adult Blainville's beaked whales are brownish or blue-gray above and lighter below. Coloration of young has not been well-described, but they appear to be generally countershaded, with a dark patch around the eye. The dark areas of larger animals tend to have round or oval white scars and widely-separated, paired scratches are common on what are (often presumed to be) adult males. This species generally shows more white scratches and scarring in adult males than in most other *Mesoplodon* species. There is very often a yellowish-orange sheen (probably resulting from diatom films) to the head and anterior part of the thorax.

Maximum known size for males appears to be around 4.7 m, and for females also about 4.7 m (but on



average, females are larger than males). Weights of up to 1,033 kg have been recorded. Length at birth is presumed to be between 2.0 and 2.5 m.

Calf— Less than about 1/2 adult size, arch of lower jaw present, but not exaggerated. Dark eye patches present, body color darker than adults.

Female/subadult male— Full or nearly adult size, back dark brownish-gray in color, lower jaw arched more strongly than in calf.

Adult male— Full or adult size, back dark brownish-gray in color, with numerous white parallel scratches on back, lower jaw with massive arches, and forward-leaning triangular tusks sitting atop each arch.

Recognizable geographic forms None.

Can be confused with Generally, at sea only adult males of this species will be distinguishable from other mesoplodonts. The high arching mouthline and massive flattened tusks (often covered in barnacles) that extend above the upper jaw may allow identification of bulls, if they are observed well, but some other species (such as *M. stejnegeri*) have similar features. The massive size of the arches in Blainville's beaked whales and relatively flat-looking melon are the best clues to separate this species from other, similar-appearing ones in the genus. Coloration and head-shape differences, along with a more peaked dorsal surface, will help to distinguish this species from Cuvier's beaked whale, which overlaps its distribution extensively.

Distribution Blainville's beaked whales occur in temperate and tropical waters of all oceans. This species has the most extensive distribution of any species of the genus *Mesoplodon*, and is also one of the most tropical. Like other beaked whales, they are found mostly offshore in deep waters. A detailed analysis of habitat preferences in the Bahamas, where this species is commonly encountered, indicated that Blainville's beaked whales were found preferentially in waters of intermediate depth gradients and depths between 200 and 1,000 m (continental slope waters). These may be areas of increased prey availability caused by interactions of currents and local topography. Sightings are also common at some areas in the Hawaiian and Society Islands. They occur in many enclosed seas with deep water, such as the Gulf of Mexico, Caribbean

This unscarred, and therefore presumably female or young, Blainville's beaked whale has an unidentified orange film that is commonly seen on these animals. It may be pigmentation, diatoms, or some other factor. PHOTO: V. GLEZ

The broken teeth of adult male Blainville's beaked whales are testimony to the fierce battles they apparently wage over access to females. Bahamas. PHOTO: J. DURBAN

This dorsal view of a stranded adult male Blainville's beaked whale from Florida shows the massive boney arches that buttress the teeth in the lower jaws. PHOTO: N. B. BARROS

A battle-scarred adult male Blainville's beaked whale in Hawaii, showing old and fresh linear tooth rake marks, along with oval cookie-cutter shark bites. The pair of teeth are elevated and exposed for maximum effectiveness; they also lean inwards and may prevent full opening of the mouth. PHOTO: R. W. BAIRD

A female or young Blainville's beaked whale. Although the prominent arch in the jaw is a clue, this animal can be positively identified only by the presence of an identifiable adult male. Bahamas. PHOTO: T. PUSSER

Sea, and the Sea of Japan. However, there are only rare records of this species occurring in the Mediterranean.

Ecology and behavior There is more information available on the behavior and ecology of Blainville's beaked whale than for any other species of *Mesoplodon*. There is a population of this species that is being studied in detail in the Bahamas. Individual whales have been identified, based on natural marks, and this represents only the second case (in addition to the northern bottlenose whales in the Gully) that a beaked whale population has undergone long-term behavioral and ecological study. Groups of 3–7 Blainville's beaked whales have been recorded, although singles or pairs are most common. In the Bahamas, adults are generally grouped into what appear to be harems, with a single adult male accompanying several adult females. Subadults appear to stay in separate groups. The "harems" tend to occur in more productive waters over the continental shelf waters of canyon walls, while subadults tend to occur in less productive waters inshore and offshore of these areas.

Dives of up to 1,400 m and over 54 minutes have been recorded in Hawaiian waters. However, they also appear to spend prolonged periods in the upper layer of the water column (< 50 m deep), and this may be an adaptation to compensate for pushing the body's physiological limits on long, deep dives. Animals often lift their beaks out of the water upon surfacing, and sometimes slap them down on the surface again.

There are almost no data on sexual maturity for any mesoplodont, but a 9-year old female of this species had just reached maturity.

Feeding and prey Squid are apparently the main food items, but some deepwater fish may be taken as well. Like other mesoplodonts, they are thought to be suction feeders.

A mother Blainville's beaked whale and her very young calf. This photo clearly shows that the lower jaw arches are present even from birth in this species. PHOTO: C. MACLEOD

Two Blainville's beaked whales at the surface. The closer animal is an adult male, as indicated by the raised tusks and heavy scarring on the back and especially around the top of the head. PHOTO: T. PUSSER

Threats and status Some Blainville's beaked whales have been taken incidentally by Japanese tuna boats off the Seychelles and western Australia, as well as directly by small cetacean hunters in various areas. They are sometimes injured or killed by naval operations using mid- and low-frequency sonar, which cause multiple animals to strand over an extensive area of coastline. Subadult whales, found in more offshore waters, appear to be most vulnerable. Some may also die from ingestion of marine debris. Overall, the species appears to be fairly common in most tropical seas. Estimates of abundance are generally not available, but there are thought to be about 2,100 in waters of Hawaii.

IUCN status Data Deficient.

Gray's Beaked Whale—*Mesoplodon grayi*

von Haast, 1876

Recently-used synonyms None.

Common names En.–Gray's beaked whale or Scamperdown whale; Sp.–*zifio de Gray*; Fr.–*baleine a bec de Gray*.

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Ziphiidae.

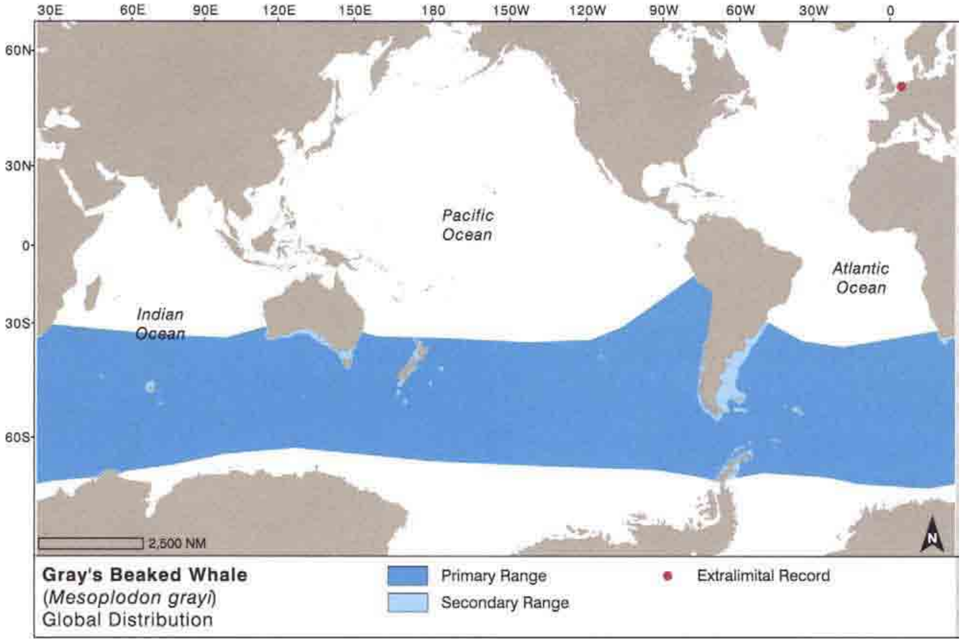
Species characteristics Gray's beaked whales are characterized by a spindle-shaped body, with a small head, small dorsal fin located about two-thirds of the way back from the snout tip, small and narrow flippers, and flukes that typically have no median notch. There is also a single pair of shallow throat grooves, and the blowhole is a crescent with the ends pointing forward. They are relatively slender, with extremely long, narrow beaks, the longest of any of the mesoplodonts. The mouthline is straight, even in bulls. It is reminiscent of the beak of the rough-toothed dolphin. The melon bulges slightly between the beak and the blowhole.

This species has a distinctive color pattern. Although mostly gray, sometimes with a tan tinge, white patches are found in the genital region and the beak (both upper and lower jaws) and much of the front of the forehead also becomes white in adults. Young animals appear to have much darker beaks and lighter bellies than adults. There may be dark patches around the eyes in young individuals. Cookie-cutter shark bite scars have been observed on the bodies of some individuals, and adult males may have a number of long linear scars on the body.

There are two triangular teeth set in the middle of the lower jaw, which erupt only in bulls, and 17–22 pairs of small teeth in the posterior half of the upper jaw. The tusks of males are located midway along the length of the mouthline, and are mostly covered in gum tissue, with only the tips exposed. They may be narrow or quite wide (up to 10 cm). A low and diffuse blow has been reported for some sightings.

Maximum known sizes are 5.6 m for males and 5.3 m for females. These animals are known to reach

A Gray's beaked whale in New Zealand, showing the tapered head; long, all-white beak; and a barely visible tooth in the middle of the lower jaw. The exposed tooth and heavy scarring indicate this is an adult male. PHOTO: G. LENTO, COURTESY OF M. DALEBOUT



weights of at least 1,100 kg. Length at birth is estimated to be between 2.1 and 2.2 m.

Recognizable geographic forms None.

Can be confused with When seen from a distance, this species may be confused with any of the other species of the genus that overlap it in distibution (e.g., Andrews', Hector's, Blainville's, and strap-toothed beaked whales). The extremely long white beak of adults (often stuck up out of the water as the animal surfaces) and straight mouthline may allow Gray's beaked whales to be distinguished from other mesoplodonts, if a good look at these features is obtained.

Distribution Gray's beaked whale is primarily a Southern Hemisphere cool temperate species, which is apparently circumantarctic in occurrence. It typically occurs in deep waters beyond the edge of the continental shelf, with most records south of 30°S. There are many sighting records from Antarctic and subantarctic waters, and in summer months they appear near the Antarctic Peninsula and along the shores of the continent (sometimes among sea ice). Many of the stranding records are from New Zealand and southern Australia, South Africa, Argentina, Chile, and Peru. The area between the South Island of New Zealand and the Chatham Islands has been suggested to be a "hot spot" for sightings of this species. There is one record of a Gray's beaked whale straying into the Northern Hemisphere, a stranding record in the Netherlands. This was almost certainly an extralimital occurrence, however.

Ecology and behavior Not a great deal is known of the biology of this species. Gray's beaked whales are seen mostly as singles or pairs; however, there is one record of a mass stranding of 25–28 of these whales (and other mass strandings are known). They are relatively frequently stranded, especially in New Zealand. Gray's beaked whales generally raise their long beaks

A genetic sample was used to identify this juvenile as a Gray's beaked whale. The long beak and clearly delineated dark head may prove to be useful for identifying young animals of this species. Western Australia. PHOTO: N. GALES

Stranded adult male Gray's beaked whale; the orientation of the tusks indicates that tooth rakes are probably going to leave single (as opposed to parallel) scars. PHOTO: G. LENTO, COURTESY OF M. DALEBOUT

Gray's beaked whales often lift their long beaks out of the water upon surfacing, facilitating identification. As there are no tusks, this is probably a female or young male. PHOTO: P. ENSOR

A stranded adult female Gray's beaked whale; as in the adult male, the entire beak, upper and lower jaws, are white. PHOTO: COURTESY OF M. DALEBOUT

out of the water when surfacing. Breaching, spyhopping, flipper-slapping, and fluke-slapping behavior has been observed, and they may almost "porpoise" out of the water when moving fast. They typically do not lift their flukes out of the water upon commencing a dive.

A female with a calf that was observed in Mahurangi Harbor, New Zealand, had a series of corrugated scars behind the dorsal fin suggesting that the animal had been struck by a vessel. Observations in such shallow waters are very unusual for this species.

Feeding and prey Like other mesoplodonts, they are thought to feed mainly on cephalopods in deep waters.

Threats and status This species may not be as rare as some other species of the genus *Mesoplodon*, based on the number of records. In particular, they seem to be fairly common around New Zealand. No significant exploitation is known, and there are no known estimates of abundance.

IUCN status Data Deficient.

References Dalebout 2002; Dalebout et al. 2004; Mead 1989; Pitman 2002.

Ginkgo-toothed Beaked Whale—*Mesoplodon ginkgodens*

Nishiwaki and Kamiya, 1958

Recently-used synonyms *Mesoplodon hotaula.*

Common names En.–ginkgo-toothed beaked whale; Sp.–*zifio Japonés* or *ballena picuda de dientes de gink-go*; Fr.–*baleine a bec de Nishiwaki*.

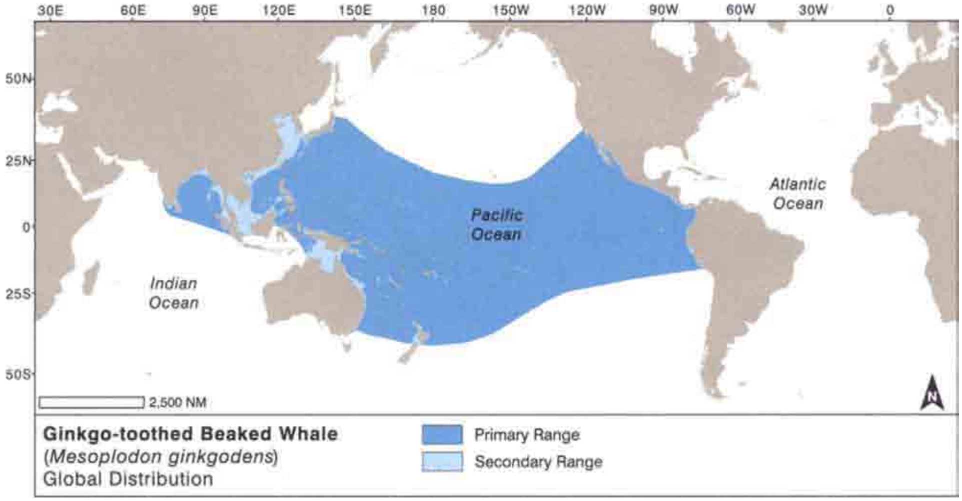
Taxonomic information Order Cetacea, Suborder Odontoceti, Family Ziphiidae. A subspecies (or even a distinct species) may occur in the tropical central/western Pacific.

Species characteristics Ginkgo-toothed beaked whales are characterized by a spindle-shaped body, with a small head, small dorsal fin located about two-thirds of the way back from the snout tip, small and narrow flippers, and un-notched flukes. There is also a single pair of shallow throat grooves, and the blowhole is a crescent with the ends pointing forward. The beak is moderate in length and the mouthline has a slight arch in adult males. The forehead has a shallow rise to it.

The color pattern is poorly-known (few fresh specimens have been examined), but appears to consist largely of basic countershading. Adult male ginkgo-toothed beaked whales are dark gray, and apparently the anterior portion of the beak is white. Females are reported to be somewhat lighter than males. It is unclear whether females share the white beak, but there is some evidence for at least a paler lower jaw in females. Light spots on the back and ventral surface of the tail stock also appear in adults. These white scars are considered to be caused by parasites (lampreys or cookie-cutter sharks). Unlike most other beaked whales, males generally have few or no white scratches (this may be due to the small amount of tooth that erupts from the gums).

Bulls have wide (up to 10 cm), round or elliptical, flattened tusks with an S-shaped outline sloping down from the point, which sit atop small arches slightly behind the middle of the lower jaw. They barely break the gumline, and most of the tusks are buried in gum tissue. Teeth

This ginkgo-toothed beaked whale from Taiwan has numerous cookie-cutter shark bites and no obvious linear scarring, correctly suggesting it is an adult female. The females of most mesoplodonts are not identifiable to species in the field, including this one. PHOTO: J. Y. WANG



do not erupt from the gums in females. In juveniles (but not adults), they resemble the leaves of the ginkgo tree.

Maximum known sizes are 5.3 m (for both males and females), although females appear to be larger on average. At birth, gingko-toothed beaked whales are thought to be about 2.0–2.5 m.

Recognizable geographic forms None.

Can be confused with The uniform dark pigmentation, small posteriorly-placed teeth, and lack of characteristic ziphiid scars make it nearly impossible to identify these animals at sea, even when adult males are seen. Generally, this species may be virtually indistinguishable from other mesoplodonts that share its range (e.g., Hubbs', Blainville's, and Stejneger's beaked whales).

The arched beak of this adult female ginkgo-toothed beaked whale from Japan suggests that the teeth of adult males probably erupt in the middle of the lower jaw. This is a species with a medium-sized beak – otherwise skull characteristics and/or genetics will be needed to identify animals such as this. PHOTO: K. NAKAMURA, COURTESY OF T. YAMADA

Distribution The ginkgo-toothed beaked whale is known from a few dozen widely-scattered (albeit sparse) strandings and captures (no sightings) in temperate and tropical waters of the Indo–Pacific Ocean, from Sri Lanka, east to the shores of North America and the Galapagos Islands. There have been a few records from New Zealand, indicating that this species also inhabits the southern Indo–Pacific. Most records are from the seas around Japan. Sightings of what may have been this species were also made in the Arabian Sea. It is generally hypothesized that the range is continuous across the Pacific and at least to the eastern Indian Ocean, but until the species can be identified at sea, its true distribution will probably remain unknown.

Ecology and behavior Almost nothing is known of the ecology and biology of the ginkgo-toothed beaked whale, short of what little has been gleaned from stranded specimens. It has never been reliably identified alive in the wild.

Feeding and prey Ginkgo-toothed beaked whales are presumed to be primarily squid eaters, but may also take some fish.

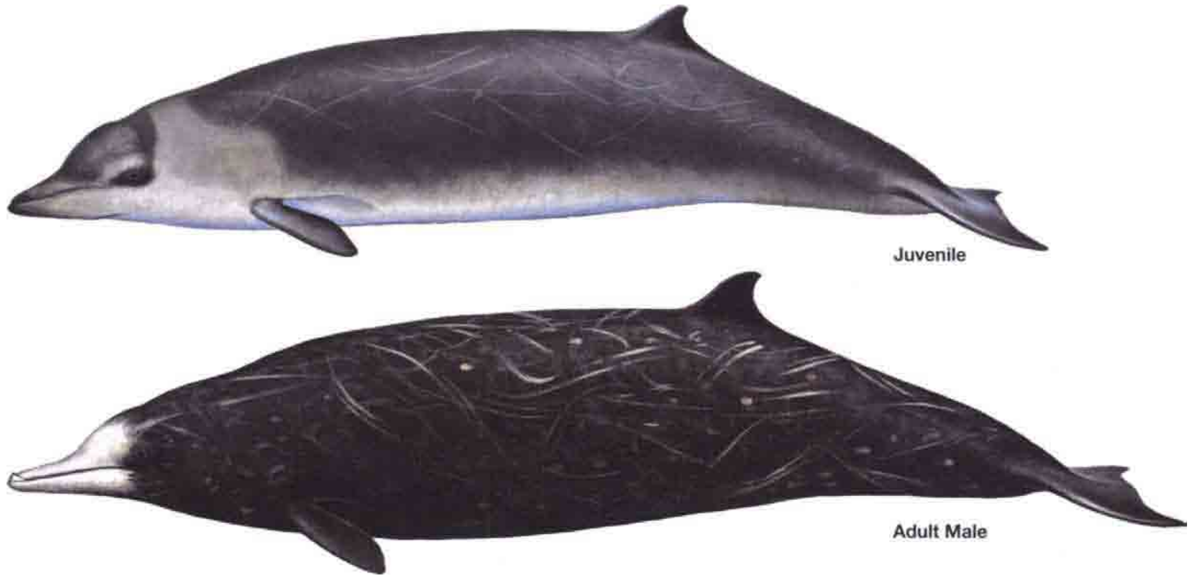
Threats and status Ginkgo-toothed beaked whales have occasionally been taken by Japanese and Taiwanese whalers, and some have been caught in deepwater drfit gillnets. There are no estimates of abundance, but the species does not appear to be very common.

IUCN status Data Deficient.

References Dalebout 2002; Dalebout et al. 2007; Mead 1989; Pitman 2002.

Hector's Beaked Whale—*Mesoplodon hectori*

(Gray, 1871)



Recently-used synonyms None.

Common names En.–Hector's beaked whale; Sp.–*zifio de Hector* or *ballena picuda de Hector*; Fr.–*baleine a bec de Hector*.

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Ziphiidae. Several sightings and strandings of beaked whales originally thought to be this species occurred in southern and central California in the 1970s. However, these are now known to have been Perrin's beaked whales (see below).

Species characteristics Hector's beaked whales are characterized by a spindle-shaped body, with a small head, small dorsal fin located about two-thirds of the way back from the snout tip, small and narrow flippers, and un-notched flukes. There is also a single pair of shallow throat grooves, and the blowhole is a crescent with the ends pointing forward. In adults, the beak is quite long, and the mouthline is relatively straight.

The single pair of flattened, triangular tusks are moderate in size and they are located near the tip of the lower jaw. They erupt only in bulls, and may be angled slightly outwards.

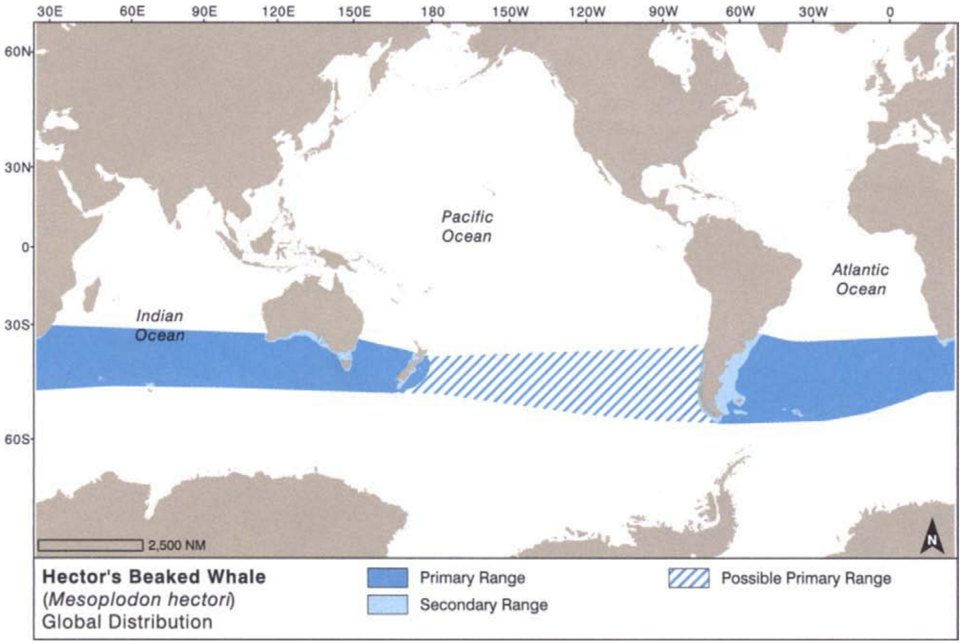
Body color of Hector's beaked whales was not well-known until recently (2006), as few fresh specimens had been examined. However, it is now known that adult males are dark gray-brown above and slightly lighter below. Single and closely-paired scratches, as well as white cookie-cutter shark scars, may be present on the body. The most distinctive feature of the adult male is its' white beak and anterior part of the head (although this description is based on only one specimen). Females and young, in contrast, appear to be relatively non-descript. In at least some individuals, probably younger animals, there is a dark patch surrounding the eye and running forward to connect to the melon and upper beak. The lower jaw may be light in color.

Specimens of up to 4.3 m have been reported, although few have been measured. Females are probably slightly larger than males. Size of newborns is unknown, but is presumably about 1.9–2.0 m.

Recognizable geographic forms None.

Can be confused with If adult males are not present, it may be nearly impossible to identify these animals at sea. For bulls, the placement of the flattened teeth at

This juvenile Hector's beaked whale was identified from a genetic sample; otherwise it appears to be virtually indistinguishable from several other species. Western Australia. PHOTO: N. GALES



the tip of the lower jaw, in combination with their white beaks and closely-paired scratches, should allow them to be distinguished from other species of *Mesoplodon* that are sympatric, if the head is seen quite well. Of the species that share the range of Hector's beaked whale, Gray's beaked whale can be similar in appearance. For adult males, note the presence (Hector's) or absence (Gray's) of paired scratches, and placement of the tusks at the tip (Hector's) or middle (Gray's) of the lower jaw.

Distribution Hector's beaked whale is considered to be a Southern Hemisphere cool temperate species. The records (mostly strandings) are from southern South America, South Africa, southern Australia, and New Zealand. The single sighting record is from southwest Australia. It has been speculated that the species has a continuous distribution in the Atlantic and Indian oceans at least from South America to New Zealand. Although there are no current records from the central and eastern Pacific Ocean, the range may prove to be circumpolar. They may be relatively common around New Zealand.

This is the only known photo showing the color pattern of an adult male Hector's beaked whale, this one stranded in Argentina. The all-white upper and lower jaws, and long tapering head are similar to Gray's, but the teeth at the tip of the jaw distinguish this species. PHOTO: COURTESY OF H. L. CAPPOZZO AND T. PUSSER

Ecology and behavior Almost nothing is known of the biology of the Hector's beaked whale. Most of what had previously been attributed to this species was later found to be referable to Perrin's beaked whale (when that species was described in 2002). Even the external appearance was not adequately described until recently.

In the only known confirmed identification of this species alive at sea, a single individual was observed nearshore in western Australia—almost definitely atypical for the species. The animal breached several times near a research vessel. It dove for periods of up to 4 minutes, but these are clearly not representative of the diving capabilities of this species.

Feeding and prey Little is known of the diet, but Hector's beaked whales are known to feed on squid, like most other beaked whales.

Threats and status There are no known threats, and no estimates of abundance. It is possible that this species is naturally rare; however, the paucity of records may have much to do with the challenge of identifying it at sea.

IUCN Status Data Deficient.

References Cappozzo et al. 2005; Dalebout et al. 2002; Mead 1989; Pitman 2002.

Perrin's Beaked Whale—*Mesoplodon perrini*

Dalebout, Mead, Baker, and van Helden, 2002

Recently-used synonyms None.

Common names En.–Perrin's beaked whale; Sp.–*zifio de Perrin*; Fr.–*baleine a bec de Perrin*.

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Ziphiidae. In the 1970s, several sightings and strandings of beaked whales thought to be Hector's beaked whales occurred in California. Genetic evidence recently indicated that a new species was actually involved, and these are now known to have been Perrin's beaked whales.

Species characteristics Externally, this species appears very similar to Hector's beaked whale, and in fact, the two were thought to be the same until *M. perrini*'s description in 2002. It has a spindle-shaped body, with a small head and a slight bulge to the melon, small dorsal fin located about two-thirds of the way back from the snout tip, small and narrow flippers, and un-notched flukes. There is also a single pair of shallow throat grooves, and the blowhole is a crescent with the ends pointing forward. The beak is shorter than in any other *Mesoplodon*, except pygmy beaked whales; it is even shorter in calves.

Apparently, these animals are countershaded, with a dark gray back and whitish belly. Adult males, at least, have a white patch around the umbilicus, and a mask of dark gray color extending from near the gape to the eye and from there dorsally. The lower jaw and throat are light in color. The ventral surface of the flukes exhibits white striations. Any tooth scrapes on adult males tend to be singular, not paired. Cookie-cutter shark scars may be present on the body.

The flattened, triangular tusks of adult males are situated just behind the tip of the lower jaw, and the mouthline is relatively straight. The tusks are splayed outwards at an angle of about 15°, and barnacles may infest the teeth. Females may have similar teeth, but they do not erupt.

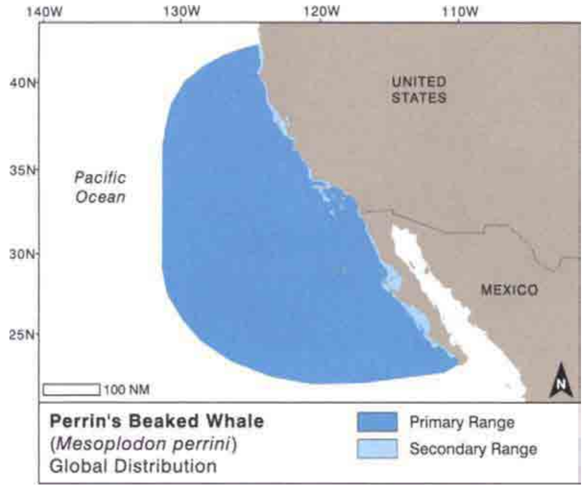
Only five specimens have been examined, but these indicate that the animals can grow to at least 4.4 m (females) and 3.9 m (males).

Recognizable geographic forms None.

Can be confused with Only adult males will likely be identifiable from their external appearance. Perrin's beaked whale is most likely to be confused with Hector's beaked whale; however, the two probably do not overlap in distribution. A specimen of unknown origin will require expert examination of the skull or genetic analyses to distinguish the two with certainty.

Distribution All five specimens so far examined have been from southern and central California (between 32° and 37°N), and it is likely that this species is endemic to the North Pacific Ocean (possibly even the Eastern

Almost nothing is known about the color pattern of Perrin's beaked whale, but the adult male's large, protruding, triangular teeth at the end of a short beak should allow for positive identification at sea. Southern California. PHOTO: J. G. MEAD



North Pacific). Like other members of the genus, it presumably prefers oceanic habitats with waters > 1,000 m deep, and sightings thought to be of this species have occurred in deep waters.

Ecology and behavior This is one of the most recently discovered species of marine mammal; its original description was only published in July 2002. Almost nothing is known of its biology or behavior. The specimens that are currently known were mostly erroneously thought to have been Hector's beaked whales in the past. The only possible sightings are of two groups off southern California, and they are not confirmed to be of this species. Calves may be weaned by the time they reach about 2.5 m in length.

Feeding and prey Based on a limited sample of stomach contents, Perrin's beaked whale probably feeds mainly on squids (including *Octopoteuthis* sp.). The remains of an unidentified invertebrate have been found in the stomach of an animal stranded in California.

Threats and status All records have been of strandings, so nothing is known of potential threats. No estimates of abundance exist.

IUCN status Not Listed.

References Dalebout 2002; Dalebout et al. 2002; Pitman 2002.

Hubbs' Beaked Whale—*Mesoplodon carlhubbsi*

Moore, 1963

Recently-used synonyms None.

Common names En.–Hubbs' beaked whale; Sp.–*zifio de Hubbs* or *ballena picuda de Hubbs*; Fr.–*baleine a bec de Hubbs*.

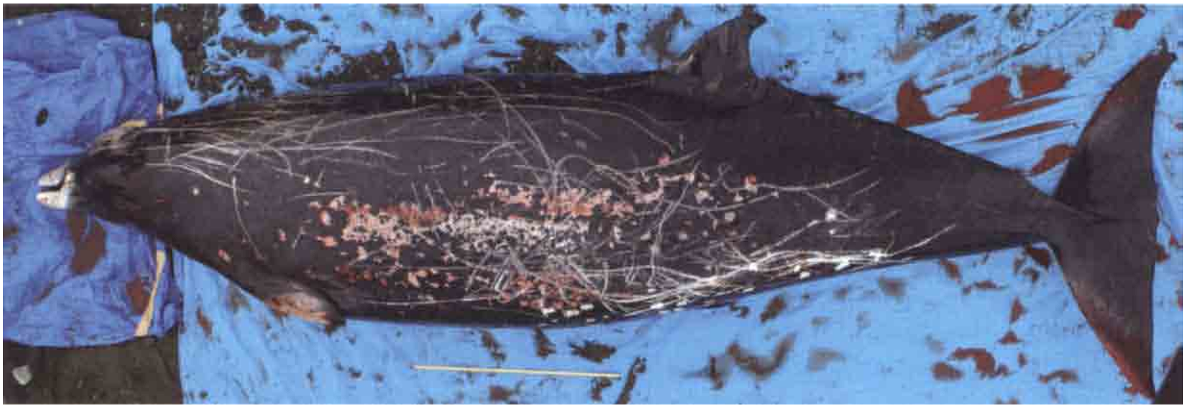
Taxonomic information Order Cetacea, Suborder Odontoceti, Family Ziphiidae. In the past, there was some suggestion that this species may simply be a subspecies of *M. bowdoini* (and some previous records were erroneously attributed to that species), but recent genetic studies confirm its specific distinctness.

Species characteristics Hubbs' beaked whales are characterized by a spindle-shaped body, with a small head, small dorsal fin (generally 22–23 cm high in adults) located about two-thirds of the way back from the snout tip, small and narrow flippers, and un-notched flukes. There is also a single pair of shallow throat grooves, and the blowhole is a crescent with the ends pointing forward. The beak is fairly short and there is a strong "arch" to the lower jaw of adult males, although the arch is more subdued in females. The length of the arched area is much smaller than in the Blainville's beaked whale (<1/3 of the lower jaw vs. well over 1/2). There is a distinct bulge on the melon.

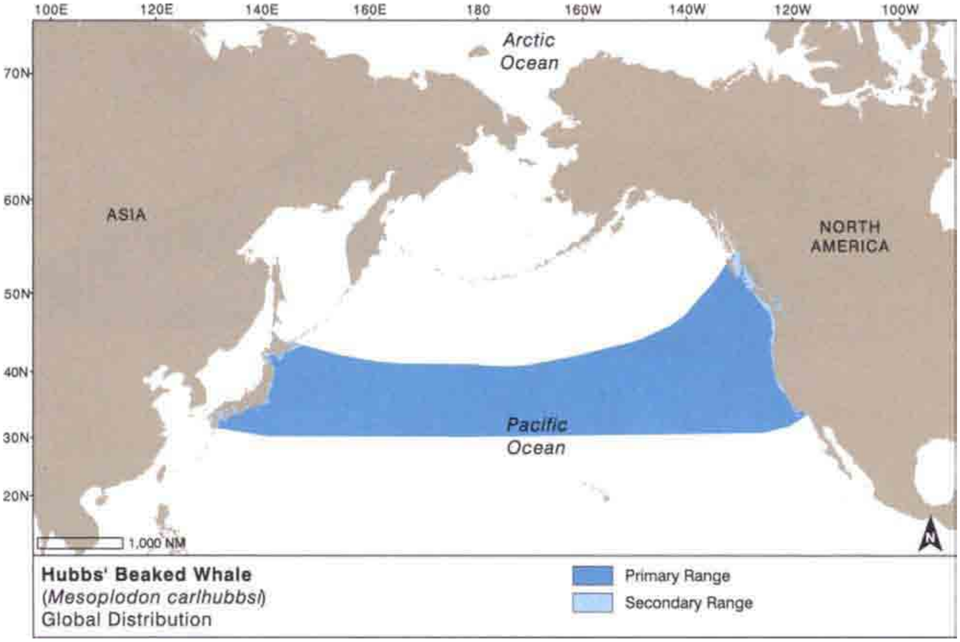
Males have massive flattened tusks erupting from the middle of narrow arches in each side of the lower jaw. The "arch" is actually mostly gum tissue surrounding the tusk, and only the tips of the teeth are exposed. The tusks protrude above the level of the upper jaw.

The basic body color is dark gray to black. Adult males of this species are more readily identifiable than individuals of most other species of mesoplodont. They have a white beak and a brilliant white "cap" or "beanie" on the melon ahead of the blowhole. The combination of these two features is diagnostic. Females and young are more generic, being more-or-less countershaded, but they may also have a light beak. Adult males are generally covered with long scratches, many of which are arranged in pairs.

Maximum known size for both sexes is about 5.3–5.4 m. Weights of over 1,500 kg are attained. Newborns are thought to be about 2.5 m long.



Adult male Hubbs' beaked whales are readily identified by their stout white beak (upper and lower jaws) and white patch on the top of the head in front of the blowhole. Despite this, sightings at sea have been rare. Japan. PHOTO: COURTESY T. YAMADA



Recognizable geographic forms None.

Can be confused with If a good look is obtained of the head, the white "beanie" and beak tip, and large tusks may allow bulls of this species to be distinguished from other species of *Mesoplodon*. Other age classes will be nearly impossible to distinguish from congeners, based on their external appearance. Genetic testing or cranial examination may be required.

Distribution Apparently limited to the North Pacific Ocean, Hubbs' beaked whale is known from central British Columbia to southern California in the east, and from Japan in the west. Sightings have been made off the coast of Oregon. It is an oceanic species, and the range is thought to be continuous across the North Pacific, although this is not confirmed.

Head of a 523 cm female *Mesoplodon carlhubbsi* that stranded in Oregon. The white upper and lower jaw separates it from other mesoplodonts within its North Pacific range. The crescentic blowhole is visible just behind the melon and the eye is located between the two large white pigment patches on the face. PHOTO: M. GRAYBILL

Ecology and behavior Very little is known about the biology of this species, as only a few reliable sightings at sea have been made. This is somewhat surprising, as this is one of the more distinctive species of the genus (at least for adult males). The long, white, parallel scratches on the bodies of males are thought to be caused by closed-mouth fighting in this and other mesoplodonts. Hubb's beaked whale has particularly dense bone in the rostrum as an adaptation to strengthen the upper jaw for such combat. Not much is known of the reproductive biology of this species, but calving may occur mainly in summer months.

Feeding and prey Hubbs' beaked whales feed on squid (including the genera *Gonatus*, *Onychoteuthis*, *Octopoteuthis*, *Histioteuthis*, and *Mastigoteuthis*) and some deepwater fishes.

Threats and status Hubbs' beaked whale has occasionally been taken by Japanese whalers in several small cetacean fisheries. Incidental catches in drift gillnets occur off the coast of California. There are no estimates of abundance.

IUCN status Data Deficient.

Pygmy Beaked Whale—*Mesoplodon peruvianus*

Reyes, Mead, and Van Waerebeek, 1991

Adult Female

Adult Male

Recently-used synonyms None.

Common names En.–pygmy beaked whale; Sp.–*ballena picuda*; Fr.–*baleine a bec pygmée*.

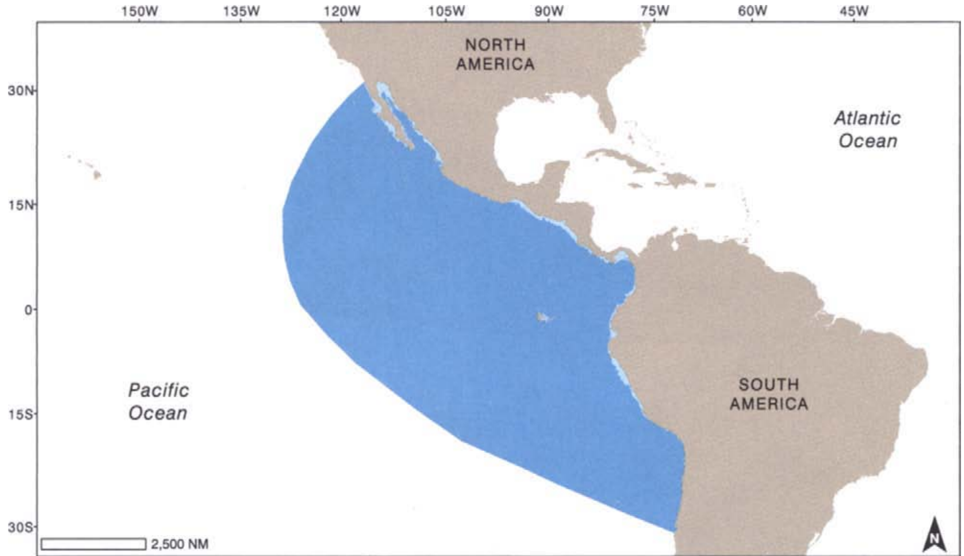
Taxonomic information Order Cetacea, Suborder Odontoceti, Family Ziphiidae. The pygmy beaked whale was described as a new species only in 1991. Whales now known to be of this species had previously been sighted in the eastern tropical Pacific. Since it was unknown to what species they belonged, they were listed in some previous field guides as "*Mesoplodon* sp. A."

Species characteristics The pygmy beaked whale is one of the most recently described members of the genus, and appears to be the smallest of the species of *Mesoplodon*. These whales are characterized by a spindle-shaped body, with a small head with a slightly bulging melon, short beak, dorsal fin located about two-thirds of the way back from the snout tip, small and narrow flippers, and un-notched flukes. There is also a single pair of shallow throat grooves, and the blowhole is a crescent with the ends pointing forward. These animals have fairly short beaks, and slightly arched mouthlines. Their small, triangular, wide-based dorsal fins are shaped quite like those of harbor porpoises, and their tail stocks are deepened.

Two morphs exist, a scarred black and white form with a white swathe across the back that is easily identified in the field (apparently adult males), and another one that is largely uniformly colored on the back (females and subadults). The latter tend to be dark brownish-gray above and lighter below, with relatively little scarring.

The most distinctive characteristic is the teeth, however, which erupt from the middle of the lower jaw in adult males. They are quite small and oval or egg-shaped

Adult male pygmy beaked whale photographed from a helicopter in the eastern tropical Pacific. A combination of white pigmentation and tooth scarring from other males produce what appears to be a large white chevron on the back. Parallel tooth rake marks are clearly visible and two white areas near the front of the beak indicate where this animal's teeth have erupted. PHOTO: C. STINCHCOMB; NOAA FISHERIES/SWFSC



Pygmy Beaked Whale
(*Mesoplodon peruvianus*)
Global Distribution

Primary Range
Secondary Range

in cross section (although generally they are not visible in at-sea sightings). They lean forward at an angle of 20–40°. The mouthline has a slight to moderate arch.

This is the smallest known species of *Mesoplodon*; maximum known length is only about 3.7–3.9 m in both sexes. At birth, these animals are probably about 1.6 m long.

***Calf*—**Approximately 1/2 to 2/3 the length of adults, coloration simply countershaded.

***Female/subadult*—**Adult size, lower jaw with slight arch, no erupted teeth, back grayish-brown with lighter belly, scarring minimal or absent.

***Adult male*—**Adult size, body may be especially robust, most of upper body dark brown to black, prominent white or cream-colored blaze extending from ventral area forward over back to just behind head (may present appearance of a chevron), often white beak tip, light patches on lower jaw near teeth, white scratches moderate to extensive, lower jaw moderately arched, with protruding tusks.

Recognizable geographic forms None.

Can be confused with Adult male pygmy beaked whales may be easily distinguishable from other mesoplodonts in their range (several species, but only *M. densirostris* appears to be common) by the presence of a broad light swathe that runs from the head and down the sides, on the otherwise dark brown or black body. Females and immatures are not easily distinguishable

A probable pygmy beaked whale, most likely a young male. It has scratches on its back, but the large white chevron that identifies older males is just starting to appear. Off western Mexico. PHOTO: M. CARWARDINE

Pygmy beaked whales surface in the rain; the low, triangular dorsal fins and 4 m body length distinguish this species. Eastern tropical Pacific. PHOTO: M. RICHLEN, NOAA FISHERIES/SWFSC

from other mesoplodonts. It is likely that osteological or genetic methods will need to be used to identify anything other than adult males.

A female pygmy beaked whale found floating dead in the eastern tropical Pacific; note the low, triangular dorsal fin. PHOTO: NOAA FISHERIES/SWFSC

Distribution The pygmy beaked whale is known from a handful of specimens and several dozen sightings from the eastern tropical/warm temperate Pacific, including the Gulf of California. These records extend from about 30°S to 28°N, and suggest that the species may be an eastern Pacific endemic. However, there is a single record of a stranding in New Zealand, possibly suggesting that this species may have a more extensive distribution than previously believed. Alternatively, the New Zealand record may be an extralimital wandering. This is the most frequently sighted *Mesoplodon* whale in the eastern tropical Pacific (ETP). Like other members of the genus, it occurs in deep waters beyond the continental shelf.

Ecology and behavior Most groups have been of about two animals (average is 2.3 individuals), but have ranged up to five. The behavior of these animals appears to be similar to that of other species of mesplodonts. Groups may include mixed sex and age classes. During a sighting of a single male in the ETP, the animal breached three times.

Virtually nothing is known of the reproductive biology of this species. Small calves are generally not seen in the ETP late in the year, when effort there is concentrated, which suggests either a calving peak early in the year or that females segregate from adult males during the calving season.

Feeding and prey The diet consists of small midwater fishes, oceanic squids, and shrimps. Presumably, these are taken at moderate to great depths.

Threats and status Little is known of the pygmy beaked whale's status or threats. They are killed in drift gillnets for sharks off Peru. Although there are no estimates of abundance available, they are seen quite frequently in the ETP, and they do not seem to be rare there.

IUCN status Data Deficient.

References Dalebout 2002; Pitman 2002; Pitman et al. 1987; Pitman and Lynn 2001; Reyes et al. 1991.

Sowerby's Beaked Whale—*Mesoplodon bidens*

(Sowerby, 1804)

Recently-used synonyms None.

Common names En.–Sowerby's beaked whale or North Sea beaked whale; Sp.–*zifio de Sowerby*; Fr.–*baleine a bec de Sowerby*.

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Ziphiidae.

Species characteristics Sowerby's beaked whales are characterized by a spindle-shaped body, with a small head, small dorsal fin located about two-thirds of the way back from the snout tip, small and narrow flippers, and un-notched flukes. There is also a single pair of shallow throat grooves, and the blowhole is a crescent with the ends pointing forward. Although there is some variation, Sowerby's beaked whales have a long and thin (for mesoplodonts) beak and often a prominent bulge on the forehead. There may be a very slight arch to the lower jaw, but typically the mouthline is straight.

The two flattened, triangular tusks of adult males erupt from the lower jaw, about two-thirds of the way back from the beak tip. They are visible outside the closed mouth, although they are not particularly large.

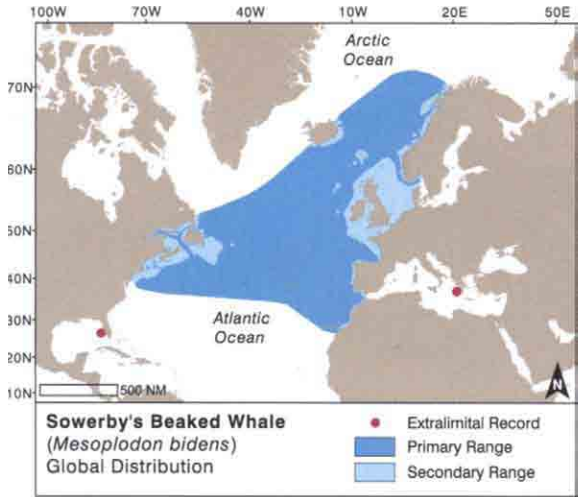
Coloration is not well-known, but generally appears to be indistinctive, with a charcoal gray back and somewhat lighter belly. White or light gray spots are common on the bodies of adults; however, young animals appear to have less spotting. Scarring of adult males is generally in the shoulder region and lower flanks. The scars generally consist of single scratches (not paired).

Males reach lengths of at least 5.5 m and females, 5.1 m. They attain weights of at least 1,300 kg. Newborns average about 2.4 m.

Recognizable geographic forms None.

Can be confused with Sowerby's beaked whales can be confused with other North Atlantic species of *Mesoplodon* (e.g., True's, Gervais', and Blainville's

An adult female Sowerby's beaked whale. This is the only long-beaked mesoplodont that normally occurs in the North Atlantic. The small melon gives the head a very tapered look; note also the rather straight gape. Eastern North Atlantic. PHOTO: COURTESY S. LEATHERWOOD



beaked whales); without a close look, even bulls would be difficult to distinguish from related species at sea. However, the limited distribution and presence of a long beak (and posteriorly-set tusks in males) may help to make an identification, if the head is seen well. This species may also appear somewhat darker than others in its range.

Distribution Sowerby's beaked whales are known almost exclusively from the colder waters of the North Atlantic, from at least Massachusetts to Labrador in the west, and from Iceland to Norway in the east. This is the most northerly distributed of the Atlantic species of *Mesoplodon*, and most records are north of 30°N. The range is known to include the Baltic Sea, but only rarely (possibly as a stray) the Mediterranean. The species appears to be more common in the eastern North Atlantic than in the western. Based on strandings, northern Europe appears to be the center of abundance. There is a single record from Florida in the Gulf of Mexico, but this appears to represent an extralimital wandering. As with other members of the genus, it occurs in deep waters past the continental shelf edge.

Ecology and behavior Very little is known of the natural history of this species beyond what has been learned from occasional sightings and strandings, which have generally involved singles and pairs. However, in several sightings observed at sea off Nova Scotia, groups ranged in size from 3–10 and some were of mixed composition. Mass strandings of up to six individuals of this species have been recorded. Recorded dives lasted 12–28 minutes. These whales often bring their heads up out of the water at a 45° angle when surfacing, and often arch their backs relatively high when diving. Breaching, spy-hopping, and fluke-slapping have been observed in sightings at sea. There have also been some instances in which the animals approached vessels.

This Sowerby's beaked whale provides a good view of the head and beak, which is essential for distinguishing this species from the other three North Atlantic species of the genus (True's, Gervais', and Blainville's beaked whales).
PHOTO: J. QUARESMA

A Sowerby's beaked whale mother and calf surface, lifting their heads out of the water in the eastern North Atlantic.
PHOTO: J. QUARESMA

The breeding season for Sowerby's beaked whale appears to be late winter to spring. Males possess tusks, which are presumably for male/male combat over access to females (as in other species of the genus). As they reach maturity, structural changes in the tusks and lower jaw occur, which strengthen and reduce the prospects of injury to them. Essentially nothing else is known about the reproductive biology of this species.

Feeding and prey Sowerby's beaked whales feed on squid and small fish, including Atlantic cod.

Threats and status There is little specific information on the status or threats to this species, and no abundance estimates exist. However, some are known to have been incidentally killed by whalers in Newfoundland, Iceland, and in the Barents Sea. A few entanglements in fishing gear (e.g., driftnets) have been documented. Sowerby's beaked whale is not thought to be endangered.

IUCN status Data Deficient.

References Coles 2001; Hooker and Baird 1999; Mead 1989; Pitman 2002.

Gervais' Beaked Whale—*Mesoplodon europaeus*

(Gervais, 1855)

Recently-used synonyms *Mesoplodon gervaisi.*

Common names En.–Gervais' beaked whale; Sp.–*zifio de Gervais*; Fr.–*baleine a bec de Gervais*.

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Ziphiidae.

A whale, thought to be a Gervais' beaked whale, surfaces in the northern Gulf of Mexico. PHOTO: K. D. MULLIN

A beaked whale, thought to be a Gervais' beaked whale, with coloration very similar to that in the previous photo. Off North Carolina. PHOTO: G. ARMISTEAD, COURTESY T. PUSSER

Species characteristics Gervais' beaked whales are characterized by a spindle-shaped body, with an especially small head, small dorsal fin located about two-thirds of the way back from the snout tip, small and narrow flippers, and un-notched flukes. There is also a single pair of shallow throat grooves, and the blowhole is a crescent with the ends pointing forward. The beak is fairly short, and generally blends smoothly into the forehead.

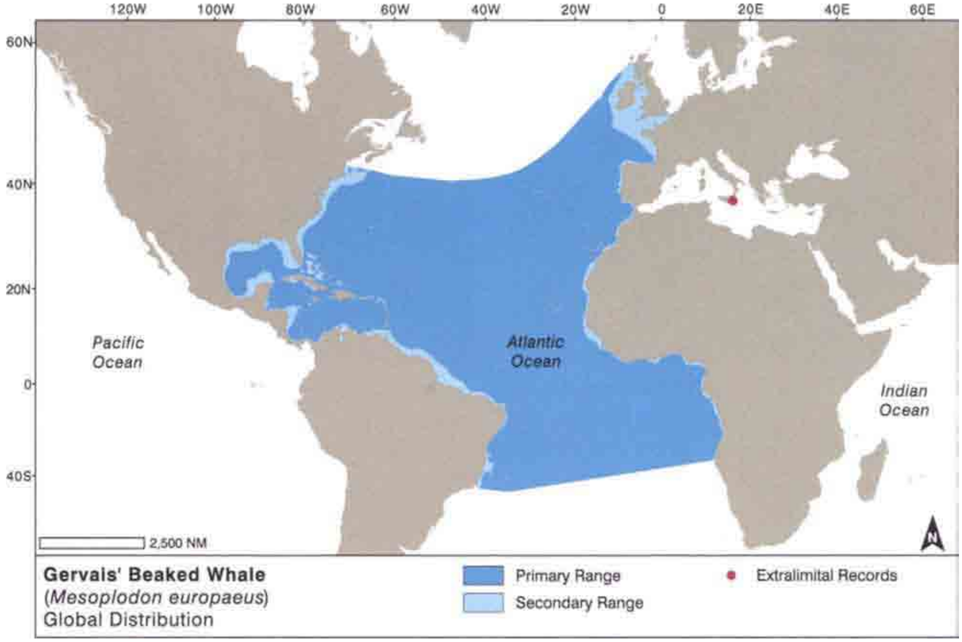
The triangular teeth of adult males are found one-third of the distance from the tip of the lower jaw. Although they are mostly buried in gum tissue, the exposed tips are angled slightly outwards, and are visible outside the closed mouth. They may fit into grooves in the gums of the upper jaw. The mouthline tends to be relatively straight (with only a slightly raised area around the tusks).

Gervais' beaked whales have a relatively nondescript mesoplodont color pattern. They are dark gray above and lighter gray below. In young animals, the belly is white, but it appears to darken with age. In females, there is often a white patch in the genital area. Scarring is generally not heavy, even on adult males, and any scars present are generally single lines. There is often a dark patch around the eye, which appears to be more pronounced in this species than in some other mesoplodonts.

Gervais' beaked whale males attain lengths of at least 4.6 m, and adult females reach at least 4.8 m. Females appear to be larger, on average. Weights of at least 1,200 kg are attained. Newborns are about 2.1 m in length.

Recognizable geographic forms None.

Can be confused with Due to their relatively generic color pattern and non-distinctive tusks, Gervais' beaked whales are extremely difficult to distinguish from



overlapping mesoplodonts at sea. In the North Atlantic, it may be nearly impossible difficult to distinguish them from True's beaked whales (if no adult males are present). Only a very detailed view of the head of an adult male would allow identification, and that would be based largely on tusk shape and position. Genetic study or details of the morphology of the skull will generally be required for positive identification.

Distribution Although sometimes depicted as a North Atlantic endemic, this species is probably continuously distributed in deep waters across the tropical and temperate Atlantic Ocean, both north and south of the equator. Most records are from the east and Gulf coasts of North America, from New York to Texas, but Gervais' beaked whales are also known from several of the Caribbean islands. This is the most commonly stranded beaked whale in the southeastern United States. In the eastern Atlantic, they are known from the British Isles to Guinea-Bissau in West Africa. There is only one record of this species from the Mediterranean. There are also strandings at Ascension Island in the central South Atlantic, and along the coast of Brazil. There is speculation that its Southern Hemisphere distribution could extend to Uruguay and Angola.

Ecology and behavior The favored habitat of Gervais' beaked whales appears to be warm temperate and tropical waters. Little else is known of their biology. They have only rarely been reliably identified alive in the wild, mostly in the eastern Atlantic, although many *Mesoplodon* sightings in the Gulf of Mexico are thought to have been of this species. Around the Canary Islands, they sometimes lift their heads out of the water upon surfacing. Live-stranded individuals have been held in captivity for short periods of time.

Growth layer group counts in the teeth of one specimen suggest they live to at least 48 years of age. Other aspects of their life history are not known.

Feeding and prey Like other members of the genus, Gervais' beaked whales are known to feed primarily on squid, although some fish may be taken as well. There is also a record of a mysid shrimp found in the stomach of a stranded specimen.

Threats and status Specimens of Gervais' beaked whale have been entangled and killed in pound nets off

A Gervais' beaked whale from the Canary Islands, confirmed by genetic analysis of a biopsy sample; it was with an adult male and is presumably an adult female. Notice the dark dorsal ridge and the perpendicular wavy lines. PHOTO: V. MARTIN

This, and the photograph below, show the same adult male Gervais' beaked whale. In the first, the erupted teeth are just visible, and the head is not as flat or the teeth raised as high as in Blainville's beaked whale. Off North Carolina. PHOTO: S. HOWELL

A Gervais' beaked whale; a female with this male was genetically identified as this species. Apparently, the teeth aren't raised high enough in this species to produce parallel tooth rake marks, as in *M. densirostris*. Canary Islands. PHOTO: V. MARTIN

This Gervais' beaked whale shows what appear to be linear tooth rake marks from other males; why these did not heal white, as in most other beaked whales, is not known. Off North Carolina. PHOTO: S. HOWELL

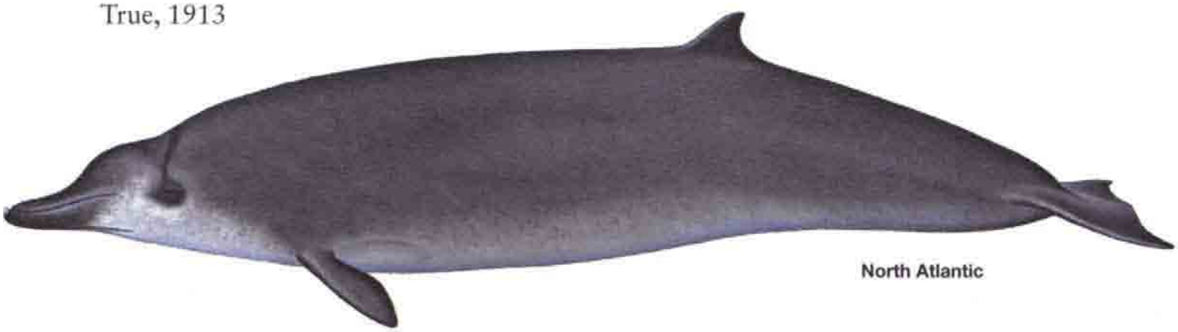
New Jersey. Based on the frequency with which they strand, they are presumed to be relatively common in waters along the east coast of North America. No specific estimates of abundance exist; however, about 100 *Mesoplodon* whales occur in the northern Gulf of Mexico (most of which are probably of this species).

IUCN status Data Deficient.

References Coles 2001; Mead 1989; Norman and Mead 2001; Pitman 2002.

True's Beaked Whale—*Mesoplodon mirus*

True, 1913



Recently-used synonyms None.

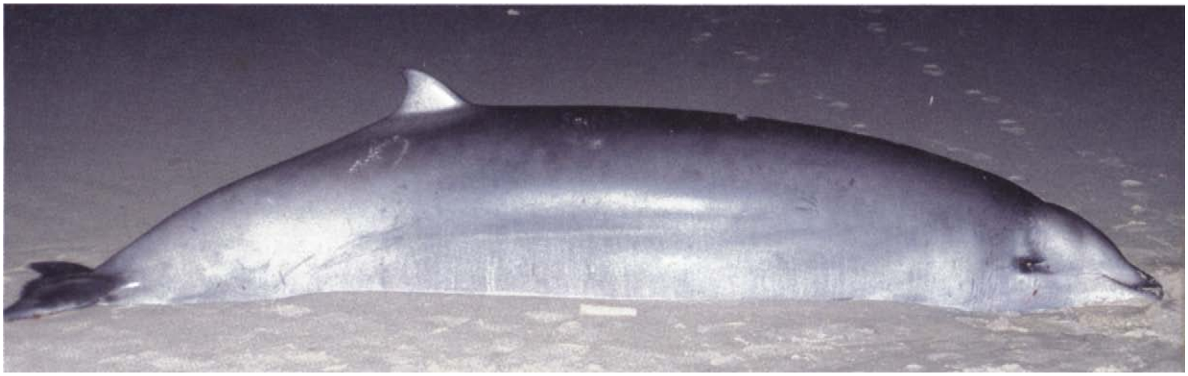
Common names En.–True's beaked whale; Sp.–*zifio de True*; Fr.–*baleine a bec de True*.

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Ziphiidae. Two geographic forms are recognized (see below), and they appear to be genetically quite distinct.

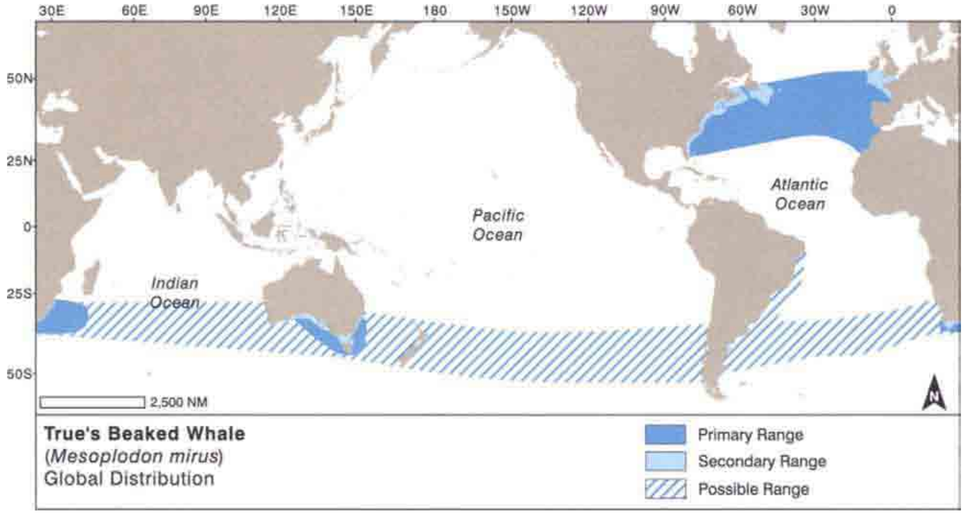
Species characteristics True's beaked whales are characterized by a spindle-shaped body, with a small head, small dorsal fin located about two-thirds of the way back from the snout tip, small and narrow flippers, and un-notched flukes. There is also a single pair of shallow throat grooves, and the blowhole is a crescent with the ends pointing forward. The forehead transitions into a moderately-short beak, with a straight or slightly-curved mouthline. The melon tends to be rounded and prominent, reminiscent of that of the bottlenose dolphin. Some animals may have a distinct indentation behind the blowhole.

The overall color pattern appears to be one of basic countershading, with a light belly and darker sides and back. However, there is significant geographic variation (see below). There is generally a dark ring around the eye, which often connects by a narrow line to the darker color on top of the head. There may be dark flecking on the throat and lower jaw, which probably increases with age. There is also a white urogenital patch in some animals. Calves may have a more simple countershaded pattern.

These animals usually show little or no scarring. However, any scarring that exists is generally in the form of closely-spaced parallel scratches. The existence of two



A stranded True's beaked whale, providing a good view of the body shape. PHOTO: COURTESY S. LEATHERWOOD



apparently widely-separated and morphologically-distinct forms suggests possible subspecific (or even specific) differentiation. However, this remains to be confirmed.

These beaked whales are characterized by the position of the mandibular teeth at the very tip of the lower jaw. The small tusks are oval in cross-section (i.e., acorn-shaped), lean forward, and are visible outside the closed mouth of adult males. The blow is usually bushy or indistinct.

Both sexes are known to reach lengths of up to about 5.3–5.4 m (with females presumably slightly larger). Weights of up to 1,400 kg have been recorded. Newborns are probably between 2.0 and 2.5 m long.

These animals were previously identified as True's beaked whales, but they are indistinguishable from the Gervais' beaked whale on page 133; clearly we have more to learn about mesoplodont identification. Off North Carolina. PHOTO: M. TOVE

Recognizable geographic forms

***North Atlantic form*—**In the Northern Hemisphere, adult True's beaked whales possess a brownish-gray dorsal fin and upper tail stock, and the belly is light gray to white. However, on the entire dorsal surface they may be significantly lighter in color than other members of the genus within their North Atlantic range. The anterior half of the beak is dark gray to black, fading to a lighter gray behind.

***Southern Hemisphere form*—**In most (or all) Southern Hemisphere adults, the white or light gray ventrum extends back to encompass the tail stock and underside of the flukes, and another extension goes forward to surround the dorsal fin (this light patch appears to fade rapidly postmortem, however). The light ventral surface of the flukes develop dark streaks radiating out from the center of the trailing edge; the dorsal surface of the flukes is dark, however. The anterior half of the upper jaw is dark, while the lower jaw is nearly all light gray to white.

Can be confused with At sea, True's beaked whales are difficult to distinguish from other mesoplodonts that share their range. In the North Atlantic, it may be nearly impossible to distinguish them from Gervais' beaked whales (if no adult males are present). The unique color pattern (white patch on the tail stock and

This neonate True's beaked whale (southern form) looks like most other mesoplodonts do at this age. PHOTO: COURTESY OF THE PORT ELIZABETH MUSEUM

A southern geographical form of True's beaked whale with a short, dolphin-like beak and dark eye patch—very similar to several other short-beaked species. Brazil. PHOTO: S. SEBASTIAS

dorsal fin) can allow identification in at least the Southern Hemisphere. Otherwise, if the teeth of adult males are seen, they may be identifiable. The only other species in which males have oval teeth at the tip of the lower jaw is Longman's beaked whale. However, the latter species is generally much larger, and the forehead is much more steeply-rising than in True's beaked whale. Also, Longman's is a more tropical species, which does not appear to occur in the North Atlantic.

This adult female True's beaked whale (southern form) would be impossible to identify at sea, unless the white tail stock was observed. Northern Australia. PHOTO: D. COUGHRAN

A South African True's beaked whale showing white on the caudal peduncle that extends forward of, and includes, the dorsal fin. PHOTO: COURTESY PORT ELIZABETH MUSEUM

Distribution True's beaked whales appear to have a disjunct, antitropical distribution. In the Northern Hemisphere, they are known only in the North Atlantic, from records in eastern North America (Nova Scotia to Florida), Bermuda, Europe to the Canary Islands, the Bay of Biscay, and the Azores. They also occur at least in the southern Indian and Atlantic oceans, from South Africa, Madagascar, southern Australia, and Brazil. This peculiar disjunct pattern suggests that there may actually be separate species or subspecies in the Northern and Southern Hemispheres, and also that the southern form may extend into the South Pacific.

Ecology and behavior Since True's beaked whale has rarely been identified in the wild until recently, and is not one of the more commonly-stranded species, there is not much information available on the natural history of this species of beaked whale. Groups observed at sea have consisted of up to three individuals. They may show their beaks when surfacing. Energetic breaching behavior, up to 17 times in a row, has been observed in what is thought to be this species in the Bay of Biscay.

Essentially nothing is known of the life history of True's beaked whale, other than a record of a female that was simultaneously pregnant and lactating. Their unusual antitropical distribution and apparently different color morphs north and south of the equator lure one to believe that multiple species or subspecies may be involved, but this question will have to await further morphometric or genetic work.

A ventral view of a True's beaked whale stranded in eastern South America, showing the white peduncle characteristic of the species in the Southern Hemisphere.
PHOTO: S. SEBASTIAS

Feeding and prey Like other members of the genus, stranded animals have had squid (mostly *Loligo* spp.) in their stomachs. They may also take fish, at least occasionally.

Threats and status Almost no information is available on the threats and status of this species. It appears never to have been hunted. True's beaked whales are not commonly identified at sea, and there are no estimates of abundance.

IUCN status Data Deficient.

References Coles 2001; Dalebout 2002; Mead 1989; Pitman 2002; Ross 1984.

Strap-toothed Beaked Whale—*Mesoplodon layardii*

(Gray, 1865)

Recently-used synonyms None.

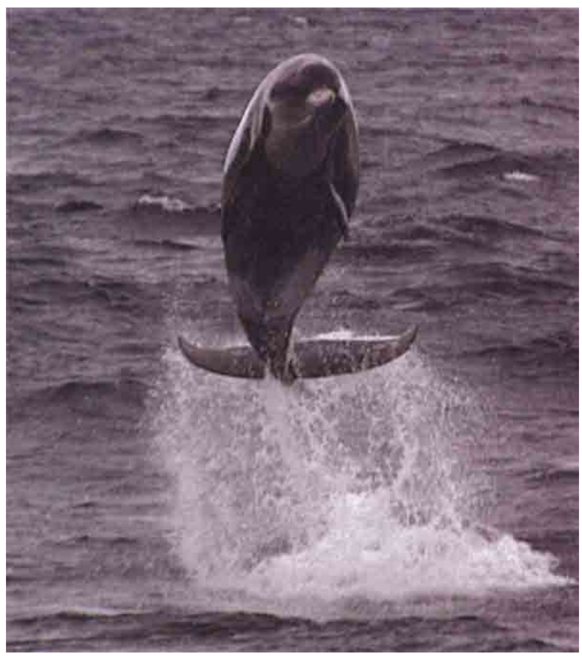
Common names En.–strap-toothed beaked whale; Sp.–*zifio de Layard*; Fr.–*baleine a bec de Layard*.

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Ziphiidae.

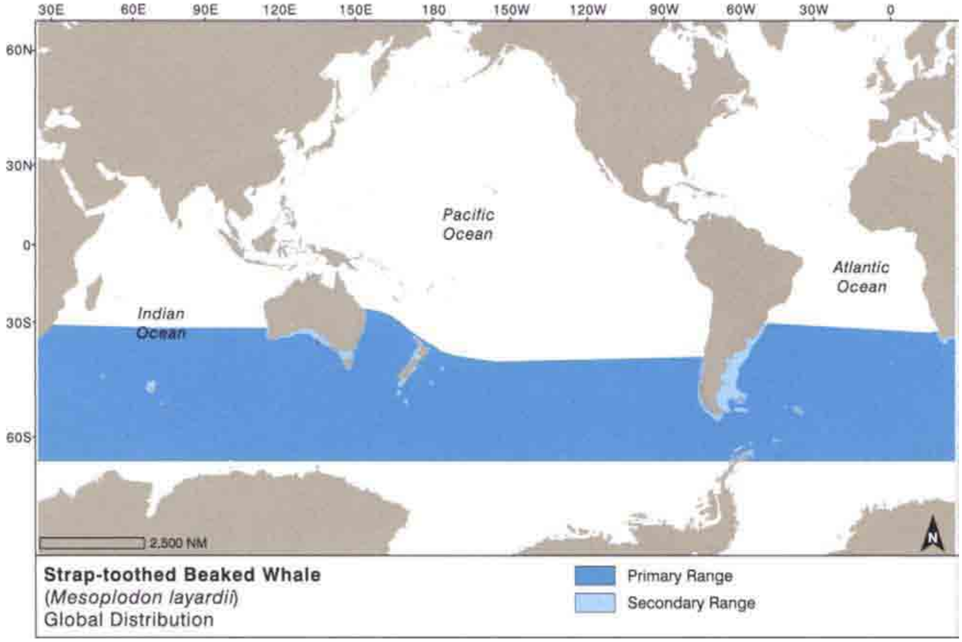
Species characteristics Strap-toothed beaked whales are characterized by a spindle-shaped body, with a small head, small dorsal fin located about two-thirds of the way back from the snout tip, small and narrow flippers, and un-notched flukes. There is also a single pair of shallow throat grooves, and the blowhole is a crescent with the ends pointing forward. The beak is quite long, among the longest in the genus. The forehead may appear to have a slightly steeper rise than in most other mesoplodonts.

The complex adult color pattern is distinctive and is better known than that of most other mesoplodonts, as this species is documented from quite a large number of specimens. Subadults and calves do not appear to possess the distinctive coloration of adults, and they appear more generic, with a general countershaded pattern. However, the belly does darken with age. In larger animals, the body is mostly gray or black, sometimes with a purple or brown tinge. Distinct white to light gray patches develop in the thoracic area, and these are connected to a light throat patch, which extends to cover most of the lower jaw. The top of the head and the area around the eye remain dark, however. The melon darkens and the rostrum becomes white in adults. A white or light gray patch is found around the urogential area. The result of all this is a rather complex adult color pattern of contrasting dark and white patches.

The dentition of this species is very distinctive, one of the most bizarre sets of teeth of any mammal. The long (up to 30 cm) tusks emerge from near the middle of the lower jaw and curl backward at about 45° and inward, extending over the upper jaw, often preventing



An amazing image of an airborne strap-toothed beaked whale. Between South Orkneys and South Georgia. PHOTO: A. WILSON



it from opening more than a few centimeters. There is a small denticle at the tip of each tooth, and the teeth often possess stalks of barnacles. How the animals eat with such an arrangement is unknown, although like other beaked whales, they do seem to use suction to bring prey into the mouth.

Adult females reach lengths of at least 6.2 m and males reach about 6.1 m, making this the largest of the mesoplodonts. They probably reach weights of well over 1,300 kg. Length at birth is unknown, but may be close to 3.0 m.

Recognizable geographic forms None.

Can be confused with The unique tusks of adult males of this species will make them easily identifiable, if seen. The primary confusion would be with the spade-toothed beaked whale, which has similar tooth morphology. Adult females may be identifiable if a good view of the unique color pattern is obtained. However, since nothing is known of the external appearance of the spade-toothed beaked whale, it will be virtually impossible to fully exclude this species in sightings at sea. Calves and juveniles, however, will likely be nearly impossible to distinguish from other mesoplodonts.

Distribution Strap-toothed beaked whales apparently have a continuous distribution in cold temperate waters of the Southern Hemisphere, mostly between 35° and 60°S; there have been strandings in South Africa, Australia, Tasmania, New Zealand, the Kerguelen Islands, Heard Island, Argentina, Uruguay, Brazil, and the Falkland Islands. The seasonality of strandings suggests that this species may migrate. Like all beaked whales, they occur mostly in deep waters beyond the edge of the continental shelf. There is some evidence of sexual segregation in distribution.

An adult male strap-toothed beaked whale stranded in Australia. Notice the extremely long tusks, covered in barnacles. PHOTO: K. WESTERSKOV

Ecology and behavior Groups of up to three strap-toothed beaked whales have been seen. These animals are difficult to approach. Strap-toothed whales are commonly stranded, in fact more commonly than most other species of *Mesoplodon*. However, little has been learned from the few sightings

A rare sight—a breaching strap-toothed beaked whale, bringing its entire body out of the water. Mesoplodont beaked whales are not known to be particularly acrobatic, but this one shows that they can perform energetic leaps on occasion. Between South Orkneys and South Georgia. PHOTO: A. WILSON

A strap-toothed beaked whale surfaces in waters of the subantarctic, providing a good view of the light coloration found on the thorax of this species. The color pattern of this species is diagnostic, perhaps more so than for any other species of *Mesoplodon*. PHOTO: I. BEASELY

The black cap and long, bicolored beak of the strap-toothed beaked whale are diagnostic. PHOTO: I. BEASLEY

The strap-toothed beaked whale with its white beak, black cap and white cowling, is one of the easiest mesoplodonts to identify at sea. PHOTO: R. L. PITMAN

of live animals. These animals often bring their head up out of the water at a 45° angle when surfacing. In adult males, the teeth will show in such surfacings. They have been observed to respond to ships by slowly sinking below the surface.

The bizarre teeth of adult males are thought to be used in male/male combat for female access, although this has never been observed directly. This may be a good example of strong sexual selection forces, as some males can only open their mouths about 3–4 cm. This restricts them to eating only small squid. Calving appears to occur in the southern spring to summer months.

Feeding and prey Strap-toothed beaked whales eat primarily squid, although they may also take fish and crustaceans. Males appear to be restricted to eating only very small, slender squid (mostly < 16 cm and 100 g), because of their unusual dentition.

Threats and status There is little information available on the status of the strap-toothed whale, but based on the number of strandings, it is probably not a rare species. Whales of this species have not been hunted, and there are no estimates of abundance.

A juvenile strap-toothed beaked whale; this animal lacks the distinctive coloration of the adult and would be difficult to identify by itself at sea, although the long beak provides a useful clue. PHOTO: S. BROWN, COURTESY OF C. KEMPER

IUCN status Data Deficient.

Recently-used synonyms None.

Andrews' Beaked Whale—*Mesoplodon bowdoini*

Andrews, 1908

Common names En.–Andrews' beaked whale; Sp.–*zifio de Andrews*; Fr.–*baleine a bec de Bowdoin*.

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Ziphiidae. Some researchers have suggested that this species and Hubbs' beaked whale may represent subspecies of the same species. However, recent genetic and morphological studies have supported the distinctness of the two species.

Species characteristics The external appearance of Andrews' beaked whale has only recently become known. We now know that this, along with its osteology, are similar to that of Hubbs' beaked whale. It has the basic *Mesoplodon* body plan, which consists of a spindle-shaped body, with a small head, small, somewhat triangular dorsal fin located about two-thirds of the way back from the snout tip, small and narrow flippers (fitting into flipper pockets), and un-notched flukes (sometimes a prominence is present instead). The beak is relatively short and can be quite stubby, and the forehead rises at a shallow angle. The mouthline of females is slightly arched, and in adult males the arch is much more pronounced. A pair of throat grooves is present, which converge toward the tip of the jaw.

A young male Andrews' beaked whale, just beginning to develop the large jaw arches and tusks that are characteristic of the species. PHOTO: C. KEMPER.

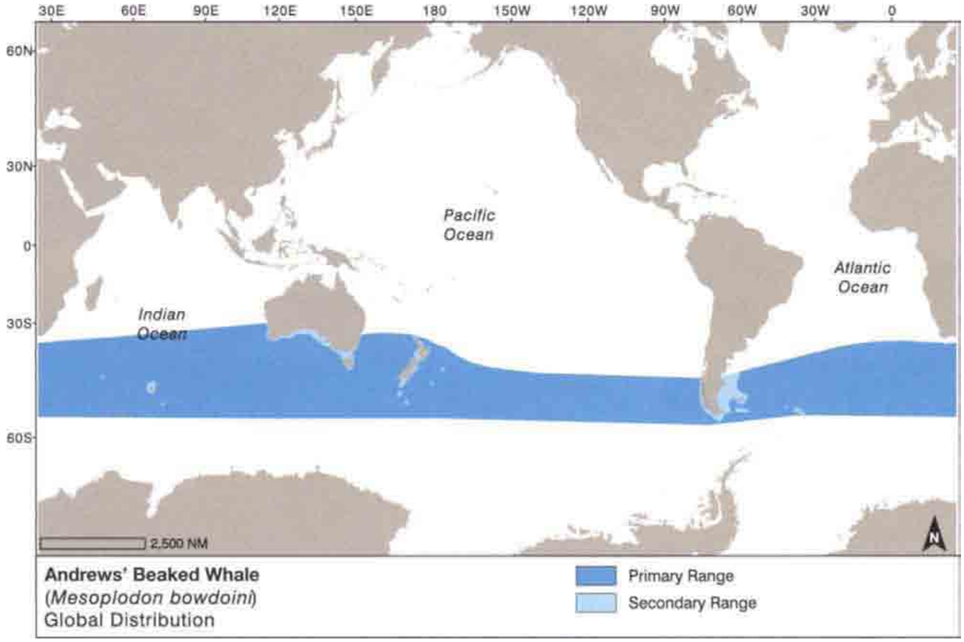
The basic color pattern appears to be dark bluish-gray, like that of most mesoplodonts. The anterior half of the beak to just past the teeth are white in adult males (and maturing ones). Males may also be covered in white scratches, some of which may be paired. Females and juveniles are basically countershaded, apparently with a white lower jaw and dark upper jaw, and light patches in front of each eye. Cookie-cutter shark scars may be present on the body.

The laterally flattened tusks of males emerge from the middle of the lower jaw on raised arches of gum tissue, and the tips are exposed, protruding slightly above the upper jaw and splaying outwards. The tusks are very reminiscent of those of the Hubbs' beaked whale (and for some time these two species were thought to be closely related). There is a denticle at the tip of each tooth, and stalked barnacles may attach to the tusks.

Only a few specimens have been measured, but both male and female Andrews' beaked whales reach at least 4.4 m in length. Length at birth is estimated to be about 2.2 m.

Recognizable geographic forms None.

Can be confused with The short, white beak tip may help to rule-out some other species of *Mesoplodon* that overlap in range (e.g, *M. layardii, M. hectori, and M. grayi*, which have much longer beaks). The tusks of bulls are fairly unique (only the Hubbs' beaked whale has similar ones, and that species is a North Pacific endemic). If seen well, *M. bowdoini* tusks may allow these animals to be distinguished from most other mesoplodonts. Among those mesoplodonts that share their range, they are perhaps most likely to the mistaken for Blainville's beaked



whales, but the lower jaw arch is much more massive and wider in that species, and it lacks the white beak.

Distribution To date, Andrews' beaked whale is known only from a few dozen stranding records between 32° and 55°S; most of these have come from the South Pacific and Indian oceans (well over half are from New Zealand). Strandings have occurred in southern Australia, New Zealand, Tasmania, Tristan de Cunha, the Falkland Islands, Macquarie Island, and Argentina. The overall range may be circumpolar in the Southern Hemisphere; however, there is a gap in the known distribution between Chatham Island and the east coast of South America. It is presumably a creature of deep, offshore waters.

Ecology and behavior Virtually nothing is known of the biology of this species, other than the few facts that have been gleaned from stranded individuals. This species has never been identified alive in the wild, so there is nothing known of its social organization and behavior.

Not much is known of the life history of this species, other than evidence for a summer-autumn breeding season, at least in the seas around New Zealand. A male specimen stranded in Uruguay appeared to be sexually immature at 430 cm length.

Feeding and prey Andrews' beaked whales are assumed to feed primarily on cephalopods, like other members of the genus.

Threats and status Virtually nothing is known of the population status of Andrews' beaked whale. At least around New Zealand, the frequency of stranding records suggest that it may not be all that rare. No estimates of abundance exist.

An adult male Andrews' beaked whale stranded in northern Australia. This animal shows several sets of long, paired scratches on the head and back—evidence of many fights with other males. PHOTO: AUSTRALIAN DEPARTMENT OF ENVIRONMENT AND CONSERVATION.

IUCN status Data Deficient.

Stejneger's Beaked Whale—*Mesoplodon stejnegeri*

True, 1885

Recently-used synonyms None.

Common names En.–Stejneger's beaked whale; Sp.–*zifio de Stejneger*; Fr.–*baleine a bec de Stejneger*.

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Ziphiidae.

Species characteristics Stejneger's beaked whales are characterized by a spindle-shaped body, with a small head, small dorsal fin located about two-thirds of the way back from the snout tip, small and narrow flippers, and un-notched flukes. There is also a single pair of shallow throat grooves, and the blowhole is a crescent with the ends pointing forward. The beak is relatively short, and the lower jaw contains a moderate arch in all age classes. The flipper pockets typical of mesoplodonts are present.

The massive flattened tusks of males are situated near the middle of the lower jaw, and point forward and slightly inward. They are located on broad raised prominences or arches, so that the crowns extend above the upper surface of the beak. They may somewhat restrict the opening of the jaws. The size and shape of the teeth and arches are somewhat reminiscent of those in the Blainville's beaked whale.

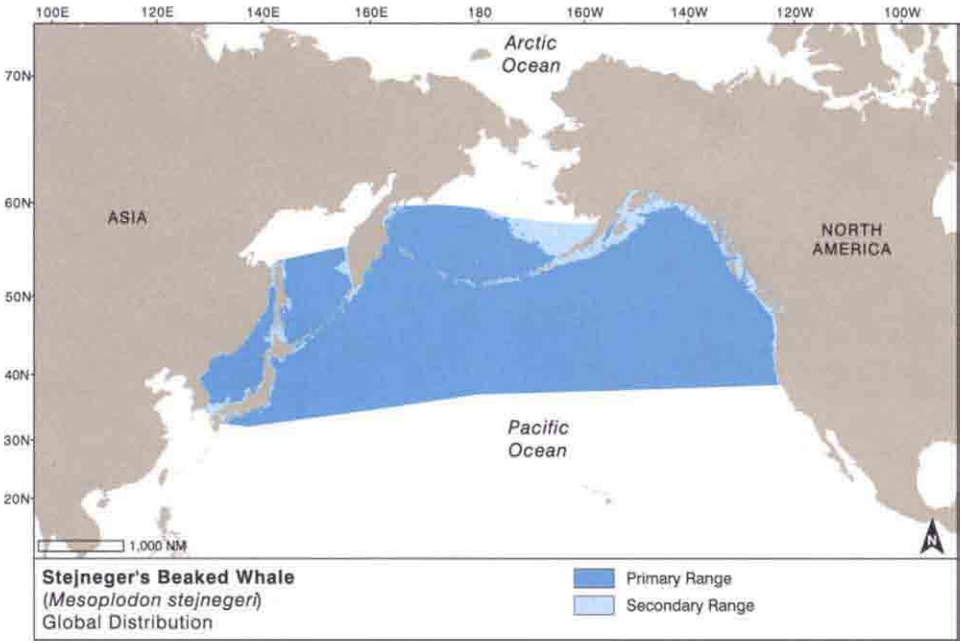
Perhaps the only photo of a live Stejneger's beaked whale, the black on the head is apparently diagnostic in the North Pacific. Off Volcano Bay, Hokkaido, Japan. PHOTO: K. SASAMORI

Apparently, both sexes are uniformly brownish-gray to nearly black in color, although females may be somewhat lighter on the back. The body is often covered with white mottling, especially on the ventral surface; these may represent healed scars from cookie-cutter shark bites (more common on older individuals). Adult males often have prominent scratches on the back, many of which may be arranged in paired patterns. Most age classes appear to have a dark upper jaw and cranial cap, extending back to about the level of the blowhole, with extensions ventrally to surround the eyes. The area behind this appears to be somewhat lighter in color. The ventral surface of the flukes of adults has a series of white concentric lines, radiating from the midpoint of the trailing edge. Such markings are found in other mesoplodonts, but appear to be more exaggerated in adults of this species.

Stejneger's beaked whale females may be larger than males on average. The largest male measured was 5.7 m long. They reach weights of at least 1,600 kg. A fetus of 2.2 m was measured, and therefore newborns are assumed to be between 2.3 and 2.5 m in length. They may weigh about 80 kg at birth.

Recognizable geographic forms None.

Can be confused with When seen well, adult males will be distinguishable from most other mesoplodonts by tooth shape and position, and the shape of the lower jaw arch. Within the range of the Stejneger's beaked whales, both Hubbs' and Blainville's beaked whale males have



broadly similar teeth, but attention to details of the color pattern may allow an identification. Also, these other species are more common in the warm temperate to tropical waters of the North Pacific.

Distribution Stejneger's beaked whales are found in continental slope and oceanic waters of the North Pacific Basin, from central California, north to the Bering Sea, and south to the Sea of Japan (presumably including the southern Okhotsk Sea). This appears to be primarily a cold temperate and subarctic species, and this is probably the only species of the genus common in Alaskan waters. It is most commonly stranded in Alaska, especially along the Aleutian Islands. Also, there are a large number of strandings (at least 34) from along the Sea of Japan coast of Japan, and much fewer along the Pacific coast. The large peak in strandings in this area in winter and spring suggests the species may migrate north in summer.

Ecology and behavior A great deal has been learned of the biology of this species in recent years, based on strandings that have occurred in the Aleutian Islands and along the west coast of Japan. In Stejneger's beaked whales, groups of 5–15 individuals have been observed, often containing animals of mixed sizes. Groups may be tightly bunched at the surface. Stejneger's beaked whales are presumably deep divers, feeding in the mesopelagic and bathypelagic zones.

It has been hypothesized that there may be a resident population in the Sea of Japan and southern Okhotsk

This female Stejneger's beaked whale would not be distinguishable from any of several other mesoplodont females if seen at sea; however, the arched jawline would rule out the species with a straight gape. Japan. PHOTO: T. YAMADA

A bull Stejneger's beaked whale, with the tusks covered in barnacles—something that is common on adult males of many species of *Mesoplodon*. PHOTO: NATIONAL SCIENCE MUSEUM, COURTESY OF T. YAMADA

Sea. Based on a number of fetuses that have recently been examined, calving in the North Pacific appears to occur mainly from spring to early autumn, although the season may be protracted. Sexual maturity apparently occurs by about 4.5 m. Longevity is known to be at least 36 years, based on the aging of 7 specimens.

Feeding and prey Stejneger's beaked whales are known to feed primarily on squids of the families Gonatidae and Cranchiidae, mostly in mesopelagic to bathypelagic depths. They also take some fish as prey. A pelagic tunicate was also found in the stomach of one stranded specimen. Stomachs of some specimens have contained non-food items, such as plastic bags and string.

Threats and status Not much is known about the status of Stejneger's beaked whale, but in the past some were taken in the Japanese salmon driftnet fishery in the Sea of Japan and in driftnets off the west coast of North America. They were also hunted to a certain degree in a Japanese fishery, along with Cuvier's beaked whales. There are no available estimates of abundance, but the species may not be rare in the northern North Pacific and Sea of Japan.

IUCN status Data Deficient.

Spade-toothed Beaked Whale—*Mesoplodon traversii*

(Gray, 1874)

External Appearance Unknown

Recently-used synonyms *Mesoplodon bahamondi.*

Common names En.–spade-toothed beaked whale; Sp.–*zifio de Travers*; Fr.–*baleine a bec de Travers*.

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Ziphiidae. In 1995, a new species of beaked whale was described as *Mesoplodon bahamondi*. However, further study showed that it was actually the same as a previously-described beaked whale that had long been considered synonymous with the strap-toothed beaked whale. *Mesoplodon traversii* was found to be the proper scientific name of the new species.

Species characteristics Because no whale of this species has ever been seen in the flesh, nothing is known of the external appearance of this beaked whale, except that adult males have a large tusk erupting from each side of the lower jaw. It is presumed that the tusks extend high above the lower jaw, but it is unknown whether the lower part of the tooth is surrounded by gum tissue (as in for instance Hubbs' and Andrews' beaked whales) or whether it is largely exposed (as in the strap-toothed whale).

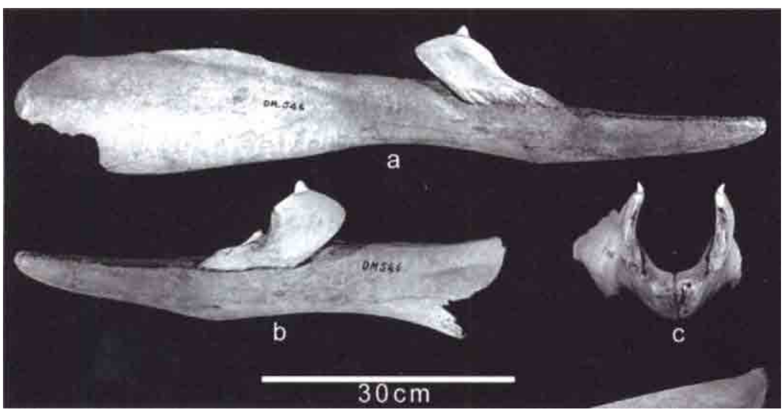
The tusks lean backwards at an angle of about 45°, and are considered spade-shaped, with a large denticle at the tip. If they are like other species in the genus, they would have a spindle-shaped body, with a small head, small dorsal fin located about two-thirds of the way back from the snout tip, small and narrow flippers, and un-notched flukes.

Size is unknown, but adults are presumed to be about 4.5–5.5 m long.

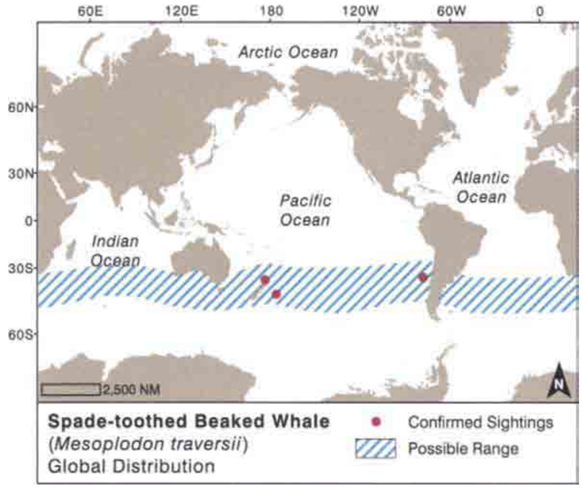
Recognizable geographic forms None.

Can be confused with Until the external appearance of this species is known, it can only be identified from the examination of the skull and/or teeth. The skulls of spade-toothed beaked whales are most likely to be confused with those of strap-toothed beaked whales, which are very similar. They can be distinguished by the detailed structure of the male's tusks and cranial features; however, this will most likely require expert examination.

Distribution The three specimens so far examined have come from White Island (New Zealand), Pitt Island (Chatham Islands), and Robinson Crusoe Island (Juan Fernandez Archipelago) off Chile. Therefore, this is probably a Southern



Although nothing is known of the external appearance of the spade-toothed beaked whale, the tusks of the adult male are similar in size, shape, and location to those of the strap-toothed beaked whale, but they do not wrap over the rostrum. PHOTO: A. VAN HELDEN



Hemisphere (possibly circumantarctic) species, or maybe a South Pacific species. However, it may be much more widely-distributed, and until more records are available, this will remain unknown.

Ecology and behavior The spade-toothed beaked whale is probably the most poorly-known of all mammal species. Nothing is known of the biology and behavior of this species, which is known only from two skulls and the mandibles and teeth from a third. It is assumed to be similar to the other *Mesoplodon* species in general behavior and habits.

Feeding and prey Nothing is known of the diet, other than an assumption that squid are the main prey.

Threats and status Nothing is known of the status of the species. It is probable that the species is relatively rare, given the small number of records of its occurrence so far discovered.

IUCN status Not Listed.

References Pitman 2002; Reyes et al. 1995; Van Helden et al. 2002.

Longman's Beaked Whale—*Indopacetus pacificus*

(Longman, 1926)

Recently-used synonyms *Mesoplodon pacificus*.

Common names En.–Longman's beaked whale or Indo–Pacific beaked whale; Sp.–*zifio de Longman*; Fr.–*baleine a bec de Longman*.

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Ziphiidae. Some marine mammal scientists believe this species should be in the genus *Mesoplodon*, but recent genetic studies have suggested its generic distinctness. Until just a few years ago, this species was known only from two skulls. Sightings of what are now known to be this species in tropical waters were often mistakenly attributed to a whale of the genus *Hyperoodon*.

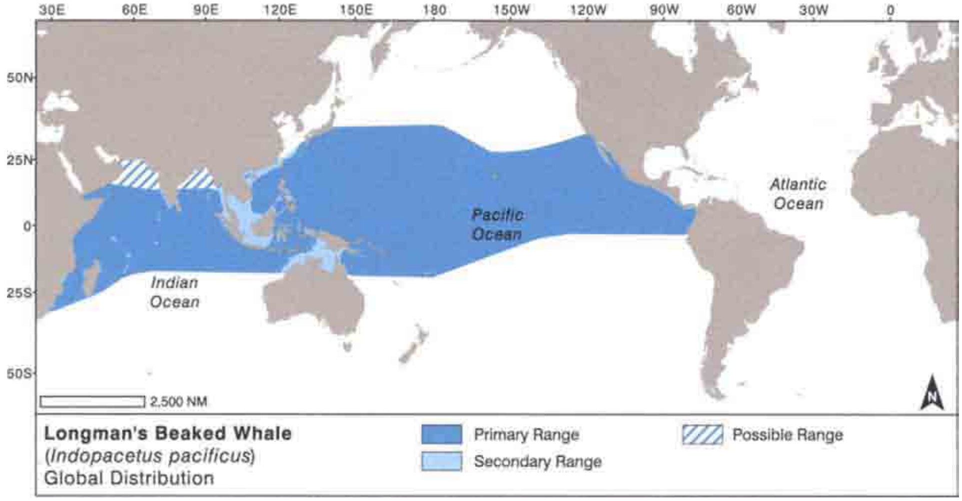
Species characteristics Longman's beaked whales have moderately steep, bulging foreheads and moderate, tube-like beaks. Adults generally have a crease between the melon and beak. As in most other beaked whales, the dorsal fin is located behind the midpoint of the back, but it is a bit larger than in other beaked whales. The fin is falcate and shaped like a dolphin's dorsal fin. Typically, there is no notch on the trailing edge of the flukes. There is generally a pair of V-shaped grooves on the throat. The small, blunt flippers fit into "flipper pockets" on the sides. When seen, the blowhole was oriented with the ends pointing anteriorly, the opposite of the situation in Baird's and Arnoux's beaked whales, species with which it can be confused.

Coloration ranges from umber-brown to bluish-gray above, generally with light areas on the sides and around the head. These light areas are often separated by a diffuse dark band just behind the blowhole, which extends down to the flipper and to surround the eye. The dark band is continuous with the dark upper back. The above color pattern features appear to be most pronounced in young animals, and may fade with age. The white of the melon extends back only as far as the blowhole. Some individuals have had scratches on the back, and white circular scars (probable cookie-cutter shark bites) are not uncommon. The upper surface of the flippers is dark and the underside is light. The upper surfaces of the flukes are dark (nearly black), and the lower surfaces generally have a series of light streaks.

There is a single pair of oval teeth at the tip of the lower jaw, which may be embedded in the gums. During at-sea sightings, the teeth have not been visible outside the closed mouth. The blow is low and bushy, but fairly conspicuous.

This is a relatively large beaked whale; size estimates from at-sea sightings have been in the range

A group of Longman's beaked whales surfaces in the Indian Ocean, showing the typical surfacing profile of the species. Maldives. PHOTO: R. C. ANDERSON



of 4–9 m. Two presumably adult females that stranded recently in Japan and the Maldives measured about 6.0 and 6.5 m, and a specimen live-stranded in the Philippines was 5.7 m long. Length at birth is not known, but a neonate measured 2.9 m long.

Recognizable geographic forms None.

Can be confused with The large size and relatively steep forehead of this species should rule-out confusion with most species of beaked whales. However, the southern bottlenose and Baird's and Arnoux's beaked whales may cause some confusion. However, there is little overlap in distribution with these high latitude species. In shape and position, the teeth most closely resemble those of True's beaked whale. Examination of the skull by experts or genetic analyses may be required for positive identification. Longman's can also be mistaken for southern bottlenose whales, but attention to details of head and body shape and coloration should allow distinction. Longman's are a bit more slender than southern bottlenose whales.

Distribution There have been many sightings at widespread locations in the tropical Pacific and Indian oceans of what we now know to be the Longman's beaked whale. The distribution of this species is not fully known, but it appears to be limited to the Indo–Pacific region. The available specimens are from Australia, Somalia, South Africa, the Maldives, Kenya, Sri Lanka, the Philippines,

A cow and calf Longman's beaked whale—calves always have a conspicuous pale melon; some adults do as well, but they may lose it with age. Maldives. PHOTO: C. JOHNSON

Longman's beaked whales often occur in groups of 10 or more animals—numerous individuals often show the distinctive pale melon. Maldives. PHOTO: R. C. ANDERSON

and Japan. The sightings come from scattered locations, many in deep oceanic waters, in the tropical to subtropical Indo-Pacific. Sightings have occurred in areas with surface water temperatures of 21–31°C. These beaked whales are relatively infrequently seen in the eastern tropical Pacific, and may be more common in the western Pacific and western Indian Ocean. They also appear to be especially common around the Maldives archipelago.

Ecology and behavior Large, coordinated herds appear to be characteristic of Longman's beaked whales. Herds sighted in the Pacific Ocean have contained from 1 to an estimated 100 individuals, with many groups of 10 or greater (this is much larger than for Cuvier's beaked whale or the various *Mesoplodon* species). Groups in the western Indian Ocean have generally been smaller. They often swim in tight groups, and have been seen associated with pilot whales and bottlenose and spinner dolphins. Breaching has been observed, and these whales swim aggressively when moving along at the surface. Dive times may be quite long and can range up to at least 33 minutes.

All aspects of the biology of Longman's beaked whale are very poorly known—the species is known from only 7 specimens (as of late 2005). It was known from only two skulls until as recently as 2003, when it was redescribed from several fresh strandings. A live-stranding occurred in the Philippines in 2004, and sightings have become more common in the western Indian Ocean in recent years. There is virtually nothing known of its reproductive biology. Probable predators of Longman's beaked whales are killer whales and large sharks.

Feeding and prey Nothing is known of its feeding habits, except for the stomach contents of a single specimen from Japan. These suggested that whales of this species may feed primarily on cephalopods, like other beaked whales.

Threats and status There is no known human exploitation of this species. Most records are of strandings or sightings, although some animals have been by-caught in Sri Lankan waters. Gillnet fisheries in the western Indian Ocean may be a threat. While certainly not the rarest of beaked whales, the paucity of recent sightings indicate that it is not particularly common either. The only estimate of abundance available is of about 760 individuals in the waters around Hawaii.

IUCN status Data Deficient.

References Anderson et al. 2006; Dalebout et al. 2003; Pitman 2002; Pitman et al. 1999.

Irrawaddy Dolphin—*Orcaella brevirostris*

(Owen *in* Gray, 1866)

Recently-used synonyms *Orcaella fluminalis, Orcella brevirostris.*

Common names En.–Irrawaddy dolphin; Sp.–*delfín del Irawaddy*; Fr.–*orcelle.*

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Delphinidae. Although there has long been considered to be only one species in the genus, recent studies have demonstrated there are two: *O. brevirostris* and *O. heinsohni.*

Species characteristics The Irrawaddy dolphin resembles the finless porpoise, but unlike that species, it has a dorsal fin. It is a moderately robust species. The dorsal fin is small (averaging 3% of total length) and rounded, and is set just behind mid-back. It is variably shaped. The large paddle-shaped flippers (width averaging 7.3% of total length) have curved leading edges and rounded tips. The head is blunt and bulbous, with no beak; the mouthline is straight, and there may be an indistinct neck crease. There is generally a distinct dorsal groove running along the back from the neck region to just before the dorsal fin. The U-shaped blowhole is open toward the front, the reverse of the situation in most dolphin species.

Coloration is somewhat variable, and animals kept captive indoors may nearly lose their pigmentation, becoming almost white in color. In the wild, Asian animals are two-tone—the back and sides are gray to bluish-gray; the belly from the lower chin to the anus is somewhat lighter. The light ventral coloration extends up as an 'elbow' onto the underside of the flippers.

Tooth counts in each row range from 8–19 and average about 15 (upper); and range from 11–18 and average about 13–14 (lower). The teeth have slightly expanded crowns. In dolphins from the Mahakam River population, the teeth may not erupt.

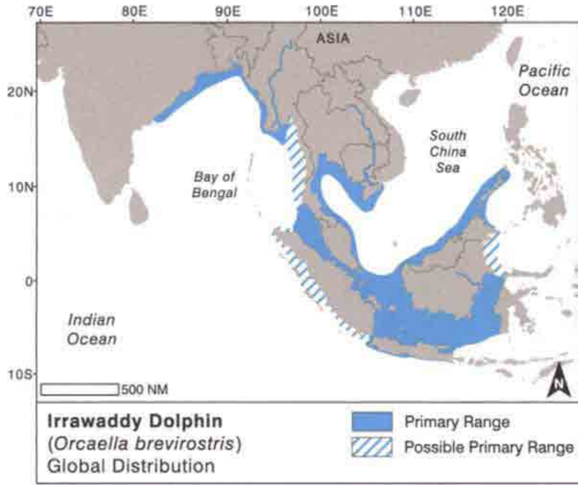
This is a relatively small dolphin; adults range from 1.73 to 2.75 m and average about 2.05 m. Males are somewhat larger than females. Average weight is about 115–130 kg. Scant evidence indicates that the length at birth is about 1 m, and weight is about 10–12 kg.

Recognizable geographic forms While there are clearly many populations of this species, and freshwater populations are clearly distinct (from each other, as well as from marine stocks), recognizable geographic forms have not yet been described.

Can be confused with Irrawaddy dolphins can be confused with finless porpoises or dugongs throughout most of their range, where these species overlap in distribution. When a clear view is obtained, Irrawaddy dolphins are easily distinguishable, because neither of the other species has a dorsal fin.

In Papua New Guinea and West Papua/Irian Jaya, there is some possibility of the two species of *Orcaella*

Cetaceans with round heads rarely porpoise out of the water—a rare photograph of a leaping Irrawaddy dolphin from Malampaya Sound in the Philippines. PHOTO: M. MATILLANO.



A traveling group of Irrawaddy dolphins showing their small fins and round heads; the animal on the right shows the dorsal groove that distinguishes this species from *O. heinsohni*. PHOTO: I. BEASLEY

being sympatric. They can be distinguished by coloration (two-tone in *O. brevirostris* vs. three-tone in *O. heinsohni*), and external morphology (*O. brevirostris* has a dorsal groove and *O. heinsohni* has a more distinct neck crease).

Distribution Irrawaddy dolphins inhabit coastal, brackish, and fresh waters of the tropical and subtropical Indo-Pacific. They occur from Borneo and the central islands of the Indonesian archipelago, north to Palawan in the Philippines, and west to the Bay of Bengal, including the Gulf of Thailand. There are freshwater populations in the Ayerawaddy (up to 1,500 km upstream), Mahakam (up to 560 km upstream), and Mekong (up to 690 km upstream) rivers, and Songkhla and Chilka lakes. The range is poorly documented in much of southeast Asia. These animals appear to favor shallow estuaries throughout most of their coastal range.

The Irrawaddy dolphin is one of the only dolphins that regularly spits water, and these dolphins even use this to assist in feeding. PHOTO: D. SUTARIA

Ecology and behavior Groups of fewer than six individuals are most common, but sometimes up to 15 Irrawaddy dolphins are seen together. Aggregations of up to 25 dolphins can be found in deepwater pools of the Mekong River during the dry season. Irrawaddy dolphins have been seen in the same areas as bottlenose and Indo-Pacific humpback dolphins, as well as finless porpoises. Irrawaddy dolphins are not especially active, but they do make low leaps, breaches, and spyhops on occasion. They are not known to bowride. These dolphins have been observed cooperating with fishermen to herd fish into nets in the Ayeyarwaddy River of Myanmar. Also, their mobile lips allow them to spit water, and there is some evidence suggesting that this is used as a feeding technique. A maximum dive time of 12 minutes has been recorded, but most dives are less than 3 minutes

This Irrawaddy dolphin gives the impression that it can see out of the water; the unfused cervical vertebrae in this species give great flexibility to the neck. Chilka Lake, India. PHOTO: D. SUTARIA

A newborn calf lunges at the surface. Neonates of all cetacean species swim with jerky, erratic movements at first and often seem unable to judge the surface. Mekong River, Cambodia. PHOTO: I. BEASLEY;

long. They will occasionally lift their flukes out of the water upon diving. The lack of fusion of neck vertebrae means that Irrawaddy dolphins can move their head and bend their neck much more so than most other dolphin species.

The calving season is not well-known. Some calves appear to have been born in June–August, but one captive female from the Mahakam River gave birth in December. Gestation has been estimated at 14 months. There is probably a great deal of geographic variation in life history parameters. Maximum known longevity is about 30 years.

Irrawaddy dolphins have the lumpy bodies, rounded heads, and low rounded dorsal fins characteristic of slow swimmers. Chilka Lake, India. PHOTO: D. SUTARIA

A mother and calf Irrawaddy dolphin killed in fishing nets in the Mekong River of Cambodia/Laos. PHOTO: I. BAIRD, COURTESY OF S. LEATHERWOOD

Feeding and prey Irrawaddy dolphins appear to be generalist feeders, taking a wide variety of fishes (including freshwater species, such as catfish), and cephalopods (squid, cuttlefish, and octopus). Dolphins from freshwater populations sometimes spit water while feeding, apparently to herd fish.

Threats and status Irrawaddy dolphins may not be immediately threatened with extinction on a global scale, but certain populations appear to be reduced and are in serious danger of local extinction. This is especially true for freshwater stocks, such as those in the Mahakam, Ayerawaddy, and Mekong rivers, as well as that in Songkhla Lake, which each appear to number less than 100 individuals. The nearshore and freshwater occurrence of this species makes it particularly vulnerable to threats from human modification and degradation of the coastal and freshwater environments. These result from fishing net entanglement, habitat loss, dam and waterway construction, prey depletion, environmental contamination, and vessel strikes. Live captures for aquaria display have also been a conservation issue in some areas. Irrawaddy dolphins have been hunted directly in the past, at least in Cambodia, but are also revered by local people in many other areas of Asia. Abundance estimates are available only for certain portions of the range: 77 animals in Malampaya Sound, Philippines; < 100 in the Mekong River; 33–55 in the Mahakam River, Indonesia; 55–70 in the Ayeyarwaddy River, Myanmar, and 5,400 in Bangladesh. Nothing certain is known of trends in abundance, but there have been strong suggestions of population declines in some areas.

IUCN status Critically Endangered (Mahakam River, Ayeyarwady River, Malampaya Sound, Mekong River, and Sonkhla Lake populations), Data Deficient (all others).

Australian Snubfin Dolphin—*Orcaella heinsohni*

Beasley, Robertson, and Arnold, 2005

Recently-used synonyms None.

Common names En.–Australian snubfin dolphin; Sp.–*delfín del Australia*; Fr.–*orcelle de Australia*.

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Delphinidae. For many years, only a single species was recognized in the genus. Recent studies have found evidence of two species of Irrawaddy dolphin, and *O. heinsohni* has now been split-off as a second species in the genus.

Species characteristics The Australian snubfin dolphin resembles the Irrawaddy dolphin and the finless porpoise, but unlike the latter species, it has a dorsal fin. The fin is small (averaging 4.4% of total length) and rounded, and is set slightly behind mid-back. The large flippers (width averaging 6.6% of total length) have curved leading edges and rounded tips. The head is blunt and can be bulbous, with no beak; the mouthline is straight; and there is a distinct neck crease. The dorsal groove characteristic of the Irrawaddy dolphin is absent in this species. The U-shaped blowhole is open toward the front, the reverse of the situation in most dolphin species.

Coloration of the Australian snubfin dolphin is slightly different than in the Irrawaddy dolphin. These animals have a tripartite pattern, with a distinct dark grayish-brown cape, lighter sides, and whitish belly. The margin of the cape is fairly straight and extends fairly low on the sides.

Tooth counts in each row are 11–22, averaging 18 (upper); and 14–19, averaging 17 (lower). The teeth have slightly expanded crowns.

This is a relatively small dolphin, although a bit larger than the Irrawaddy dolphin. Adults range from 1.86 to 2.70 m. The average adult size is 2.18 m. They are known to reach weights of at least 130 kg. Scant evidence indicates that the length at birth is about 1 m.

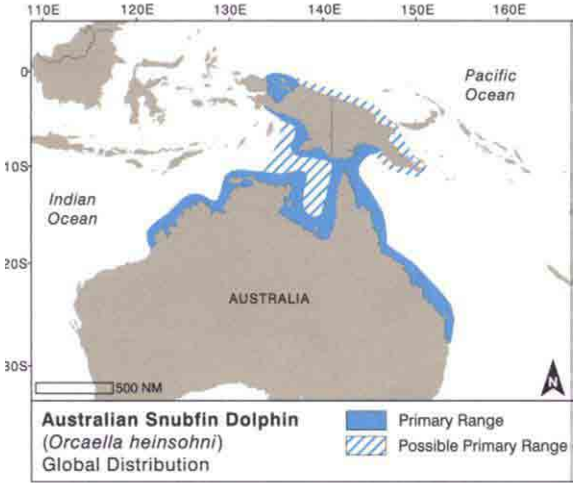
Recognizable geographic forms None.

Can be confused with Australian snubfin dolphins can be confused with dugongs in most parts of their range. When a clear view is obtained, Irrawaddy dolphins are easily distinguishable, because dugongs do not have a dorsal fin. Confusion with the finless porpoise is also possible at a distance. Again, the presence of a dorsal fin in the Australian snubfin dolphin will clear-up any identification problems.

In Papua New Guinea and West Papua/Irian Jaya, there is some possibility of the two species of *Orcaella* being sympatric. They can be distinguished by coloration (2-tone in *O. brevirostris* vs. 3-tone in *O. heinsohni*), and external morphology (*O. brevirostris* has a dorsal groove and *O. heinsohni* has a more distinct neck crease).

An Australian snubfin dolphin that was killed in a northern Australian anti-shark net. The subtle tripartite color pattern of this species is often difficult to discern. PHOTO: G. HEINSOHN, COURTESY OF I. BEASLEY

Distribution Australian snubfin dolphins inhabit coastal, brackish waters of the tropical and subtropical zones of Australia, and at least some parts of Papua New Guinea (PNG). In Australia, they occur from Broome,



Western Australia, to the Brisbane River, Queensland. They most often occur near river and creek mouths, generally in waters < 10 m deep (with a preference in some areas for waters < 2 m deep). The range in northern Australia and PNG is poorly documented.

Ecology and behavior Very little is known of the ecology of these animals, largely because they were only recently split-off as a separate species from the Irrawaddy dolphin. Group sizes typically range from 1 to 10, but they sometimes occur in aggregations of up to 14 dolphins. Average group size is 5.3 individuals in northeast Queensland. Groups are somewhat fluid in structure, with dolphins having a series of constant companions and also casual acquaintances. At least in Cleveland Bay, Queensland, most dolphins are not resident in the bay.

Australian snubfin dolphins have been seen in the same area as Indo-Pacific humpback dolphins. In Cleveland Bay, snubfin dolphins are sometimes aggressively chased and "harassed" by humpback dolphins. Individual dolphins have been identified by scars and marks on the back and dorsal fin. They are not especially active, but do make low leaps on occasion. They are not known to bowride.

Almost nothing is known of the life history of this species. A few dolphins that were aged from tooth growth layers reached adult size at 4–6 years, and some lived as long as 30 years. Longevity may be greater than this, however.

Feeding and prey Australian snubfin dolphins appear to be generalist feeders, taking a wide variety of fishes (including anchovies, sardines, eels, halibut, breams, grunters, and other estuarine species). They also eat cephalopods (squid, cuttlefish, and octopus), and crustaceans (shrimps and isopods, although the latter may be incidental).

Threats and status There are only two abundance estimates available for the Australian snubfin dolphin: about 1,000 in the Gulf of Carpentaria, and <100 in Cleveland Bay. The nearshore occurrence of this species makes it vulnerable to detrimental human activities. However, most of the range of the species in northern Australia has not yet been severely degraded. Animals do die from fishing and anti-shark net entanglement, and habitat loss, prey depletion, environmental contamination may be other, long-term threats. The designation of a series of marine parks in the northern waters of Australia bodes well for the survival of this species, although some populations need greater protection.

IUCN status Not Listed.

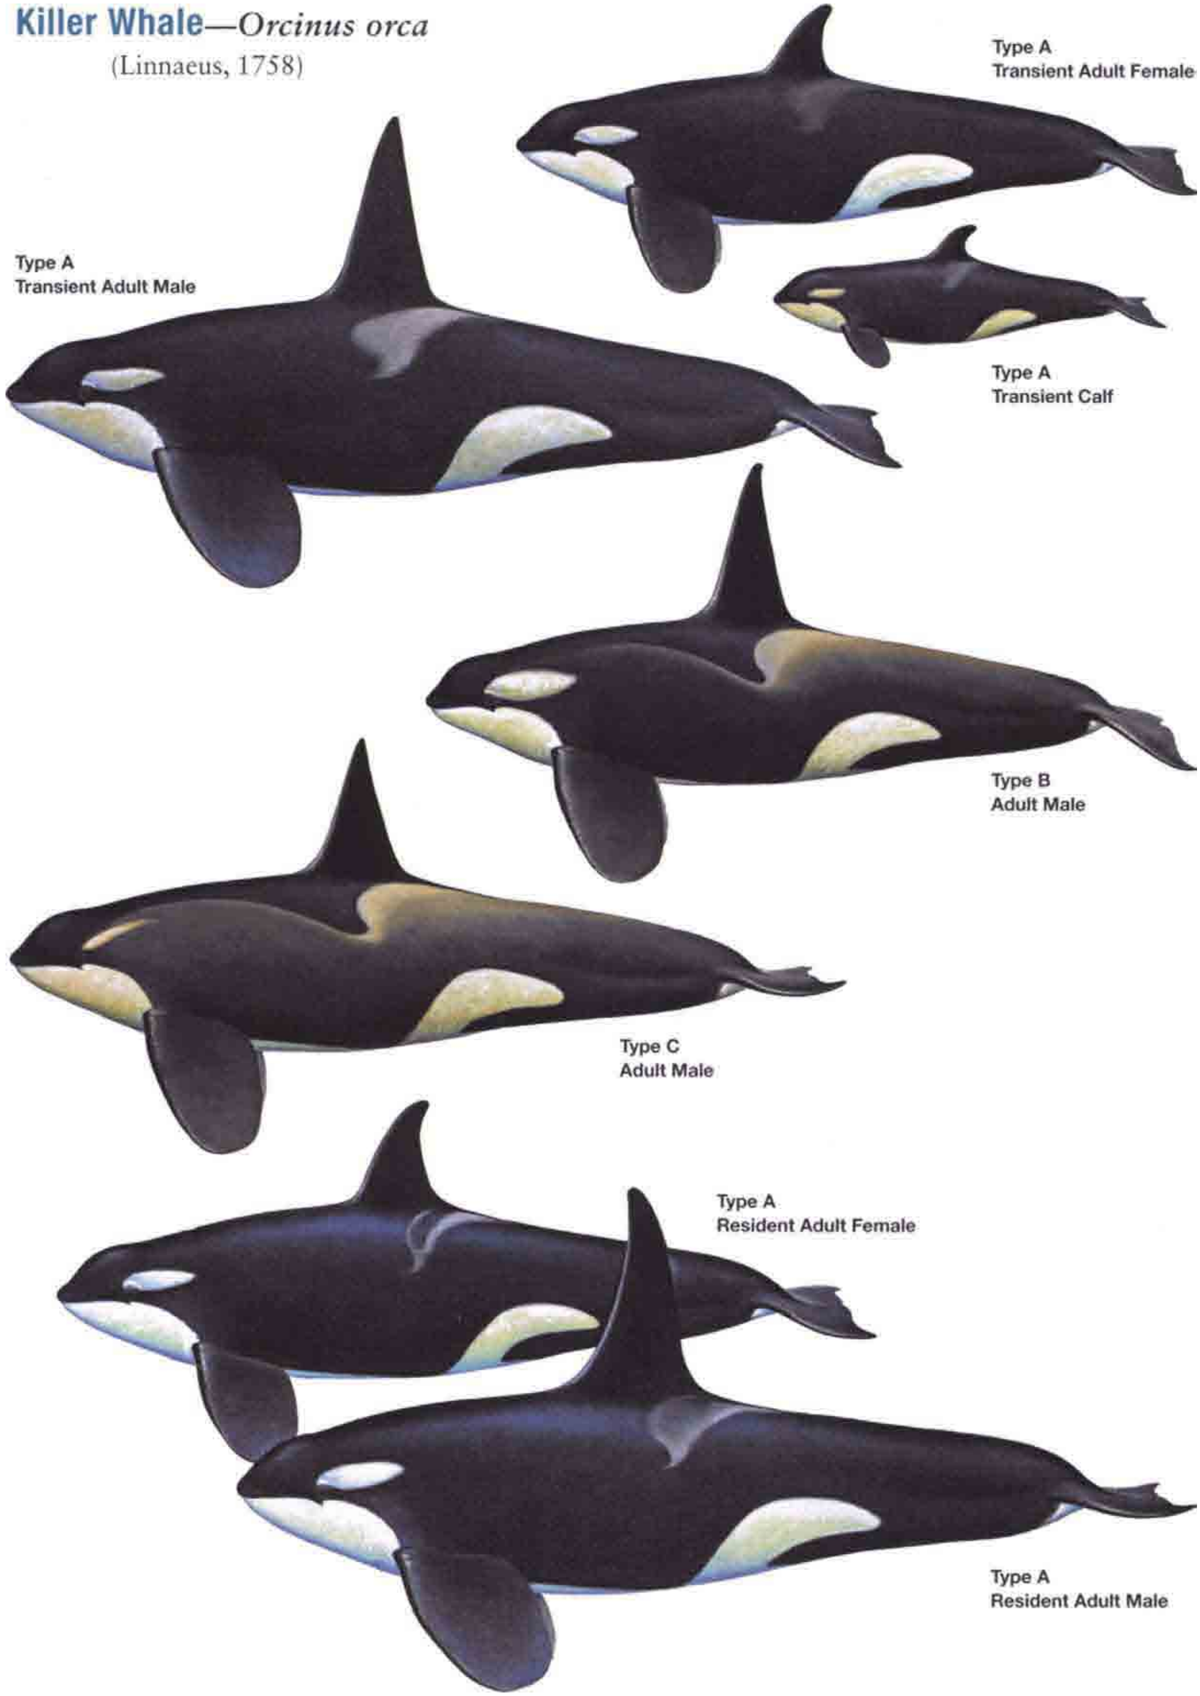
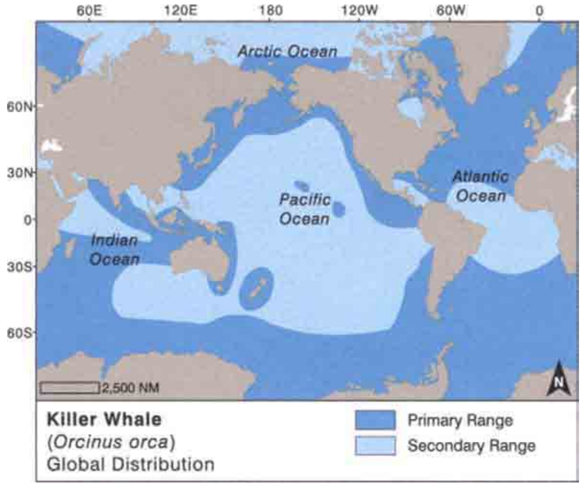
Killer Whale—*Orcinus orca*

(Linnaeus, 1758)





Recently-used synonyms *Grampus (Orcinus) rectipinna, Orcinus nanus, Orcinus glacialis.*

Common names En.–killer whale; Sp.–*orca*; Fr.–*orque or épaulard.*

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Delphinidae. A single species of killer whale has been recognized for many decades, and this has been somewhat supported by the results of studies of mitochodrial DNA patterns. However, recent genetic, morphological, coloration, and ecological evidence suggests that there may be many different geographical forms of killer whale. Currently, at least four separate forms of killer whales are known, at least some of which may represent separate species. The taxonomy of this genus is clearly in serious need of revision, and it is very likely that *O. orca* will be split into a number of different species (or at least subspecies) over the next few years.

Species characteristics Killer whales are among the most distinctive, and therefore easily identified, of all cetaceans. The body is robust, but somewhat spindle-shaped. The tall, erect dorsal fin is nearly as distinctive as the color pattern. It may reach 0.9 m high in females and 1.8 m in males. The dorsal fins of females and young whales are falcate, and are generally pointed or slightly rounded at the tip. Adult males tend to have dorsal fins that are triangular or that may even cant forward to varying degrees. The flippers are large (especially so in bulls) and oval, with blunt tips, and grow to lengths of up to 2 m (about 11–17% of total length for adult females, and 18–22% for adult males). Scant information suggests that tropical females may have larger flippers. The flukes are broad, with a straight or even slightly convex trailing edge. The fluke tips may be curled down in some large adults (especially bulls). Killer whales have blunt snouts, with only very short and poorly-defined beaks. The mouthline has a slight downward curve toward the gape.

The black-and-white color pattern of the killer whale is unmistakable. The lower jaw, undersides of the flukes, and ventral surface from the tip of the lower jaw to the urogenital area are white. White lobes extend up the sides behind the dorsal fin, and there is a white oval patch above and behind each eye. The rest of the body is black, except for a light-gray "saddle patch" behind the dorsal fin, and there may be a distinct cape extending forward from the lower point of the saddle. The boundaries between black and white are generally very distinct and sharp. Anomalously-white individuals have been observed and held in captivity (in the latter case, the white color was not from albinism, but from a genetic condition called Chediak-Higashi Syndrome).

Killer whales have 10–14 large, slightly recurved teeth in each half of both jaws, which are pointed and oval in cross section. They can be up to 2.5 cm in diameter. In older animals, they are often extensively worn and can be damaged by abscesses.

Newborn killer whales are 2.1–2.6 m in length and about 160–180 kg in weight. Adult females are up to 8.5 m long and 7,500 kg in weight; adult males can be up to 9.8 m and nearly 10,000 kg. There is clearly extensive geographic variation among different populations,

The iconic killer whale is perhaps the most universally recognized marine species; unmistakable even when it is not hanging in the air. Puget Sound, Washington.

but this is only beginning to be adequately documented to recognize different geographic forms (see below).

Calf— Much smaller than adults; with a muted color pattern, often with a yellowish to orangish tinge to the eye patch, and no saddle patch.

Juvenile— Noticeably smaller than adult size; dorsal fin small and generally falcate.

Adult female— Of adult size; dorsal fin of moderate height (< 1 m) and usually falcate to a varying extent.

Adult male— Noticeably larger than all other age classes; dorsal fin extremely tall (up to almost 2 m) and erect or canted forward; extremely large flippers; flukes often convex, with tips curved downward.

Recognizable geographic forms Several geographic forms of killer whale have been recognized, and most killer whales worldwide fall into the Type A pattern. Preliminary genetic studies indicate that Types B and C are more closely related to each other than either is to Type A. The actual taxonomic status of each of these forms still remains to be confirmed, but mounting evidence is pointing to different species status for each of them:

Type A resident killer whale— This form is best-known from the Pacific Northwest and Alaskan waters (where it has been intensively studied), but it may occur in many areas throughout the globe. Type A "residents" have a relatively rounded tip to the dorsal fin, and the saddle patch can be open or closed. The saddle patch generally extends no further forward than the midpoint of the dorsal fin base. There is no obvious dorsal cape in Type A residents, and the eye patch is a medium-sized oval oriented parallel to the body axis. Type A "offshores" are very similar in appearance to resident killer whales, and reliable methods of distinguishing them from external appearance in the field have not yet been found.

Type A transient killer whale— Although best-known from the Northeast Pacific, animals resembling Type A transient killer whales are found throughout the globe. These are the largest of the three types, with adult females about 6–7.5 m and adult males up to at least 9.2 m long. Type A "transients" have a more pointed dorsal fin tip than residents, and always possess a closed saddle patch. The saddle patch typically extends quite far forward, sometimes nearly to the anterior insertion of the dorsal fin. There is no obvious dorsal cape, and the eye patch is a medium-sized oval oriented parallel to the body axis.

Type B killer whale— Occurring in Antarctic and subantarctic waters, the Type B killer whale generally appears to be smaller than the Type A killer whale (but probably not as small as Type C). It has dorsal coloration with a distinct narrow black cape, below which the dark areas are more nearly charcoal gray. The white areas usually have a yellowish tinge (caused by diatoms), and the eye patch is very large and oriented horizontally. Saddle patches are always of the closed type.

Type C killer whale—Type C killer whales are apparently restricted to Antarctic and surrounding waters. This type is a dwarf form, and grows to lengths about 1–3 m shorter than the other types. Adult females average about 5.2 m and adult males about 5.6 m, with the maximum known about 6.1 m. It also has a distinct cape and yellowish light patches, but the eye patch is very small and is oriented at about a 45° angle to the long axis of the body. The saddle patch is rarely open.

Can be confused with Killer whales are easily recognizable to almost anyone who has spent time on the water or along the coast. The great size of the dorsal fin (especially of adult males) and unique black and white color pattern are diagnostic. At a distance, groups without adult males can be confused with Risso's dolphins or false killer whales. However, the confusion should disappear as a closer look is obtained.

Distribution The killer whale is undoubtedly the most cosmopolitan of all cetaceans, and may be the second most wide-ranging mammal species, after humans. Killer whales can literally be seen in any marine region, from the equator to the ice edges, and they have even been known to ascend rivers (although this is uncommon). They occur in many enclosed seas, such as the Mediterranean, Red Sea, Persian Gulf, and Gulf of California, although they may not be common there. Although they are generally more common in nearshore areas and at higher latitudes, there appear to be no hard and fast restrictions of water temperate or depth on their range. Type A killer whales are found in all oceans and seas, from the ice edges to the equator, in both hemispheres; however, they appear to be more common in nearshore, cool temperate to subpolar waters. They don't often occur among ice floes. Type B killer whales are found mainly in the Antarctic and surrounding waters (there are records from the Falklands and New Zealand), often among the pack ice. They appear to be concentrated around the Antarctic Peninsula. Type C is also an Antarctic form, but seems to prefer waters of East Antarctica, occurring mainly in the pack ice. Killer whales are known to enter, at least as visitors, virtually all enclosed seas of the world at times, although they would be considered extralimital in the Baltic Sea. They are rare in the Mediterranean proper, but there is a resident population in the Strait of Gibraltar.

Ecology and behavior In terms of ecology and behavior, killer whales are among the best-studied of all ce-

Killer whales "spyhopping;" the relatively small pectoral fins identify them as females or juveniles. PHOTO: F. UGARTE/ARC-PIC.COM

tacean species, with a few long-term ecological studies running for several decades. Studies in the eastern North Pacific, from Washington State to Alaska, have distinguished three types of killer whales, referred to as residents, transients, and offshores. Although distinguished by ecological differences, there are also differences in coloration and external morphology. In Washington and British Columbia, at least, residents and offshores are primarily fish eaters and transients eat mostly marine mammals. Studies in other parts of the world suggest that while other populations also tend to have similar prey preferences, the relationships among the different types are complex. The evidence that at least residents and transients in the Pacific Northwest are different species is quite strong.

Pods of resident killer whales in British Columbia and Washington represent one of the most stable societies known among non-human mammals; individuals stay in their natal pod throughout life. Pods are structured around matrilines (maternally-based patterns of descent). Differences in vocal dialects among sympatric groups appear to help maintain pod discreteness. Most pods contain 1–55 whales and resident pods tend to be larger than those of transients (however, it should be noted that subunits within a pod often break-up and travel independently from other such units for periods of time). Transients in the Pacific Northwest also have a matrilineal-based social structure, but there appears to be much more dispersal from the natal pod. Pods are thus much smaller (generally less than 10 members).

Killer whales are among the most enthralling of all animals to observe in the wild. They do not typically ride bow waves, but this behavior has been seen in the Gulf of Mexico, and in some other areas. They may show great interest in vessels; at other times they may avoid them. This is a very aerially active species, and killer whales often breach, spyhop, flipper-slap and fluke-slap; they often perform these behaviors in bouts. The flukes are sometimes lifted out of the water when whales make a steep dive. When resting, they often travel line abreast and surface at regular intervals. Although they do not appear to migrate, movements can be extensive; for instance, some killer whales have been documented to have moved between Alaska and central California.

In the Pacific Northwest, calving occurs year-round, with a peak from October to March. Similarly, in the northeast Atlantic, it occurs from late fall to mid-winter. Gestation appears to last for 15–18 months, which is extremely long for a mammal. The calving interval is about 5 years in the Pacific Northwest, and a post-reproductive period is known for females. The age at weaning is thought to be about 1–2 years, but may occur somewhat later. Sexual maturity is reached at ages of 10–15 years for females and about 15 years for males. These are extremely long-lived animals, with males living to 50–60 years and females up to 80–90 years!

Feeding and prey Though best-known for their habits of preying on warm-blooded animals (killer whales are known to attack marine mammals of all groups, from sea otters to blue whales, except river dolphins and manatees), killer whales often eat various species of fish (including sharks and rays) and cephalopods. Killer whales also occasionally eat seabirds and marine turtles. Killer whales often use cooperative techniques to herd fish and to attack large prey. They have a great diversity of feeding strategies, including intentional beaching to gain access to seals onshore.

At least some populations are known to show extreme dietary specializations on particular types of prey. Thus the Pacific Northwest residents are salmon specialists (at least during the summer months). Transients in Puget Sound appear to focus their foraging on harbor seals, and killer whales in the Norwegian fjords specialize on herring. There is even evidence that some killer whales in New Zealand may forage mostly on sharks and other elasmobranchs. In the Antarctic, Type A killer whales specialize on minke whales, Type B eats mostly seals, and Type C is a fish-eater.

Threats and status Killer whales have at one time or another been targets of both commercial and subsistence whalers, although never on a particularly large scale. They are still killed in small numbers in fisheries in Japan, Greenland, Indonesia, and the Caribbean islands. They have also been persecuted because of real or perceived interference with fisheries and their supposed dangerousness. Entanglements in fishing nets, vessel collisions, and live-captures for oceanaria have also contributed to their problems. Recently, the effects of high levels of environmental contaminants and acoustic "pollution" have become issues of concern, especially for northeast Pacific pods. Although not considered to be highly abundant anywhere, killer whale populations in many areas appear to be healthy. No global estimates of abundance are available. There are thought to be about 80,000 south of the Antarctic Convergence, and about 445 in northern Norway. In the eastern tropical Pacific, there are estimated to be about 8,500 killer whales. There are about 1,500 of these animals in coastal waters

In subantarctic waters of the Southern Hemisphere, killer whales with extremely small eye patches have been observed recently. These do not match any known type, and have been dubbed "Type D" killer whales. Near South Georgia. PHOTO: M. GREENFELDER, COURTESY I. VISSER

of North America, from the Aleutian Islands to California, and about 2,000 in Japanese waters. The resident population that inhabits the inland waters of Washington and southern British Columbia is apparently depleted and is considered to be endangered.

IUCN status Lower Risk/Conservation Dependent.

References Baird 2002; Dahlheim and Heyning 1999; Ford 2002; Ford and Ellis 1999; Ford et al. 1994; Heyning and Dahlheim 1988; Pitman and Ensor 2003.

Long-finned Pilot Whale—*Globicephala melas*

(Traill, 1809)

Recently-used synonyms *Globicephala melaena, Globicephala edwardii.*

Common names En.–long-finned pilot whale; Sp.–*calderón comun*; Fr.–*globicéphale commun*.

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Delphinidae. Three subspecies are recognized in some classifications: *G. m. melas* in the North Atlantic, *G. m. edwardii* in the Southern Hemisphere, and an un-named subspecies in Japanese waters (now extinct).

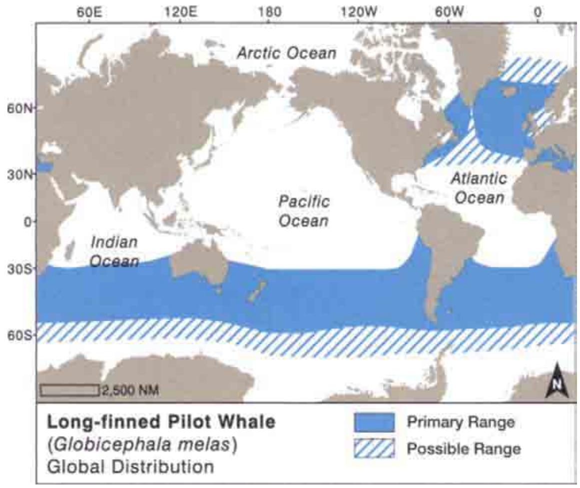
Species characteristics Externally, the long-finned pilot whale resembles its short-finned relative, *G. macrorhynchus*. The body is relatively robust, but the tail stock is long. The head is globose, with an upsloping mouthline, and there is only a slightly discernible beak (if any). The flippers are extremely long (18–27% of the body length) and slender, with pointed tips and a strongly angled leading edge that forms an "elbow." The dorsal fin is about 1/3 of the way back from the snout tip, and is low, extremely wide-based, and falcate. The tail stock is deepened (it remains of more-or-less uniform depth from the the saddle patch to just ahead of the flukes). Compared to females, male pilot whales have larger, more bulbous heads (which may actually be rather squarish); larger, thicker dorsal fins; and deeper tail stocks.

Predominantly dark grayish-brown to black in color, pilot whales have a white to light gray anchor-shaped patch on the chest, extending back to the urogenital area, a light gray post-dorsal fin saddle, and light gray "eyebrow" streaks. A line between the forward extension of the saddle and the eyebrow streak may be present, forming a cape—this tends to be especially prominent in Southern Hemisphere animals. Calves are significantly lighter than adults, and may have a distinct brownish tinge.

Inside the mouth are 8–13 pairs of sharp, pointed teeth in each jaw.

They are extremely sexually dimorphic. Adults reach 6.7 m (males) and 5.7 m (females) in length. Females reach weights of up to 1,300 kg, and males up to 2,300 kg. Newborns are 1.7–1.8 m long, and weigh about 75 kg.

Recognizable geographic forms In the Southern Hemisphere, at least some pilot whales appear to have a more extensive "eyebrow" streak and more exaggerated post-dorsal fin saddle than in North Atlantic specimens. However, the extent and degree of potential overlap of these characters has not yet been adequately studied.



Can be confused with In some temperate waters (e.g., South Pacific; North Atlantic; off southern Africa; and off southern Brazil, Uruguay, and northern Argentina), long-finned and short-finned pilot whales overlap in distribution. In these areas, the two species are virtually impossible to distinguish at sea. Tooth counts and relative flipper lengths (both of which are generally not useful in at-sea sightings) are the only reliable means of separating the two. In the lower latitude areas of its range, the long-finned pilot whale can be confused with false killer and less likely, pygmy killer and melon-headed whales; however, the differences in head shape and dorsal fin shape and position (in particular, the short, forward-placed, wide-based dorsal fin of the pliot whale) should permit correct identification.

Distribution Long-finned pilot whales occur in temperate and subpolar zones. They are found in oceanic waters and some coastal waters of the North Atlantic Ocean, including the western Mediterranean Sea and North Sea. In the western North Atlantic, they occur in high densities over the continental slope in winter and spring months. In summer and autumn months, they move over the shelf. Long-finned pilot whales were previously found in the western North Pacific, but appear to be absent there today. The circumantarctic population(s) in the Southern Hemisphere occur as far south as the Antarctic Convergence, sometimes to 68°S. They are isolated from those of the Northern Hemisphere.

Ecology and behavior Pilot whales are highly social; they are generally found in pods of about 20–100, but some groups contain over 1,000 individuals. These large pods are generally dispersed in smaller subgroups of 10–20. Based on photo-identification and genetic work, pilot whales appear to live in relatively stable, maternally-based pods like those of killer whales, and not in fluid groups characteristic of many smaller dolphins.

The mating system is thought to be polygynous; this is consistent with the observed sexual dimorphism and adult sex ratio. Pilot whales are apparently deep divers. Groups sometimes forage in broad ranks, sometimes with other species. Although they sometimes are aerially active, pilot whales are often seen rafting in groups at the surface, apparently resting. They often spyhop, but breaching is much less common.

This is one of the species most often involved in mass strandings. Strandings are fairly frequent, for instance, on Cape Cod (Massachusetts, USA) beaches from October to January. Their tight social structure also makes pilot whales vulnerable to herding, and this has been taken advantage of by whalers in drive fisheries off Newfoundland, the Faroe Islands, and elsewhere. Pilot whales frequently associate with other marine mammal species, including several species of dolphins and large whales.

Breeding of long-finned pilot whales can apparently occur at any time of the year, but peaks occur in summer

Long-finned pilot whales often have a distinct light streak above the eye, which forms part of the border of the dorsal cape. North Atlantic. PHOTO: R. W. BAIRD

Long-finned pilot whales, especially the southern form (shown here), often show a prominent whitish saddle behind the dorsal fin, and eye patch. Here we see a female and her calf. Western Australia. PHOTO: L. MORSE

All pilot whales show this characteristic white ventral color, but it is more extensive and contrasting on the long-finned species. Mediterranean. PHOTO: A. GANNIER/GROUPE DE RECHERCHE SUR LES CETACES

in both hemispheres. Mating occurs primarily in spring to summer. Pilot whales have a polygynous mating system. Sexual maturity occurs at about 8 years for females and about 12 for males. Longevity is about 35–45 years for males and more than 60 for females.

Feeding and prey Primarily squid eaters, pilot whales will also take small to medium-sized fish, such as mackerel, when available. Other fish species taken include cod, turbot, herring, hake, and dogfish. They will sometimes also ingest shrimp. Most feeding appears to take place at depths of 200–500 m.

Threats and status Long-finned pilot whales have been taken directly in several large-scale drive fisheries in the North Atlantic Ocean. The most famous of these occurred previously in Newfoundland, and another one still operates in the Faroe Islands. The annual catches in the Faroes were about 1,000–1,500 in the 1990s. Other such drive fisheries used to occur in the USA (Cape Cod), Norway, Iceland, Greenland, Ireland, and Scotland (Orkney and Hebrides Islands). A drive fishery in the Falkland Islands has taken whales from the southern population(s). In addition, there are incidental catches in several fisheries, especially trawls, driftnets, and longlines. Other threats that have been identified include live-captures for captive display and the effects of environmental contaminants. There are estimated to be about 200,000 long-finned pilot whales in summer south of the Antarctic Convergence in the Southern Hemisphere; approximately 10,000–20,000 in the western North Atlantic; and about 780,000 in the eastern North Atlantic. The species is clearly not endangered.

IUCN status Least Concern.

Short-finned Pilot Whale—*Globicephala macrorhynchus*

Gray, 1846

Recently-used synonyms *Globicephala seiboldii, Globicephalus scammoni, Globicephala brachyptera.*

Common names En.–short-finned pilot whale; Sp.–*calderón de aletas cortas*; Fr.–*globicéphale tropical*.

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Delphinidae. Hybrids with common bottlenose dolphins have been reported from captivity.

Species characteristics Pilot whales are large, with bulbous heads, dramatically upsloping mouthlines, and extremely short or non-existent beaks. The shape of the head varies significantly with age and sex, becoming more globose in adult males. In some forms, the head of adult males may appear very squarish, when viewed from above or below. The dorsal fin, which is situated only about 1/3 of the way back from the head, is low and falcate, with a very wide base (it also varies with age and sex). The flippers are long and sickle-shaped, 14–19% of the body length. The shape of the flippers are more curved in this species, than in the long-finned species. Adult males are significantly larger than females, with large, sometimes squarish foreheads that may overhang the snout, very hooked dorsal fins with thickened leading edges, and deepened tail stocks with post-anal keels.

Except for a light gray, anchor-shaped patch on the chest, a gray post-dorsal fin saddle, and a pair of roughly parallel bands high on the back that sometimes end as a light streak or teardrop above each eye, pilot whales are black to dark brownish-gray. This is the reason for one of their other common names, blackfish (the term blackfish is variously used, usually by fishermen, to refer to killer, false killer, pygmy killer, pilot, and melon-headed whales). Calves are paler than adults.

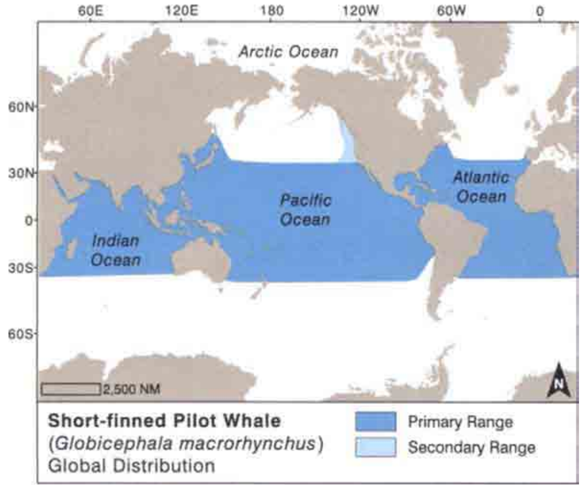
There are two geographical forms of short-finned pilot whales off Japan, differing in external and cranial morphology. Their exact taxonomic status is unresolved, but they may represent separate subspecies.

There are usually 7–9 short, sharply pointed teeth in each tooth row.

Short-finned pilot whales are about 1.4–1.9 m long at birth. Adults reach 5.5 m (females) and 7.2 m (males). Males may weigh nearly 3,600 kg.

Short-finned pilot whales often do not show the pale saddle patch and eye marks that are so common on long-finned pilot whales. Mozambique Channel, near Mayotte. PHOTO: J. KISZKA

Among pilot whales, including the short-finned shown here, adult males are easily identified by their massive, often lobed-looking dorsal fin. Mayotte. PHOTO: J. KISZKA



The light saddle patch behind the dorsal fin (and eye patch) is often difficult to discern on short-finned pilot whales; however, it shows up fairly well on this adult male. PHOTO: R. L. PITMAN

A group of short-finned pilot whales; the near animal shows a typical adult female dorsal fin—more pointy and less lobed than in the male. Eastern tropical Pacific. PHOTO: H. FEARNBACH/SWFSC/CSCAPE

Recognizable geographic forms Two geographic forms have been described from Japanese waters, and these appear to represent separate subspecies, although they have not yet been formally described as such:

Japanese northern form—This form of pilot whale is found off the Pacific coast of Japan, north of 35°N. It is much larger than the southern form, with females attaining lengths of up to 5.1 m and males reaching 7.2 m. Newborns are about 1.85 m. There is a distinct, light gray saddle behind the dorsal fin. When viewed from above or below, the head of adult males is rounded.

Japanese southern form—This form of pilot whale is found off the Pacific coast of Japan, south of 39°N. It is much smaller than the northern form, with females reaching lengths of only 4.05 m and males reaching only 5.25 m. Newborns are about 1.4 m long. The saddle patch behind the dorsal fin is very faint and indistinct. When viewed from above or below, the head of adult males of this form is squarish.

Can be confused with In and near the areas of overlap (South Pacific; North Atlantic; off southern Africa; and off southern Brazil, Uruguay, and northern Argentina), the two species of pilot whales are difficult or impossible to distinguish at sea. Most sightings can be tentatively assigned to species, based on the area. Other smaller blackfish, such as false killer whales, and less commonly, pygmy killer and melon-headed whales, may be confused with pilot whales at a distance. Dorsal fin shape and position are the best clues to distinguishing pilot whales from these species.

Distribution Short-finned pilot whales are found in warm temperate to tropical waters of the world, generally in deep offshore areas. They do not usually range north of 50°N or south of 40°S. There is some distributional overlap with their long-finned relatives (*G. melas* is the only other species currently recognized), which appear to prefer cold temperate waters of the North Atlantic, Southern Hemisphere, and previously the western North Pacific. Only short-finned pilot whales are thought to inhabit the North Pacific, although distribution and taxonomy of pilot whales in this area are still largely unresolved. There are two geographic forms of short-finned pilot whale off Japan. They occur in the Red Sea, but not the Mediterranean.

Ecology and behavior In the eastern Pacific, short-finned pilot whales are commonly associated with other species (such as bottlenose, Pacific white-sided, common, and Risso's dolphins, and sperm whales). Pods of up to several hundred short-finned pilot whales are seen, and members of this highly social species are almost never seen alone. Strong social bonds may partially explain why pilot whales are among the species of cetaceans that most frequently mass-strand. Although detailed studies of behavior have only begun recently, pilot whales appear to live in relatively stable maternal groups.

In 1982–83, a strong El Niño event brought about major ecosystem changes off the southern California coast. Pilot whales avoided the area (presumably due to the absence of spawning squid) for much of the next 10 years.

Sexual maturity occurs at around 8–9 years for females and 13–17 years for males. Females become post-reproductive at around 40 years, but may continue to suckle young for up to 15 additional years, suggesting a complex social structure in which older females may give their own or related calves a "reproductive edge" through prolonged suckling. Calving peaks occur in spring and fall in the Southern Hemisphere, and in fall and winter in most Northern Hemisphere populations. However, the southern form off the Pacific coast of Japan gives birth mostly in July and August. Longevity is at least 63 years.

Adult male short-finned pilot whales off southern Japan (and elsewhere) develop a characteristic flat front to the melon. Mayotte. PHOTO: J. KISZKA

Short-finned pilot whales often loll at the surface in tight groups during the daytime, and individuals will sometimes spyhop to look at a nearby boat. Solomon Islands. PHOTO: B. KAHN/APEX ENVIRONMENTAL

Feeding and prey Although they also take fish, pilot whales are thought to be primarily adapted to feeding on squid. One of the main genera taken off the California coast is the market squid (*Loligo* sp.). They show the tooth reduction typical of other squid-eating cetaceans.

Threats and status Short-finned pilot whales have been killed directly in drive fisheries in Japan and in harpoon fisheries in the Caribbean and Indonesia. This species is also taken as by-catch in several fisheries in

With its blunt head, the short-finned pilot whale is clearly a slow swimmer; the squared-off shape suggests that this is an adult male. Bahamas. PHOTO: T. PUSSER the North Pacific, including driftnet fisheries for swordfish and sharks. At least in the past, they have also been incidentally taken in the squid purse seine fishery that operates off the Cailfornia coast. Several short-finned pilot whales have been captured for public display and research in the US and Japan. There are no estimates of global abundance, but some estimates for specific areas do exist. Off the west coast of the US there are about 1,000, in the eastern tropical Pacific there are about 500,000, in the Sulu Sea of the Philippines there are about 7,700, and off Japan there are around 60,000 (53,000 of which are of the southern form). Clearly, the species is not endangered.

IUCN status Lower Risk/Conservation Dependent.

False Killer Whale—*Pseudorca crassidens*

(Owen, 1846)

Recently-used synonyms None.

Common names En.–false killer whale; Sp.–*orca falsa*; Fr.–*faux-orque*.

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Delphinidae. Hybrids with common bottlenose dolphins have been reported from captivity.

Species characteristics The false killer whale is one of several species of delphinids that some people call "blackfish." It is a large, dark gray to black dolphin, with a faint light gray patch on the chest, and sometimes light gray areas on the head. Any indication of a cape is generally very faint and indistinct.

The false killer whale has a long, slender, cigar-shaped body, a rounded overhanging melon (more so in males than in females), and no discernable beak. The dorsal fin, although variable in shape, tends to be falcate and slender along most of its height, and is generally somewhat rounded at the tip (however, there is a great deal of within-species variation). It is located near the midpoint of the back. The flippers have rounded tips and a characteristic hump on the leading edge, probably the species' most diagnostic character. This gives the flippers the appearance of an S-shape.

Each jaw contains 7–12 pairs of large conical teeth, which are round in cross-section.

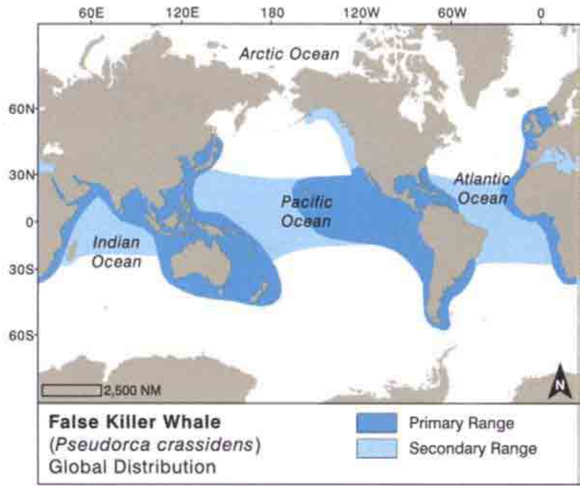
Adult false killer whales are up to 6 m (males) or 5 m (females) long; newborns are 1.5–2.1 m. Large males may weigh up to 2,000 kg.

Recognizable geographic forms Skulls of false killer whales from Australia, South Africa, and Scotland have been shown to differ, and this suggests the existence of different populations in these areas. However, distinctive geographical forms have not been described in terms of external appearance.

Can be confused with False killer whales are most commonly confused with other "blackfish," especially pygmy killer and melon-headed whales, and less commonly, pilot whales. The differences in head shape (bulbous in pilot whale adults and rounded, but more slender, in false killers) and dorsal fin shape and position (very wide-based and located on forward part of the back in pilot whales, and much more slender and

A false killer whale makes an acrobatic leap. Clearly visible are the distinctive S-shaped flippers, the blunt but conical head, and the small, centrally-placed dorsal fin. Hawaii. PHOTO: R. W. BAIRD

A young false killer whale shows the all-black coloration and uniquely tapered head of this species. Mayotte. PHOTO: J. KISZKA



positioned mid-back in false killers) will make it easy to separate pilot whales. Size will be helpful with the other two species, as false killer whale adults are much larger than pygmy killer and melon-headed whales. Small false killer whales will present the most difficulty, as they may overlap in size with these two. Shape of the head (more elongated and narrow from above in false killers), dorsal fin (more rounded at the tip in false killers), and flippers (S-shaped in false killers, with the diagnostic flipper hump) will be the best characters to use in distinguishing them. Ideally, a multitude of characters should be used to confirm an identification as a false killer whale.

Distribution False killer whales are found in tropical to warm temperate zones, generally in relatively deep, offshore waters of all three major oceans. In addition to deep, oceanic areas, they do sometimes occur over the continental shelf and appear to move into very shallow waters on occasion. They do not generally range poleward of about 50° in either hemisphere. However, some animals may move into shallow and more high-latitude waters, on occasion. They are found in many semi-enclosed seas and bays, but only occasionally occur in the Mediterranean Sea. There are also records from the Persian Gulf and Red Sea.

Ecology and behavior As is the case for most of the tropical oceanic delphinids, this species is rather poorly-known. In some areas, false killer whales take fish from longlines and therefore are not popular with fishermen. This species is considered to be extremely social. Groups of 10–60 are typical, though much larger groups are known. Some groups are very tight-knit, while others may be spread over a kilometer or more of ocean. Individual false killer whales have been photo-identified in Costa Rica and Hawaii. Some site fidelity has been noted, although there was a considerable amount of inter-island movements in Hawaii. The Costa Rica study also supported the idea that false killer whales may exhibit stable associations (like their larger cousin, the killer whale).

This is one of the most common species involved in cetacean mass strandings. In one case, over 800 stranded together! The false killer whale is a lively, fast-swimming cetacean, which behaves more like the spritely smaller dolphins than other mid-sized cetaceans. It occasionally rides bow waves of vessels. False killer whales are known to behave aggressively toward other small cetaceans, and have even been seen chasing and attacking dolphins and large whales.

No dramatic seasonality in breeding is known for the false killer

Only under excellent lighting conditions like this is the cape pattern of false killer whales visible. The dorsal fin often appears somewhat flat on top, like on the animal in the foreground. Hawaii. PHOTO: R. W. BAIRD

A false killer whale swims with a mahi mahi (dorado) in its mouth. This and other large fish, such as billfish (and perhaps dolphins), are the main prey of false killers. Taiwan. PHOTO: J. Y. WANG

whale, although one population has an apparent peak in late winter. Surprisingly (considering how commonly it strands), life history of this species has not been well-studied. From what little is known, both sexes are thought to reach sexual maturity at between 8 and 14 years of age. Longevity may reach 57 years for males and 62 for females.

Feeding and prey Although false killer whales eat primarily fish and cephalopods, they also have been known to attack small cetaceans, humpback whales, and on one occasion, even sperm whales! They eat some large species of fish, such as mahi mahi and tunas.

Threats and status False killer whales have a propensity for taking fish from longlines, thus earning them the ire of fishermen. Because of this habit, they have been shot and otherwise persecuted. In Japan, they have been targets of drive fisheries, largely because of perceived competition with fishermen. Incidental catches in fishing gear, such as driftnets and purse seines occurs at least occasionally. Live captures (mostly in the US and Japan) and damaging effects from pollutants are among the other potential threats to this species. There are few estimates of abundance, and none for the total population size, but in general false killer whale populations are not thought to be in particular trouble from human activities. The Hawaiian population appears to number no more than a few hundred individuals.

IUCN status Least Concern.

Pygmy Killer Whale—*Feresa atenuata*

Gray, 1874

Recently-used synonyms *Feresa intermedia*.

Common names En.–pygmy killer whale; Sp.–*orca pigmea*; Fr.–*orque pygmée*.

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Delphinidae.

Species characteristics The body of the pygmy killer whale is slender to moderately robust, narrowing significantly posterior to the dorsal fin. The head is rounded (even bulbous) in profile, and has no beak (except in some young animals). The head also appears rounded (as opposed to triangular) from above. The dorsal fin is tall and slightly falcate, often rising at a relatively shallow angle from the back. The flippers have rounded tips, with a convex leading edge and concave trailing edge. The pygmy killer whale is often confused with the false killer whale and melon-headed whale, which are both very similar in general appearance.

Pygmy killer whales are superficially similar to melon-headed whales. However, they have blunter heads, a shallower cape and more extensive white on the face. Taiwan. PHOTO: J. Y. WANG.

When the lighting is good, the high cape of the pygmy killer whale shows quite well, such as in these animals off Taiwan. PHOTO: J. Y. WANG

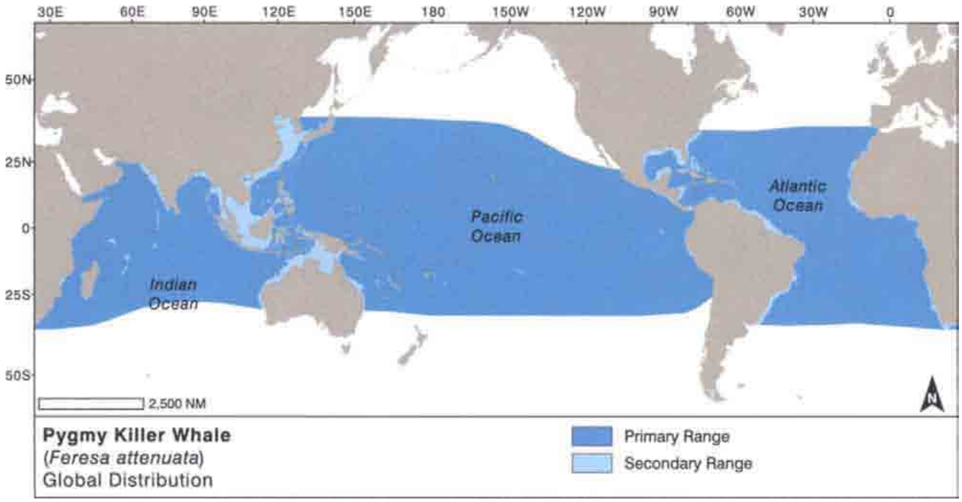
The color of the pygmy killer whale's body is dark gray to black, with a fairly prominent narrow cape that dips only slightly below the dorsal fin, and a white to light gray ventral band that widens around the genitals. Also, the lips and snout tip are often white. Occasionally, this white color may extend to the entire front of the head (apparently in older animals). White cookier-cutter shark scars are quite common on the bodies of many larger pygmy killer whales.

The upper jaw contains 8–11 pairs of teeth, and the lower jaw has 11–13 pairs. The teeth are quite large and heavy.

Newborns are about 80 cm long, adults up to 2.6 m. Males are apparently slightly larger than females. Maximum known weight is 225 kg.

Recognizable geographic forms None.

Can be confused with Pygmy killer whales are most easily confused with melon-headed whales, and less



commonly with false killer whales. Flipper shape (rounded tips in the pygmy killer whale, pointed tips in the melon-headed whale, and with a prominent hump in the false killer whale) and the contour of the cape (relatively distinct and straight in the pygmy killer whale, indistinct and dipping low below the dorsal fin in the melon-headed whale, and virtually absent in the false killer whale) are the best features to use in distinguishing these three species. Also, the shape of head when viewed from above (rounded in this species, triangular in the melon-headed whale) may be useful.

Distribution This is a tropical/subtropical species that inhabits oceanic waters around the globe (Atlantic, Pacific and Indian oceans), generally not ranging north of 40°N or south of 35°S. They are rarely seen in nearshore waters, but may occur relatively close to shore where the water is deep and clear.

Ecology and behavior There is little known of the biology of the pygmy killer whale. It is rarely encountered in most areas, making it one of the least-known of all the delphinids. Groups generally contain about 12–50 individuals, although herds of up to several hundred have been seen. In Hawaiian waters, pygmy killer whales show high fidelity to specific islands, and association patterns are strong and stable. Its movements tend to be slow and lethargic compared to the similar-appearing melon-headed whale. It generally does not bow ride, but has been known to on occasion. Leaps and spyhops are sometimes seen. In captivity, most of the few animals that have been held have been very aggressive.

Not much is known of the reproductive biology of this species. Reliable estimates of length and age at sexual maturity are not available, but it is thought that these animals probably reach adulthood at something over 2.0 m.

Feeding and prey Pygmy killer whales eat mostly fish and squid, although they occasionally have been known to attack other dolphins, at least when the dolphins are involved in tuna fishery interactions in the eastern tropical Pacific.

Threats and status Pygmy killer whales have been killed both directly in harpoon and driftnet fisheries (Caribbean islands, Sri Lanka, and Indonesia) and incidentally in various types of fishing gear (most areas of the species' range). The only abundance estimate available is of about 39,000 in the eastern tropical Pacific. Although

A pygmy killer whale breaches in waters of Taiwan. The bulbous head shape, white lips, and rounded flipper tips, all diagnostic of the species, clearly show here. PHOTO: J. Y. WANG

The longer, more rounded flippers of this pygmy killer whale not only distinguish it from the very similar melon-headed whale, but also correctly suggest that it is the slower swimmer of the two species. Balabac, Philippines. PHOTO: M. L. L. DOLAR

In the pygmy killer whale, the lips and much of the front of the head are often white in adults. PHOTO: COURTESY OF THE LATE S. LEATHERWOOD

few serious conservation problems are known, this species does not appear to be particularly abundant anywhere that it has been sighted—although widespread, it has been suggested that it may be naturally rare. In Hawaii, populations appear to be small, and this, along with their limited movements, suggests the species may be particularly vulnerable to human impacts.

IUCN status Data Deficient.

References Donahue and Perryman 2002; Leatherwood et al. 1991; Madsen et al. 2004; Ross and Leatherwood 1994.

Melon-headed Whale—*Peponocephala electra*
(Gray, 1846)

Recently-used synonyms *Lagenorhynchus asia, Lagenorhynchus electra, Electra electra.*

Common names En.–melon-headed whale; Sp.–*calderón pequeño* or *delfín cabaza de melón*; Fr.–*péponocéphale*.

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Delphinidae.

Species characteristics Melon-headed whales are moderately robust small whales. The dorsal fin is tall and slightly falcate, and is located near the middle of the back. The head of adults can be bulbous, and the melon can be overhanging in adult males. However, younger animals have a more sloping forehead, although there is generally little hint of a beak. The flippers are sickle-shaped and have pointed tips. Compared to females, males have more bulbous melons, longer flippers, taller dorsal fins, and tail stocks with pronounced post-anal humps (often called keels).

Although often described as simply black with a few patches in older literature, the melon-headed whale actually has an interesting color pattern. The body is generally charcoal gray to nearly black (young are lighter gray), with a white urogenital patch with irregular margins. On many individuals, there is also an anchor-shaped patch of light color on the underside of the head, just ahead of the flippers. On larger animals, the black triangular "mask" on the face of melon-headed whales distinguishes them from the somewhat more uniformly-colored pygmy killer whale. A darker strip runs forward from the eye to the beak tip, and there is a pale, streaked blowhole stripe, which widens as it runs toward the tip of the upper jaw. The lips and tip of the lower jaw of larger animals are light gray or white. Much of the facial coloration is subtle and can only be seen when the lighting is right. Melon-headed whales also have a rounded cape that dips much lower below the dorsal fin than that of pygmy killer whales, although its margin is often faint and there is little contrast between it and the lighter flanks. The cape may not be visible in sightings at sea, unless the lighting is good.

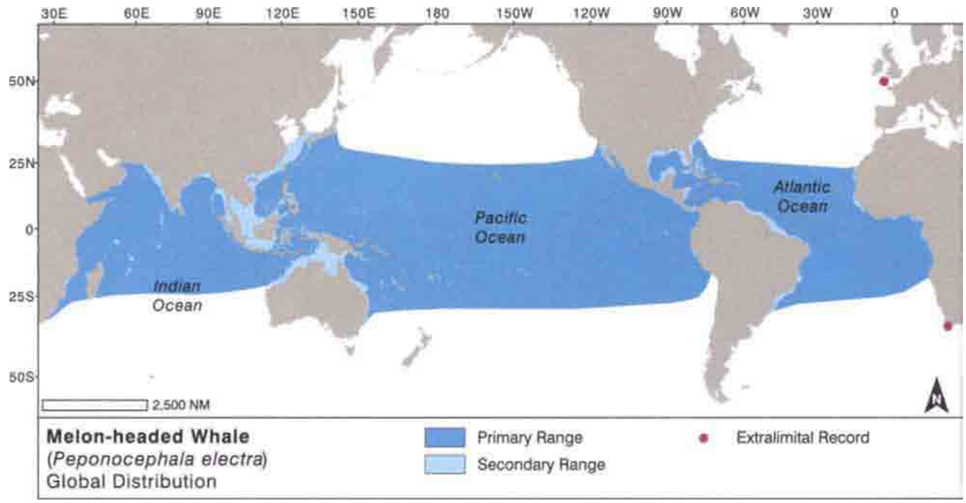
These animals have 20–25 small slender teeth in each tooth row. The teeth are much more similar to those of the smaller dolphins than they are to those of other blackfish species.

Melon-headed whales reach a maximum of about 2.78 m, with males reaching somewhat greater lengths than females. Length at birth is thought to be about 1 m or less. Maximum known weight is about 275 kg.

Recognizable geographic forms None.

Can be confused with Melon-headed whales can be difficult to distinguish from pygmy killer whales, especially when seen at sea from a distance. Head shape, flipper shape, and the shape and distinctness of the

A group of melon-headed whales at the surface, showing the tight social structure that is typical of these animals. Off Mayotte. PHOTO: J. KISZKA



cape can be useful in identification. Pygmy killer whales have rounded (as opposed to pointed) flipper tips and only 8–13 pairs of robust teeth (as opposed to 20–25 pairs of slender ones). Also, melon-headed whales tend to have a more triangular head shape (when viewed from above or below), and females and young have a beak, albeit very short and poorly defined. False killer whales may also be confused with this species at a distance, but size and close attention to body shape and coloration will allow them to be distinguished.

Distribution The range of the melon-headed whale coincides almost exactly with that of the pygmy killer whale in tropical/subtropical oceanic waters between about 40°N and 35°S. They are rarely found nearshore, unless the water is very deep. A few high-latitude strandings are thought to be extralimital records, and are generally associated with incursions of warm water.

Ecology and behavior Melon-headed whales are highly social, and are known to occur usually in pods of 100–500 (with a known maximum of 2,000 individuals). They are often seen swimming with other species, especially Fraser's dolphins in the Gulf of Mexico, eastern tropical Pacific, and Philippines. Melon-headed whales often move at high speed, porpoising out of the water regularly, and are eager bowriders in many areas, often displacing other species from the bow wave. In the calm waters of the Philippines and some other tropical archipelagos, this species is often seen in large schools of rafting individuals in resting formation.

This is a species that is sometimes involved in mass strandings, generally containing many dozens or even hundreds of animals. The largest ones known have included up to 250 animals.

There is some scant evidence to indicate a calving peak in July and August, but this is inconclusive. In Japanese waters, females reach sexual maturity at about 11.5 years and 235 cm, and males at 16.5 years and 244 cm. Little else is known of the species' life history or reproductive biology.

Feeding and prey Melon-headed whales are known to feed on several species of squid and small fish. They appear to feed mainly deep in the water column. Some shrimps have also been found in melon-headed whale stomachs.

The black 'bandit mask', pointy flippers, and dorsal cape dipping low beneath the dorsal fin are all evident in this melon-headed whale. It is a much faster swimmer than the similar-appearing pygmy killer whale. Western North Pacific. PHOTO: J. COTTON

Threats and status Although no regular, large hunts are known, melon-headed whales have been taken in various fisheries. This includes direct killing in drive fisheries in Japan and harpoon/driftnet fisheries in the Caribbean, Sri Lanka, the Philippines, and Indonesia, as well as incidental catches in tuna purse seines in the eastern tropical Pacific. This species is relatively common in

some areas of its range, such as parts of the Philippines and around some archipelagos in the western tropical Pacific. The only abundance estimates available are of about 45,000 animals in the eastern tropical Pacific, and 2,000 in the northern Gulf of Mexico. On a global scale, the melon-headed whale is not considered to be threatened or endangered.

IUCN status Least Concern.

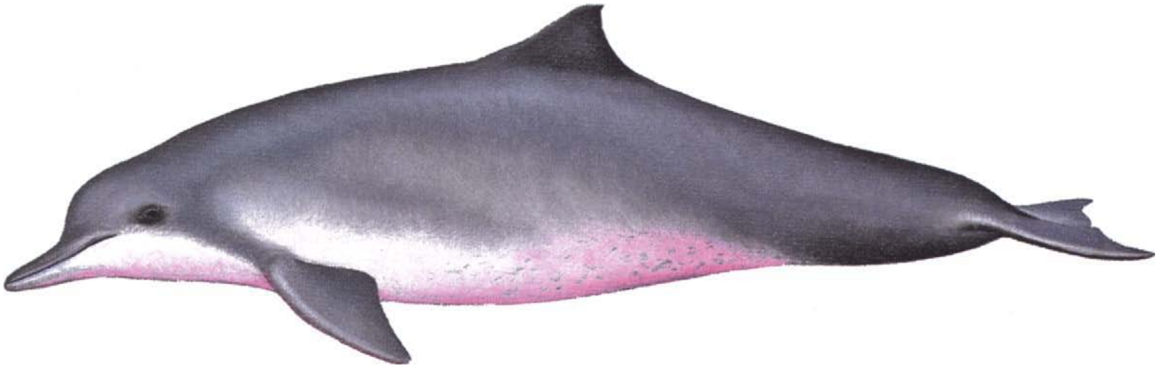
Tucuxi—*Sotalia fluviatilis*

(Gervais and Deville, 1853)



Recently-used synonyms *Sotalia tucuxi, Sotalia pallidus.*

Common names En.–tucuxi; Sp.–*bufeo gris, bufeo negro* Fr.–*sotalia*.

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Delphinidae. Recently, it has been recommended that the riverine and marine forms of *Sotalia* be split into two species: *S. fluviatilis* in the Amazon River system and *S. guianensis* in coastal marine waters of central and South America. The evidence for separate species status appears to be overwhelming, and it appears very likely that this proposed split will be accepted by most marine mammal biologists.

Species characteristics This small dolphin resembles the bottlenose dolphin in general body shape. It is significantly smaller than its congener. It is rather chunky, with a moderately long and narrow beak, and broad flippers. The dorsal fin that is shorter and more triangular and wide-based than in the bottlenose dolphin—it is sometimes recurved at the tip. The tucuxi has a rounded melon, which is not separated from the beak by a distinct crease (as it is in most other dolphins).

On the upper surface, tucuxis are dark-bluish or brownish-gray, fading to light gray or white (usually with a pinkish tinge) on the belly. There is a broad, somewhat poorly-defined stripe from the eye to the flipper, with a distinct lower boundary between the dark above and light below. A lateral area of lighter gray is present behind the flipper, and another one laterally from mid-body to the anus. The flipper and flukes are dark gray on the undersides.

The mouth contains 28–35 small, pointed teeth in each upper tooth row and 26–33 in each lower.

Adult female dolphins of this species are only up to about 1.52 m in length, and males are slightly smaller, reaching 1.49 m. Size at birth is poorly-known, but it estimated to be 0.7–0.8 m.

Recognizable geographic forms None.

A pair of tucuxis surfaces alongside a boat in the Peruvian Amazon. They are somewhat reminiscent of small bottlenose dolphins. PHOTO: T. A. JEFFERSON

Can be confused with In the Amazon River system, Amazon River dolphins (botos) are the only other cetaceans present, and it is usually easy to distinguish the two species. Differences in size, coloration, dorsal fin shape, head shape, and behavior are the best clues to distinguishing them. The tucuxi and costero may be sympatric in waters near the estuary of the Amazon River, and it would be nearly impossible to distinguish them "at sea."

Distribution Tucuxis are almost exclusively freshwater animals, and

Tucuxis have relatively short beaks and well-developed dorsal fins, and they porpoise when moving fast. All these facts suggest that their adaptation to riverine life has only come in recent evolutionary times. Peruvian Amazon. PHOTO: T. HENNINGSEN

occur in the Amazon River and possibly the Orinoco system as well (although it is thought to be the costero that inhabits Orinoco waters). This species is found throughout the Amazon drainage basin, as far inland as southern Peru, eastern Ecuador, and southeastern Colombia.

Ecology and behavior Dolphins of this species live mostly in groups of four or fewer, although they may be found in groups of up to 20. They are social animals, and they often feed in groups, sometimes appearing to use cooperative techniques. Dive times are generally less than 1.5–2.0 minutes. They do not bow ride, but they are sometimes quite active, with various types of leaps and other aerial behaviors seen.

They are generally shy and difficult to approach. During the flood season, animals may move into smaller tributaries, but apparently do not move into the inundated forest to feed (as Amazon River dolphins often do), staying mainly in the main river channels, tributaries and lakes. Tucuxis are largely sympatric with botos in the Amazon system, but generally do not interact with them (although they have been known to do so at times).

Life history has been little studied; most of the studies involve the marine species. At least in Brazil, calving apparently occurs primarily during the low water period, October to November. Sexual maturity is reached at about 1.3–1.4 m in length. Lifespan is estimated to be at least 30–35 years.

Feeding and prey A wide variety of fish, mostly small schooling species, are eaten. Feeding occurs both individually and in large groups.

Threats and status There are no global estimates of abundance available, and only estimates for specific portions of the range have been made. The tucuxi has been taken in fishing gear, especially gillnets and seines, in many areas of its range. Damming of rivers has also contributed to problems for this species. Additional threats include the damaging effects of gold mining with mercury, habitat loss/destruction, vessel collisions, environmental contaminants, and behavioral disturbance. In the past, live captures have also resulted in the loss of some animals. The species is not uncommon, and in many parts of the Amazon River system it is actually quite abundant. It occurs in some of the highest densities known for any cetacean species, and receives some protection there from myths and legends that discourage killing.

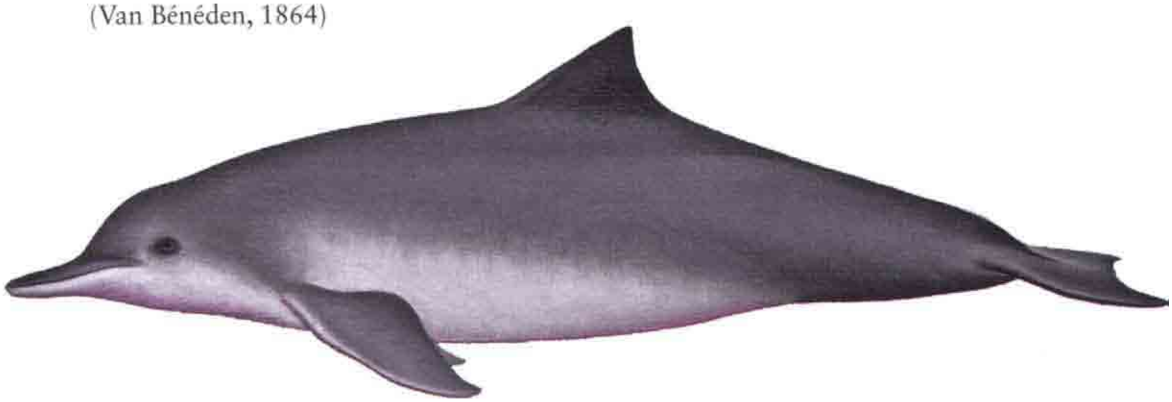
IUCN status Data Deficient.

References Caballero et al. 2007; Cunha et al. 2005; da Silva and Best 1994, 1996; Flores 2002.

A tucuxi leaps out of the water in the brownish, muddy waters of the Columbian Amazon. These animals can be quite acrobatic, and when seen so clearly, they are reminiscent of a bottlenose dolphin calf. PHOTO: F. TRUJILLO

Costero—*Sotalia guianensis*

(Van Bénéden, 1864)



Recently-used synonyms *Sotalia brasiliensis*.

Common names En.–costero; Sp.–*bufeo negro, tonina*; Fr.–*sotalia*. (Note—there are currently no universally agreed-upon common names for this species. In Brazil, they are *called boto*, *boto comun*, or *golfinho cinza*.)

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Delphinidae. Recently, it has been recommended that the riverine and marine forms of *Sotalia* be split into two species, *S. fluviatilis* in the Amazon River system and *S. guianensis* in coastal marine waters of central and South America (and probably the Orinoco system as well). The evidence for separate species status appears to be overwhelming, and it appears very likely that this proposed split will be accepted by most marine mammal biologists.

Species characteristics This small dolphin resembles the bottlenose dolphin in general body shape. It is somewhat larger than its close relative, the tucuxi. It is rather chunky, with a moderately long and narrow beak, and broad flippers. The dorsal fin is shorter and more triangular and wide-based than in the bottlenose dolphin—it is often recurved at the tip. The costero has a rounded melon, which is not separated from the beak by a distinct crease (as it is in most other dolphins).

On the upper surface, dolphins of this species are dark-bluish or brownish-gray, fading to light gray (often with a pinkish tinge) on the belly. The belly tends to be darker than in the tucuxi. There is a broad, somewhat poorly-defined stripe from the eye to the flipper. They may have another light streak of gray on the sides of the tail stock. The undersides of the flippers and flukes are gray.

The mouth contains 30–36 small, pointed teeth in each upper tooth row, and 28–34 in each lower. This is slightly more than in the tucuxi.

Adult dolphins of this species can be up to nearly 2.1 m in length (the largest known male was 1.7 m and the largest known female 1.87 m). They reach weights of at least 40 kg. Size at birth is estimated to be 0.8–1.15 m.

Recognizable geographic forms None.

A group of the costeros in southeastern Brazilian waters, showing the typical surfacing profile. PHOTO: L. FLACH

Can be confused with Bottlenose dolphins could be mistaken for costeros, but they are much larger, with taller, more falcate dorsal fins. Franciscanas might also be difficult to distinguish from *Sotalia* in coastal waters, but only if not seen well. The franciscana generally has a smaller body, much longer snout, and squarish (rather than pointed) flippers. Also, the franciscana has a shorter, more rounded dorsal fin. Near the mouth of the Amazon, the costero may overlap with the tucuxi (unconfirmed), and distinguishing them would be nearly impossible.

Distribution Costeros are found along the Atlantic coast of central and South America, mostly in shallow, nearshore marine waters, and in estuaries. They occur from Nicaragua (perhaps even Honduras) to Florianopolis, southern Brazil. The species has also been reported around some Caribbean islands, such as Trinidad and Tobago, as well as the Abrolhos archipelago, off Brazil. There is a population in Lake Maracaibo, an estuarine system in Venezuela. Dolphins of the genus *Sotalia* also occur in the Orinoco River basin, as far as about 300 km upriver (to about Ciudad Bolivar), and it is thought they these are members of the present species, but this remains uncertain.

Ecology and behavior Costeros live mostly in groups of four or fewer, although they are found in groups of up to 50 at times. They are social animals, and they often feed in groups, sometimes appearing to use cooperative techniques. Dive times are generally less than 1.5–2.0 minutes. They do not bow ride, but they are sometimes quite active, with various types of leaps and other aerial behaviors seen. Long-term photo-identification studies have shown that at least some individuals display long-term residency. Costeros are easier to approach than are tucuxis. Along the coast of Brazil, there are apparently at least three populations.

Life history has been studied in some detail recently. There is little or no evidence of calving seasonality in this species. There appears to be a 2-year calving interval. Sexual maturity is reached at about 1.6–1.8 m and 5–8 years. Lifespan is estimated to be at least 30–35 years.

Feeding and prey Costeros consume a wide variety of pelagic and demersal fishes and cephalopods. Feeding occurs both individually and in large groups.

Threats and status There are no global estimates of abundance available, and only estimates for specific portions of the range have been made (e.g., about 420 animals in Guanabara Bay, Brazil). They have been taken in fishing gear, especially gillnets and seines, in many areas of their range. There has been some direct killing for human consumption and for shark bait. Additional threats include habitat loss/destruction, vessel collisions, environmental contaminants, behavioral disturbance and

hand-feeding by tourist boats. In the past, live captures have also resulted in the loss of some animals. The species is relatively common throughout much of its range along the central and South American coast.

IUCN status Not Listed.

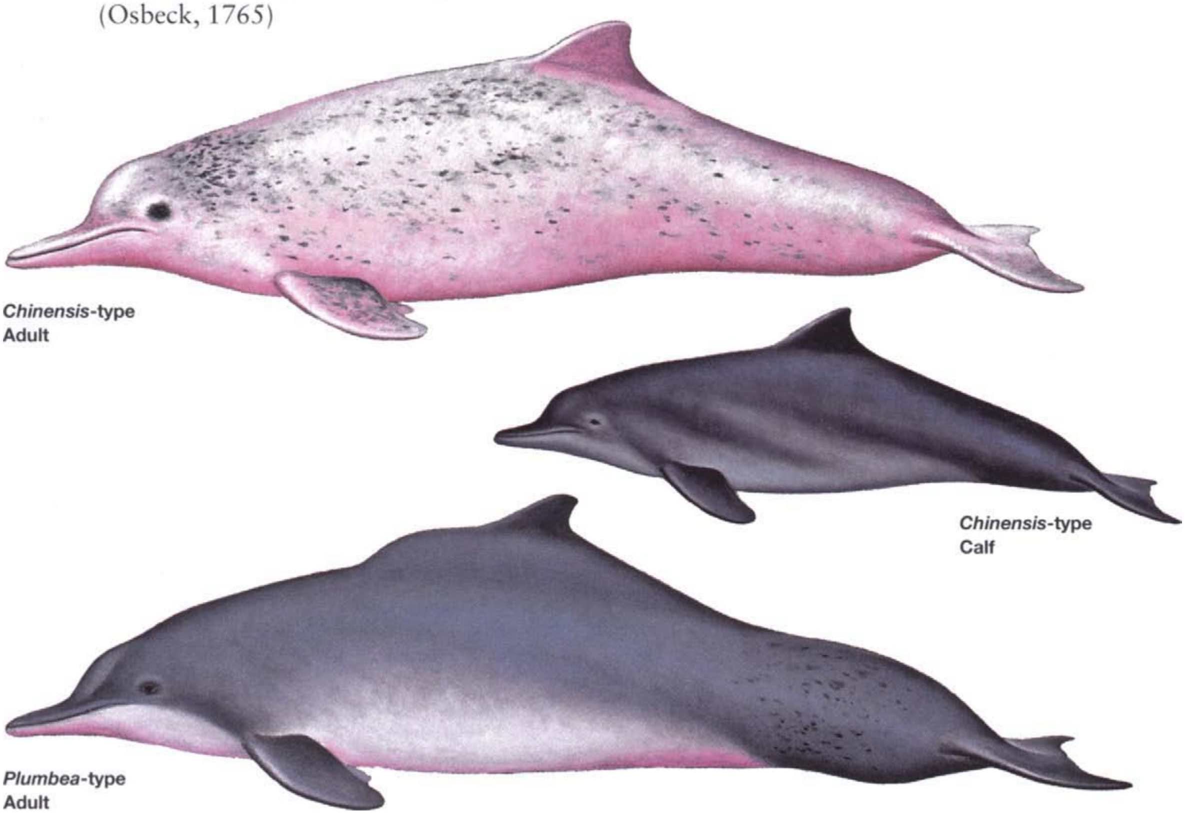
Indo–Pacific Humpback Dolphin—*Sousa chinensis*

(Osbeck, 1765)



Recently-used synonyms *Sousa plumbea, Sousa lentiginosa, Sousa borneensis.*

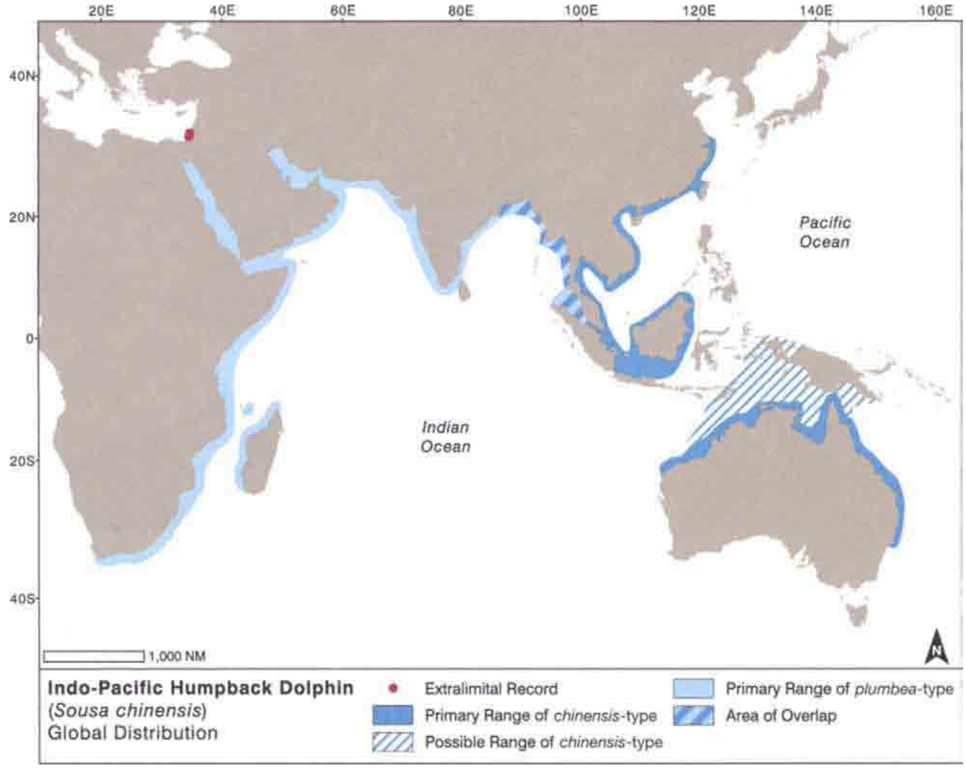
Common names En.–Indo–Pacific humpback dolphin; Sp.–*delfín jorobado del Pacífico*; Fr.–*dauphin a bosse de l'Indo–Pacifique*.

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Delphinidae. Some biologists consider this group to consist of two species: *Sousa plumbea* from South Africa to India, and *Sousa chinensis* from the east coast of India to the east. Morphometric and genetic studies underway may resolve this controversy in the near future, but there is growing evidence that at least these two putative species (and others not yet well-described) may be valid.

Species characteristics Dolphins of this highly-variable species are characterized by robust bodies with long, well-defined beaks. The beak is distinctly set-off from the rounded melon, but not by a deep crease (as it is in many other dolphin species). In populations in the western Indian Ocean, the small dorsal fin sits on a hump, or ridge, in the middle of the animal's back. The hump is present in young animals, but gets larger in older animals, especially adult males. In humpback dolphins in the eastern Indian and Pacific oceans the ridge appears to be absent, or nearly-so, and the dorsal fin is short and very wide-based. In some western areas, there also appear to be well-developed dorsal and ventral ridges on the tail stock, which are more exaggerated in males.

The color pattern varies with age and area. In the western part of the range, light-colored calves darken with age to become dark lead gray above and light gray below as adults (sometimes with white scarring around the dorsal fin and hump). Spotting tends to be relatively sparse, if present at all. However, in the eastern Indian

A humpback dolphin porpoises in the Pearl River Estuary, west of Hong Kong. This animal is of the *chinensis*-type, which lacks the dorsal hump. PHOTO: T. A. JEFFERSON



and Pacific oceans, dark gray calves lighten with age. In most areas of Southeast Asia and Australia, adults become pinkish-white, often with spots and blotches. In at least southern China, the spotting disappears in old females, leaving them ghostly white (often with a pink tinge).

There are 31 to 39 sturdy teeth in each upper tooth row, and 29–38 in each lower row. *Plumbea*-type dolphins have more teeth, on average, than *chinensis*-type specimens.

Maximum known body lengths are 2.8 m (males) and 2.6 m (females). Although unconfirmed reports of lengths up to 3.2 m have been reported, these are probably erroneous. Weights of up to 280 kg have been recorded. Newborns appear to be around 1 m in length.

A captive humpback dolphin of the *chinensis*-type at an oceanarium in Singapore. This animal was captured in the Gulf of Thailand. PHOTO: T. A. JEFFERSON

Pacific humpback dolphin* (chinensis-*type)

Calf—About 1/3–1/2 of adult size; dark gray to black dorsal surface, with no spotting.

Juvenile—About 2/3–3/4 adult size; gray dorsal surface, often with some lightening of the dorsal fin.

Subadult—Close to adult size; dark ground color of the dorsal surface fades in blotches to leave gray/black spotting.

Adult—Ground color white (often with pinkish tinge); spotting on dorsal surface may be extensive to completely absent.

Indian humpback dolphin* (plumbea-*type)

Calf—About 1/3–1/2 of adult size; off-white to light gray coloration, with no spotting.

Juvenile/Subadult—Greater than about 2/3 adult size; uniform slate gray dorsal surface.

Adult—Body robust, generally with prominent dorsal hump and deepened tail stock; dorsal surface and head often whitened, scarred, and spotted.

Recognizable geographic forms

Pacific humpback dolphin* (chinensis-*type)—Pacific humpback dolphins occur from at least the Sundarbans delta of Bangladesh (and possibly further east into India)

Indo-Pacific humpback dolphins surface in waters of the Pearl River Estuary of southern China. These dolphins may lose all their pigmentation and become completely white as adults. PHOTO: HONG KONG CETACEAN RESEARCH PROJECT

to central China and northern Australia. These animals have no prominent dorsal hump, and the dorsal fin is larger, with a wide base. Sexual dimorphism in body shape and size is weak or nonexistent. Coloration of adults generally ranges from gray to pure white, often with moderate to heavy spotting on much of the body (including the dorsal fin and back). Tooth counts are slightly lower than in the Indian form, ranging from 29–38 (with an average of about 33–35).

***Indian humpback dolphin* (plumbea-*type*)**—These animals are found in the Indian Ocean from South Africa to at least the Mergui Archipelago of southern Myanmar (and possibly southwards to the Strait of Malacca). They have a prominent dorsal hump (even in newborns), and the dorsal fin sits atop this hump. Sexual dimorphism is pronounced, with males larger than females and possessing a much larger dorsal hump. Coloration is generally brownish-gray, with a lighter belly and spotting is limited to small areas of the tail stock. The only white areas on the dorsal surface of the body are generally scarring in large adults. Tooth counts range from 32–39 (with an average of about 35–37).

Can be confused with Humpback dolphins are most likely to be confused with bottlenose dolphins. Differences in dorsal fin shape (including presence of the hump on many humpback dolphins), head shape, and color can be used to distinguish between the two. The surfacing behavior is also different, and may be useful once the observer has seen a number of groups of both species. Other species that share the nearshore range of this species (e.g., Irrawaddy dolphins, common

Not all *chinensis*-type humpback dolphins are white or pink as adults. This male individual, a regular in Hong Kong, is at least 15 years old and is undoubtedly an adult. PHOTO: T. A. JEFFERSON

dolphins, finless porpoises) should be easy to distinguish, based on size, general color pattern, head shape and dorsal fin shape.

Distribution Indo-Pacific humpback dolphins are found from both coasts of northern Australia and central China in the east, through the Indo–Malay Archipelago, and westward around the coastal rim of the Indian Ocean to southern Africa. They are inhabitants of tropical to warm temperate coastal waters and they often enter rivers, estuaries, and mangroves. The species' distribution

extends to enclosed seas: Persian Gulf, Red Sea, and Gulf of Thailand. There are a few extralimital records for the Mediterranean (apparent strays from the Red Sea).

Ecology and behavior Groups tend to be small, containing fewer than 10 individuals, although up to 30–40 have been seen together on occasion in Chinese waters. In Arabian waters, groups of over 100 are sometimes seen together. Group structure has been studied using photo-identification techniques. At least off South Africa and in Hong Kong, fluidity in group structure is the rule. Ranging patterns appear to vary, depending on the type of coastline involved, but residency of at least some individuals appears to be typical.

Off South Africa, where the behavior of these dolphins has been most thoroughly studied, herds often patrol slowly parallel to shore and preferentially use sandy bays for resting and socializing, and rocky coastline and larger estuarine areas for foraging. They are moderately acrobatic. Groups in Hong Kong and in Australian waters often feed behind active trawlers. In Hong Kong, they do not feed around reefs, but often consume fish near the bottom in shallow, murky waters. Bowriding behavior is extremely rare, although some individuals may ride swells or vessel wakes. They are shy of boats in South Africa and many other parts of the range, but in Hong Kong, dolphins are very accustomed to heavy vessel traffic.

Little is known about reproductive biology. Sexual maturity appears to be reached at around 9–10 years for females, and a few years later for males. Mating and calving occur all year, at least in South Africa and China, but there appear to be calving peaks in late spring to summer.

Feeding and prey Humpback dolphins appear to be rather opportunistic feeders. Feeding is primarily on a very wide variety of nearshore, estuarine, and reef fish. They also eat cephalopods in some areas, although crustaceans appear to be rare in the diet.

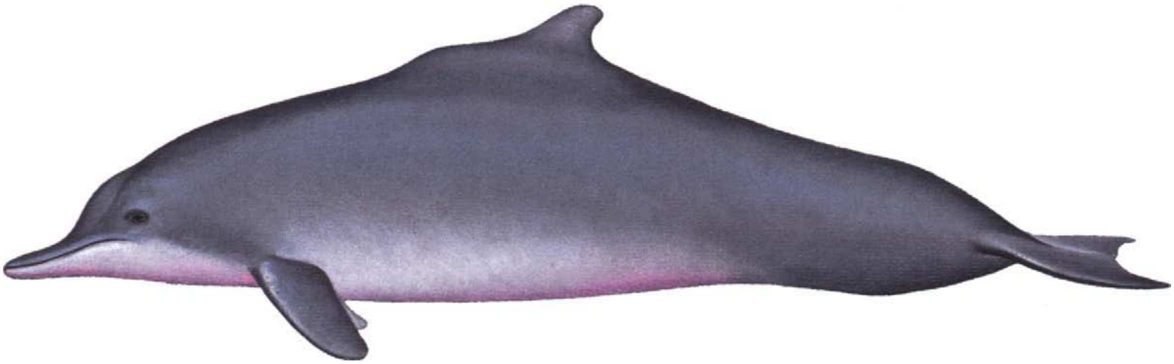
Threats and status Humpback dolphins are not known to be hunted directly anywhere in their range in significant numbers. However, they are often caught in fishing nets (such as gillnets and trawls), and also in anti-shark nets off South Africa and Australia. Because they are coastal in nature, habitat loss, vessel strikes, and pollution are additional important threats to these animals, and they are especially vulnerable to human threats. In particular, organochlorines and trace metals have been found to be very high for several populations (such as those off South Africa and Hong Kong). The species is not in any immediate danger of extinction, but certain populations are thought to have been depleted. Most of the small number of abundance estimates obtained have been in the lower hundreds of dolphins, but there appear to be at least 1,500 in the Pearl River Estuary of southern China.

IUCN status Data Deficient.

References Jefferson and Karczmarski 2001; Karczmarski et al. 2000; Ross 2002; Ross et al. 1994.

Atlantic Humpback Dolphin—*Sousa teuszii*

(Kükenthal, 1892)



Recently-used synonyms None.

Common names En.–Atlantic humpback dolphin; Sp.–*delfín jorobado del Atlantico*; Fr.–*dauphin a bosse de l'Atlantique.*

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Delphinidae. The validity of this species has been questioned in the past few years, but recent studies on skull morphology and genetics have made it clear that the species is indeed valid and separate from the Indo–Pacific humpback dolphin.

Species characteristics Atlantic humpback dolphins have a robust body; long, distinct beak (but with no crease between the beak and melon); broad flippers with rounded tips, and a moderately deepened tail stock. The dorsal fin is variable in shape, but is generally small and falcate. It emerges from a wide hump or ridge of connective tissue on the back. All animals, except for possibly very young calves, appear to possess the hump. Although this species is poorly known, it is probably sexually dimorphic, like some forms of the Indo–Pacific humpback dolphin.

Coloration is somewhat variable. Animals are typically slate gray on the sides and back, and light gray to whitish below. The coloration may appear brownish in some lighting. Some individuals have dark spots or flecks on the tail stock and near the base of the dorsal fin.

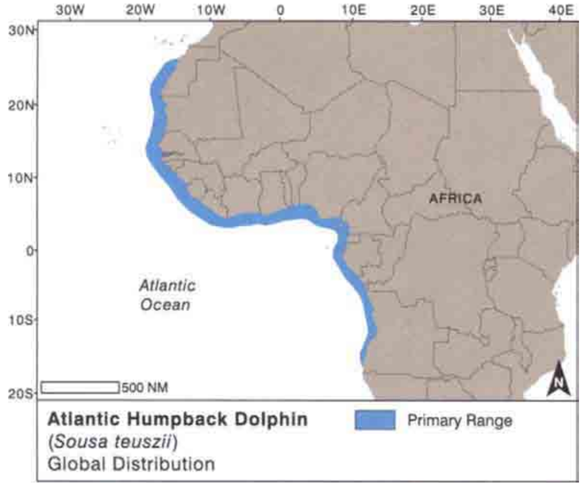
Tooth counts are 27–32 per upper tooth row, and 26–31 per lower row.

Adults are up to about 2.8 m in length (probably with males reaching greater sizes), and weigh up to 284 kg. Length at birth is thought to be about 1 m, but there are few records.

Recognizable geographic forms None.

Can be confused with The similar-looking bottlenose dolphin also inhabits the inshore range of the Atlantic humpback dolphin. The two can be distinguished by differences in beak length, dorsal fin shape (including the

A group of Atlantic humpback dolphins in the very murky waters off Mauritania. PHOTO: T. HENNINGSEN



This Atlantic humpback dolphin clearly shows the prominent dorsal hump that characterizes the species. PHOTO: T. HENNINGSEN

presence of the hump in *Sousa*), and coloration. This species is externally very similar to the form of *Sousa chinensis* that occurs in the western Indian Ocean, but there should not be any identification problems, as the two do not overlap in distribution.

Distribution Atlantic humpback dolphins occur in nearshore waters off tropical to subtropical West Africa, from Morocco south to at least southern Angola. They apparently occur as distinct populations, separated by areas of low or zero density. They are found primarily in estuarine and shallow coastal waters. Humpback dolphins may occupy lower reaches of rivers to slightly beyond the tidal influence, but there is no evidence that there are separate freshwater populations. In at least some areas, they frequent the surf zone just offshore of the breakers.

Ecology and behavior Groups of Atlantic humpback dolphins generally contain 5–7 individuals, occasionally up to 30 or 40 animals may gather in scattered subgroups. Groups generally feed very near shore, often within easy view of the beach, and sometimes in the turbid surf zone. These animals generally do not bowride, and appear not to be very aerially active. Compared to some populations of the Indo-Pacific humpback dolphin, they are generally shy and difficult to approach. Little else is known of the behavior of these animals.

Two Atlantic humpback dolphins surface just outside the surf zone. Gabon, West Africa. PHOTO: T. COLLINS

Breeding has been documented in March and April, but the reproductive season may well be more protracted. Virtually nothing else is known of the life history of the species.

Feeding and prey Atlantic humpback dolphins feed on nearshore schooling fishes such as mullet and, contrary to some descriptions, are not thought to eat vegetable matter. Off the coast of Mauritania, fishermen sometimes cooperate with Atlantic humpback and bottlenose dolphins to capture mullet with beach seines.

Threats and status Incidental catches in fishing nets are known, and some Atlantic humpback dolphins may be taken directly by local people in West Africa. Habitat destruction, vessel collisions, and environmental contamination may be additional threats. There are no statistically defensible estimates of abundance available for anywhere in the range, although there are thought to be at least several hundred in Guinea Bissau. This species has a restricted range, and it is likely that there are no more than a few thousand of these animals left. Due to the evidence of low densities in most areas of study, and significant threats from human activities, the Atlantic humpback dolphin may be threatened with extinction on a global scale.

IUCN status Data Deficient.

Rough-toothed Dolphin—*Steno bredanensis*

(G. Cuvier *in* Lesson, 1828)

Recently-used synonyms *Steno rostratus*.

Common names En.–rough-toothed dolphin; Sp.–*esteno* or *delfín de dientes rugosos*; Fr.–*sténo*.

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Delphinidae. Hybrids with common bottlenose dolphins have been reported from captivity.

Species characteristics The rough-toothed dolphin is relatively robust, with a long, conical head and no demarcation between the gently-sloping melon and the moderately long beak. It has a somewhat reptilean appearance. This species has large flippers (seemingly oversized for the animal), which are set farther back on the body than in most other dolphin species. The dorsal fin is prominent and slightly falcate. Adult males may have a post-anal hump of connective tissue on the underside of the tail stock.

The color pattern is generally three-tone. The body is dark gray, with a prominent, narrow dorsal cape that dips slightly down onto the side below the dorsal fin. The belly, lips, and much of the lower jaw are usually white, sometimes with a pinkish cast. There may be a dark eye patch. The sides are an intermediate shade of gray. White scratches and spots, apparently mostly caused by bites of cookie-cutter sharks and probably other rough-toothed dolphins, often are present on the bodies of older individuals. Young animals are lighter in color than adults, have a muted, less-contrasting color pattern, and generally lack the white spots.

The jaws contain 19–28 stout teeth in each row with subtle, but detectable, vertical wrinkles or ridges. These ridges give rise to the species' English common name.

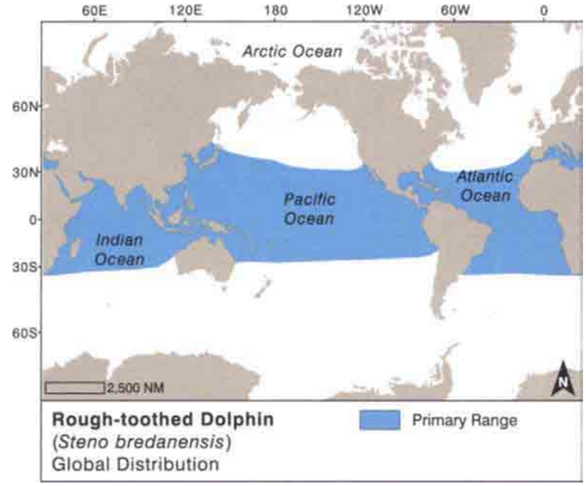
Adults are up to about 2.65 m long (with males slightly larger than females), and may occasionally reach 2.8 m. They are known to reach weights of up to 155 kg. Length at birth is unknown.

Recognizable geographic forms None.

Can be confused with Because of their unique color pattern and head shape, rough-toothed dolphins are generally easy to identify, when seen at close range. However, they may be mistaken for bottlenose dolphins, if seen at a distance. The narrow cape and cone-shaped head will be the best clues to identification of rough-toothed dolphins in such situations.

Distribution The rough-toothed dolphin is a tropical to subtropical species, which generally inhabits deep, oceanic waters of all three major oceans, rarely ranging

Underwater view of a rough-toothed dolphin, showing the unique coloration and body shape. Marquesas. PHOTO: A. GANNIER/GROUPE DE RECHERCHE SUR LES CETACES



Rough-toothed dolphins will approach vessels and bowride on occasion. When such close views are obtained, the species is easy to identify. Eastern tropical Pacific. PHOTO: P. A. OLSON

north of 40°N or south of 35°S. However, in some areas (such as off the coast of Brazil and West Africa), rough-toothed dolphins may occur in more shallow coastal waters. They are found in many semi-enclosed bodies of water (such as the Gulf of Mexico, Caribbean Sea, Red Sea, and Gulf of California), but only occasionally occur in the Mediterranean Sea.

Ecology and behavior Rough-toothed dolphins have been seen most commonly in groups of 10–20, although herds of over 100 have been reported. They may appear lethargic and slow-moving, especially in comparison to the smaller oceanic dolphins of the genera *Delphinus* and *Stenella*. At other times, they move at high speed with the chin and head above the surface, in a distinctive skimming behavior, sometimes described as "surfing." They do bowride at times and aerial behavior, including spyhops and leaps are sometimes seen. They have been seen feeding opportunistically around trawlers.

A mother and calf rough-toothed dolphin; in calves, the lower jaw starts out gray and becomes whiter with age. Hawaii. PHOTO: R. W. BAIRD

Rough-toothed dolphins are thought to be capable of very deep-diving, and dives of up to 15 min. have been recorded. In the eastern tropical Pacific, they tend to associate with floating objects and sometimes with other cetaceans (especially pilot whales and other dolphins).

Not much is known about the reproductive biology of this species. Studies in Japan suggest that males reach sexual maturity at about 14 years of age and 225 cm, and females at 10 years and 210–220 cm. Longevity may be around 36 years or more.

Feeding and prey Rough-toothed dolphins feed on cephalopods and fish, including such large fish as *mahi mahi* (also called dorado or dolphinfish). Recently, it has been suggested that these dolphins may be adapted to be specialist feeders on *mahi mahi*.

Even when little is seen of the animal, rough-toothed dolphins can be identified by the sloping forehead, with no crease between the melon and the beak. Arabian Sea. PHOTO: C. JOHNSON

Although most of the rough-toothed dolphins' identification characteristics can not be seen here, the narrow, well-defined cape is clearly visible. PHOTO: SWFSC/HICEAS

A young male rough-toothed dolphin that live-stranded in Hong Kong; notice that the lower jaw and lips have not turned white yet. PHOTO: T. A. JEFFERSON

Threats and status No fisheries are known to specifically target this species, but rough-toothed dolphins are one of several species killed in direct fisheries in Japan, Sri Lanka, Indonesia, the Caribbean, Papua New Guinea, the Solomon Islands, and West Africa. They are sometimes taken as by-catch in purse seine fisheries for tuna in the eastern tropical Pacific, and in gillnet fisheries in Sri Lanka, Brazil, and the offshore North Pacific. Their offshore distribution in most areas should reduce potential problems of habitat loss and alteration. There are few estimates of abundance, except for the eastern tropical Pacific (146,000 animals) and northern Gulf of Mexico (450–850 animals). This species is generally not one of the more common species of tropical dolphins, but there is no reason to believe that it is threatened on a global scale.

IUCN status Data Deficient.

References Addink and Smeenk 2001; Jefferson 2002; Miyazaki and Perrin 1994; Pitman and Stinchcomb 2002.

Bowriding rough-toothed dolphins are easy to identify by their narrow cape and smooth transition from beak to forehead. The area of the eyes often seems to bulge out as well. Eastern tropical Pacific. PHOTO: R.L. PITMAN

Pacific White-sided Dolphin—*Lagenorhynchus obliquidens*

Gill, 1865

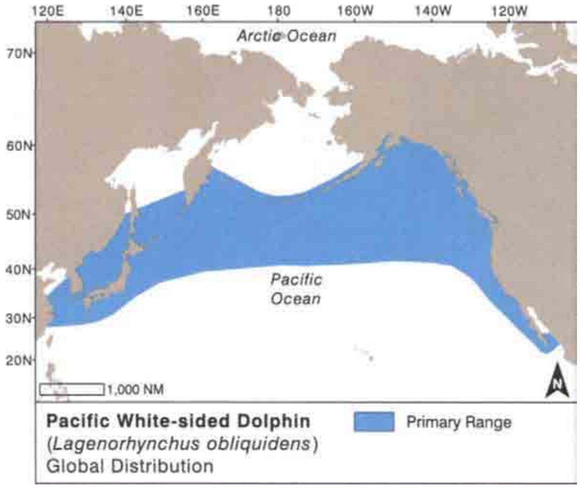
Recently-used synonyms *Lagenorhynchus ognevi.*

Common names En.–Pacific white-sided dolphin; Sp.–*delfín de costados blancos del Pacifico*; Fr.–*dauphin a flancs blancs du Pacifique*.

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Delphinidae. Some biologists have suggested that the Pacific white-sided dolphin may simply be a subspecies of the dusky dolphin, but recent research does not support this idea.

The appearance of cetaceans can change with their environment. These Pacific white-sided dolphins in the southern Bering Sea, at the northern extreme of their range, appear chunkier because of a heavier fat load and have an orange tinge, probably due to diatom infestation. PHOTO: H. FEARNBACH, COURTESY NOAA FISHERIES/NMML

Species characteristics Pacific white-sided dolphins, like all members of the genus *Lagenorhynchus*, are stocky animals with very short, thick snouts. There is a shallow crease, which defines the beak from the melon. The large flippers are recurved, with slightly rounded tips. The dorsal fin, one of the most diagnostic features, is large and strongly-recurved in some individuals. In some older animals (apparently adult males), the dorsal fin becomes so hooked (lobate) that the tip may curl down to a point below the midpoint of the dorsal fin height. It remains relatively wide to the tip.



A Pacific white-sided dolphin leaps out of the water in Monterey Bay, showing the beautiful and unmistakable color pattern of the species. PHOTO: D. FRANK

The dark gray back and light gray sides are distinctly set-off from the white belly by a black border. Light gray streaks beginning on the sides of the melon above the eyes sweep back and then downwards gradually past the dorsal fin and expand into large gray flank patches. In the thoracic area they form light gray "suspender stripes." The lips and beak tip are black, while most of the lower jaw is white. The anterior part of the dorsal fin is dark gray, and the posterior portion is light gray to white. The upper surfaces of the flippers may also contain light patches. The color of young calves is muted, much lighter than in adults, and they may have an orangish tinge.

There are several uncommonly-occuring morphs. One is an animal with the regular color pattern, but with the gray and black shades replaced by an orangish rust color. There is another one with the suspender stripe above and just behind the eye greatly expanded and white in color. The third is largely white (but is not an albino), with some remnants of the normal color pattern (e.g., black beak tip, lips, and top of head, and dark gray fringing on appendages and sides). All-black individuals have also been reported. Several individuals with these unusual color morphs may be present in large schools.

Each tooth row contains 23–36 pairs of relatively fine, sharply pointed teeth.

Eastern North Pacific adults of this species reach 2.5 m in length in males and 2.4 m in females. In the western Pacific, they reach up to 2.4 m (males) and 2.3 m (females). Maximum weight is about 198 kg. Length at birth is estimated to be 92–100 cm in the central Pacific.

Recognizable geographic forms Two geographical forms have been described from the eastern North Pacific and two for the western Pacific. However, they are known to differ from each other mainly in modal length and cranial characteristics, and are generally not distinguishable in the field.

Can be confused with Among sympatric species, Pacific white-sided dolphins are most likely to be confused with both common dolphins, because all three species are found in large schools and have large light-colored flank patches. Beak length (much longer in common dolphins) and specifics of the color pattern (e.g., no suspender stripes on common dolphins) are the best keys to distinguishing them. Also, the common dolphin generally has a much more erect dorsal fin.

Distribution Pacific white-sided dolphins inhabit cool temperate waters of the North Pacific and some adjacent

This group of Pacific white-sided dolphins clearly displays all the species' distinctive characteristics. The bicolored dorsal fin will sometimes even allow identification of rolling groups at a great distance. PHOTO: B. WATTS

seas (Sea of Japan, Okhotsk Sea, the southern Bering Sea and southern Gulf of California). Although they are widely distributed in deep offshore waters, they also extend onto the continental shelf and very near shore in some areas. They reach their southern limits at the mouth of the Gulf of California (and occasionally venture northward in the Gulf to or beyond La Paz) and southern Japan (records from Taiwan are considered to be misidentifications). They occur in some of the inshore waters of the Pacific Northwest (Washington and British Columbia). Seasonal inshore/offshore and north/south movements have been documented. On both eastern and western sides of the Pacific, separate stocks have been documented.

Ecology and behavior Often seen in large herds of hundreds or even thousands, these highly gregarious dolphins are also commonly seen with a large variety of other marine mammal species, especially northern right whale dolphins and Risso's dolphins. Predaton by killer whales has been reported. There is often segregation of schools, according to age and sex. They are highly acrobatic and playful, commonly bowriding, and often leaping, flipping, or somersaulting. However, there have been few detailed studies of the behavior of this gregarious species of dolphin. Large herds are often observed feeding in an apparently cooperative manner on large schools of fish. Dives of over 6 minutes have been recorded.

Males in the central North Pacific reach sexual maturity at about 10 years and 170–180 cm, and females at 8–11 years of age and 175–186 cm. Calving in some areas apparently occurs during a protracted summer breeding season, which extends into fall. In the central Pacific, calving takes place in late winter to spring.

Feeding and prey Pacific white-sided dolphins feed mostly in epipelagic and mesopelagic waters on small schooling fish, such as lanternfish, anchovies, saury, horse mackerel, and hake, as well as cephalopods. There is evidence that these dolphins feed mostly on deep scattering layer (DSL) organisms, possibly using cooperative foraging techniques.

Threats and status Pacific white-sided dolphins have never been primary targets of Japanese drive fisheries, but some dolphins have been harpooned and taken in

Pacific white-sided dolphins are one of the most acrobatic of dolphin species found in the temperate Pacific. They often perform fancy leaps and breaches. PHOTO: K. WHITTAKER

These are both Pacific white-sided dolphins; the lower animal is a color pattern variant that occurs regularly in the eastern North Pacific. PHOTO: S. WEBB

drives in Japanese waters. They are taken in a number of fisheries (mainly gillnet and driftnet fisheries, but also trawls and purse seines) in the eastern North Pacific, and in the 1980s and early 1990s, several thousand per year were killed in the now-defunct squid driftnet fisheries that operated in the offshore central Pacific by Japan, Taiwan, and Korea. Estimates of total Pacific white-sided dolphin abundance range from about 930,000 to 990,000, but both of these may be overestimates (due to unaccounted-for dolphin attraction to survey vessels). The species is not considered to be threatened.

IUCN status Least Concern.

Dusky Dolphin—*Lagenorhynchus obscurus*

(Gray, 1828)

Recently-used synonyms *Lagenorhynchus fitzroyi, Lagenorhynchus superciliosus*.

Common names En.–dusky dolphin; Sp.–*delfín obscuro*; Fr.–*dauphin sombre*.

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Delphinidae. Some researchers used to believe that the Pacific white-sided dolphin was a subspecies of *L. obscurus*, but this is not longer considered likely. Three subspecies are recognized: *L. o. obscurus* in southern Africa, *L. o. fitzroyi* in southern South America, and an unnamed subspecies in New Zealand. Recent genetic evidence suggests that, despite some gene flow, Peruvian and Argentine animals should be considered separate stocks. Hybrids with long-beaked common dolphins and southern right whale dolphins have been reported in the wild.

From above, this bowriding dusky dolphin can easily be identified by its stubby dark beak, light face, and "suspender" stripes. Sympatric Peale's dolphins have a dark face. PHOTO: R.L. PITMAN

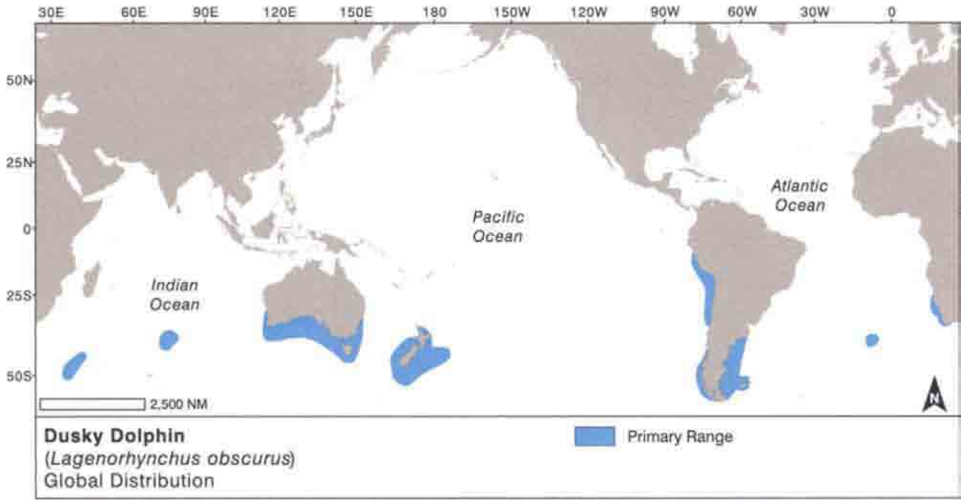
Species characteristics The dusky dolphin is a small, moderately robust species. The rostrum is short and clearly demarcated from the melon (forehead). The conspicuous dorsal fin is moderately falcate and pointed. The flippers are moderately curved on the leading edge, with bluntly rounded tips.

The body coloration is complex, and is generally countershaded, dark gray to blue black above and white below. The sides are marked with blazes and patches of pale gray. In front of the dorsal fin, they bear a broad light gray thoracic patch that encompasses the face, most of the head, and thorax, tapering towards the belly. A separate crescent-shaped flank patch reaches the top of the tail stock, just in front of the flukes. The front of this flank patch splits into two blazes, a shorter ventral and a longer dorsal one; this latter one narrows and stretches up onto the back, almost to the blowhole. The rostrum is gray-black around the tip, tapering back to darken just the lips near the gape. The eye is set in a small patch of gray-black. A variable crescent of pale gray contrasts the trailing half of the dorsal fin with the dark-colored front half, and the flippers are pale gray, but darken around the edges.

Dolphins that appear to be hybrids between dusky and southern right whale dolphins have been observed at sea off Argentina. The presumed hybrids appear to be almost exactly intermediate between dusky and right whale dolphins.

There are 27–36 small, pointed teeth on each side of each jaw.

The maximum recorded length is 2.1 m. Most adults are less than 2 m long, and there is not known to



be any significant difference in the size of males and females. Specimens from Peru appear to be larger than those from South Africa or New Zealand, but sample sizes are small. Healthy adults weigh 70–85 kg. Length at birth has been reported to be 80–100 cm.

Recognizable geographic forms Other than the apparent differences in size among dusky dolphins from different stocks, there are no known reliable differences in external appearance.

Can be confused with At sea, dusky dolphins can be distinguished from the closely-related, but larger and more robust, Peale's dolphin, primarily by careful attention to color pattern components (especially the much-darker beak of the Peale's dolphin). They may also be confused with common dolphins, which share a light anterior thoracic patch. The much longer beak of the common dolphins will be the best feature to distinguish them.

Distribution Dusky dolphins are widespread in the Southern Hemisphere. They occur in apparently disjunct populations in the waters off New Zealand (including the Chatham and Campbell islands), central and southern South America (including the Falkland Islands), and southwestern Africa. They also occur around some oceanic island groups (e.g., Tristan de Cunha, Prince Edward, Amsterdam, and St. Paul islands). This is a more-or-less coastal species and is usually found over the continental shelf and slope. They do dive over deep waters in some areas (e.g., New Zealand), but always along continental slopes. Inshore/offshore shifts in abundance have been noted for Argentina and New Zealand.

Ecology and behavior The behavior of dusky dolphins has been studied in detail in both Argentina and New Zealand. They are highly social, gregarious animals. They sometimes form impressive herds of over 1,000 individuals, but are more likely to occur in groups of 20–500. These dolphins are known to gather into large cooperative groups for feeding on schooling fish. Group foraging is thought to be coordinated through use of a series of acrobatic leaps. Some stable subgroups exist, but the overall social structure appears to be one of fluid associations. Dusky dolphins are one of the most acrobatic of all the dolphins, frequently leaping high out of the water, at times tumbling in the air. They readily approach vessels

A group of dusky dolphins underwater in New Zealand waters. The complex color pattern of this species is similar to that of the Pacific white-sided dolphin of the North Pacific, but the two do not overlap in distribution. PHOTO: S. DAWSON

When dusky dolphins are being demonstrative, they find it hard to stay in the water; the bi-colored fin is always a useful identification feature. New Zealand. PHOTO: T. PUSSER

to engage in bowriding. Many species of cetaceans have been observed in association with dusky dolphins.

In Peru, calving is believed to peak in August to October (spring), while in Argentina, South Africa and New Zealand, calving appears to occur in summer months (November to February). Sexual maturity is reached at ages of about 4–6 years in females and 4–5 years in males (the lower values may reflect a density dependent response to past exploitation).

Seasonal inshore/offshore movements are known for several parts of the range, including both Argentina and New Zealand. Individuals are highly adaptable and may change their feeding strategy to conform to local conditions.

Feeding and prey Dusky dolphins take a wide variety of prey, including southern anchovy near the surface in shallower waters, as well as mid-water and benthic prey, such as squid, hake, and lanternfishes. They may also engage in nocturnal feeding, in association with the deep scattering layer. New Zealand dolphins appear to engage in feeding deeper in the water column than do those from Argentine waters.

Threats and status Dusky dolphins are known to be taken directly in the multi-species small cetacean fisheries of Peru and Chile, which make use of both driftnets and harpoons for capture. Although recent catches appear to have decreased, the Peruvian catch is still thought to be unsustainable. Dusky dolphins are also killed incidentally in gillnets in New Zealand, and in mid-water trawl nets in Argentina. There are no statistically-defensible abundance estimates available for any significant portion of the range. Although the species is in no danger of extinction on a global scale, some populations are thought to have been seriously depleted by human activities (e.g., off Peru).

IUCN status Data Deficient.

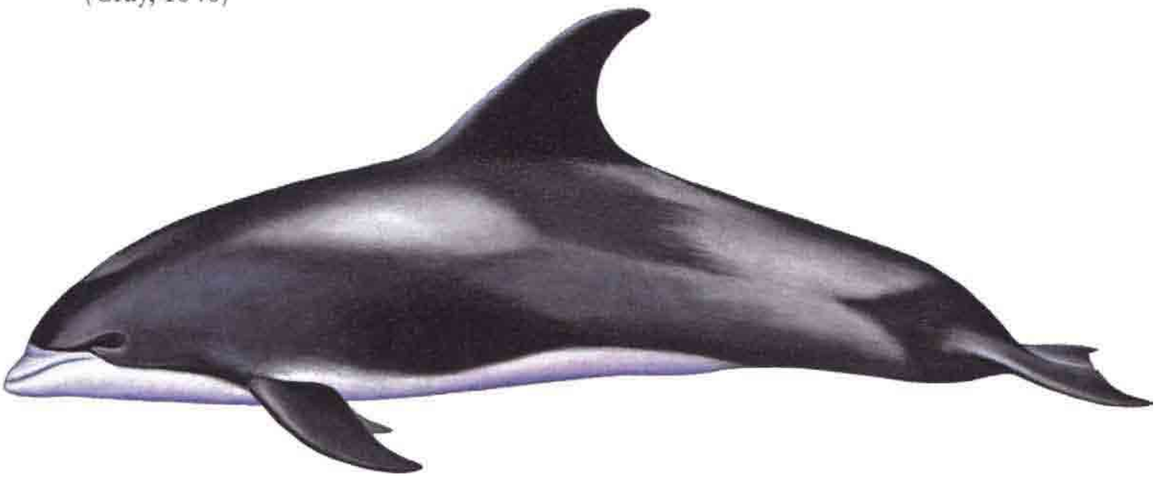
White-beaked Dolphin—*Lagenorhynchus albirostris*

(Gray, 1846)



Recently-used synonyms None.

Common names En.–white-beaked dolphin; Sp.–*delfín de hocico blanco*; Fr.–*dauphin avec bec blanc*.

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Delphinidae. Recent genetic studies suggest that this species is not closely-related to any of the others currently placed in the genus *Lagenorhynchus*. It is likely that future work will split out the other species, leaving this one as the only member of the genus *Lagenorhynchus*.

Species characteristics White-beaked dolphins are extremely robust animals. The beak is very short and thick (usually 5–8 cm long), but is set-off from the melon by a shallow crease. The dorsal fin is very tall and only slightly falcate, with a pointed tip. The flukes and dorsal fin get proportionately larger as the animal ages. The pointed flippers are moderately broad and long (up to 19% of the total length), with a falcate trailing edge. The tail stock is not particularly deepened, tapering gradually as it approaches the flukes.

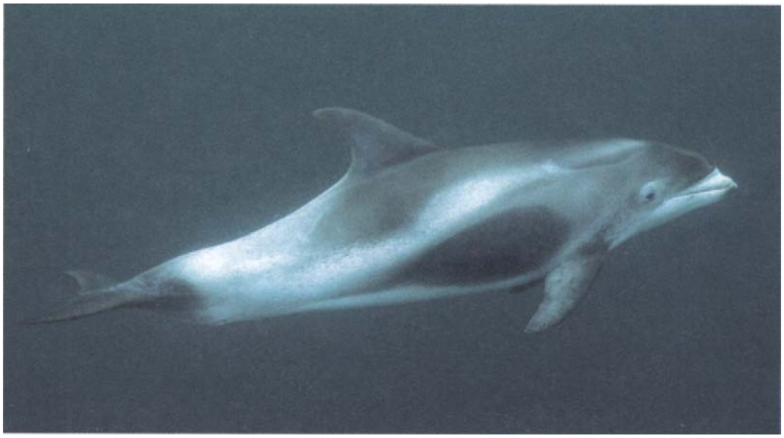
The color pattern is highly variable, but the animals are mostly black to dark gray on the upper sides and back. The beak and most of the belly are white to light gray, and (especially the beak) are often mottled, flecked, or ashy gray. The light color of the beak extends dorsally to cover the apex of the melon. Light streaks may surround the eye. An area of light gray with an indistinct border originating on the upper flank broadens to cover most of the tail stock—this is the species' most distinctive characteristic. There is generally a black thoracic patch, surrounded by lighter coloring. There is often dark or light flecking in the region between the eye and the flipper. The dorsal fin, flippers, and flukes are mostly dark.

Twenty-two to 28 sharp, but moderately large (compared to other members of the genus) teeth line each half of each jaw.

Adults are 2.4–3.1 m in length (males grow larger than females) and weigh between 180 and 350 kg. Newborns are between 1.1 and 1.2 m long, and weigh approximately 40 kg.

Recognizable geographic forms None.

Can be confused with White-beaked dolphins are most likely to be confused with Atlantic white-sided dol-



A stunning photo of a white-beaked dolphin, showing the robust body and distinctive color pattern including white tail stock and back behind the dorsal fin. Norway.
PHOTO: R. SVENSEN

phins, from which they can be distinguished by differences in coloration and beak length. Also, in the few areas where they overlap with bottlenose dolphins, care must be taken to distinguish between these two.

Distribution White-beaked dolphins inhabit cold temperate to subpolar waters of the North Atlantic, from Cape Cod and Portugal, north to central Davis Strait, southern Greenland, and Svalbard. The range includes Iceland, the UK, and most Scandanavian waters (but apparently not very far into the Baltic Sea). The species does not normally occur in the Mediterranean, but there are a few questionable records from at least the western Mediterranean. They inhabit continental shelf and offshore waters, although there is evidence suggesting that their primary habitat is in waters less than 200 m deep.

Ecology and behavior The behavior and ecology of white-beaked dolphins has received little detailed study. Groups of less than 30 white-beaked dolphins are most common, but herds of many hundreds (or even thousands) have been seen. These animals are active, often leaping and breaching, and they often approach vessels to ride bow or stern waves. However, they may be quite elusive in some areas. They sometimes associate, while feeding, with large whales (such as fin and humpback whales), and are known to form mixed groups with a number of other dolphin species (including bottlenose and Atlantic white-sided dolphins). Cooperative feeding has been observed. Little is known of group structure or association patterns, but there is some evidence of age and sex class segregation among schools. Mass strandings are relatively rare.

There appears to be a protracted calving peak in summer to early fall (May to September), but not much else is known about reproduction in this species. Sexual maturity has not been well-studied, but males appear to become mature at around 250 cm and females at around 240 cm.

A group of white-beaked dolphins moving quickly along the surface off eastern Canada. PHOTO: S. GOWANS

Feeding and prey White-beaked dolphins feed on a variety of small mesopelagic and schooling fishes (such as herring, cod, haddock, poorcod, bib, hake, and whiting), squid, and crustaceans.

Threats and status Although not a target of any commercial fisheries, some dolphins are shot

in Greenlandic waters, and they have been hunted opportunistically in other countries (e.g., Norway, Iceland, and Canada) as well. In addition, incidental catches in gillnets, cod traps, and trawl nets are also known from several areas of the species' range. Some dolphins may die from collisions with vessels, although there is little documentation of this. Some also die from getting entrapped in encroaching ice. The species is not considered to be threatened. Declines in abundance have occurred in some areas, such as the Gulf of Maine (however, this may have more to do with habitat shifts than changes in population size). At least 7,800 white-beaked dolphins are estimated to inhabit the North Sea and adjacent waters. There are few estimates of abundance, but it is clear that there are many tens of thousands (or even low hundreds of thousands) of these animals throughout their range.

IUCN status Least Concern.

References Kinze et al. 1997; Kinze 2002; Reeves et al. 1999.

Even in this more typical view of white-beaked dolphins, the species can be identified by its short, stubby beak and unique color pattern. PHOTO: S. GOWANS

Delphinidae

White-beaked Dolphin

Atlantic White-sided Dolphin—*Lagenorhynchus acutus*

(Gray, 1828)

Recently-used synonyms *Leucopleurus acutus*.

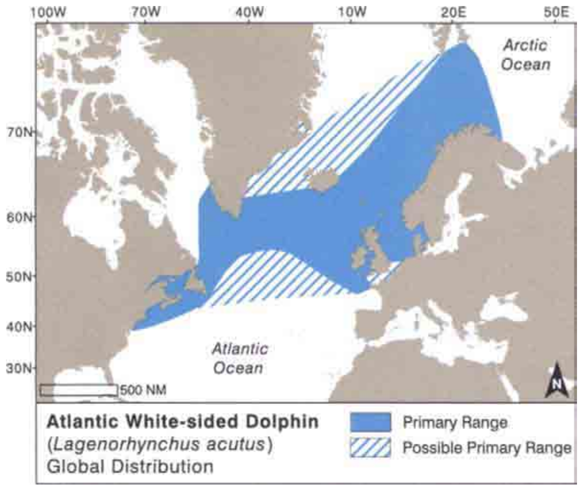
Common names En.–Atlantic white-sided dolphin; Sp.–*delfín de flancos blancos*; Fr.–*dauphin a flancs blancs de l'Atlantique*.

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Delphinidae. The Atlantic white-sided dolphin is currently placed in a multi-species genus. However, molecular analyses suggest that it is not closely-related to any of those species, and it is possible that it will be split off from them into its own genus (*Leucopleurus*) in the next few years.

Atlantic white-sided dolphins moving along just below the surface in clear water, showing the unique color pattern and short, stubby beak. PHOTO: R. W. BAIRD

Species characteristics Atlantic white-sided dolphins are robust and deep-bodied (maximum girth can be up to 60% of total length), with a tail stock that is strongly deepened into "keels" above and below. The deepening of the tail stock is more pronounced in adult males than in other age/sex classes. The beak is very short, but is somewhat defined from the rounded melon. The dorsal fin is tall (more than 12% of the total length), slightly falcate, and pointed. The flippers are moderately large and pointed at the tips, and there may be tubercles on the leading edges.

The color pattern is complex and striking. The back and upper sides, upper jaw, dorsal fin, flippers, and flukes are black or dark gray, and a thin, dark line runs backwards from the beak and meets a black patch around the eye. There is a thin eye-to-flipper stripe. The lower jaw and belly, as far as the urogenital area, are white. In between, the sides from just ahead of the eye to the base of the flukes are light gray. Along the upper margin of the gray side is a white patch from below the dorsal fin to midway along the tail stock. There is another narrow band, this one yellow to ochre in color, at the lower margin of the dark upper flank, from mid-tail stock to just in front of the flukes. Calves appear to have a muted pattern with less contrast than adults. Some individuals with unusual pigmentation patterns have been observed, most commonly, dolphins with extensive amounts of white on the body.



Two Atlantic white-sided dolphins leap beside a vessel in the North Atlantic Ocean. The color pattern of this species is beautiful and distinctive. PHOTO: COURTESY OF S. LEATHERWOOD

Each tooth row contains 30–40 pointed teeth. The teeth are small.

Adult Atlantic white-sided dolphins reach 2.8 m (males) or 2.5 m (females) in length and about 235 kg (males) and 182 kg (females) in weight. Newborns are 1.1–1.2 m.

Recognizable geographic forms None.

Can be confused with Confusion is most likely with the white-beaked dolphin, which shares a nearly identical range (however, Atlantic white-sided dolphins are more common in the southern parts of the range). The two can be distinguished most readily by size, color pattern, and subtle head shape differences. The Atlantic white-sided dolphin is smaller and more slender, and its color pattern is much more bold and striking, with more distinct flank patches. It also lacks the white tail stock of the white-beaked dolphin.

Distribution Atlantic white-sided dolphins are found in cold temperate to subpolar waters of the North Atlantic, from about 38°N (south of Cape Cod) in the west and the Brittany coast of France in the east, north to southern Greenland, Iceland, and southern Svalbard. The range includes the UK and the northern coasts of Scandanaviia, although they rarely enter the Baltic Sea. They also sometimes move quite far up the Saint Lawrence River of eastern Canada. The preferred habitat appears to be deep waters of the outer continental shelf and slope, but these dolphins are found in somewhat shallow and in oceanic waters across the North Atlantic as well. Seasonal shifts in abundance have been noted in several areas of the range.

Ecology and behavior Much of what we know of this species' biology comes from examination of several mass strandings. Herd size varies considerably, with most groups numbering less than 100 (the average in New England coastal waters is about 52). However, up to 2,000–4,000 are sometimes seen in a single school, and there may be age and sex segregation of herds. Older immature individuals are not generally found in reproductive herds of mature females and young. Little is known of long-term association patterns, but there is some evidence of some stable subgroups within large herds. They often strand in large herds. These dolphins often associate and feed with large baleen whales (fin and humpback whales), and are known to form mixed groups with pilot whales and a number of other dolphin species (including bottlenose and white-beaked dolphins).

Atlantic white-sided dolphins are lively and acrobatic, often breaching and tail-slapping. Aerial behavior is more common in larger groups. Larger animals, especially males, are avid bowriders, and also will ride the stern wakes of vessels. These animals are not known to be long divers, with the longest recorded dive of a tagged dolphin being just 4 minutes. Coordinated "ball" feeding on schools of sand lance has been observed off New England. White-sided dolphins appear to have extensive movements, and there is currently no evidence for separate populations.

Life history is rather poorly known, despite the fact that this species live-strands in large herds. Calves are born over an extended period around the summer season, with apparent peaks in June and July. Sexual maturity occurs at around 201–222 cm in females, and at larger sizes for males (different studies suggest either 230–250 cm or 215–230 cm). These correspond to ages of 6–12 years. Longevity can be at least 22 years.

Feeding and prey Atlantic white-sided dolphins feed mostly on small schooling fish (such as herring, mackerel, cod, smelt, hake, and sandlance), shrimp, and squid. They often feed in association with large whales and other species of dolphins.

Threats and status Atlantic white-sided dolphins have been hunted in drive fisheries in Norway, Newfoundland, Greenland, and the Faroe Islands. Incidental catches are known from many different areas of the species' range, and although they do get caught in gillnets, captures in mid-water trawls appear to be the most significant. Recent incidental catches in trawls off Ireland have been quite large. This species is quite abundant throughout its range, and the total numbers are estimated to be in the hundreds of thousands. There are thought to be over 52,000 Atlantic white-sided dolphins off the eastern North American shoreline, and about 96,000 off the west coast of Scotland. On a global scale, it is not considered to be threatened by human activities.

IUCN status Least Concern.

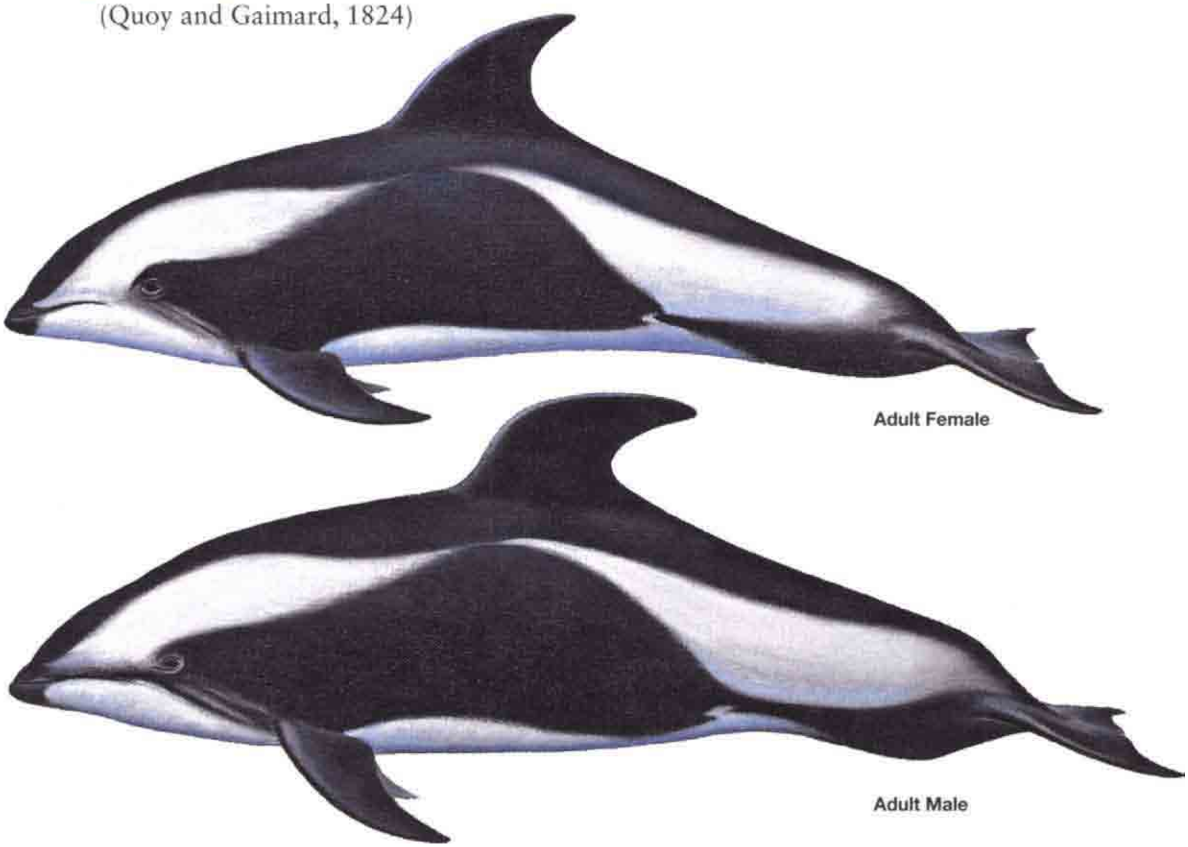
Hourglass Dolphin—*Lagenorhynchus cruciger*

(Quoy and Gaimard, 1824)



Recently-used synonyms *Lagenorhynchus wilsoni.*

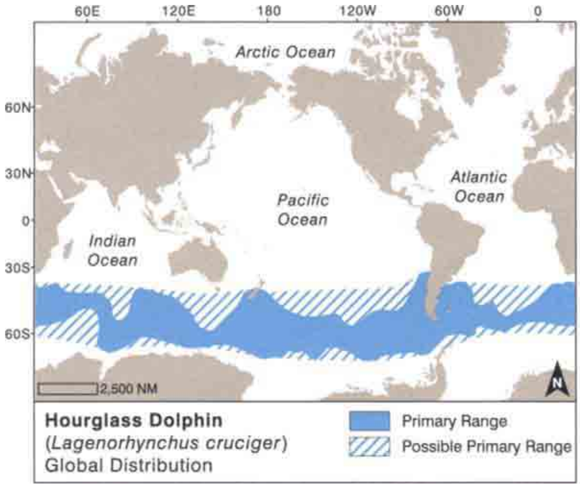
Common names En.–hourglass dolphin; Sp.–*delfín cruzado*; Fr.–*dauphin a museau court*.

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Delphinidae.

Species characteristics Hourglass dolphins are moderately robust, with extremely short and stubby (but well-defined) beaks. The moderately tall dorsal fin is set midway along the back. The markedly hooked fins seen on some individuals probably develop at the onset of maturity. In some animals (possibly adult males), the dorsal fin also possesses a sharp backward bend about halfway up. The tail stock is generally deeply keeled in both sexes, but more so in males. The flippers are recurved, with a concave trailing edge.

Hourglass dolphins are strikingly marked; black above and white below. The black sides are broken by a bold white flank patch that covers most of the tail stock in a wedge shape, tapering as it rises towards the fin. There, it meets the vertex of a white dorsal-spinal blaze that widens above the flippers, passes above the eye to cover the sides of the face and finally converges at the gape with the white of the chest and throat. These white markings resemble an hourglass in shape and give the dolphin its common name. The rostrum, forehead, and top of the head are also black. A white, hook-shaped mark curves up to the black side below the flank patch,

An hourglass dolphin porpoises alongside a vessel, showing the distinctive figure-eight pattern of black and white. PHOTO: J. DUFFIELD



This hourglass dolphin is leaping as it rides the bow wave of a vessel, something that these animals appear very fond of doing. Drake Passage. PHOTO: R. L. PITMAN

near the genital aperture. The flippers, dorsal fin, and flukes are all black. The coloration of calves and juveniles has not been described, but based on what we know about related species, is probably somewhat muted.

Tooth counts of 26–34 (upper) and 27–35 (lower) on each side have been recorded. The teeth are rather slender and pointed.

Less than 20 specimens have been measured, so the following measurements probably do not represent the full range. The maximum lengths and weights so far recorded were 1.9 m and 94 kg (males), and 1.8 m and 88 kg (females). Length at birth is assumed to be about 1 m.

Can be confused with As the only small oceanic dolphin with a pointed dorsal fin in subantarctic and antarctic waters, the strikingly marked hourglass dolphin should not be confused with other species.

Hourglass dolphins rooster-tail alongside a vessel, giving a good view of the stocky body and unique color pattern. Drake Passage. PHOTO: S. HEINRICH

Recognizable geographic forms None.

Distribution Hourglass dolphins are distributed in a circumpolar pattern in the higher latitudes of the southern oceans. They range to the ice edges in the south, but the northern limits are not well-known (they are found to at least 45°S, although some occasionally reach 33°S). The most southerly sighting is from near 68°S, in the South Pacific. Hourglass dolphins appear to be largely oceanic, and they are mostly seen in deep offshore waters. However, some sightings have been made in waters of 200 m or less, near islands and banks. This is the only small dolphin species regularly found south of the Antarctic Convergence.

Ecology and behavior Very little is known about hourglass dolphins; in fact, this is one of the most poorly-known of all the small cetaceans. Groups tend to be small, which is unusual for a small oceanic delphinid. Although herds of up to 60 have been seen, groups of 1–8 are more common. Hourglass dolphins have been encountered with several other species of cetaceans, and are often seen with large whales (especially fin whales). These dolphins are enthusiastic bowriders, often leaping as they race towards the bow or stern. They can also move rapidly without leaping, usually when avoiding a vessel; at such times they cause a highly visible “rooster tail” spray.

Stranding records of this species are quite rare, probably at least partially related to its oceanic, high latitude range. Almost nothing is known of the life history of this dolphin species. Based on a handful of specimens, females may reach sexual maturity at around 180–185 cm, and males appear to mature by 174 cm. Calves have been observed in January and February.

A mother and calf hourglass dolphin ride the bow wave of a vessel. Even from this view, the color pattern is unmistakable. Drake Passage. PHOTO: S. HEINRICH

Feeding and prey The stomach contents of the five specimens of hourglass dolphins that have been examined contained small fish (including myctophids), squids, and crustaceans. They often feed in aggregations of seabirds and in plankton swarms.

Threats and status The only known exploitation has been several individuals taken for scientific research, one taken in a Japanese experimental drift net in the South Pacific, and three specimens incidentally killed in a gillnet operation in the South Pacific Ocean. Because of its habitat in one of the most remote marine regions known, this species is not thought to be threatened by human activities. There are estimated to be 144,000 hourglass dolphins south of the Antarctic Convergence.

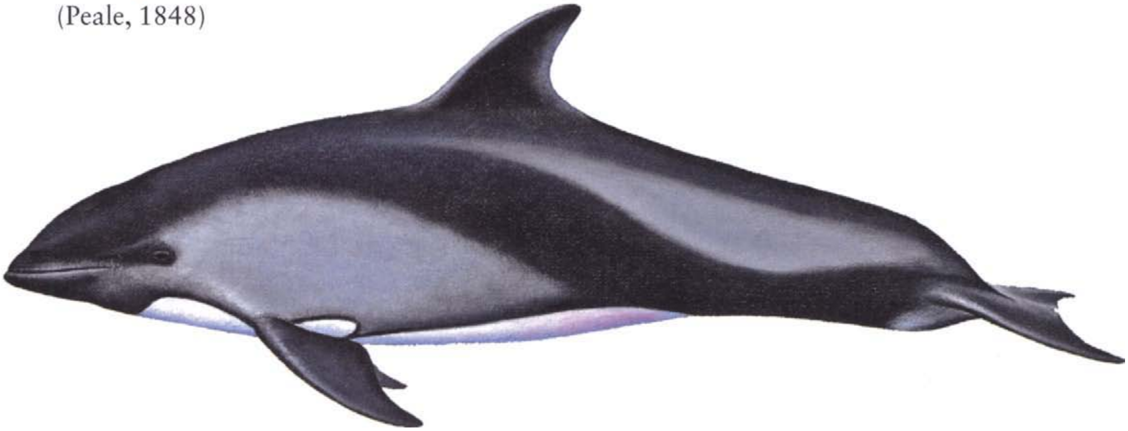
Sexual dimorphism in hourglass dolphins: the two probable adult males in the rear have heavier and more hooked fins than the female (or possibly young male) in the lead; they also have deeper bodies with well-developed post-anal keels. Drake Passage. PHOTO: R. L. PITMAN

IUCN status Least Concern.

References Brownell and Donahue 1999; Goodall 2002; Goodall et al. 1997.

Peale's Dolphin—*Lagenorhynchus australis*

(Peale, 1848)



Recently-used synonyms *Sagmatias amblodon, Sagmatias australis*.

Common names En.–Peale's dolphin; Sp.–*delfín austral*; Fr.–*dauphin de Peale*.

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Delphinidae.

Species characteristics The general body shape is typical for dolphins of the genus *Lagenorhynchus*. Few specimens have been examined, but Peale's dolphins are fairly robust. They have a short, stubby beak, which is only moderately well-delineated from the melon. They have a tall, slightly falcate dorsal fin. The flippers are recurved and pointed.

This leaping Peale's dolphin shows the species' distinctive characters, especially the dark anterior part of the head. Southern Chile. PHOTO: S. HEINRICH

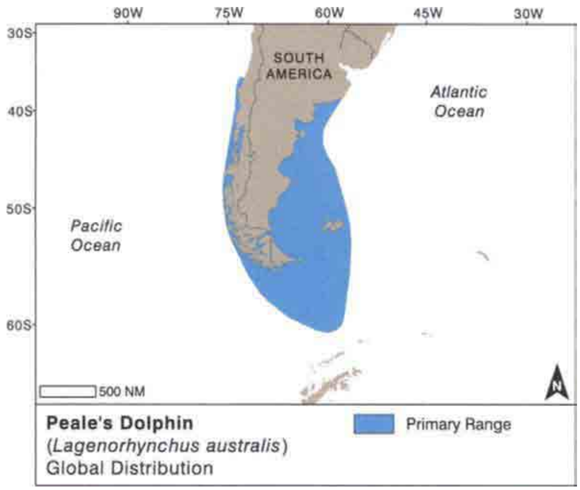
Peale's dolphins share coloration pattern components with both dusky and Pacific white-sided dolphins. Peale's dolphins are grayish-black above and white below. They have a curved flank patch of light gray with a single dorsal spinal blaze, or "suspender," fading into the black of the back near the blowhole. A large pale gray thoracic patch extends from the eye to mid-body; it is separated from the white below by a well-developed dark stripe. The stripe loops up above a small white patch under the flipper. The flippers are gray-black, and the dorsal fin is dark gray-black, with a thin crescent of light gray on the trailing margin. The most distinctive feature is that the beak tip, lips, and entire lower jaw are dark gray to black in color (unique to the genus *Lagenorhynchus*). Calves have a lighter color pattern than adults.

Tooth counts for the few examined specimens were up to 37 (upper) and 34 (lower) on each side of the jaw.

Only a few dozen specimens have been measured. The largest male recorded was 2.2 m long and the largest female was 2.1 cm. Of only five specimens weighed, the heaviest (an adult female) weighed 115 kg. Length at birth is thought to be about 1 m.

Recognizable geographic forms None.

Can be confused with Peale's dolphins are most easily confused with dusky dolphins, which are very similar in body shape and general color pattern. The face, rostrum, melon and most of the chin of Peale's dolphins are dark gray-black, as if encased in a mask. This feature, plus the well-developed black stripe below the thoracic patch, helps to distinguish Peale's dolphins from dusky dolphins. At a distance, they may be confused with hourglass dolphins, but with a better look, the two are easily distinguished.



Distribution Peale's dolphins are apparently confined to South America, from the southern tip to about the latitudes of Santiago, Chile (33°S), and northern Argentina (38°S). The distribution may extend south well into Drake Passage. They are regularly seen around the Falkland Islands. Peale's dolphins are relatively coastal animals, found in bays and inlets, around islands, and over the continental shelf. They are frequently seen close to shore (often in waters < 20 m deep off southern Chile), even shoreward of kelp beds. Occasional sightings have been made in deeper waters, up to about 300 m deep. Inshore/offshore movements have been documented in some areas of the range.

One clearly extralimital sighting of what was thought to be this species was reported from tropical waters of Palmerston Atoll. However, several other sightings of *Lagenorhynchus*-like dolphins in tropical/subtropical waters of the Indo–Pacific have since come to light. This brings up the possibility of a more tropical form of the Peale's dolphin or an undescribed species in this area.

Ecology and behavior Very little is known about the biology of this species. Peale's dolphins have been seen in small groups (5–30 are typical), but some groups of up to 100 have been observed. They often occur in the riptides at the entrances to fjords and channels, and are often seen swimming slowly in and around kelp beds, especially in the Falkland Islands. Dives are known to last up to nearly 3 minutes, with an average of about 28 seconds.

Aerial behavior, including breaching, spyhopping, and slapping the head, flukes, and flippers on the surface is not uncommon. Peale's dolphins frequently bowride, and will sprint to a ship's bow. At the bow, they often speed ahead, leap high into the air and fall back into the water on their sides, producing a large splash with a loud slapping noise. They produce a wide splash or wave when swimming near the surface. Peale's dolphins associate with other cetacean species, especially Commerson's dolphins.

Virtually nothing is known about reproduction, with the exception of a 2.1 m mature female and immature females of 1.9 and 2.0 m. Calves have been reported from spring through autumn.

Feeding and prey Little is know of food and feeding habits in this species, with less than 20 stomachs having been examined. The few stomachs that have been examined contained mostly demersal fish, octopus, and squid species that occur in shallow waters and in kelp beds. Some shrimps have also been found in stomachs.

Threats and status A few Peale's dolphins have been taken for scientific research. More substantially, Peale's dolphins have been killed for crab bait in both Chile and Argentina. At times, this exploitation was heavy

Like other members of the genus *Lagenorhynchus*, Peale's dolphins can be quite robust, as this leaping dolphin demonstrates. PHOTO: F. VIDDI

This breaching Peale's dolphin gives a good view of the ventral color pattern of the species, as well as the dark face, which is diagnostic. Note the white axillary patches, which are found in several species of dolphins. PHOTO: S. HEINRICH

Peale's dolphins are coastal animals and are often found around kelp beds in some parts of their range. Southern Chile. PHOTO: S. HEINRICH

enough to consider the species at risk of local extripation, but the mortality has apparently subsided in recent years. Some incidental catches are known in anti-predator nets in Chile, and in gillnets and trawls in Argentina. The only known estimate of abundance is of about 200 animals in southern Chile, but the species is considered to be fairly abundant, at least around the Falkland Islands.

IUCN status Data Deficient.

Risso's Dolphin—*Grampus griseus*

(G. Cuvier, 1812)

Recently-used synonyms *Grampidelphis griseus.*

Common names En.–Risso's dolphin; Sp.–*delfín de Risso*; Fr.–*grampus or dauphin de Risso.*

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Delphinidae. Hybrids with common bottlenose dolphins have been reported from captivity and in the wild.

Species characteristics Risso's dolphins have a rather unique body shape. They are robust blunt-headed animals without distinct beaks. The forehead is bulging, but with a more squarish profile than the rounded melon in some other small cetaceans. One of the most distinctive features is a vertical crease on the front of the melon. The flippers are long, pointed, and recurved. The dorsal fin is very tall and slender, somewhat falcate, and generally pointed at the tip. Risso's dolphins have mouthlines that slope upward. The tail stock is generally very shallow, especially directly in front of the flukes. This gives the animal the appearance of having most of its bulk ahead of the dorsal fin.

At sea, the best identification characteristic is the coloration and scarring. Adults range from dark gray to nearly white, but are typically covered with white scratches, spots, and blotches. Many of these are thought to result from the beaks and suckers of squid, their major prey, but others may be caused by the teeth of other Risso's dolphins. In fact, this species is the most heavily-scarred of all the dolphins. Higher latitude animals are much lighter overall. The chest has a whitish anchor-shaped patch, and there is another white patch of variable extent around the urogenital area. The appendages tend to be darker than the rest of the body. Young animals range from light gray to dark brownish-gray and are relatively unmarked. The scars and scratches are highly unique, and can be used in conjunction with dorsal fin scars, to identify individuals. In older individuals, the lips often contrast strongly with the surrounding area. Calves and juveniles are more of a brownish-gray color, and have few or no scratches and scars. Young animals also have a distinct cape that extends down over the eye, and dips slightly below the dorsal fin.

The pigment pattern on the chest of this Risso's dolphin is similar to that of other "blackfish." Both (black) eyes are visible and suggests this animal may have binocular vision when looking straight down. PHOTO: B. WATTS

Although not known as especially acrobatic, Risso's dolphins are capable of some impressive leaping. PHOTO: D. FRANK

The teeth of this species are also unique; there are 2–7 pairs of stout, pointed teeth in the front of the lower jaw, and usually none (but occasionally 1–2 pairs) in the upper jaw. Some or all of the teeth may be worn-down in, or missing from, older adults.

Newborns are 1.1–1.5 m long and adults range up to at least 3.8 m long. Some evidence suggests geographic variation in body size. There appears to be little or no sexual dimorphism in the length of adults. Weights of up to 400 kg have been recorded, and the maximum may be near 500 kg.

Recognizable geographic forms None.

Can be confused with Risso's dolphins are generally easy to identify when seen at close range, as they are the only medium-size, blunt-headed cetaceans that are typically light in color. However, from a distance they may be confused with other large delphinids with a tall dorsal fin (such as bottlenose dolphins, false killer whales, and even killer whales). When visible, the light, extensively-scarred bodies and squarish heads of Risso's dolphins make them unmistakable. If the vertical crease on the forehead is observed, there can be no doubt about the identity of the specimen.

Distribution This is a widely-distributed species, inhabiting primarily deep waters of the continental slope and outer shelf (especially with steep bottom topography) from the tropics through the temperate regions in both hemispheres. They also occur in some oceanic areas, beyond the slope, such as in the eastern tropical Pacific. They are found from Newfoundland, Norway, the Kamchatka Peninsula, and Gulf of Alaska in the north to the tips of South America and South Africa, southern Australia, and southern New Zealand in the south. Their range includes many semi-enclosed bodies of water, such as the Gulf of Mexico, Red Sea, Persian Gulf, Sea of Japan, and Mediterranean Sea.

Ecology and behavior These large dolphins are often seen surfacing slowly and somewhat lethargically, although they can be energetic, sometimes breaching, spyhopping, or porpoising, and occasionally bowriding. Most herds tend to be small to moderate in size (10–100), but groups of up to 4,000 have been reported. Social organization has not been well-studied; however, it appears that young animals remain with their natal school until around puberty, adult females gather together, and males move among schools. Group composition is relatively fluid (although with some elements of stable subgroups), at least in Monterey Bay, California. Risso's dolphins commonly associate with other species of cetaceans (especially Pacific white-sided and northern right whale dolphins off the California coast), including large whales such as gray whales. Hybrids between this species and bottlenose dolphins have been recorded, both in captivity and in the wild. Dive times of up to 30 min. have been reported.

There have only been a few studies on the life history parameters of Risso's dolphins. In at least the North Atlantic, there appears to be a summer calving peak. Calving peaks appear to differ in different parts of the North Pacific—summer/fall off Japan, and fall/winter off California. Sexual maturity appears to occur at lengths of about 260–277 cm for both sexes, with some apparent regional differences. It has been suggested that the scarring may have evolved, at least partly as a mechanism to allow animals to guage the "quality" of other group members during social interactions. Longevity in this species is at least 35 years.

The most famous Risso's dolphin was probably "Pelorous Jack," who accompanied steamers and ferries into and out of Admiralty Bay in New Zealand for many years in the early part of the last century. Long-term changes in the occurrence of Risso's dolphins in some areas (e.g., off Catalina Island and in central California) have been linked to oceanographic conditions and movements of spawning squid.

Feeding and prey Risso's dolphins feed on crustaceans and cephalopods, but seem to prefer squid. Squid bites may be the cause of at least some of the scars found on the bodies of these animals. In the few areas where feeding habits have been studied, they appear to feed mainly at night.

Threats and status Occasional direct killing of Risso's dolphins has occurred. This is generally as a result of the dolphins stealing fish from longlines, or in multispecies small cetacean fisheries, such as those that occur in Sri Lanka, the Caribbean, and Indonesia. One regular hunt occurs in Japan, where about 250–500 are taken per year in a drive fishery. There are also records of incidental catches in several fisheries, in particular driftnet fisheries, but also in purse seines. Some Risso's dolphins have been captured for live display in oceanaria, although there are not many of them in oceanaria. There are no estimates of global abundance, but there are some estimates for specific areas. There are estimated to be 175,000 in the ETP, 33,000 off the western United States, 29,000 off the eastern US coast, 2,700 in the northern Gulf of Mexico, 83,000 off Japan, 950 in the Philippines, and 5,500–13,000 off Sri Lanka. The species is not considered threatened or endangered.

IUCN status Data Deficient.

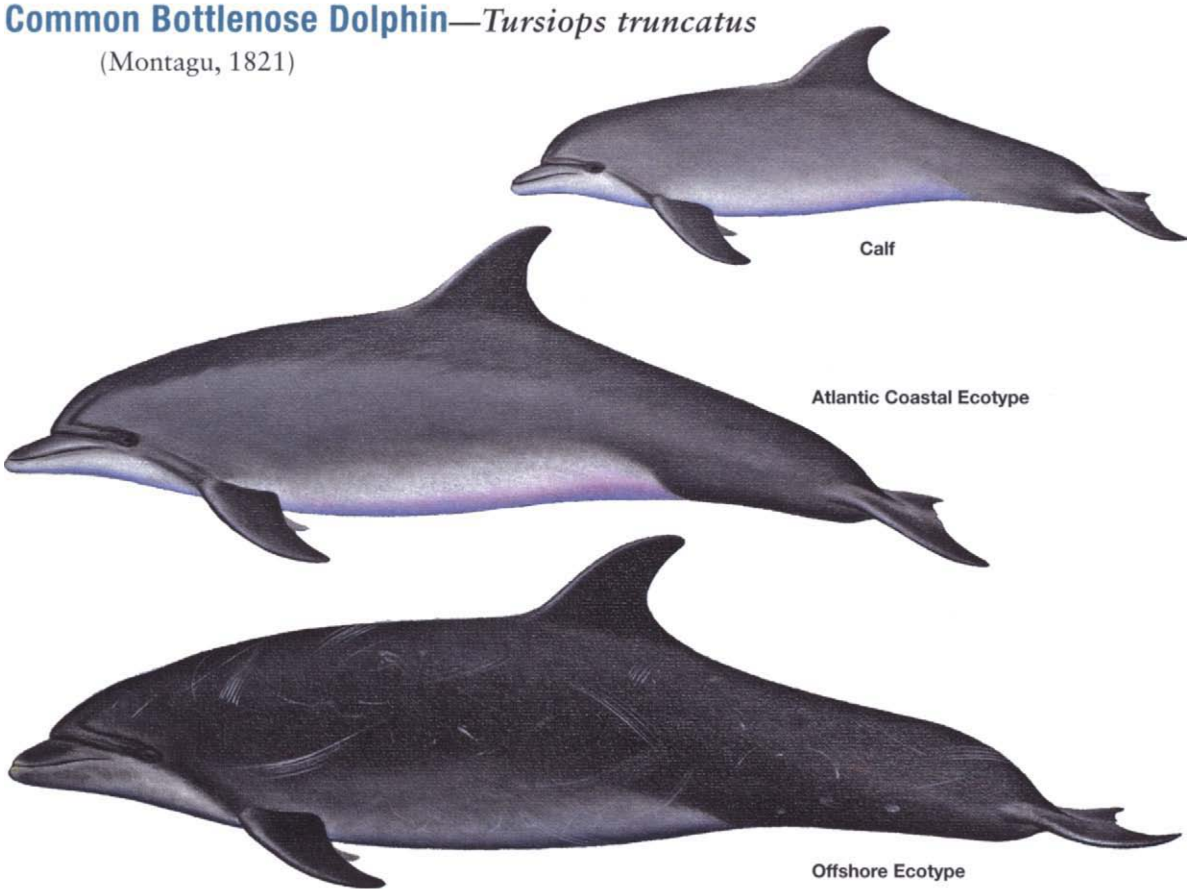
Common Bottlenose Dolphin—*Tursiops truncatus*

(Montagu, 1821)



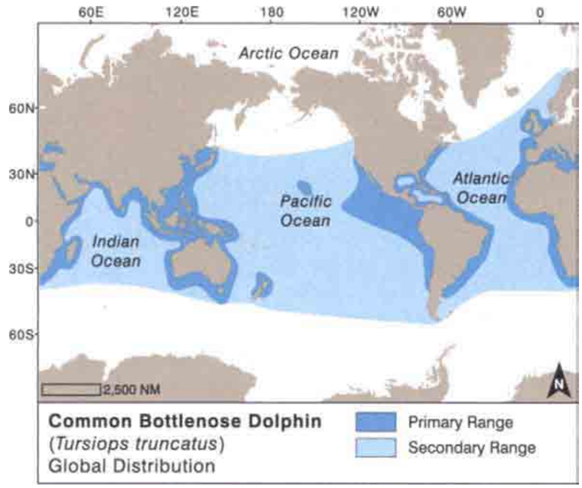
Recently-used synonyms *Tursiops gephyreus, Tursiops gillii, Tursiops nuuanu.*

Common names En.–common bottlenose dolphin; Sp.–*tursion or tonina*; Fr.–*grand dauphin*.

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Delphinidae. All bottlenose dolphins around the world were previously recognized as *T. truncatus*, but in the past few years the genus has been split into two species: *T. truncatus* and *T. aduncus* (the smaller Indo–Pacific bottlenose dolphin). Many other species of bottlenose dolphins have been described, but most of these are thought to be synonymous with *T. truncatus*. The taxonomy of bottlenose dolphins is still confused, however, due to the great extent of geographical variation, and it is very possible that additional species will be recognized in the future. For instance, more and more evidence is suggesting that coastal bottlenose dolphins in some areas of the Atlantic belong to a different species from those in offshore waters. Hybrids with several other delphinid species (rough-toothed, long-beaked common, and Risso's dolphins, and false killer and short-finned pilot whales) are known, both from captivity and in the wild.

A common bottlenose dolphin porpoises out of the water in the eastern Pacific, showing the typical body shape and coloration of the species. PHOTO: SWFSC/STAR

Species characteristics The common bottlenose dolphin is probably the most familiar of the small cetaceans because of its coastal habits, prevalence in captivity worldwide,



and frequent appearance on television and in advertising. It is a large, relatively robust dolphin, with a short to moderate-length stocky beak that is distinctly set off from the melon by a crease. It has a gently-curved mouthline that dips down from the tip of the beak, then back up, and finally down again at the gape (many people feel the mouthline resembles a smile). The dorsal fin is tall and falcate, and set near the middle of the back. The flippers are recurved and somewhat pointed at the tips. The shape of the body is generic for a dolphin, but there is extensive geographical variation in specifics of body shape, appendages, and coloration.

The color pattern is the most generalized of all the marine dolphins, and varies from light gray to nearly black on the back and sides, fading to white (sometimes with a pinkish hue) on the belly. The belly and lower sides are rarely spotted, and when they are the spots are generally small flecks. Although the back is generally dark gray, there is sometimes also a faint dorsal cape on the back, generally only visible at close range. Sometimes a faint spinal blaze may also be present. Often, there are brushings of gray on the body, especially on the face. A generalized delphinid "bridle," consisting of blowhole and eye stripes is present, but is variable in its intensity. A wide, but very faint, stripe often extends forward from the flipper and connects to the gape. A light patch on the side of the melon is often present, bordered by dark stripes from the blowhole to the apex of the melon. There may be a throat chevron and genital patch. Anomalously white individuals have been observed (in at least one case, this was an albino).

Bottlenose dolphins have 18–27 pairs of stout, pointed teeth in each jaw. They are generally smooth in contour. In older animals, many of these may be worn down or missing.

Length at birth is about 1–1.3 m. Adults range from 1.9–3.8 m, with males tending to be somewhat larger than females in at least some populations. There is wide variation in size between different populations, with the largest known specimens coming from the eastern North Atlantic, around the United Kingdom. Maximum weight is at least 650 kg, although most bottlenose dolphins are much smaller.

In coastal areas, most common bottlenose dolphins are avid bowriders, but can be difficult to identify when only viewed from directly above. The dorsal cape is straighter than in *Steno* and without the light outline; also notice *Tursiops* usually has a spinal blaze that is visible from above. Eastern tropical Pacific. PHOTO: R. L. PITMAN

Recognizable geographic forms Many different geographical forms of the common bottlenose dolphin have been described for different areas of the range. However, in most cases there is some question as to their validity (since they are often based on small or in-

A common bottlenose dolphin, showing some of the variation in the coloration. New Zealand. PHOTO: K. STOCKIN

Bottlenose dolphins are highly variable in behavior, as well as in morphology. Diverse feeding techniques, such as intentional stranding to trap fish on the beach, are known from throughout the range. North Carolina. PHOTO: T. PUSSER

adequate samples). Even for those cases where their distinctness is well-recognized, it is often the case that reliable external morphological characters have not been provided and range limits are generally not known, which compromises our ability to distinguish them in the field. Hybridization may contribute to some of this confusion.

In many areas of the world, such as the western North Atlantic, eastern North Pacific, and Peru, there appear to be two "ecotypes," a coastal ecotype and an offshore ecotype. These forms have been distinguished by various morphological, ecological, and physiological features, but differences are subtle and regionally-variable. Therefore, separation into ecotype should be left to experts.

Can be confused with Because of their somewhat generic appearance, common bottlenose dolphins can be mistaken for several other species of dolphins, depending on the region. Identification of the species may be mostly a process of elimination of other potential species. They are most likely to be confused with Indo–Pacific bottlenose dolphins where the two species overlap in distribution. Overall size, head and beak shape, and subtleties of coloration are the best cues (for instance, common bottlenose dolphins are generally quite a bit larger, more strongly countershaded, and ventral spotting is rare). There can be confusion in the tropical Atlantic Ocean with young, as yet unspotted Atlantic spotted dolphins, along the east coast of South America with dolphins of the genus *Sotalia*, and in the Indo–Pacific and off West Africa with humpback dolphins. When seen from a distance, they can also be confused with Risso's or rough-toothed dolphins. Such confusion will generally only occur when the animals are not seen well; in most situations, bottlenose dolphins can be identified by their various combinations of coloration, body shape and size, head (especially beak) shape characteristics.

Distribution Common bottlenose dolphins are very widely-distributed. They are found most commonly in coastal and continental shelf waters of tropical and temperate regions of the world. They occur in most enclosed or semi-enclosed seas (e.g., the North Sea, Mediterranean Sea, Black Sea, Caribbean Sea, Gulf of Mexico, Red Sea, Persian Gulf, Sea of Japan, Gulf of California). They frequent bays, lagoons, channels, and even the mouths of rivers. Although they can also be found in very deep waters in some oceanic regions (e.g., the eastern tropical Pacific), population density appears to be higher nearshore. Except for their occurrence around the United Kingdom, northern Europe, and southern New Zealand, they generally do not range poleward of 45° in either hemisphere.

This bowriding common bottlenose dolphin shows the subtle color pattern elements of the head of this species. When seen at such close range, in good lighting conditions, the subdued facial markings (e.g., face-to-flipper stripe, and brushings and streaks from the apex of the melon) are usually visible. Costa Rica. PHOTO:T. PUSSER

Ecology and behavior More is known of the biology of this species than of any other dolphin. Its behavior has been studied, both in captivity and in a large number of different coastal areas throughout the range. Group size is commonly less than 20, but large herds of several hundred are sometimes seen in offshore areas (such as the eastern tropical Pacific and western Indian Ocean). Bottlenose dolphins are commonly associated with other cetaceans, including both large whales and other dolphin species (mixed schools with Indo-Pacific bottlenose dolphins have been found, for instance off China and Taiwan). They have been observed to attack and kill harbor porpoises.

Based on a number of studies of nearshore populations, bottlenose dolphins seem to live in relatively fluid (fission/fusion) groupings with somewhat closed societies. Mother/calf bonds and some other associations may be strong, but other individuals may be seen from day-to-day with a variety of different associates. In many inshore areas where they are not migratory, they maintain definable, long-term multi-generational home ranges; in others, they are migratory, generally ranging further. The behavior and social systems of these animals are highly adaptable and diverse.

The bottlenose dolphin is the most common species of dolphin held in captivity. It has proven highly adaptable and is easily trained. Much of what we know of the general biology of dolphins comes from studies of bottlenose dolphins, both in captivity and in the wild. Some solitary dolphins in the wild have become "friendly" and interacted with humans for extended periods of time. Bottlenose dolphins are avid bowriders, in both inshore and offshore waters and may perform acrobatic leaps while riding. They also sometimes ride the waves produced by the heads of large whales. Bottlenose dolphins tend to be quite active (especially when feeding or socializing), often slapping the water with their flukes, leaping, and performing other aerial behaviors.

Life history has been studied in many areas, and there is wide geographic variation in reproductive param-

These bottlenose dolphins in inshore waters of southern Texas show the longer and more slender beak and more distinct coloration typical of the coastal Gulf of Mexico form. PHOTO: T. A. JEFFERSON

eters. Females mature at 5–13 years of age, and males at 9–13 years. Spring and summer or spring and fall calving peaks are known for most populations. Calves are typically suckled for 1.5–2 years, although nursing can last longer, especially for a last-born calf. Females may live to over 50 years of age and males to 40–45 years.

Feeding and prey Common bottlenose dolphins are generalist feeders, which use a wide variety of prey species, mostly fish (with a tendency towards sciaenids, scombrids, and mugilids) and squid. They sometimes eat shrimps and other crustaceans. In some areas, they apparently take the most abundant or easiest prey at the time, but in other areas they demonstrate apparent preferences. Feeding behavior is varied, mostly involving individual capture of fish, but it can range from cooperative foraging on schooling fish, to chasing fish onto mudbanks, to feeding behind shrimp trawlers.

Threats and status Common bottlenose dolphins have been hunted directly in several areas. The largest takes in recent years have been in the Black Sea, but large numbers have occasionally been taken in drive fisheries in Japan and Taiwan as well. Some animals have also been taken in small cetacean fisheries in the Caribbean, Peru, Sri Lanka, West Africa, and Indonesia. Bottlenose dolphins were deliberately hunted on the east coast of the US in the late 1800s and early 1900s. Finally, significant numbers have been taken in live-capture fisheries for display, research, and use by the military. They continue to be collected for captive display and research in some parts of the world.

Common bottlenose dolphins interact with fisheries throughout their range, and are often seen following behind and feeding from shrimp trawlers. Incidental catches are also known from throughout the species' range. Catches have occurred in gillnets, driftnets, purse seines, trawls, and on hook-and-line gear. Mortality related to recreational fishing is also being documented with increasing frequency, in some cases exceeding commercial catches. Coastal bottlenose dolphins are susceptible to habitat destruction and degradation by human activities. Vessel collisions and the effects of environmental contaminants also result in some mortality. There have been several die-offs of bottlenose dolphins in recent years, most often linked to poisoning from biotoxins of natural origin. Anthropogenic contaminants are also a serious concern, especially in that they can affect the immune and reproductive systems.

There are no estimates of overall abundance, although abundance has been estimated for some parts of the range. In the eastern tropical Pacific, there are about 243,500, in Japan 317,000, off the eastern US coast 10,000–13,000, in the northern Gulf of Mexico 35,000–45,000, off Natal, South Africa 900 (many of these may be *T. aduncus*), and in the Black Sea 7,000. There are also at least minimum estimates (based on photo-identification) for many smaller study areas. Clearly, the species is not endangered, although some populations may be threatened by human activities.

IUCN status Data Deficient.

Indo–Pacific Bottlenose Dolphin—*Tursiops aduncus*

(Ehrenberg, 1833)

Recently-used synonyms *Tursiops catalania.*

Common names En.–Indo–Pacific bottlenose dolphin; Sp.–*delfin mular del Oceano Indico*; Fr.–*grand dauphin de l'ocean Indien.*

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Delphinidae. The validity of this species was in doubt for many years, and until the last few years, most marine mammal biologists classified all bottlenose dolphins as *T. truncatus*. Now, the Indo–Pacific bottlenose dolphin is known to be distinct, based on concordance in genetics, osteology, and external morphology. Recent genetic studies have even suggested that dolphins currently recognized at *T. aduncus* off southern Africa might be a third species in the genus *Tursiops*. Future studies will be needed to confirm this. In the past few years, some doubt as to the specific identity of the well-studied bottlenose dolphins in Shark Bay, Australia, has also been raised.

Species characteristics Indo–Pacific bottlenose dolphins look very similar to common bottlenose dolphins, with a relatively robust body, moderate-length beak, and tall falcate dorsal fin. However, they tend to be somewhat more slender than common bottlenose dolphins, and the beak is relatively longer and more slender. Also, the melon tends to be slightly less convex. The flippers are typically dolphin-shaped—recurved with acutely rounded tips. The dorsal fin is tall and slightly falcate (it is relatively larger and more wide-based than in the common bottlenose).

Coloration (although variable) tends to be somewhat lighter and less countershaded than in most common bottlenose dolphins. The belly is generally off-white to pale gray, and tends to grade smoothly to darker gray on the lateral and dorsal surfaces. The moderate to dark-gray cape is generally more distinct, and extends back onto the tail stock. There is usually a light spinal blaze extending to below the dorsal fin (this may be quite prominent in some animals). The most distinctive feature is generally the presence of prominent black spots or flecks on the bellies of adults of this species (these are very rarely present on common bottlenose dolphins). However, not all Indo–Pacific bottlenose dolphins necessarily have ventral spotting. In particular, young animals appear to lack ventral spots. There is also often a dark ring around the eye. The delphinid "bridle," consisting of a blowhole and eye stripe is also present.

The teeth number 21–29 in each half of the upper and lower jaws. They are a bit more slender than those of common bottlenose dolphins.

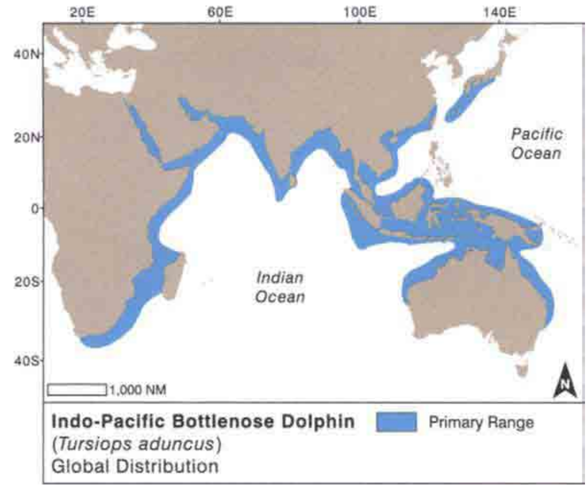
Although maximum size is geographically variable, Indo–Pacific bottlenose dolphins grow to lengths of about 2.7 m and 230 kg. Males tend to be somewhat larger than females. Length at birth is about 85–112 cm.

Recognizable geographic forms None.

This Indo–Pacific bottlenose dolphin in an oceanarium in South Africa displays the body shape and dark ventral spotting that characterize the species. PHOTO: N. B. BARROS

Delphinidae

Indo–Pacific Bottlenose Dolphin



An Indo–Pacific bottlenose dolphin surfacing in a Maldivian atoll. The spinal blaze and relatively wide-based dorsal fin are visible here. PHOTO: T. A. JEFFERSON

Can be confused with This species can be difficult to distinguish from the larger common bottlenose dolphin in sightings at sea, and the two do overlap in distribution in the Indo–Pacific. Multiple characters are required to distinguish them in areas of overlap. The best field characters to look for are overall size and robustness, the length and slenderness of the beak, extent of a spinal blaze, and the presence/absence of dark spots or flecks on the belly. The Indo–Pacific species may also have a slightly brownish tinge to its cape, when seen in bright sunlight.

Distribution Indo–Pacific bottlenose dolphins are found only in the warm temperate to tropical Indo–Pacific, from South Africa in the west to southern Japan and central Australia in the east. They are found throughout the islands and peninsulas of the Indo–Malay archipelago, and the distribution extends into the Red Sea and Persian Gulf. They occur almost exclusively over the continental shelf, mostly in very shallow coastal and inshore waters. There are also populations around some oceanic Indo–Pacific island groups (e.g., the Ryukyu and Amami Islands of southern Japan, the Maldives, and the Cocos/Keeling Islands of the southern Indian Ocean).

Ecology and behavior Indo–Pacific bottlenose dolphins have not been studied as well as their congeners, but some detailed studies have been done in South Africa, Australia, and recently in Japanese waters. These animals occur in groups ranging in size up to the low hundreds, but groups of less than 20 are much more common. In most areas, they do not appear to be avid bowriders. They sometimes occur in mixed groups with common bottlenose dolphins and other delphinid species. Off western Australia, where dolphins come into shallow beaches to be fed and touched by humans, this species' behavior has been intensively studied. There, male Indo–Pacific bottlenose dolphins often band together into "coalitions" to garner young females from the group. The social structure is characterized by a fission-fusion type of society, with great fluidity in group mem-

The long, slender beak and lighter coloration of this bowriding Indo–Pacific bottlenose dolphin differ from those of most common bottlenose dolphins. Off Mayotte. PHOTO: J. KISZKA

An Indo–Pacific bottlenose dolphin porpoises beside a research vessel in the Red Sea, showing the slender beak that characterizes the species. PHOTO: C. JOHNSON bership. The dolphins in Shark Bay have also been found to use sponges as tools, and there appears to be cultural transmission of this behavior from mother to offspring.

Although reproductive activity occurs throughout the year, breeding peaks in spring and summer months. The gestation period is about 12 months, and calves are weaned after 18–24 months of lactation. Ventral spotting develops at around the time of sexual maturity, which occurs for both sexes at around 230–235 cm in length. Individuals may be 12 years or older at the time of sexual maturity.

Sharks often prey on these animals, at least in areas where they have been well-studied, such as South Africa and eastern and western Australia.

Feeding and prey Feeding is on a large variety of schooling, demersal and reef fishes, as well as cephalopods. Most prey items are less than 20 cm in length. Off eastern Australia, dolphins feed behind trawlers, often in association with sympatric humpback dolphins.

Threats and status Some Indo–Pacific bottlenose dolphins are taken in the small cetacean fisheries of Sri Lanka and possibly in Indonesia as well. Live-captures for oceanarium display have take…æ…n place in Taiwanese and Indonesian waters in recent years, and its preference as a captive display species makes it vulnerable to depletion from such catches. Until it was outlawed in 1990, this species was involved in a large-scale drive fishery in Taiwan's Penghu Islands.

Incidental catches occur in a number of fisheries throughout the range, including gillnets and purse seines. The largest known of these includes up to 2,000 per year taken in the Taiwanese driftnet fishery operating in Indonesian waters (this fishery formerly operated in northern Australian waters). In addition, Indo–Pacific bottlenose dolphins are killed in anti-shark gillnets in South Africa and Australia. Since this is a coastal species, it is subjected to a number of other human threats—including habitat destruction/degradation, vessel collisions, and environmental contamination. Indo–Pacific bottlenose dolphins interact with fisheries throughout their range, and are often seen following behind and feeding from trawlers.

Few estimates of abundance have been made, although the species is not rare. However, some populations appear to have been depleted by human activities. There are estimated to be about 900 bottlenose dolphins off Natal, South Africa, and most of these are probably *T. aduncus* (the rest are *T. truncatus*).

IUCN status Data Deficient.

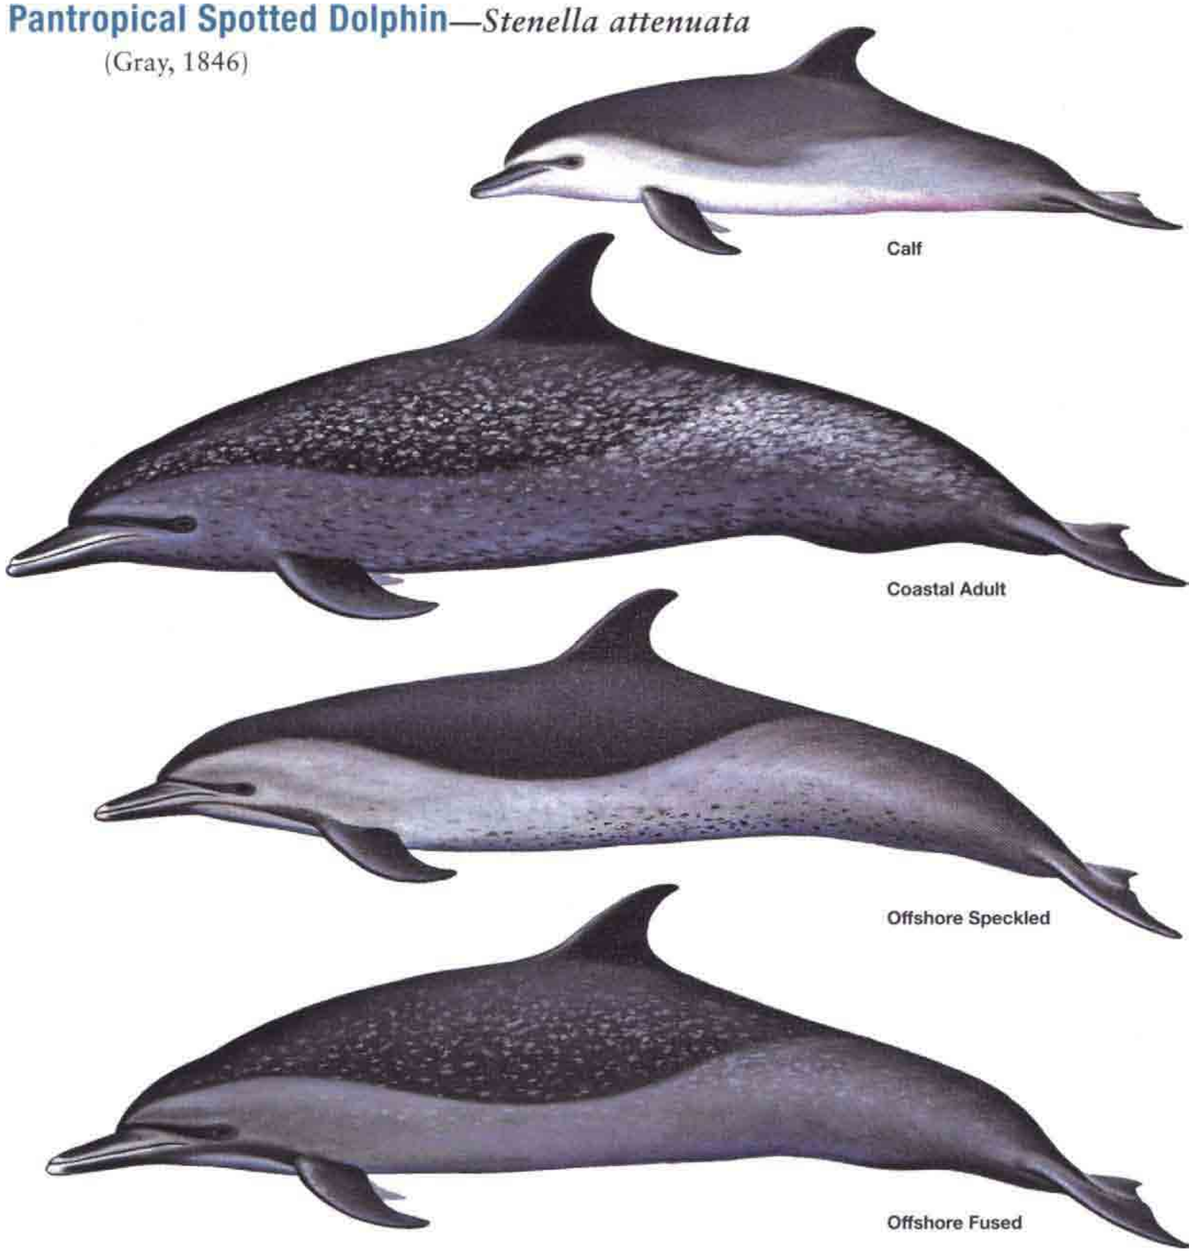
Delphinidae

Indo–Pacific Bottlenose Dolphin

Pantropical Spotted Dolphin—*Stenella attenuata*

(Gray, 1846)

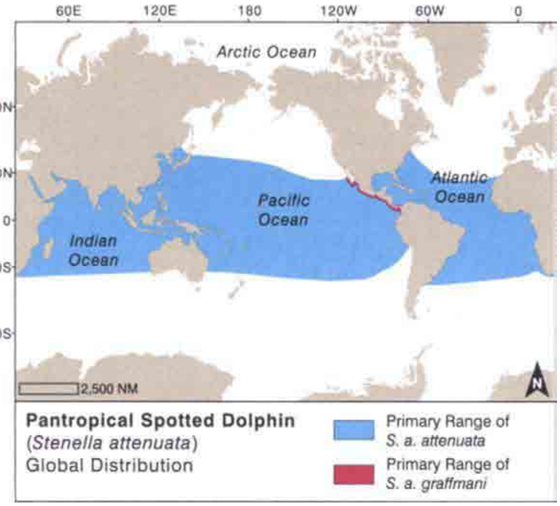


Recently-used synonyms *Stenella graffmani, Stenella dubia*.

Common names En.–pantropical spotted dolphin; Sp.–*estenela moteada* or *delfín manchado pantropical*; Fr.–*dauphin tacheté pantropical*.

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Delphinidae. Two subspecies are recognized: *S. a. at`enuata* in oceanic tropical waters worldwide, and *S. a. graffmani* in the coastal waters of the eastern tropical Pacific. Recent genetic work suggests that the genus *Stenella* is actually paraphyletic, and it is likely that it will be restructured in coming years. Dolphins that appear to be hybrids between pantropical spotted and spinner dolphins have been observed off the Fernando de Noronha archpelago of Brazil.

Species characteristics Pantropical spotted dolphins (sometimes called "spotters") are generally fairly slender, streamlined animals. However, the coastal form in the eastern Pacific is moderately robust. They have a long, slender beak that is separated from the melon by a distinct crease. The dorsal fin is very narrow, falcate, and usually pointed at the tip, and the flippers are very slender and strongly recurved. There may be a small post-



anal protuberance (presumably in adult males).

The most distinctive color pattern component of this species is the dark dorsal cape, which is high above the flipper and sweeps very low on the side below the dorsal fin. Although unspotted at birth, by adulthood spotted dolphins have varying degrees of white mottling on the dark cape. The tail stock, posterior to the upsweep of the cape, is often streaked with light extensions of the ventral field. The spotting ranges from very slight (or even non-existent) in offshore animals to heavy enough to obliterate the cape in coastal dolphins. The lower sides and belly of adults are gray and the lips and beak tip tend to be brilliant white. A dark gray band encircles the eye, and continues forward to the apex of the melon as a narrow eye stripe. There also is a dark gape-to-flipper stripe. Younger animals may have extensive dark ventral spotting as well.

In each tooth row are 34–48 slender, sharply pointed teeth.

At birth, pantropical spotted dolphins are about 80–85 cm long. Adults range in length from 1.6–2.4 m (females) or 1.6–2.6 m (males), depending on the population. Maximum recorded weight is 119 kg.

Neonate—Neonates are about 1/4–1/3 of adult size; with a two-part color pattern (dark gray above, white below), with no spotting.

Two-tone—Two-tone calves are about 1/3–3/4 adult size; with a two-tone gray color pattern and no spotting.

Speckled—Speckled juveniles are at least 3/4 of adult size; the two-tone color pattern is still evident, with dark ventral spots developing.

Mottled—Mottled adults/subadults have dark ventral spotting (beginning to converge and fuse) and light dorsal spotting

Fused—The two-tone color pattern is still evident, with light dorsal spotting and the ventral spots mostly fused into a solid gray belly; the beak is variably white-tipped.

Recognizable geographic forms

***Offshore spotted dolphin* (S. a. attenuata)**—Offshore spotted dolphins are slightly smaller and more slender than the coastal form, and the beak tends to be more slender as well. Dorsal spotting is much less dense, and in some populations can be virtually nonexistent in adults. Adults range in length from 1.6 to 2.4 m long, and tend to weigh somewhat less than the coastal form.

***Coastal spotted dolphin* (S. a. graffmani)**—In coastal waters of the eastern tropical Pacific, a larger coastal form of the pantropical spotted dolphin exists. It is larger and stockier, with a thicker beak than the offshore form. Spotting tends to be much more extensive on the coastal form, and in some adults the white dorsal spots can be so dense as to completely obscure the cape. Coastal spotted dolphins range from 1.8–2.6 m long, and can weigh up to at least 119 kg.

A pantropical spotted dolphin swims in calm waters off Hawaii, showing the white beak tip that is common among larger animals of the species. The large white spots on the back are probably cookie-cutter shark scars. PHOTO: R. W. BAIRD

A pantropical spotted dolphin mother and calf ride the bow wave of a vessel. These animals are avid bowriders throughout much of their range, but they avoid vessels in some parts of the eastern tropical Pacific, where they have been harassed by tuna seiners. Off Mayotte. PHOTO: J. KISZKA

Can be confused with Pantropical spotted dolphins can be confused with several other long-beaked oceanic dolphins. Spinner dolphins, which share much of the range, can be distinguished by differences in dorsal fin shape, beak length, and color pattern. Atlantic spotted dolphins can look similar, but attention to head shape, dorsal fin shape, and color pattern details will allow correct identification. In addition to Atlantic spotted dolphins, both bottlenose and humpback dolphins can also be spotted (generally most extensively on the belly), but will be distinguishable by attention to differences in body shape and size. In fact, presence/absence of spotting is not really a very good character to use in identification of *S. attenuata*, as the species can range from heavily spotted to unspotted. The shape of the dorsal cape is a better field character.

Distribution Pantropical spotted dolphins are found in the Pacific, Atlantic, and Indian oceans. They are mostly creatures of offshore tropical zones, although they do occur close to shore in some areas where deep water approaches the coast (e.g., off the west coast of central America and Mexico, around the Hawaiian islands, off some islands in the Caribbean, off Taiwan, and in the Philippines). As their name implies, these animals are pantropical, found in all oceans between about 40°N and 40°S, although they are much more abundant in the lower latitude portions of their range. In the eastern tropical Pacific, the offshore form primarily inhabits waters with a sharp, shallow thermocline and surface water temperatures of over 25°C. They are also found in the Persian Gulf and Red Sea.

Ecology and behavior Pantropical spotted dolphins are among the most abundant dolphins in the eastern tropical Pacific (ETP) and are the primary species involved in the tuna/dolphin interaction there. In at least the Pacific and Indian oceans, spotted dolphins associate with yellowfin tuna, spinner dolphins, and other oceanic predators; the fishermen take advantage of this association to help them locate and catch tuna more efficiently. They are also among the most common species of cetaceans in portions of the Atlantic and Indian oceans.

School sizes are generally less than 100 for the coastal form, but offshore herds may number in the thousands. They may form schools with some age and sex segregation. These gregarious animals are fast swimmers, often engaging in acrobatics (like breaches and side slaps, but they do not spin), and frequently bowriding (except on the tuna fishing grounds of the ETP, where they generally have learned to avoid boats). They may swim at speeds of at least 22 km/hr, and dives of up to 3.4 minutes in length have been recorded through time/depth recorder studies.

The life history of this species has been thoroughly studied, due to the large number of specimens available through kills in the ETP tuna fishery, as well as drive fisheries of Japan. Gestation lasts about 11.5 months. Sexual maturity is reached at ages of 9–11 years in females, and 12–15 in males. The typical calving interval is 2–3 years, and age at weaning varies strongly by population. Although pantropical spotted dolphins breed year-round, there are two calving peaks in the ETP, one in spring and one in fall.

This coastal pantropical spotted dolphin clearly shows the extensive white dorsal spotting and robust body shape that characterize that subspecies. PHOTO: SWFSC/STAR

A white pantropical spotted dolphin, possibly an albino, leaping in the eastern tropical Pacific. Such anomalously white individuals can occur in any species. PHOTO: SWFSC/STAR

Feeding and prey Offshore spotted dolphins feed largely on small epi- and mesopelagic fishes, squids, and crustaceans that associate with the deep scattering layer (DSL). In some areas, flyingfish are also important prey. The diet of the coastal form is poorly known, but is thought to consist mainly of larger and tougher fishes, perhaps mainly bottom-living species.

Threats and status The heaviest known mortality of this species has been in the ETP tuna purse seine fishery for tuna. Since the interaction was first documented in the late 1960s, millions of spotted dolphins have died in the nets (from 1959 to 1972, about three million offshore spotters were killed). Current mortality in this fishery has been greatly reduced by years of modifications to the fishing practices, fleet changes, and US and international legislation. Current concerns are focused on the potential effects of fishery-related stress, and its role in preventing recovery of the population. In addition, pantropical spotted dolphins are taken incidentally in a number of other purse seine, gillnet, and trawl fisheries throughout the range.

Large direct kills occur sporadically in the Japanese small cetacean drive and harpoon fisheries, and much smaller direct kills have occurred in the dolphin fisheries of the Caribbean, Sri Lanka, Philippines, Indonesia, St. Helena, and the Laccadive and Solomon Islands. Most of these kills have not been adequately monitored and the effects on the population are usually not known. They have been live-captured in some areas (e.g., Hawaii), and some individuals have survived for a short time in captivity.

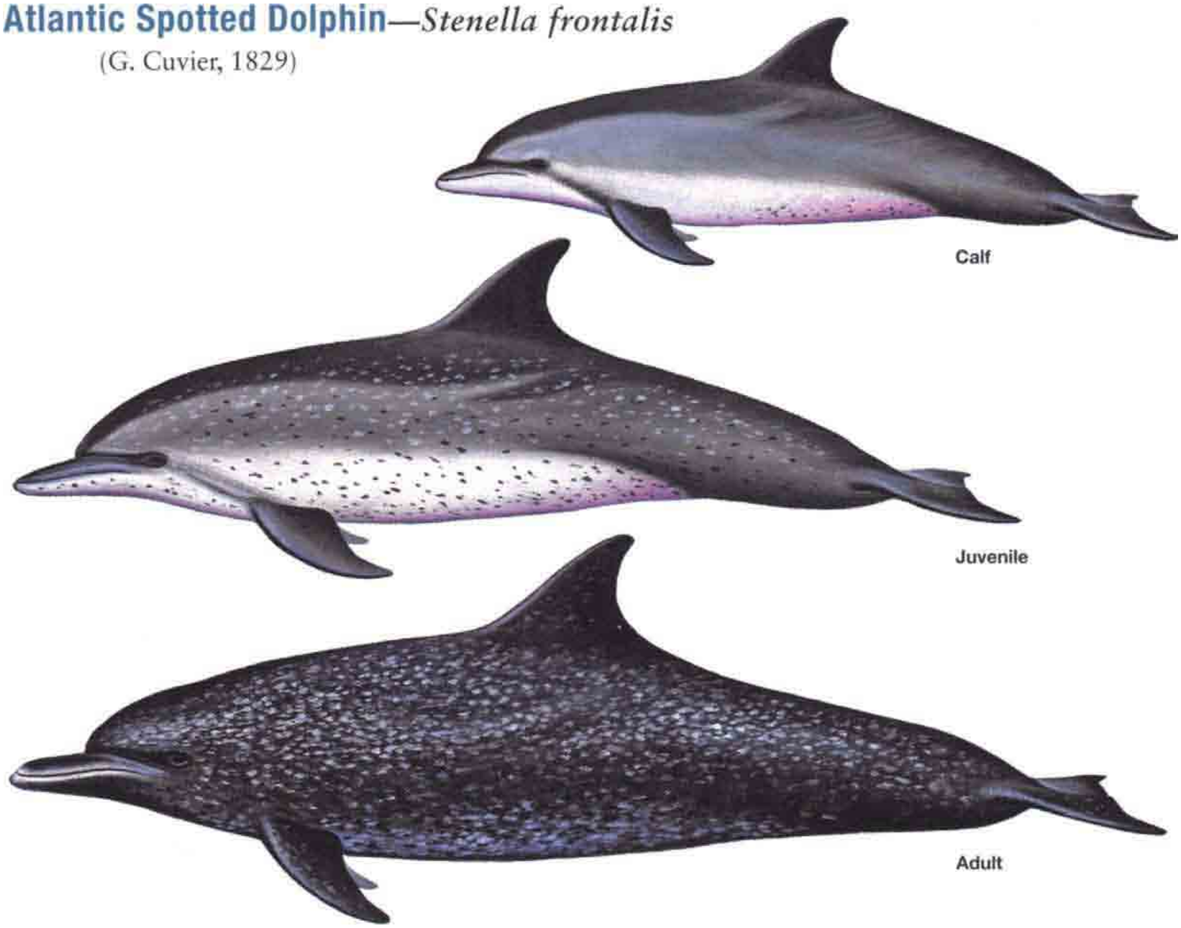
Overall, the species is very abundant, perhaps one of the most abundant dolphins in the world. In the eastern tropical Pacific, there were estimated to be 228,000 coastal spotters in 2000. The northeastern offshore spotted dolphin (the stock most affected by the ETP tuna fishery) numbered about 647,000 in 2000. This stock is not showing clear signs of recovery, despite the dramatic decline in mortality in recent years. The western/southern offshore stock (which is less affected by the fishery) numbered about 800,000. About 440,000 inhabited Japanese waters in the early 1990s. There were estimated to be over 47,000 in the northern Gulf of Mexico. Clearly, the species is in no danger on a global scale.

IUCN status Lower Risk/Conservation Dependent.

References Dizon et al. 1994; Gerrodette and Forcada 2005; Kasuya 1985; Perrin 2001, 2002; Perrin and Hohn 1994; Perrin et al. 1987.

Atlantic Spotted Dolphin—*Stenella frontalis*

(G. Cuvier, 1829)



Recently-used synonyms *Stenella plagiodon.*

Common names En.–Atlantic spotted dolphin; Sp.–*delfín pintado*; Fr.–*dauphin tacheté de l'Atlantique.*

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Delphinidae. There is some indication that this species may be closely related to the Indo–Pacific bottlenose dolphin. If so, then the genus-level taxonomy of these two groups needs revision. There is known to be some geographic variation in this species, and evidence for a distinct geographic form in the more temperate waters of the North Atlantic is accumulating.

Mother (upper) and calf (lower) Atlantic spotted dolphins in the Bahamas. Notice that the calf is essentially unspotted. PHOTO: D. PERRINE@/SEAPICS.COM

Species characteristics The Atlantic spotted dolphin, in many ways, resembles the Indo–Pacific bottlenose dolphin more than it does the pantropical spotted dolphin. In body shape, it is somewhat intermediate between the two, neither very robust, nor very slender. It has a moderately long, but rather stocky beak (somewhat reminiscent of that of the bottlenose dolphin). There is a distinct crease between the melon and beak. The dorsal fin is tall and falcate, and the flippers are recurved and of the typical dolphin shape.

There is much developmental variation in the color pattern. Atlantic

Atlantic Spotted Dolphin
(*Stenella frontalis*)
Global Distribution

spotted dolphins begin life with unspotted background coloration. Young animals look much like slender bottlenose dolphins, with a dark cape, light gray sides, and white belly. There is generally a distinct spinal blaze (which is variable in its development). Development of larger spots on both dorsal and ventral surfaces progresses as the animal ages; some individuals become so heavily spotted that the cape margin and spinal blaze are totally obscured. However, in some populations, adults are essentially unspotted (these are generally in offshore and/or more temperate areas). The white spots are generally larger than the small ones typical of the pantropical spotted dolphin.

There are 32–42 teeth in each upper tooth row and 30–40 in each lower row. Adults are up to 2.3 m long and 143 kg in weight. Newborn Atlantic spotted dolphins are 0.8–1.2 m long.

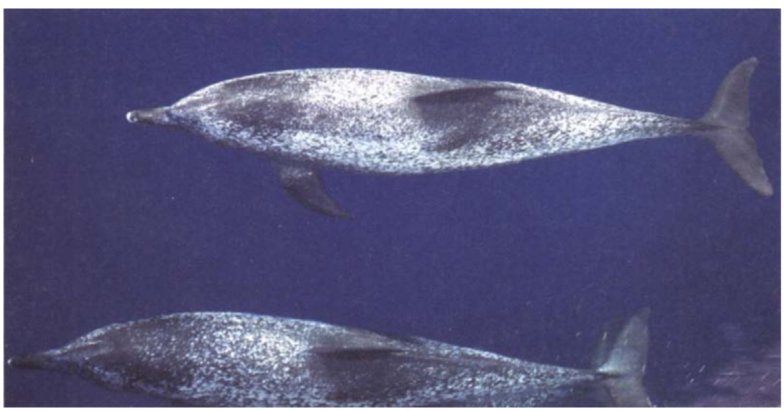
Neonate—Neonates are about 1/4–1/3 of adult size; with a two-tone color pattern (dark gray above, white below), with no spotting.

Calf—Calves are 1/3–3/4 adult size; with a two-tone color pattern, and possibly a few dark ventral spots.

Juvenile—Juveniles are at least 3/4 of adult size; the two-tone color pattern is still evident, with some dark ventral and light dorsal spots developing.

Adult—Adults have a mottled (dark ventral spotting and light dorsal spotting) to fused (same as above, with the ventral spots fusing) color pattern, often with a white-tipped beak.

Recognizable geographic forms Although two distinct geographic forms of the Atlantic spotted dolphin have been described, primarily from osteological and color pattern data, the exact ranges and extent of overlap in their external appearance are not adequately known. The larger, more heavily spotted form is mainly found over the continental shelf (the largest specimens known are from the continental shelf of North America), while a small, more lightly spotted form occurs in more oceanic areas (and around offshore islands, like the Azores).



Adult Atlantic spotted dolphins, especially in more coastal waters tend to be very heavily spotted. The spotting is less dense on the back, so that the dorsal cape and spinal blaze (adjacent to the dorsal fin in the top animal) are usually discernible. Gulf of Mexico. PHOTO: R. L. PITMAN

An offshore/temperate form of the Atlantic spotted dolphin found around the Azores. In this form, which has not yet been adequately described, the spotting appears to be less extensive and there is a distinct boundary between the light gray side and white belly. PHOTO: L. This Atlantic spotted dolphin has no visible spinal blaze; although unusual, the expression of the spinal blaze is a highly variable trait in this species. North Atlantic. PHOTO: C. FAIRFIELD

A close-up of the head of an adult Atlantic spotted dolphin. The beak in this species is of moderate length and thickness, like that of some bottlenose dolphins. PHOTO: T. PUSSER

Can be confused with Atlantic spotted dolphins can be most easily confused with bottlenose dolphins (although they do not overlap in distribution with the Indo–Pacific species). The differences in size and robustness are good clues, but may require a trained eye to distinguish in some at-sea sightings. Heavy spotting is generally a good characteristic for Atlantic spotted dolphins; however, some may be nearly unspotted, and some bottlenose dolphins may have spotting and blotches on the belly and sides. Pantropical spotted dolphins may also be difficult to distinguish from Atlantic spotters, but attention to body robustness, beak and dorsal fin shape, and color pattern differences will allow them to be separated.

Distribution This species is found only in the Atlantic Ocean, from southern Brazil to New England in the west, and to the coast of Africa in the east (the exact limits off West Africa are not well-known). They are not found in the Mediterranean Sea. Their tropical to warm-temperate distribution is mostly over the outer continental shelf and upper continental slope, but they also inhabit some deep oceanic waters. They occur near some oceanic island groups, such as the Azores. In the Bahamas, they spend much of their time over shallow (6–12 m) sand flats.

Ecology and behavior Small to moderate-sized groups, generally of less than 50 individuals, are char-

A group of Atlantic spotted dolphins rides the bow of a research vessel in the Gulf of Mexico. Individuals of several age classes can be seen here. PHOTO: T. A. JEFFERSON

acteristic of the Atlantic spotted dolphin. Coastal groups usually consist of 5–15 animals. These are acrobatic animals and they are known to be avid bowriders. They are mostly shallow divers (most dives apparently < 10 m), but dives of 40–60 m and up to 6 minutes have been recorded. Dolphins in the Bahamas have been observed to capture fish hiding in the soft, sandy bottom by sticking their beaks into the sand.

Atlantic spotted dolphins in the clear, warm waters off the Bahamas allow people to swim with them, and this population has become a major tourist draw. People come from around the world to interact with these dolphins in their natural habitat. Studies there show that Atlantic spotted dolphins have a fluid group structure, like that of bottlenose and other small dolphins. Groups are often segregated by age and sex. They may interact (sometimes aggressively) with bottlenose dolphins. Sharks are known predators.

There is not much known of the species' life history, but more tropical populations would be expected to have a protracted breeding season. Age at sexual maturity is thought to occur somewhere between 8 and 15

A group of virtually-unspotted Atlantic spotted dolphins off the coast of Brazil. These animals demonstrate how extreme the variation in spotting can be in this species. PHOTO: S. PACHECO DE SOUZA

years in females (when females are in the mottled color phase). The calving interval ranges from 1–5 years, and averages about 3 years. Nursing of calves can last for up to 5 years. Longevity is not well-known.

Feeding and prey A wide variety of epi- and mesopelagic fishes and squids, as well as benthic invertebrates, are taken by this species. There are known to be some regional differences in the diet.

Threats and status Overall, this species is not known to suffer greatly at the hands of humans. Incidental catches in fisheries are known for several areas of the range (Brazil, the Caribbean, off the east coast of the United States, and Mauritania). No direct killing is known, other than occasional catches in the Caribbean dolphin fisheries, and maybe also off West Africa. The only abundance estimate available is for the northern Gulf of Mexico, about 3,200 animals. The species is not in any danger on a global scale.

IUCN status Data Deficient.

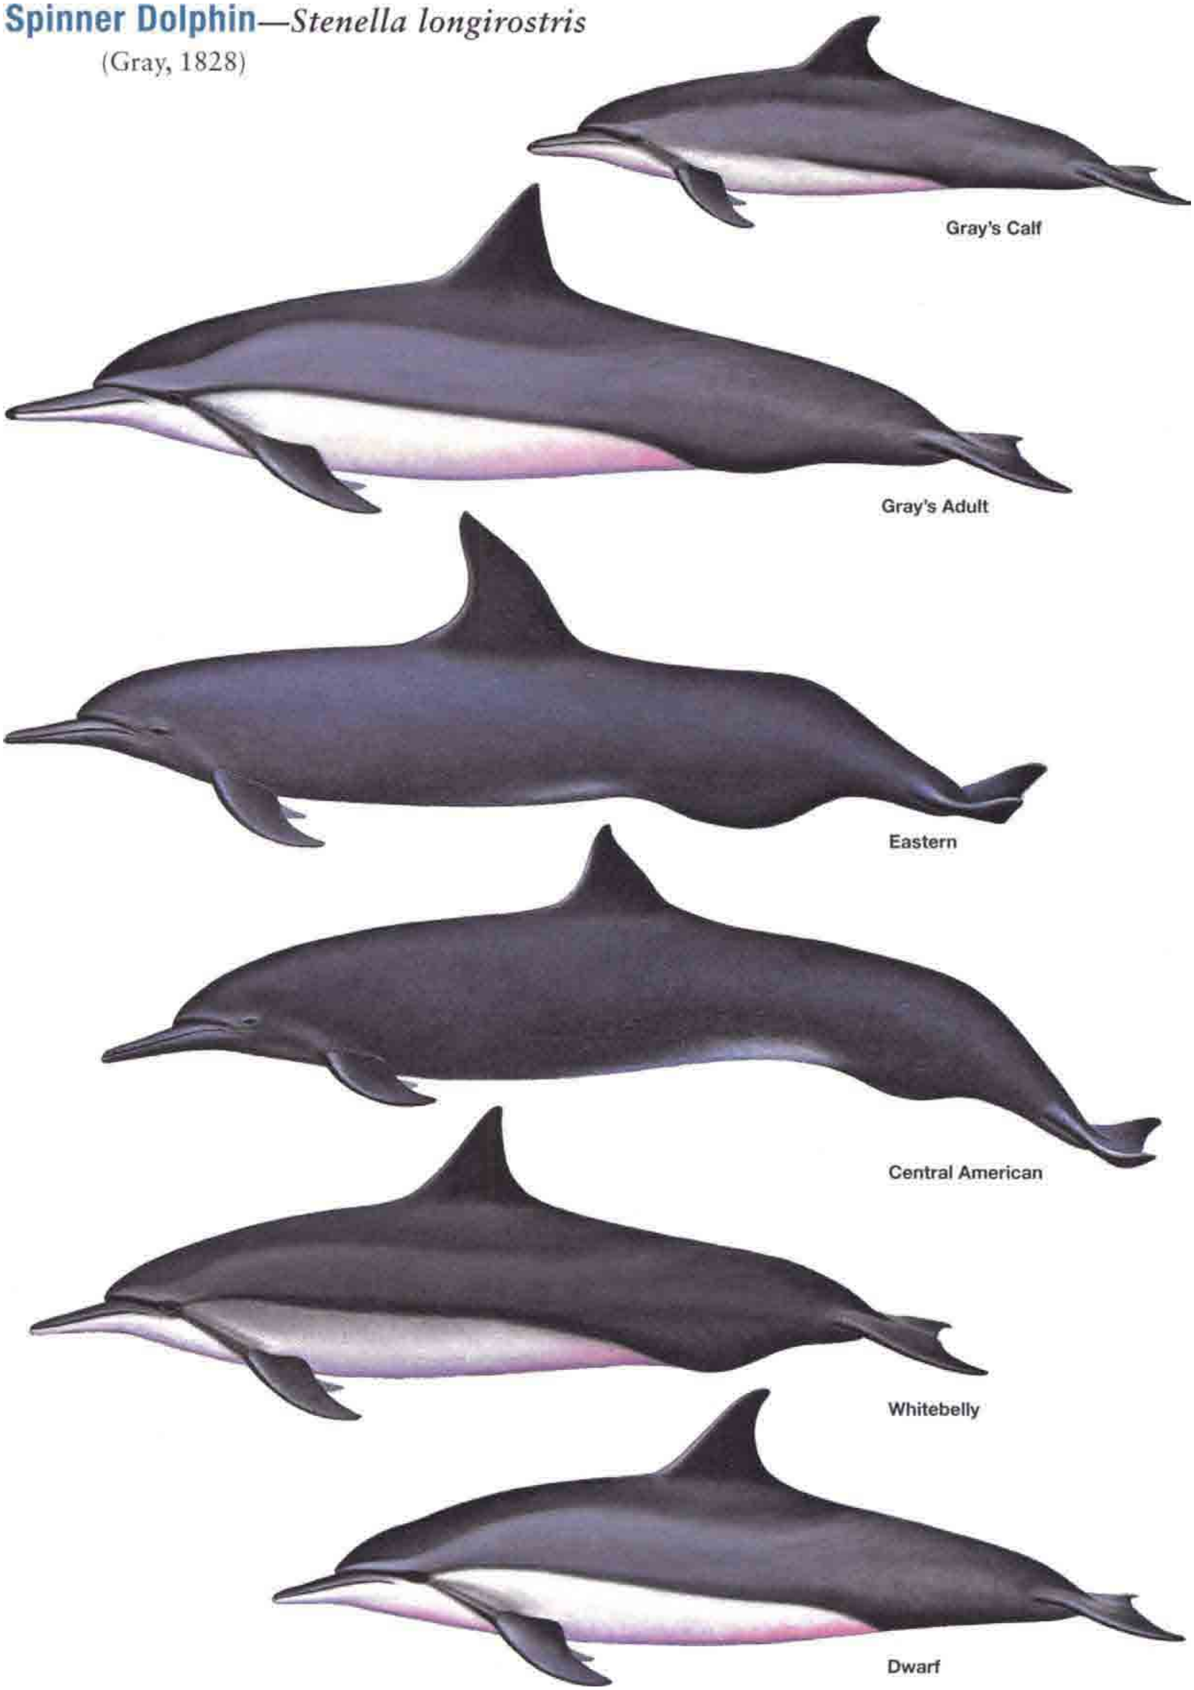
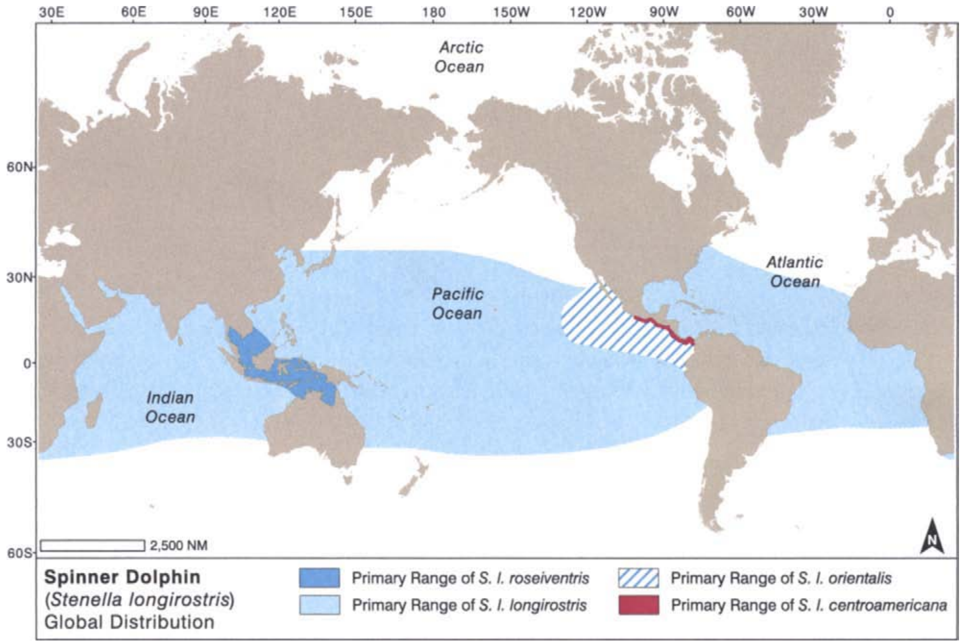
Spinner Dolphin—*Stenella longirostris*

(Gray, 1828)





Recently-used synonyms *Stenella roseiventris, Stenella microps.*

Common names En.–spinner dolphin; Sp.–*estenela giradora* or *delfín girador*; Fr.–*dauphin longirostre*.

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Delphinidae. Four subspecies are currently recognized: *S. l. longirostris* in oceanic tropical waters worldwide, *S. l. orientalis* in the offshore eastern tropical Pacific, *S. l. centroamericana* in the coastal eastern tropical Pacific, and *S. l. roseiventris* in Southeast Asia and northern Australia. Recent genetic work suggests that the genus *Stenella* is actually paraphyletic, and it is likely that it will be restructured in coming years. Dolphins that appear to be hybrids between this species (and pantropical spotted and Clymene dolphins) have been observed off the Fernando de Noronha archipelago of Brazil.

Species characteristics The spinner dolphin is a slender species, with an extremely long, thin beak. Also, the head is very slender at the apex of the melon. The flippers are slender and recurved. The dorsal fin usually ranges from slightly falcate to erect and triangular. In adult males of some populations, however, the dorsal fin can be so canted forward that it looks as if it were stuck on backwards. Also, the tail stock may become very deepened, with an enlarged post-anal hump (sometimes called a keel) of connective tissue, and the tips of the flukes may curl upwards somewhat. These three features are correlated in their development in adult males.

Spinners generally have dark eye-to-flipper stripes and dark lips and beak tips. Individuals of most spinner dolphin populations have a tripartite (three-part) color pattern (dark gray cape, light gray sides, and white belly) and only minor differences in appearance of males and females. This includes Gray's spinner dolphins (*S. l. longirostris*) and dwarf spinners (*S. l. roseiventris*). In these animals, the upper beak is dark, and most of the lower jaw is white; the beak tip tends to be dark. In the eastern tropical Pacific (ETP), three other forms with very different color patterns are found (see Recognizable Geographic Forms below). Geographical variation in spinner dolphins has not been well described for most areas outside the eastern Pacific.

In spinner dolphins, there are 40–62 pairs of very fine, pointed teeth in each jaw, with some differences between subspecies. This is more than in any other cetacean species, except the franciscana and some long-beaked common dolphins.

A Gray's spinner dolphin lifts its head out of the water to take a look around in the Comoros archipelago, off southeastern Africa. PHOTO: J. KISZKA

Newborn spinner dolphins are about 75–80 cm long; adults reach 2.0 m (females) and 2.35 m (males). There is much geographical variation; for instance dwarf spinners reach maximum lengths of only about 1.58 m. Spinners are known to reach weights of at least 82 kg (although dwarf spinners can be mature at 25 kg). Males appear to be somewhat larger than females in all forms.

Neonate—About 1/2 of adult length; color pattern muted, often with fetal folds and folded flukes and dorsal fins.

Calf—Calves are generally less than 3/4 adult size; head relatively large; with a muted color pattern.

Subadult—Length generally greater than 3/4 adult size; body more slender than that of adults.

Adult female—Shows the typical color pattern for their respective geographical form (see below); dorsal fin more erect than in subadults.

Adult male—Adult males show the typical color pattern for their respective geographical form; they have more erect or canted dorsal fins, more deepened tail stocks, and enlarged post-anal humps (the differences may be slight [Gray's/dwarf] or moderate [whitebelly], and reach great extremes in eastern and central American spinners).

Recognizable geographic forms

Gray's spinner dolphin **(S. l. longirostris)**—This is the typical form of spinner dolphin found in most areas of the world (with the exception of some waters of tropical Asia and the eastern tropical Pacific). They have the tripartite color pattern described above, with a falcate to triangular dorsal fin, small to non-existent post-anal hump, and relatively small dorsal fin and flippers. Tooth counts are generally in the range of 40–60 per row. Adult females are about 1.39–2.04 m long, and males are 1.60–2.08 m.

Eastern spinner dolphin **(S. l. orientalis)**—Eastern spinner dolphins are found only in the waters of the eastern tropical Pacific Ocean, mostly offshore. They have a monotone steel gray color pattern, with white only as patches around the genital area and axillae. They have exaggerated sexual dimorphism, with males possessing strongly canted dorsal fins, medium to large post-anal humps, and upturned fluke tips. The beak is relatively long. Eastern spinners are relatively small, with adult females being 1.52–1.93 m (mean = 1.71 m) and adult males 1.60–1.99 m in length (mean = 1.76 m).

Central American spinner dolphin **(S. l. centroamericana)**—Central American spinner dolphins, previously called Costa Rican spinners, are poorly known.

An eastern spinner dolphin in the eastern tropical Pacific. This subspecies is characterized by a monotone gray color pattern, and exaggerated sexual dimorphism. PHOTO: R. L. PITMAN

The adult male eastern spinner dolphin has a postanal keel of connective tissue and a dorsal fin that is so canted forward, it can look like it is stuck on backwards. PHOTO: R. L. PITMAN

The Central American spinner dolphin is very similar to the eastern subspecies, but tends to be even more slender. It is also a more coastal form. PHOTO: R. L. PITMAN

Eastern or Central American spinner dolphins porpoising in a group in waters of the eastern tropical Pacific. PHOTO: SWFSC/STAR

This subspecies is found only in coastal waters of the eastern tropical Pacific. They have a monotone color pattern similar to that of the eastern spinner, although apparently lacking the white ventral patches. There is pronounced sexual dimorphism, with adult males possessing strongly canted dorsal fins, large post-anal humps, and upturned fluke tips. Central American spinners are the largest subspecies, with adult females being 1.75–2.11 m and adult males reaching over 2.16 m in length. The beak is even longer than in eastern spinners.

Whitebelly spinner dolphin—A third type of spinner dolphin in the eastern tropical Pacific, called the whitebelly spinner, appears to be an intergrade between *S. l. longirostris* and *S. l. orientalis*. They occur in large schools in more offshore regions of the ETP. Whitebelly spinners are more robust, with a two-part color pattern and less exaggerated sexual dimorphism than the other forms in the ETP. Adult females are 1.57–1.98 m in length (mean = 1.76 m), and adult males 1.60–2.35 m (mean = 1.80 m).

***Dwarf spinner dolphin* (S. l. roseiventris)**—There is a dwarf form of the spinner dolphin, which is found in waters of Southeast Asia and northern Australia. It has a tripartite color pattern, similar to that of Gray's spinner dolphin. There is an erect to falcate dorsal fin, which is proportionately large (9.5–13% of total length). The flippers are also relatively large. Sexual dimorphism is reduced, and tooth counts are much lower than in the other forms (about 41–52 teeeth per row). Dwarf spinners (as the name implies) are much smaller than others of the species, with adult females ranging from 1.38–1.45 m and adult males 1.29–1.58 m (only $^{2}/_{3}$–$^{3}/_{4}$ the length of other spinner subspecies).

Can be confused with From a distance, other long-beaked oceanic dolphins can look like spinner dolphins. Spinners are most likely to be confused with Clymene dolphins in the Atlantic, but careful attention to color pattern differences and head and body shape differences will allow them to be distinguished. In any ocean, they may be confused with pantropical spotted, striped and common dolphins (especially the long-beaked species, *D. capensis*). Although the general body shape is very similar, careful attention to relative beak length, dorsal fin shape, and color patterns should allow for accurate identifications.

Distribution The range of the spinner dolphin is pantropical and nearly identical to that of the pantropical spotted dolphin, encompassing oceanic tropical and subtropical zones in both hemispheres. Limits are near

A dwarf spinner dolphin from waters of the southern South China Sea. These animals are much smaller than other subspecies of spinner dolphins, and have relatively large appendages. PHOTO: T. AQUINO

Where Gray's spinner dolphins overlap geographically with eastern spinner dolphins in the eastern tropical Pacific, they interbreed freely and intermediate forms (referred to as whitebelly spinners) such as this are common. PHOTO: R. L. PITMAN

40°N and 40°S. Spinner dolphins are found in the Red Sea and Persian Gulf, but not the Mediterranean Sea. Unlike pantropical spotted dolphins, spinners often rest in shallow, coastal waters and may spend their days in sandy-bottomed bays of oceanic islands and coral atolls. However, much of their range is oceanic, especially in the eastern tropical Pacific. The dwarf spinner occurs almost exclusively in shallow waters in southeast Asia and northern Australia, and apparently feeds over shallow reefs (it is at least partially sympatric with Gray's spinner dolphin).

Ecology and behavior The spinner dolphin is named for its habit of leaping from the water and spinning up to seven times on its long axis, before falling back to the water. This behavior may be repeated many times in "bouts." This is one of the most aerial of all dolphins and they often perform breaches, side-slaps, fluke-slaps, flipper-slaps, and spins (on the long axis). In most areas they are active bowriders (the main exception is the ETP, where these dolphins have been harassed by fishermen, who encircle them to catch tuna swimming below). Herd sizes range from less than 50 up to several thousand. Associations with spotted dolphins are common in the ETP, and they occasionally associate with several other marine mammal species. They may dive to 600 m or deeper in pursuit of prey, although most feeding is probably done in shallower waters. In the ETP, at least, they range over vast distances of open ocean in search of suitable patches of prey.

The behavior of Hawaiian spinner dolphins has been quite well studied. Moderate-sized groups of dolphins move into shallow sandy bays to rest in the daytime and then move offshore in the late afternoon/evening for nighttime feeding (mostly near dusk and dawn) in nearby continental slope and oceanic waters. Dolphins are highly aerial during the ascent from rest to foraging and often engage in "zig-zag" swimming (characterized by a great deal of stereotyped aerial behavior), thought to test the readiness of the school to move offshore. Societies are characterized by a fission-fusion system, in which group associations are very fluid. Similar behavior patterns have been noted at other island groups in the Atlantic and Indian oceans. Interestingly, at Midway Atoll (< 2,000 km away from Hawaii), spinners have a very different social structure, with stable groups of long-term associates.

Life history has been studied much more extensively than for most other dolphin species, largely due to the specimens available from the tuna fishery. Gestation lasts 10 months, nursing lasts 1–2 years, and the calving interval is about 3 years. Sexual maturity is attained at ages of about 4–7 for females and about 7–10 for males. Breeding is diffusely seasonal, and calving peaks in different populations range from late spring to fall. The different subspecies have evolved various degrees of male/male competition for females (probably ranging

Spinner dolphins sometimes have a wide black band at the boundary between the gray lateral field coloration and the white belly—this is very common in some populations (such as those around the Marquesas Islands) and rare in others. PHOTO: R. L. PITMAN

from overt competition to sperm competition). As a result, the mating system apparently ranges from more polygynous in the eastern (and probably central American) spinner to more polygynandrous in whitebelly spinners.

Feeding and prey Most spinner dolphins feed predominantly at night, on small (<20 cm) midwater fish of many different families (including myctophids), squids, and sergestid shrimps, and rest during much of the day. Their association with spotted dolphins and yellowfin tuna results in their entanglement in tuna purse seines in the ETP. Dwarf spinner dolphins are exceptional, however; they presumably feed during daylight hours on small, reef-associated organisms (benthic reef fishes and invertebrates).

Spinner dolphins are named for their habit of spinning up to seven rotations on the long axis while in the air—no other dolphin species spins so frequently or vigorously. Mayotte. PHOTO: J. KISZKA

Threats and status This is the second-most important species of dolphin involved in the ETP tuna purse seine fishery (after the pantropical spotted dolphin). The eastern spinner dolphin population is estimated to have been reduced to less than one-third of its original size by the tuna fishery kill. Although current mortality is greatly reduced, the population is not recovering at its expected potential, and fishery-related stress may be at least partially responsible for this. Other incidental kills occur throughout the range in a number of different fisheries, including driftnets, purse seines, and trawls. Dwarf spinners are caught incidentally in shrimp trawls in the Gulf of Thailand.

In some cases, human use of by-caught dolphins has led to directed fisheries. Direct kills occur in several areas, including the Caribbean, Sri Lanka, the Philippines, Indonesia, and occasionally Japan. They may also be taken in West Africa. Their habit of resting in coastal waters leads to problems of harassment by dolphin-watching boats in a number of areas. Some have been captured for public display, but they generally do not do well in captivity.

The spinner dolphin is one of the most abundant dolphins in the world. There were about 800,000 whitebelly spinners in the ETP in 2000. The eastern spinner dolphin (the spinner stock most heavily impacted by the ETP tuna fishery) numbered about 450,000 in 2000, and despite large reductions in the kill, does not appear to be showing evidence of recovery. There are estimated to be over 11,000 in the northern Gulf of Mexico. There are no abundance estimates for the dwarf subspecies, but its limited range and significant incidental kills may have resulted in conservation problems. So, while the species may not be in danger of extinction overall, some populations and subspecies clearly are threatened by human activities.

IUCN status Lower Risk/Conservation Dependent.

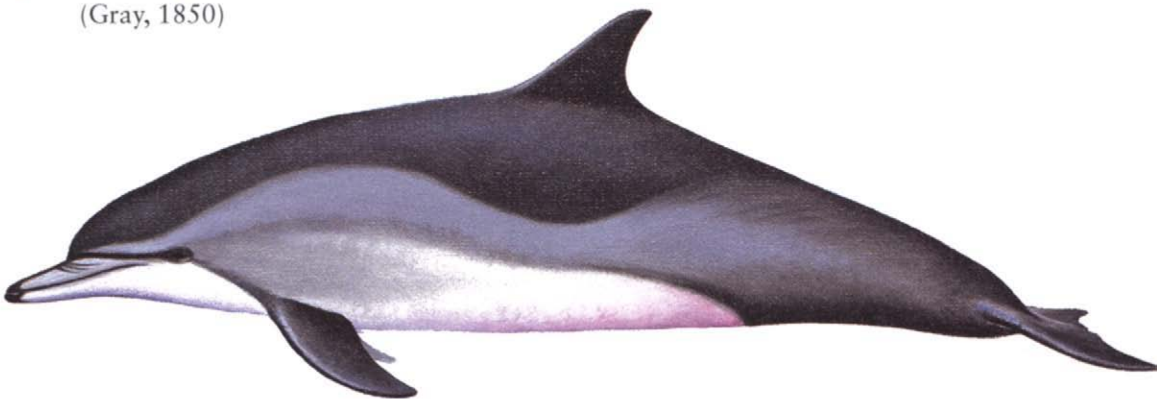
Clymene Dolphin—*Stenella clymene*

(Gray, 1850)



Recently-used synonyms None.

Common names En.–Clymene dolphin; Sp.–*delfín Clymene*; Fr.–*dauphin de Clyméné*.

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Delphinidae. Recent genetic work suggests that the genus *Stenella* is actually paraphyletic, and it is likely that it will be restructured in coming years. Although first described in 1846, the authorship of the scientific name is more correctly attributed to Gray (1850). Presumed hybrids between Clymene and spinner dolphins have been observed at sea off the Fernando de Noronha archipelago of Brazil.

Species characteristics The Clymene dolphin is externally similar to the spinner dolphin, but is smaller and more robust, with a much shorter and stockier beak. There is a distinct crease between the beak and melon. The dorsal fin is erect, but slightly falcate. Despite these external similarities with the spinner dolphin, skull morphology indicates that the Clymene dolphin may actually be more closely related to the striped dolphin. The flippers are smoothly recurved, typical of those of other species in the genus.

A three-part color pattern, with a dark gray cape, light gray sides, and white belly, is characteristic of this species. The cape dips in two places: above the eye, and below the dorsal fin. The beak is mostly light gray, but the lips and beak tip are black. There is also a dark stripe on the top of the beak, from the tip to the apex of the melon, and often a dark "moustache" marking on the middle of the top of the beak. The eye is also surrounded by black, and a dark gray stripe runs from the eye to the flipper. There may also be an indistinct dark band running diagonally along the side, from the anus forward.

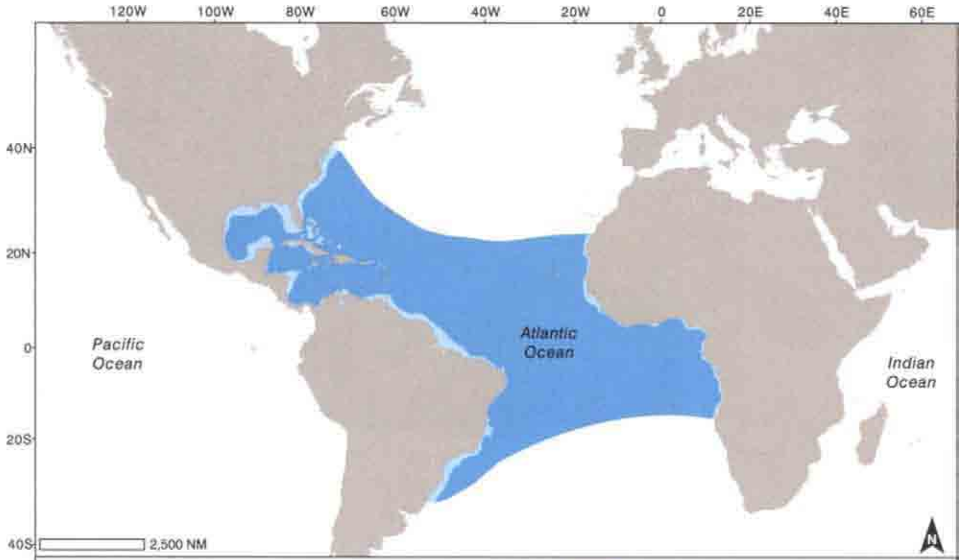
Two Clymene dolphins in the North Atlantic Ocean, showing the unique characteristics of the species. PHOTO: C. FAIRFIELD

Tooth counts are much lower than in spinners: 39–52 teeth per row. The teeth are slender and pointed.

Clymene dolphins are the smallest dolphins in the genus. They are known to reach at least 1.97 m (males) and 1.90 m (females) in length and sexual maturity appears to be reached by about 1.7–1.8 m (however, this is based on a very small sample). Newborn length is unknown, but is less than 1.2 m. This species reaches weights of at least 80 kg.

Recognizable geographic forms None.

Can be confused with Clymene dolphins are most easily confused with spinner dolphins, but are more



Clymene Dolphin
(*Stenella clymene*)
Global Distribution

robust, with shorter, stubbier beaks. Also, the color pattern is slightly different; the two dips in the cape and the dark "moustache" marking on top of the beak will allow Clymene dolphins to be distinguished. The body shape of Clymene dolphins also closely resembles that of the short-beaked common dolphin, as does the color pattern in a superficial way. Common dolphins can best be distinguished by their hourglass pattern, cape that forms a V below the dorsal fin, chin-to-flipper stripe, and absence of a "moustache." The striped dolphin also has a similar body shape, but the color pattern is very different, and a decent look should make it easy to distingiuish these two species.

Distribution The Clymene dolphin is found only in the tropical and subtropical Atlantic Ocean, including the Caribbean Sea and Gulf of Mexico. This species has a notable warm-water preference, although there are records as far north as New Jersey on the US east coast and as far south as southern Brazil. The limits on the West African coast are not well-known, but extend from at least Angola north to Mauritania. The Clymene dolphin is not known to enter the Mediterranean Sea. This is a deep-water, oceanic species, not often seen near shore (unless deep water approaches the coast).

Ecology and behavior Very little is known of the Clymene dolphin's natural history. This is partly due to the long-standing confusion between this and other similar long-beaked tropical delphinids, as well as the species' somewhat-restricted offshore habitat. Schools tend to be smaller than those of spinner dolphins, generally less than 200 animals. In the Gulf of Mexico, most schools are less than about 60–80 individuals. Schools often appear to be segregated by age and sex. They have been reported to associate with common dolphins off West Africa, and with spinner dolphins in the Caribbean.

These quick and agile dolphins are aerially active. They have been reported to spin up to 3–4 revolutions on the long axis, but the spins are less elaborate and

A Clymene dolphin from the Gulf of Mexico. The color pattern is very similar to Gray's spinner dolphin, but the body is shorter and stouter, with a much shorter beak. It generally has a three-part color pattern, but shows lots of individual variation, as evident here. PHOTO: R. L. PITMAN acrobatic than those of the spinner dolphin. Clymene dolphins are avid bowriders, and have been seen playing with seaweed while riding the bow wave of a research vessel.

Because so few specimens have been examined, almost nothing is known of the life history of this species. Both sexes appear to reach sexual maturity by the time they are about 180 cm in length.

Three Clymene dolphins leap alongside a research vessel in the Gulf of Mexico, showing the species' diagnostic characters. In many ways, they appear almost intermediate between spinner and striped dolphins. PHOTO: T. PUSSER

Feeding and prey Very few stomachs have been examined, and even fewer observations of feeding behavior reported in the literature. Clymene dolphins apparently feed on small fish (including myctophids) and squid at moderate depths, presumably mainly at night.

Bowriding Clymene dolphins can be identified by the black-tipped beak with a wide, dark stripe on the mid-line of the rostrum, and diagnostic "moustache" marking on top of the beak. Gulf of Mexico. PHOTO: T. PUSSER

Threats and status Although they are known to be taken by harpoon occasionally in dolphin fisheries in the Caribbean, and incidental captures in fishing nets do occur throughout much of the range, the Clymene dolphin is not known to suffer any heavy exploitation at present. The only possible exception may be off the coast of West Africa, where this species is possibly one of several taken in large numbers in tuna purse seines in the Gulf of Guinea. The extent of that problem has been well hidden by fisheries officials, but it must be assumed that incidental kills are significant. Abundance has been estimated for the northern Gulf of Mexico, where about 12,000 are thought to occur.

IUCN status Data Deficient.

Delphinidae

Clymene Dolphin

Striped Dolphin—*Stenella coeruleoalba*

(Meyen, 1833)

Recently-used synonyms *Stenella styx, Stenella euphrosyne*.

Common names En.–striped dolphin; Sp.–*estenela listada* or *delfín listado*; Fr.–*dauphin bleu et blanc*.

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Delphinidae. Recent genetic work suggests that the genus *Stenella* is actually paraphyletic, and it is likely that it will be restructured in coming years.

Species characteristics The striped dolphin has the basic body shape typical of the *Stenella/Delphinus* group, although it is somewhat more robust (especially in the thoracic region) than spinner and pantropical spotted dolphins. The beak is moderate in length, with a distinct crease between the melon and beak. The dorsal fin is tall and slightly falcate, and the flippers are recurved and pointed (typical dolphin shape). The flukes are not notably different from those of others in the genus (with slender blades and acutely rounded tips).

The striped dolphin's color pattern is stunning: a white or pinkish belly and dark gray dorsal cape (although it may appear bluish-gray) are separated by a light gray thorax. A light gray spinal blaze (highly variable in extent and intensity) extends from the thoracic area into the cape, to just under the dorsal fin. The mostly-black beak sends back a dark stripe (the basis for the species' common name), which encircles the eye and then widens and runs back to the anus. There is an eye-to-flipper stripe and usually a short accessory stripe between the other two. The appendages are dark gray to black.

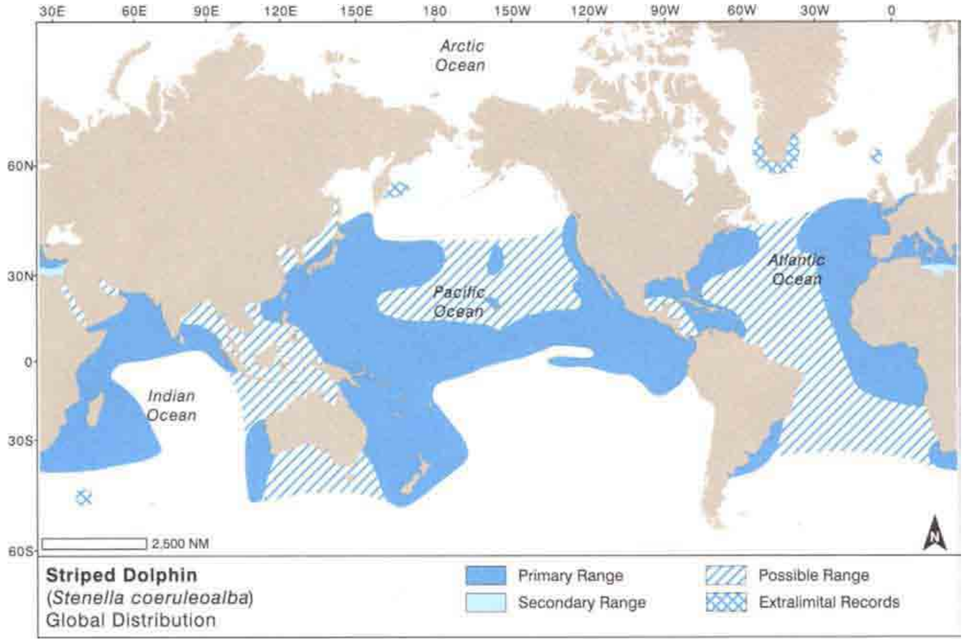
The striped dolphin's mouth contains 40–55 slender, pointed teeth in each tooth row.

Adult striped dolphins are up to 2.56 m long; males grow slightly larger than females. Newborns are about 93–100 cm in length. Maximum known weight is about 156 kg. There is geographical variation in the size of adults from different populations (for instance, dolphins from the southwestern Mediterranean are about 5–8 cm shorter than those from the northeastern Atlantic).

Recognizable geographic forms While significant geographic variation in osteological and body length characteristics has been documented, it is not currently possible to reliably recognize different geographical forms of this species in the field.

Can be confused with Although the body shape is similar to that of other species in the *Stenella/Delphinus* group, striped dolphins are generally easy to distinguish

A striped dolphin porpoises in the eastern tropical Pacific, showing the distinct side stripes of the species. PHOTO: SWFSC/STAR



by their unique color pattern. They are most likely to be confused with common dolphins (*Delphinus* spp.), but a good look at the color pattern should clear-up any problems. Fraser's dolphins also have an eye-to-anus stripe, and therefore may cause some confusion, but are much more robust, with much smaller appendages. When the color pattern is not visible, there may be some confusion with other species of the genus *Stenella*. However, observation of details of the color pattern will allow resolution.

Distribution This is a widely-distributed species, found in the Atlantic, Pacific, and Indian oceans, as well as many adjacent seas. Although also primarily a warm water species, the range of the striped dolphin extends higher into temperate regions than do those of any other species in the genus (spotted and spinner/Clymene dolphins). For instance, this is the only species of the genus that routinely reaches northern European waters. Limits are about 50°N and 40°S, although there are extralimital records from the Kamchatka Peninsula, southern Greenland, the Faroe Islands, and the Prince Edward Islands. Striped dolphins also are generally restricted to oceanic regions and are seen close to shore only where deep water approaches the coast. In some areas (e.g., the eastern tropical Pacific), they are mostly associated with convergence zones and regions of upwelling. There is a well-known and well-studied population in the Mediterranean Sea. Off the west coast of North America, they occur far offshore, in waters influenced by the warm, northward-flowing Davidson Current.

In the Maldives, two striped dolphins porpoise alongside a research vessel, giving a good look at some of the variation in coloration. PHOTO: T. A. JEFFERSON

Ecology and behavior Striped dolphins are fast swimmers, and appear to be more easily "spooked" than other tropical dolphins. This and their color pattern have prompted fishermen in the eastern tropical Pacific to call them "streakers." They are well-known in the ETP for their habit of running from vessels in low "splashy" leaps, at high speeds. They are very acrobatic, performing frequent breaches and other aerial maneuvers (including a behavior called roto-tailing, in which the dolphin whips its tail in a circle as it performs a high arcing leap out of the water). They often ride bow waves, except in the eastern tropical Pacific, where they tend to run from vessels.

Although most striped dolphin herds number between a few dozen and 500 individuals, these dolphins sometimes assemble into herds of thousands. At least off Japan, there appears to be some age/sex segregation of such herds, with individuals moving among juvenile, adult, and mixed schools. They are thought to be capable of diving to depths of 200–700 m to obtain prey.

Off Japan, where the biology of this species has been best studied, there are two calving peaks: one in summer, another in winter. Sexual maturity occurs at ages of 7–15 years for males, and 5–13 for females, generally when specimens are about 2.1–2.2 m long. Density-dependent changes in life history parameters have been documented for some areas. Gestation lasts an estimated 12–13 months. The breeding system is thought to be polygynous. Striped dolphins are estimated to live for as long as 58 years.

A striped dolphin porpoises out of the water on a calm day in the Ligurian Sea, off the Italian Mediterranean coast. PHOTO: T. PUSSER

A striped dolphin, showing the dark lateral stripes and spinal blaze that typify the species throughout its range. PHOTO: R. L. PITMAN

Feeding and prey The diet of this species consists primarily of a wide variety of small, midwater and pelagic or benthopelagic fish, especially lanternfish and cod, and squids. Striped dolphins apparently feed in pelagic to benthopelagic zones, to depths as deep as 200–700m, in continental slope or oceanic regions.

Threats and status Striped dolphins are the main delphinid species involved in small cetacean harpoon and drive fisheries in Japanese waters. Catch levels vary widely, but in some years were over 20,000, although the takes were generally much lower (< 1,000 per year) in recent years. Despite the recent reductions, the populations (more than one may be involved) are thought to be seriously depleted. This species has also been directly captured in smaller numbers in the Caribbean, Sri Lanka, and occasionally in the Mediterranean.

Incidental catches occur throughout the range in various types of fishing gear, especially purse seines and driftnets. This species was formerly caught in large numbers in pelagic driftnets in the Mediterranean and in the North Pacific, and there are catches in pelagic trawls and driftnets in western Europe. A massive die-off in the Mediterranean Sea from 1990–

As in most dolphin species, some populations of striped dolphins readily ride the bow waves of ships, while others completely avoid vessel traffic; the reasons for this are not completely known. North Atlantic. PHOTO: C. FAIRFIELD

1992 is thought to have been at least partly related to lowered immunity to disease (morbillivirus) from environmental contaminants (especially organochlorines like PCBs).

In the 1980s, there were an estimated 820,000 striped dolphins around Japan; however, this number is probably reduced now. Off the west coast of North America, there are about 20,000. In the ETP, there are estimated to be around one million striped dolphins. Estimates in the western North Atlantic are about 62,000, and in the Gulf of Mexico about 4,400. There were about 225,000 in the Mediterranean in the mid-1990s (after the mass die-off of 1990–1992). Clearly, this is not an endangered species, but due to the potential impacts of various human activities, the status of certain populations is very much a matter of concern.

IUCN status Lower Risk/Conservation Dependent.

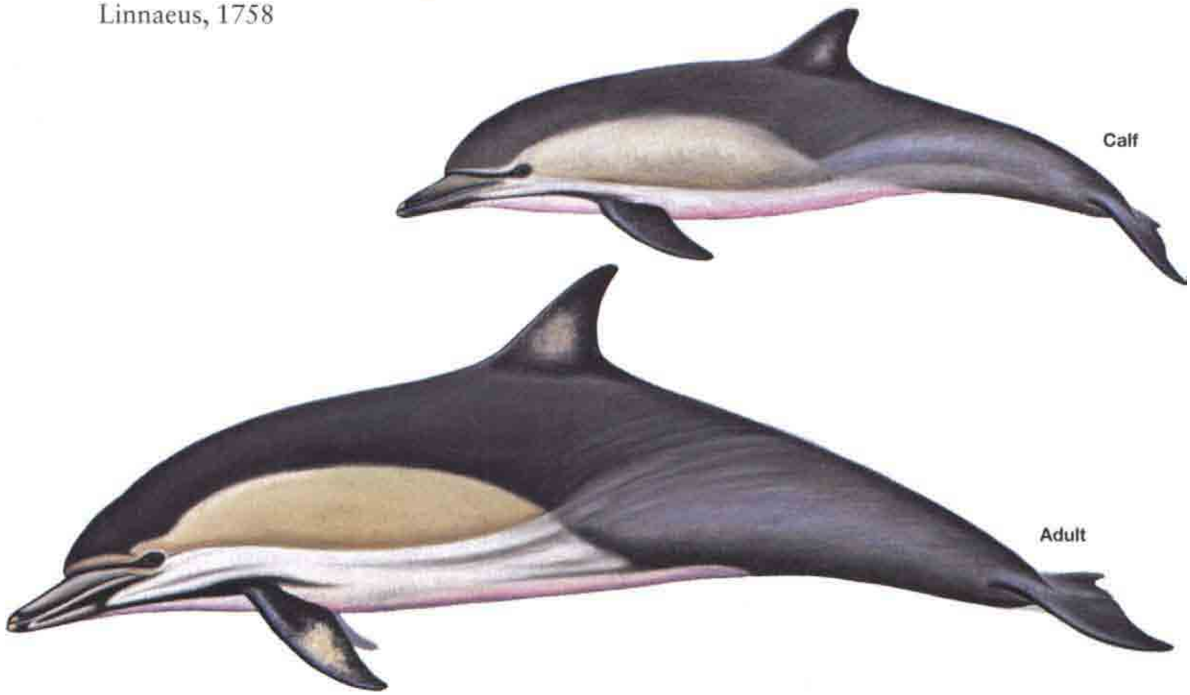
Short-beaked Common Dolphin—*Delphinus delphis*

Linnaeus, 1758



Recently-used synonyms None.

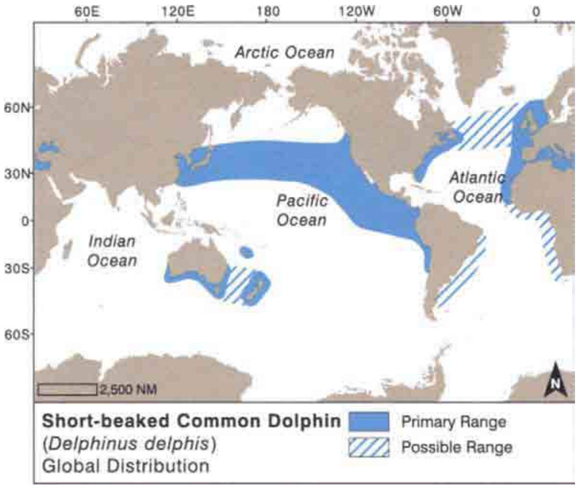
Common names En.–short-beaked common dolphin; Sp.–*delfín común de rostro corto*; Fr.–*dauphin commun a petit bec*.

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Delphinidae. Until 1994, all common dolphins were classified as a single species: *D. delphis*. However, it is now known that at least two species exist within the genus: the short-beaked (*D. delphis*) and long-beaked (*D. capensis*) common dolphins. There is a distinct short-beaked form in the Black Sea, the taxonomic status of which has not been adequately clarified (however, it is currently thought to be a subspecies: *D. delphis ponticus*).

Species characteristics Common dolphins have only recently been split into two species, and it may sometimes be difficult to distinguish the two species at sea. Short-beaked common dolphins have tall, slightly falcate dorsal fins, with pointed tips. The short-beaked species is somewhat more robust than the long-beaked species, with a shorter (but still moderately long) beak, and a more rounded, bulging melon. There is a deep crease between the melon and beak. The flippers are the typical shape for dolphins: slender, recurved, and pointed at the tips. In some individuals (presumably mostly adult males), there is a prominent post-anal hump of connective tissue—forming a ventral "keel."

Short-beaked common dolphins are strikingly marked, with a dark brownish-gray back, white belly, and tan to ochre thoracic patch. This thoracic patch dips below the dorsal fin and combines with an area of streaked light gray on the tail stock to produce the common dolphins' most characteristic feature: an hourglass pattern on the side. In short-beaked common dolphins, the thoracic patch is relatively light, contrasting strongly with the dark cape. The flipper-to-anus stripe (generally

A common dolphin off Angola. This animal was part of a group that seemed to share characteristics of both short-beaked and long-beaked common dolphins. PHOTO: C. WEIR



well-developed in the long-beaked species) is weakly developed or absent. The flippers and dorsal fin can range from completely dark to almost entirely white, but most often have a small light patch in the center. The chin-to-flipper stripe does not closely approach the gape, and it narrows anterior to the eye. The lips are black, and there is a dark, distinct stripe running from the apex of the melon to encircle the eye. The upper surface of the beak is generally light gray, with a black tip, and a dark line that runs from the tip to the apex of the melon. A light blowhole stripe runs from the apex to the blowhole. The color pattern is highly variable.

There is an uncommonly-occuring color morph (dark morph) that has been identified from most areas of the range of the species, in which the large light-colored thoracic patch appears not to develop (or to develop incompletely). This results in a dark gray lateral area, and gives the individual an appearance somewhat like that of a bottlenose or spinner dolphin. Otherwise, the color pattern appears normal. Anomalously all-white and all-black individuals have also been observed.

There are 41–57 pairs of small, sharp, pointed teeth in each jaw.

At birth, short-beaked common dolphins are about 80–90 cm long. Adult short-beaked common dolphins in the eastern Pacific are 1.6–2.2 m (females) or 1.7–2.3 m (males), with occasional specimens to 2.35 m. Those in the northeast Atlantic appear to get much larger, up to about 2.50 m. Some specimens may reach up to nearly 2.70 m. Short-beaked common dolphins may weigh up to 200 kg.

Calf— $^1/3$ to $^1/2$ adult size, color pattern muted and borders faint, light areas often with an ochre tinge, dorsal fin falcate.

Subadult— Nearly adult size, color pattern more developed, but not as bold as in adults, dorsal fin falcate.

Adult female— Full size, color pattern generally bold, often with light patches on the dorsal fin and flippers, dorsal fin relatively erect.

Adult male— Large size, color pattern generally bold, often with light patches on the dorsal fin and flippers, dorsal fin generally erect, and post-anal hump usually present.

Recognizable geographic forms While there is certainly extensive geographical variation in the coloration and external appearance of short-beaked common dolphins (for instance, a long-beaked form in New Zealand and southern Australia), in most cases the variation has not yet been described and compared adequately for distinct geographic forms to be reliably recognized in practice. Only the following forms can be reliably recognized:

A short-beaked common dolphin providing a good view of the figure-eight shaped pattern on the sides, which characterizes dolphins of the genus *Delphinus*. PHOTO: R. L. PITMAN

Standard form common dolphin (D. d. ssp.)— Found in many areas of the Pacific and Atlantic oceans, including the Mediterranean Sea. There is great geographical variation in total length, with the maximum approaching 2.70 m. Tooth counts are generally greater than in the Black Sea form, reaching up to 57 teeth in each tooth row. Coloration is highly variable among populations.

Black Sea common dolphin (D. d. ponticus)— Found only in the Black Sea, this is a dwarf form. Total length averages 1.62 m for males and 1.58 m for females, with the maximum known only 2.19 m. Tooth counts are low, and range from 41–52 teeth per row. There are slight color pattern differences, with the dark lateral band generally more prominent than in other short-beaked common dolphins.

Can be confused with Where they are sympatric (e.g., at least southern California, the west coast of Mexico, southern Japan, Korea, Peru and northern Chile, eastern South America, West Africa, and possibly southern Africa), the two species of common dolphins may be difficult to distinguish, especially in sightings at sea. The short-beaked species has a shorter beak, more steeply-rising melon, more robust body, a more contrasting color pattern, a narrower chin-to-flipper stripe, and a greater tendency to have white patches in the fins. In addition, the Clymene dolphin may cause confusion in the Atlantic Ocean, but that species has a moustache and a rounded (as opposed to V-shaped) margin to the cape.

Distribution The short-beaked common dolphin is an oceanic species that is widely distributed in tropical to cool temperate waters of the Atlantic and Pacific oceans. However, they apparently do not occur in the Gulf of Mexico, and records of their occurrence in the Caribbean are questionable. Also, there are no confirmed records for the Indian Ocean, and it is doubtful that the species occurs there (with the possible exception of the areas around southeast Africa and southwest Australia). The short-beaked common dolphin occurs from nearshore waters to thousands of kilometers offshore, although separate populations apparently occur in some enclosed seas, such as the Mediterranean and Black seas. In most areas, this species appears to have a strong preference for upwelling-modified waters and areas with steep sea-bottoms (such as seamounts and escarpments).

Ecology and behavior Large, boisterous groups of common dolphins are often seen whipping the ocean's surface into a froth as they move along at high speed. Herds range in size from about ten to over 10,000. Schools are often segregated by age and sex. Associations with other marine mammal species (especially pilot whales) are not uncommon. They have been observed in the vicinity of schools of long-beaked common dolphins, but the two species do not appear to intermix often. Schools in the eastern tropical Pacific are sometimes associated with yellowfin tuna (although not nearly as often as are spotted and spinner dolphins), and have thus been impacted by the purse seine fishery there.

Active and energetic bowriders (except in prime tuna fishing zones of the ETP), short-beaked common dolphins may be very familiar to most seagoers in low latitudes. They also ride the "bow waves" of large whales at times. They are often aerially-active, performing various breaches and leaps. Individuals are also highly vocal; sometimes their squeals can be heard above the surface

as they bowride. Foraging dives as deep as 200 m have been recorded.

Short-beaked common dolphins have reported calving intervals of 1–3 years, and the reported age at sexual maturity varies greatly among populations (3–12 years for males and 2–7 years for females). Some of this variation may result from real differences, at least partly attributable to density-dependent responses to different histories of exploitation. Gestation apparently lasts 10–11

An anomalous form of the short-beaked common dolphin, in which the cape extends down over the side to obscure the light thoracic patch. Although considered anomalous, this morph is seen not infrequently in both Atlantic and Pacific oceans. PHOTO: C. OEDEKOVEN/SWFSC/CSCAPE

Many short-beaked common dolphins have extensive white patches in the middle of the dorsal fin and on the flippers. Although not unique to this species, these patches appear to be more common in this than in other dolphin species. PHOTO: R. L. PITMAN

months. In the Black Sea, peak calving occurs in summer months (June to August). Longevity is at least 25 years.

Feeding and prey The prey of common dolphins consists largely of small schooling fishes and squid. In some areas (e.g., southern California), common dolphins feed mostly at night on creatures associated with the deep scattering layer (DSL), which migrates toward the surface in the dark. In other areas, they feed mainly on epipelagic schooling fish. Squids may form a more important part of the prey species of the short-beaked common dolphin than it does for the long-beaked species.

Threats and status Short-beaked common dolphins are taken in many fisheries worldwide. Huge direct catches formerly occurred in countries bordering the Black Sea. Common dolphin stocks there have declined and the fishery has not operated since 1983. Some direct mortality still occurs off Japan and in the Mediterranean. However, the recent common dolphin decline in the Mediterranean Sea appears to have been primarily caused by prey depletion and poor habitat quality.

The eastern tropical Pacific tuna fishery incidentally takes common dolphins from several stocks, and some of these may have been depleted by past levels of mortality. There are also incidental catches in various fisheries, in particular gillnets and pelagic trawls, throughout the range.

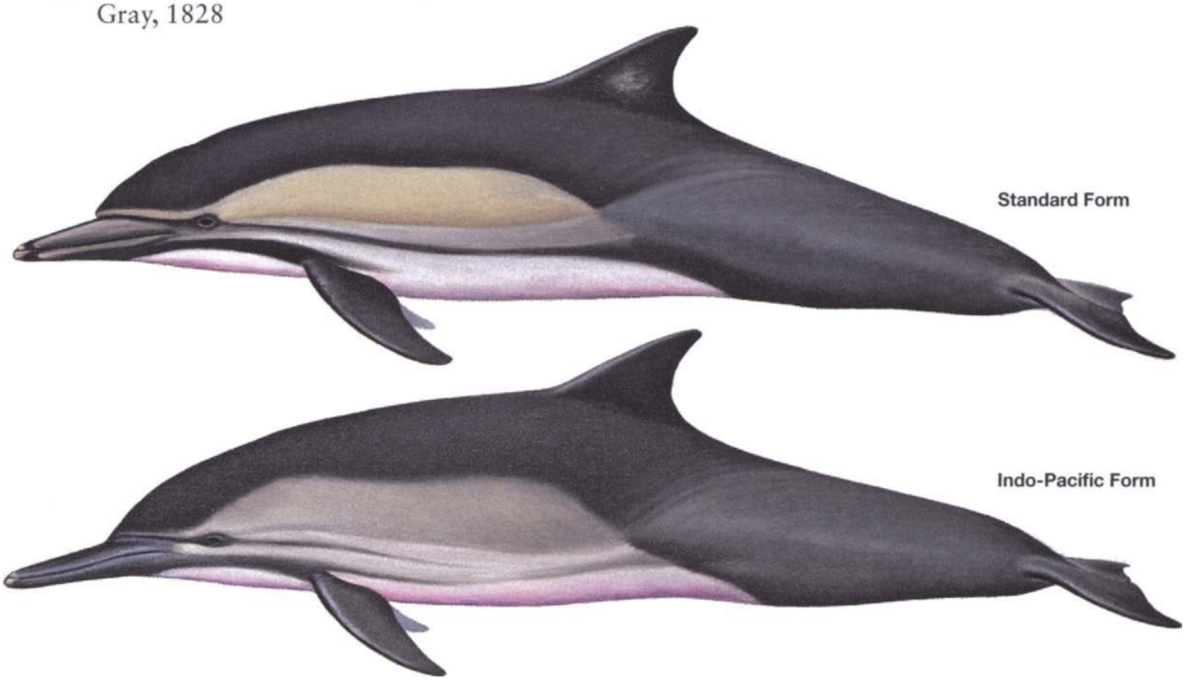
Globally, this is a very abundant species, with many available estimates for the various areas where it occurs: about 370,000 (western US coast), 3,000,000 (eastern tropical Pacific), 30,000 (eastern US coast), 96,000 (Black Sea/Turkish Straits System), 61,000 (eastern Atlantic continental shelf), 14,700 (Alboran Sea), and 75,000 (Celtic Sea shelf). Therefore, while certain populations are in danger (such as the one in the Mediterranean Sea), overall the species is abundant and not threatened with extinction by human activities.

IUCN status Endangered (Mediterranean population), Least Concern (all others).

References Dizon et al. 1994; Evans 1994; Ferrero and Walker 1995; Heyning and Perrin 1994; Perrin 2002; Perrin et al. 1995; Stockin et al. 2005.

Long-beaked Common Dolphin—*Delphinus capensis*

Gray, 1828



Recently-used synonyms *Delphinus bairdii, Delphinus tropicalis*.

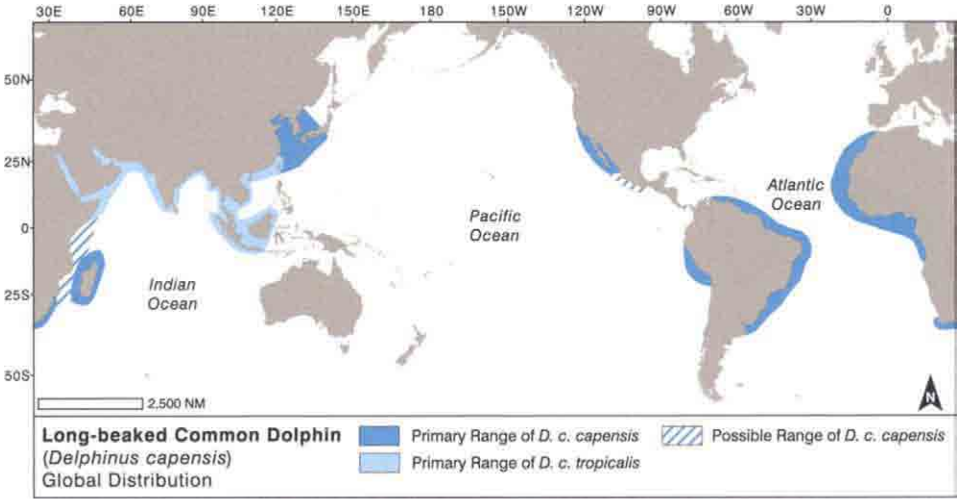
Common names En.–long-beaked common dolphin; Sp.–*delfín común de rostro largo*; Fr.–*dauphin commun a long bec*.

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Delphinidae. Some researchers consider the geographic form in the Indo–Pacific with an exceptionally long beak to be a separate species, *D. tropicalis*. However, a recent morphometric study has suggested that it is probably a subspecies of *D. capensis*. If the latter view is correct (and most current data seem to support it), there would be two subspecies, *D. c. capensis* in the Atlantic and Pacific oceans, and *D. c. tropicalis* in the Indo–Pacfic. Hybrids with common bottlenose dolphins in captivity and dusky dolphins in the wild have been reported.

Species characteristics Because of the recent discovery that common dolphins in the eastern Pacific represent two species (rather than only one, as was commonly thought), much of the older biological information available for dolphins of the genus *Delphinus* cannot be reliably applied to one or the other species.

Long-beaked common dolphins have the same basic body morphology as the short-beaked species, but tend to be more slender. They have tall, slightly falcate dorsal fins, and flippers that are recurved and pointed at the tips. Besides having longer beaks than short-beaked common dolphins (up to at least 9.7% of total length), long-beaked common dolphins have a somewhat more

Typical appearance of the long-beaked common dolphin—this pair is leaping in the eastern Pacific. PHOTO: R. L. PITMAN



flat appearance to the melon, which rises from the rostrum at a relatively low angle. There is a deep crease between the melon and beak. In some individuals (mostly adult males), there may be a prominent post-anal hump of connective tissue—forming a ventral "keel."

Long-beaked common dolphins are characterized by an hourglass pattern on the side, forming a V below the dorsal fin. In this species, the coloration generally appears somewhat muted, compared to the short-beaked species. The thoracic patch is relatively dark, contrasting less with the cape, and often the border between them is smeared. The flipper-to-anus stripe is generally moderately to strongly developed. The chin-to-flipper stripe fuses with the lip patch at or just anterior to the gape, and remains relatively wide ahead of the eye. The eye patch is imbedded in the flipper-to-anus stripe. Light patches on the dorsal fin and flippers are only occasionally present, and are small or faint when they are.

This species has higher tooth counts than any other species of delphinid, although there is strong overlap with several other species. There are 47–67 sharp, pointed teeth in each tooth row.

Most measured adults have been 2.02–2.54 m (males) and 1.93–2.22 m (females) long, although they may reach lengths of over 2.60 m. Weights of at least 235 kg are attained.

Recognizable geographic forms

Three long-beaked common dolphins leap alongside a research vessel off the coast of Baja California, Mexico. Notice the fusing of the dark facial stripes into a dark face "mask." PHOTO: T. A. JEFFERSON

Standard long beaked common dolphin (D. c. capensis)—The nominal subspecies occurs in coastal areas of the Pacific and Atlantic oceans. It is slightly shorter than the other, with adult females of 1.93–2.22 m and males of 2.02–2.54 m. The beak is relatively shorter (ranging from about 6.9–7.6% of the total length). Tooth counts are significantly lower—47–60 teeth in each upper tooth row, and 48–57 in the lower row. There are reports of tooth counts up to 62, however.

Indo-Pacific common dolphin (D. c. tropicalis)—The *tropicalis* form of common dolphin apparently only occurs in the Indian and far western Pacific oceans. This subspecies is apparently slightly longer than the nominal one, reaching lengths of at least 2.60 m. The beak is exceedingly nar-

Indo-Pacific common dolphins (*D. c. tropicalis*) leap at the bow of a vessel in the Arabian Sea area. This subspecies can be recognized by its exceedingly long beak and very high tooth counts. PHOTO: R. BALDWIN

A close-up of the head of a stranded Indo-Pacific common dolphin from Vietnam. The coloration appears to be particularly geographically-variable in the *tropicalis* subspecies. PHOTO: DAO TAN HO

row and long, the few data available suggesting it makes up about 9.4–9.7% of total length. There are significantly higher tooth counts than in the nominal subspecies—54–67 (upper) and 52–64 (lower) teeth per row.

Can be confused with The two species of common dolphins may be difficult to distinguish, especially in sightings at sea. The long-beaked species has a longer beak, less steeply-rising melon, more slender body, a more muted color pattern, a wider chin-to-flipper stripe (which often merges with the lip patch, making much of the lower jaw dark), and a reduced tendency to have white patches on the fins. Also, the spinner dolphin may easily be confused with this species, especially with the *tropicalis* subspecies in the Indo–Pacific. The body shape of the two species is nearly identical, but close attention to color patterning (especially the shape of the cape and facial stripes) should allow distinction.

Distribution Long-beaked common dolphins inhabit more nearshore and tropical waters than the short-beaked species, generally occurring within 180 km of the coast. The *capensis* subspecies appears to occur in discrete areas, and populations are known from the east coast of South America, West Africa, southern Africa, southern Japan and Korea (and possibly northern China), central California to southern Mexico, and Peru and Chile. The *tropicalis* subspecies ranges around the rim of the Indo–Pacific, from at least the Red Sea/Somalia (including the Persian Gulf, and possibly further south along the east African coast) to Taiwan and southern/central China.

Ecology and behavior The long-beaked common dolphin is highly gregarious. Herds of less than a dozen to several thousand are formed. Not much is known of the composition of schools, but it is suspected that there is some degree of age and sex segregation, as is known for other species of *Delphinus* and *Stenella*. They sometimes associate with other species of cetaceans.

In this long-beaked common dolphin from the central Gulf of California, Mexico, the vent-to-eye stripe is blackened-in, so that the eye patch is embedded in black. The face appears quite dark and the pale thoracic patch is much reduced compared to that of the short-beaked species. PHOTO: R. L. PITMAN

Long-beaked common dolphins are swift and agile creatures, often porpoising out of the water, while moving at high speed in great splashing herds. These dolphins are capable and willing bowriders, and often exhibit a great deal of aerial activity, including breaches and various types of acrobatic leaps. They are highly vocal and can sometimes be heard whistling from above the water's surface.

One or the other species of common dolphin tends to predominate in the stranding record for southern California for a particular period of time. In the years following the 1982/83 El Niño event, the long-beaked form was most common. This species occurs in some inshore waters, such as the Persian Gulf, Red Sea, Gulf of Thailand, and Gulf of California. In South African waters of Natal, they are associated with the annual "sardine run," which they follow north and inshore.

There is little information on the life history of populations of this species. What little data are available generally come from areas where the two species of *Delphinus* are sympatric and may thus be mixed with

Part of a herd of long-beaked common dolphins swimming off the coast of South Africa. Geographic variation in coloration is extensive in this species. PHOTO: D. PERRINE@/SEAPICS.COM

This long-beaked common dolphin shows the posteriorly-widening chin-to-flipper stripe and dark face that are typical of the species in the eastern North Pacific. However, in the western Pacific and other oceans, these features are generally not so evident, or may even be largely absent. PHOTO: R. L. PITMAN

data from *D. delphis* populations (e.g., off West Africa and southern California). Sexual maturity probably occurs at lengths of around 2.0 m. Because this species is generally more tropical than its congener, it is thought that its reproduction may show less evidence of seasonality. Hybrids between this species and *T. truncatus* have occurred in captivity.

Feeding and prey A wide variety of small schooling fishes (e.g., pilchards, sardines, anchovies, and hake) and squids are taken as prey. In at least the northern Gulf of California, apparently cooperative feeding techniques are sometimes used to herd fish schools. It is thought that most feeding is done in relatively shallow waters.

Threats and status This species is commonly taken in gillnets off southern California. Long-beaked common dolphins are only occasionally involved in the eastern tropical Pacific tuna fishery. They are sometimes taken in drive fisheries off Japan, and there is concern about the growing problems of direct kills off Peru. There has been a large direct kill off northern Venzuela, but its current status is not known. In the Indian Ocean and Chinese waters, long-beaked common dolphins are among many species of small cetaceans taken in gillnets, trawls, and purse seines. Some dolphins of this species have been live-captured for display, but they do not do as well in captivity as the more coastal bottlenose dolphins.

While not as numerous as the short-beaked species, overall, the species is relatively abundant and not in any danger of extinction on a global scale. There are few estimates of abundance, however. The stock that occurs off the US west coast numbers about 43,000 and there are thought to be about 15,000–20,000 long-beaked common dolphins off South Africa.

IUCN status Least Concern.

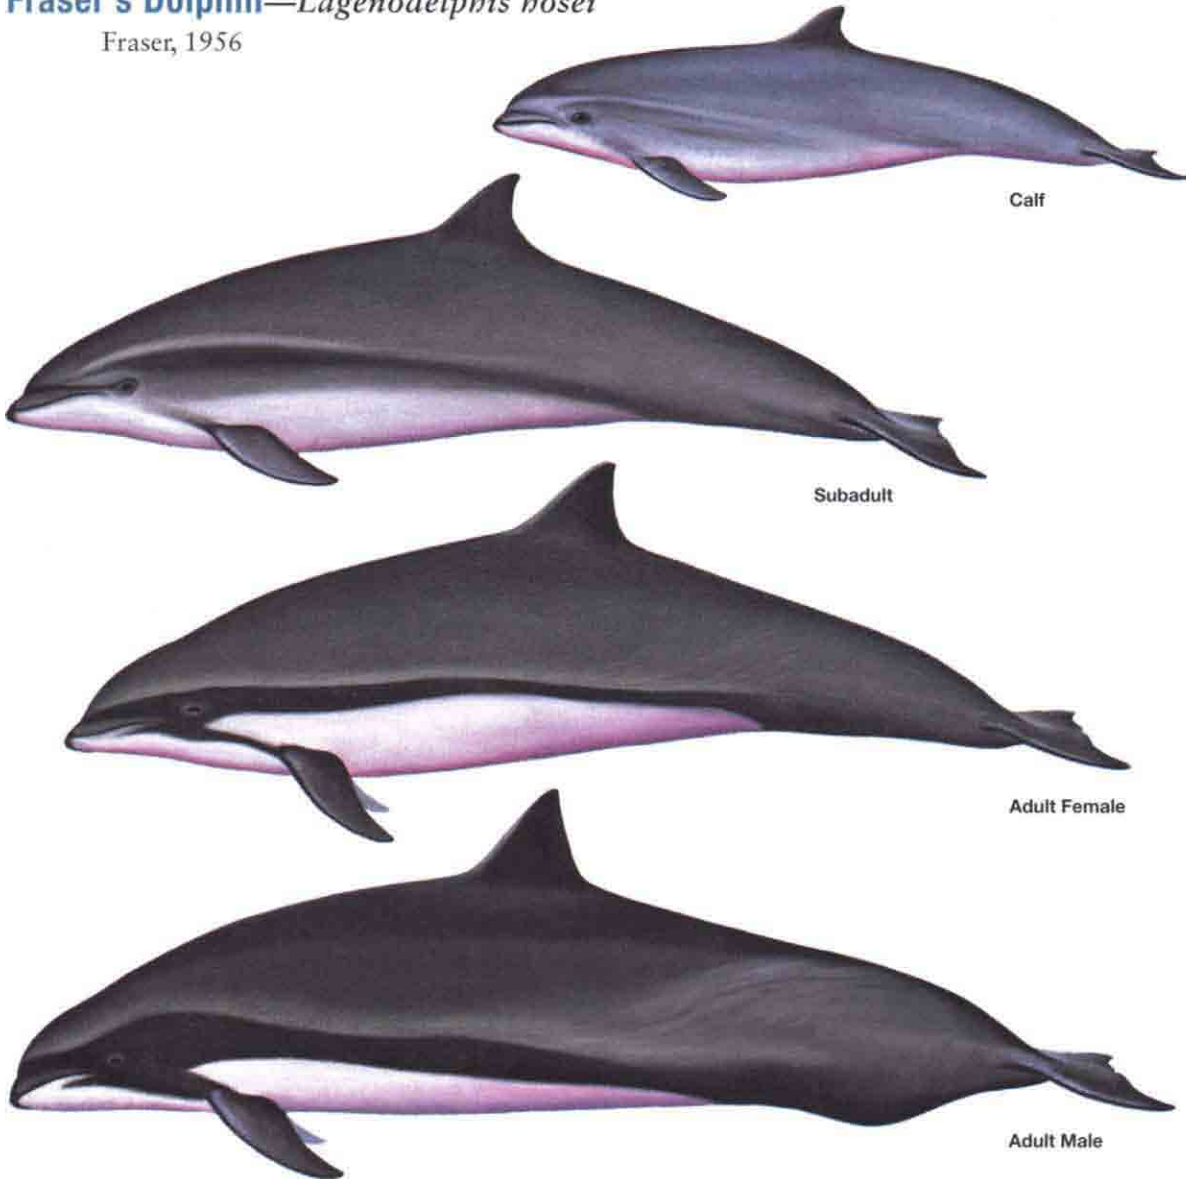
Fraser's Dolphin—*Lagenodelphis hosei*

Fraser, 1956



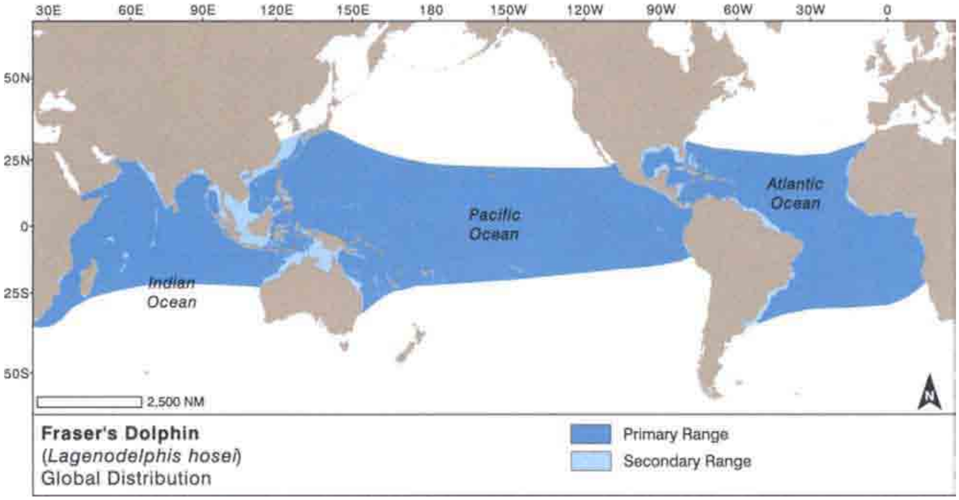
Recently-used synonyms None.

Common names En.–Fraser's dolphin; Sp.–*delfín de Fraser*; Fr.–*dauphin de Fraser*.

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Delphinidae. For almost two decades after its discovery in 1956, this species was known only from skeletal material, until it was "rediscovered" in the early 1970s.

Species characteristics This is a very distinctive dolphin, with an extremely stocky body and very small appendages. The short dorsal fin (< 9.5% of total length) is triangular or only slightly falcate, and tends to be more erect in adult males. The small flippers are pointed at the tips, and the flukes are concave on the trailing edge. There is a very short (< 3% of total length) and stubby, but well-defined, beak. Adult males often have a large post-anal hump or keel, composed of connective tissue.

The color pattern can be striking; the most distinctive feature (when present) is a dark band of varying thickness, running from the face to the anus (in some regions, the band is indistinct). This band is scarcely apparent on young animals, and appears to widen and darken with age in some animals, especially adult males. There is also a flipper stripe that starts at midlength along the lower jaw (in some animals the lateral stripe is so wide that it merges with the flipper stripe, creating a dark face mask, sometimes informally called a "bandit mask").



Otherwise, the back is dark brownish-gray, the lower sides are cream-colored, and the belly is white or pink. Young animals may have particularly pinkish bellies. The tip of the beak and lips are dark, and there is a dark stripe from the tip of the upper jaw to the apex of the melon.

There are 38–44 pairs of teeth in each jaw. Maximum size is at least 2.7 m (males) and 2.6 m (females). They may reach weights of over 210 kg. Newborns are estimated to be 1.0–1.1 m long.

Calf— 1/3 to 1/2 adult body size, color pattern muted and lateral stripe faint or absent, dorsal fin falcate, and post-anal hump not present.

Subadult— Close to adult body size, color pattern not strongly contrasting and lateral stripe faint or absent, dorsal fin falcate, and post-anal hump not present or only slightly developed.

Adult female— Full body size, color pattern with lateral stripe faint to moderate, "bandit mask" may be present, dorsal fin falcate, and post-anal hump not present or only slightly developed.

Adult male— Large body size, color pattern strongly contrasting with lateral stripe moderate to dark and broad, "bandit mask" generally present, dorsal fin erect and triangular, and post-anal hump moderate to large and well developed.

Recognizable geographic forms Although there is some evidence that Fraser's dolphins in the Atlantic are larger, with a more weakly-developed eye-to-anus stripe than those in the Pacific or Indian oceans, distinct geographic forms have not been adequately described for reliable identification.

Part of a large group of Fraser's dolphins leaps at the bow of a research vessel in the Maldives, showing the short beak, tiny appendages, and robust body of the species. When seen at such close range, there is no mistaking them. Outside the eastern Pacific Ocean, only adult male Fraser's dolphins appear to show the very dark, wide lateral stripe. PHOTO: T. A. JEFFERSON

Can be confused with When seen well, the unique body shape of Fraser's dolphin should rule out confusion with most other species, but striped dolphins, which also have an eye-to-anus stripe, can be confused with Fraser's at a distance. Identification should be assisted by the fact that this is the only small, tropical species of oceanic dolphin with a short, well-defined beak.

Distribution Fraser's dolphin has a pantropical distribution, largely between 30°N and 30°S in all three

This adult male Fraser's dolphin was killed in a fishery in the Philippines. The dark side and flipper stripes merge in this individual to form what is often informally called a "bandit mask." PHOTO: W. F. PERRIN

A young Fraser's dolphin calf leaps alongside its mother at the bow of vessel in the Maldives. Although much smaller and more slender, the basic species characters are visible even on the calf. PHOTO: T. A. JEFFERSON

Fraser's dolphins are the most robust of the smaller tropical dolphins. Their short beaks and small appendages make them appear rather fat and stocky. Maldives. PHOTO: T. A. JEFFERSON

major oceans. It is an oceanic species that prefers deep offshore waters, but it can be seen near shore in some areas where deep water approaches the coast (such as the Philippines, Taiwan, and some islands of the Caribbean and the Indo–Malay archipelago). Strandings outside the tropics (such as those in France and Uruguay) are generally considered to be extralimital, and are usually associated with anomalously warm water temperatures.

Ecology and behavior Fraser's dolphins remain somewhat mysterious—there is still little known of the ecology of this oceanic species. Herds tend to be large, consisting of hundreds or even thousands of dolphins, often mixed with other species, especially melon-headed whales in the eastern tropical Pacific, Japan, and the Philippines; as well as pilot whales, and Risso's, spotted and spinner dolphins in the Philippines. Little is known of their social structure, but they do strand *en masse* on occasion.

These are active animals, generally seen moving along in dense schools at great speeds, and often whipping the sea surface into a froth with their low-angle leaps. Fast-moving herds create a great deal of white water. In some areas, they are considered shy and difficult to approach; in others they are more approachable. They do not generally bowride in the eastern tropical Pacific, but appear to do so in most other areas. In the Philippine Sulu Sea, this species is most likely to bowride on slow-moving vessels.

Not much is known of the life history of the Fraser's dolphin. In Japan, the only place where life history has been studied in detail, sexual maturity is reached at 7–10 years and 220–230 cm for males, and at 5–8 years and 210–220 cm in females. Calving peaks in spring and autumn have been documented in Japan, and in South Africa calving appears to peak in summer. Longevity is at least 18 years.

Feeding and prey Fraser's dolphins appear to feed on midwater fish (especially myctophids), squid, and crustaceans. Physiological studies indicate that Fraser's are capable of quite deep diving (and it is thought that they do most of their feeding deep in the water column—in waters up to 600 m deep), but they have been observed to feed near the surface as well.

The lateral stripe in Fraser's dolphin is geographically variable with respect to its prevalence within groups, and with regard to its extent and intensity on individual animals. In the eastern Pacific, a heavy dark stripe can be found among animals of both sexes and all age classes, except perhaps the very youngest animals. Eastern tropical Pacific. PHOTO: R. L. PITMAN

Fraser's dolphins occur in large groups (often hundreds), and characteristically churn up lots of whitewater when they travel fast—the latter is possibly related to their rather un-hydrodynamic body form. PHOTO: R. L. PITMAN

Threats and status Direct killing of Fraser's dolphins has been documented in Japan, the Lesser Antilles, Sri Lanka, Indonesia and the Philippines. Incidental catches in purse seines (ETP and the Philippines), gillnets and driftnets (South Africa, Japan, the Philippines, and Sri Lanka), and trap nets (Japan) are also known. Their range in tropical, oceanic waters probably subjects them to less problems of habitat degradation than for most other dolphins.

This species does not appear to be particularly abundant anywhere (with the possible exception of some areas in the Philippines), although there is no serious concern about its global conservation status. There are estimated to be about 289,000 Fraser's dolphins in the eastern tropical Pacific. Only a few hundred may be present in the northern Gulf of Mexico.

IUCN status Data Deficient.

Northern Right Whale Dolphin—*Lissodelphis borealis*
(Peale, 1848)

Recently-used synonyms None.

Common names En.–northern right whale dolphin; Sp.–*delfín liso del norte*; Fr.–*dauphin a dos lisse boreal* or *dauphin aptere boréal*.

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Delphinidae.

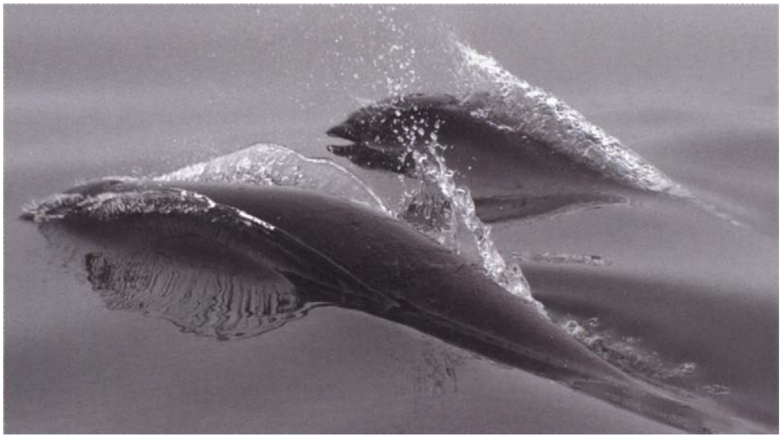
Species characteristics The northern right whale dolphin (along with its Southern Hemisphere relative) is the slenderest of all small cetaceans. The body is slim and torpedo-shaped, and the tail stock is extremely shallow (top to bottom). At close range, northern right whale dolphins are unmistakable; they are the only small cetaceans in their range with no dorsal fin. The flukes and flippers are small, narrow, and delicate-looking. The beak is short, but well-defined, and is relatively broad at its base.

Northern right whale dolphins are primarily black, with a distinctly-bordered white band from the throat to the fluke notch that widens to cover the entire area between the flippers, and a white patch just behind the tip of the lower jaw. The trailing edges of the flukes have a crescent-shaped patch of light gray edging above and white below. Young animals have muted color patterns of dark creamy gray to light gray.

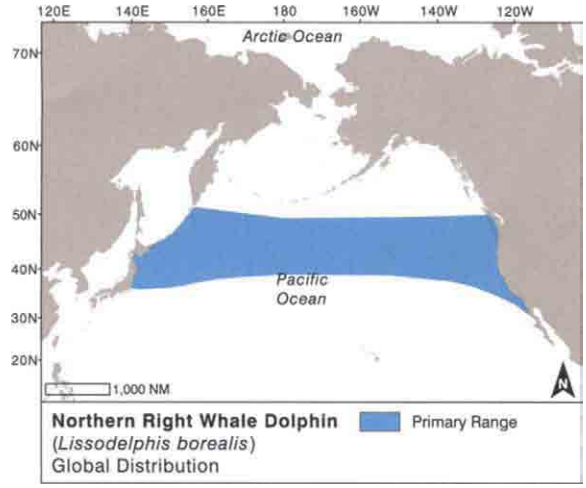
There is an uncommonly-occuring color morph (often called the "swirled" form) in which animals have a more extensive white field, which reaches onto the lower sides and often includes the lower sides of the face. In the thoracic area, this white field extends above the levels of the flippers and generally includes a white swirl at the base of the upper surface of the flippers.

The mouth contains 37–54 pairs of sharp slender teeth in each jaw.

Typical appearance of a group of northern right whale dolphins moving along at speed, porpoising out of the water with low-angle leaps. PHOTO: R. PAGEN/SWFSC



Northern right whale dolphins can be very unobtrusive swimmers, at slower speeds than this they look like ripples on the water in the distance. Monterey Bay, California. PHOTO: M. JOHNS



Measured adults have been up to 2.3 m (females) and 3.1 m (males). Length at birth is about 1 m. Maximum known weight is 115 kg.

Recognizable geographic forms None.

Can be confused with The slender, finless body should allow easy separation from all other sympatric North Pacific small cetaceans. However, porpoising California sea lions may cause some confusion at a distance.

Distribution The northern right whale dolphin is an oceanic species, inhabiting cool and warm temperate regions of the North Pacific only, between about 30°N and 50°N. Although it generally does not penetrate as far north as the Bering Sea, there are some northern (probably extralimital) records from along the Aleutian Islands and in the Gulf of Alaska. Also, it is generally not thought to enter the Sea of Japan or Okhotsk Sea, and it is seen nearshore only where submarine canyons or other features bring deep water close to the coast. It forms an anti-tropical species pair with the southern right whale dolphin. The habitat of this species is deeper waters from the outer continental shelf to the oceanic regions.

A northern right whale dolphin with an anomalous color pattern that has been called the "swirled" pattern. These animals have more extensive white ventral coloration and the white extends up onto the upper side of the flippers in a swirled pattern, thus the name. PHOTO: D. DOOLITTLE

A northern right whale dolphin riding the bow wave of a vessel in Monterey Bay. This animal displays the very slender body shape that is typical of the species. PHOTO: T. A. JEFFERSON

Ecology and behavior Most schools number between 100 and 200 individuals, but groups of up to 3,000 have been seen. Some herds are very tightly packed. Groups of northern right whale dolphins mixed with other marine mammals, especially Pacific white-sided dolphins (with which they share a nearly identical range) and Risso's dolphins, are not uncommon.

Northern right whale dolphins are fast swimmers, sometimes creating a great surface disturbance with their low-angle leaps and belly flops. When moving more slowly, these animals may cruise along and barely break the surface to breathe. They bowride, especially when accompanied by other species of dolphins. Aerial displays are not uncommon, and they breach and perform side-slaps at times.

In the central North Pacific, life history has been well-studied, based on a large sample of specimens killed in the North Pacific squid driftnet fisheries. There appears to be a calving peak in late summer (July and August), and females generally have a 2 year calving interval. Gestation lasts about 12 months. Both sexes become sexually mature at about 10 years of age, when males are about 215 cm, and females 200–201 cm. They can live to be at least 42 years of age. Reproduction in other areas of the range is very poorly-known.

A close-up of the head of a northern right whale dolphin that was caught in a driftnet in the northern North Pacific. The white spot at the tip of the lower jaw and the many slender teeth are visible. PHOTO: M. W. NEWCOMER

Feeding and prey Although market squid and lanternfish are the major prey items for northern right whale dolphins off southern California, a variety of other species are taken by this species throughout the range. These include various species of cephalopods, hake, sauries, and several species of surface and midwater fishes.

Threats and status Northern right whale dolphins have never been hunted extensively in a major fishery, although they have sometimes been taken in Japan's small cetacean fisheries. Incidental catches have occurred in Japanese and Russian purse seines, Japanese salmon driftnets, and American shark and swordfish driftnets. However, the largest takes in recent years were in the North Pacific squid driftnet fishery, which was operated by vessels from Japan, Taiwan, and Korea. Nets from this fishery took many thousands of northern right whale dolphins annually in the central North Pacific, until they were shut down by international law in the early 1990s. There is some evidence to suggest that the large kills in the latter case may have caused serious depletion of the population. There are thought to be about 68,000 of these animals in the North Pacific, and slightly over 20,000 of these animals occur in US west coast waters of California, Oregon, and Washington. Now that the squid driftnet fishery is closed-down, this species is no longer thought to be threatened.

IUCN status Least Concern.

References Ferrero and Walker 1993; Jefferson and Newcomer 1993; Jefferson et al. 1994; Lipsky 2002.

Southern Right Whale Dolphin—*Lissodelphis peronii*

(Lacépede, 1804)

Recently-used synonyms None.

Common names En.–southern right whale dolphin; Sp.–*delfín liso austral*; Fr.–*dauphin aptere austral*.

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Delphinidae. Hybrids with dusky dolphins have been reported in the wild.

Species characteristics Southern right whale dolphins, along with their Northern Hemisphere counterparts, are the most slender of all cetaceans (although this species appears to be a bit more robust than the Northern Hemisphere species). The body shape is very similar to the northern right whale dolphin (very slender and torpedo-shaped), with a short, well-demarcated beak (which is quite wide at the base), small recurved flippers, extremely shallow (top to bottom) tail stock, small flukes with a concave trailing edge, and no hint of a dorsal fin or ridge.

Southern right whale dolphins are strikingly black and white. The white coloration of the ventral area extends well up the sides, the sharp line demarcating black above and white below runs from the tail stock forward, dips down to the flipper insertion, and then sweeps back up to cross the melon between the blowhole and beak crease. The flippers are mostly white, but the trailing edge has a black band. The flukes are white below, and above are dark gray, fading to white on the leading edge.

Anomalous all-black southern right whale dolphins have been observed, as have dolphins thought to be hybrids between this species and the dusky dolphin. The presumed hybrids have been observed in Argentina, and they appear to be almost exactly intermediate between dusky and right whale dolphins.

The mouth is lined with 44–49 sharp, pointed teeth in each row.

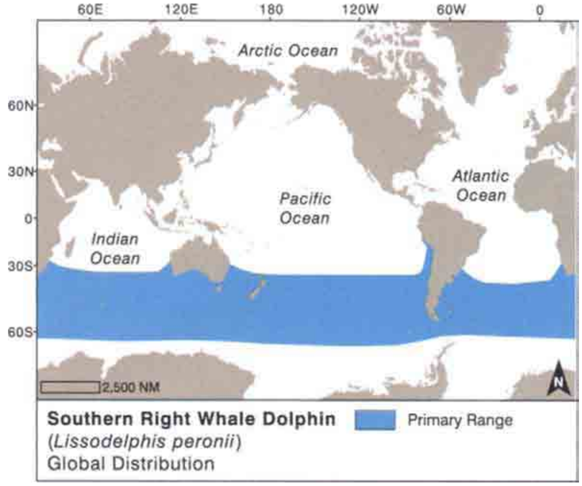
These dolphins reach lengths of at least 3.0 m and weights of 116 kg. Length at birth is very poorly-known, but is probably about 1 m.

The elegant and unmistakable southern right whale dolphin. This animal appears to have *Xenobalanus* barnacles on its right flipper. Off southern Chile. PHOTO: R. L. PITMAN

The typical appearance of a group of porpoising southern right whale dolphins. The middle animal is probably an older juvenile. Western Australia. PHOTO: L. MORSE

Recognizable geographic forms None.

Can be confused with The unique body shape, coloration, and complete absence of a dorsal fin of



An anomalously black southern right whale dolphin. Such animals have been seen at various places in the species' range. Southwest of Australia. PHOTO: P. A. OLSON

A fast-moving group of southern right whale dolphins. These animals often move in tight groups such as this. PHOTO: T. PUSSER

this species should make it difficult to confuse with any other marine mammal species. Only porpoising groups of sea lions or fur seals would likely cause confusion, and that would only be at a distance.

Distribution Southern right whale dolphins are found only in cool temperate to subantarctic waters of the Southern Hemisphere, mostly between about 30°S and 65°S. The southern limit appears generally to be bounded by the Antarctic Convergence. The range extends furthest north along the west coast of continents, due to the cold counterclockwise currents of the Southern Hemisphere. The northernmost record is at 12°S, in central Peru. This is an oceanic species, coming close to shore only in deepwater coastal areas.

Ecology and behavior This is one of the most poorly-known of all the dolphins. Large, active schools are characteristic of the southern right whale dolphin. Some estimates of group size range to over 1,000 animals. Associations with other marine mammal species are common, especially with dusky dolphins and long-finned pilot whales. Like their northern cousins, dolphins of this species are active, energetic swimmers, often coming out of the water in clean low-angle leaps, as they move at high speed. Swimming speeds of up to 22 km/hr have been reported, and dives of up to 6.4 min. have been recorded. Fluke-slaps and other aerial displays are not uncommon. Southern right whale dolphins bowride occasionally.

Virtually nothing is known of this species' reproductive biology.

Feeding and prey A variety of fish and squid have been reported as prey; lanternfish (myctophids) are especially common in southern right whale dolphin stomachs. They are probably capable of diving to depths in excess of 200 m in pursuit of prey.

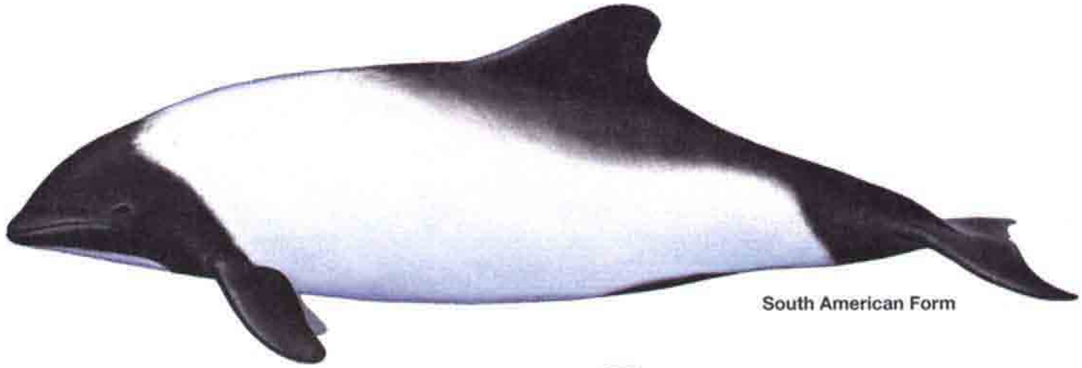
Threats and status Southern right whale dolphins have been taken directly in recent years in Peru and Chile for crab bait and for human consumption. Bycatches have been reported in small numbers in some areas. The only incidental catch of any magnitude that is known is in the swordfish gillnet fishery off Chile. There are no estimates of abundance for the southern right whale dolphin, and virtually nothing is known of the status of any population of the species.

IUCN status Data Deficient.

References Jefferson et al. 1994; Lipsky 2002; Newcomer et al. 1996.

Commerson's Dolphin—*Cephalorhynchus commersonii*

(Lacépède, 1804)



Recently-used synonyms None.

Common names En.–Commerson's dolphin; Sp.–*tonina overa*; Fr.–*dauphin de Commerson*.

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Delphinidae. Two subspecies are recognized: *C. c. commersonii* in southern South America, and an as-yet unnamed subspecies in the Kerguelen Islands. The Kerguelen subspecies was apparently founded by a few individuals as recently as 10,000 years ago.

Species characteristics The robust Commerson's dolphin is similar in body shape to porpoises (phocoenids), as are other species of the genus. The head is blunt, with only the slightest hint of a beak, and a relatively straight mouthline. The dorsal fin is small (compared to the other species in the genus) and rounded, rising at a shallow angle from the back, and leaning slightly towards the tail. The flippers and flukes have rounded tips.

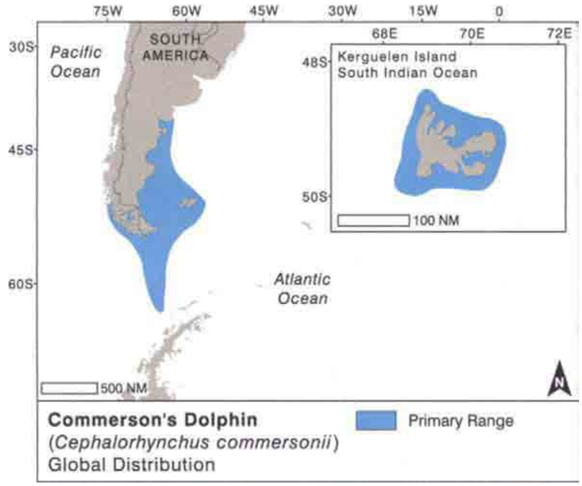
The coloration is strikingly contrasted dark and light. There is a light band that completely encircles the body dorsally from just behind the blowhole to in front of the dorsal fin, and ventrally from behind the flippers to behind the genital area. There is a large white patch on the throat, and a black oval to heart-shaped patch around the genitals that tends to vary in shape between males and females (females generally have the heart-shaped patch pointing forward, males pointing backward). The rest of the animal is dark gray or black, including the top of the head, flippers, dorsal fin, and flukes. Newborn animals and calves have a muted pattern of mostly gray tones (instead of black and white), as do many small cetaceans. In calves, the borders between the dark and light regions of the body are less distinct than in adults.

Twenty-eight to 35 small, pointed teeth line each tooth row.

Length at birth ranges from 65–75 cm. Commerson's dolphin adults can reach sizes of up 1.8 m and 86 kg. Females are slightly larger than males in this species.

Recognizable geographic forms

South American subspecies (C. c. commersonii)—South American Commerson's dolphin adults are smaller than the Kerguelen subspecies, reaching only 1.5 m and 66 kg. The body of adults is black and white, with the border between them generally very distinct.



***Kerguelen Islands subspecies* (C. c. subsp.)–** Commerson's dolphins from the Kerguelen Islands are larger than their South American counterparts. These animals reach nearly 1.8 m in length and weights of 86 kg. The dark areas of the body tend to be a dark gray, rather than black. The light band that encircles the body is mostly light gray, but the ventral portion is white. The border between light and dark is generally less distinct than in adult *C. c. commersonii*.

Can be confused with The only other black and white small cetacean likely to be confused with this species is the spectacled porpoise, but the dorsal fin shape and color pattern differences should make these two easily discernible. In some areas, Commerson's dolphins may also be confused with Chilean dolphins, which have a similarly-rounded dorsal fin, but are mostly dark gray (with no distinct black and white patterns on the dorsal surface).

Distribution There are at least two disjunct populations of Commerson's dolphins, those off South America (Chile and Argentina) and the Falkland Islands, and those off the Kerguelen Islands (about 8,500 km away). Recently, a record of a sighting of a single individual south of Capetown, in South African waters, was reported, although this should undoubtedly be considered extralimital. There are also unsubstantiated reports of this species at South Georgia, but these have been rejected by some recent workers. Commerson's dolphins occur in relatively shallow, coastal waters. They sometimes move very close to shore, even inside the breakers.

Ecology and behavior Small groups of less than 10 individuals are the norm for this species, although they do sometimes aggregate into groups of over 100. These are quick, active animals. They are known to engage in various types of leaps and other aerial maneuvers. They frequently ride bow waves, breakers, and oceanic swells. Commerson's dolphins often swim upside down, and spin on their long axes while darting around. Several individuals have been brought into captivity in the last few decades, and the species seems to do relatively well in captivity.

The breeding season is in the southern spring and summer, between October and March. Gestation lasts slightly less than a year. Sexual maturity occurs between 5 and 9 years. Not much else is known of their reproductive biology. Longevity is at least 18 years.

Feeding and prey South American Commerson's dolphins appear to be opportunistic, feeding primarily near the bottom. Feeding there is on a diverse diet of various species of fish, cephalopods, crustaceans, and benthic invertebrates. In the Kerguelen Islands, they have a more restricted diet, mostly consisting of fish.

A Commerson's dolphin off the Kerguelen Islands. These dolphins are a separate subspecies, with somewhat larger body size, and a more grayish and less contrasting color pattern. PHOTO: D. HATCH, COURTESY OF F. TODD

A Commerson's dolphin leaps from the water in Argentina. The color pattern makes it unmistakable. PHOTO: M. INIGUEZ

Threats and status Commerson's dolphins have been hunted for food and crab bait in the southern parts of their range. In addition, this species is caught incidentally in several fisheries, primarily those using gillnets. Despite these threats, the species still appears to be reasonably numerous, and is not thought to be in danger of global extinction. There are few estimates of abundance for this species, but they are reportedly quite common in the Strait of Magellan. An estimated 3,200 individuals are thought to occur there. The Kerguelen population is restricted in range, and is therefore probably small and vulnerable to human impacts.

IUCN status Data Deficient.

References Dawson 2002; Goodall 1994; Pichler et al. 2001; Robineau 1984, 1986.

Heaviside's Dolphin—*Cephalorhynchus heavisidii*

(Gray, 1828)

Recently-used synonyms None.

Common names En.–Heaviside's or Haviside's dolphin; Sp.–*delfín de Heaviside*; Fr.–*dauphin de Heaviside*. This species was named after Captain Haviside, but due to an error, it was thought that it was named after another person, Captain Heaviside. Thus, the common name should actually be Haviside's dolphin, but due to convention and habit, Heaviside's is still more commonly used.

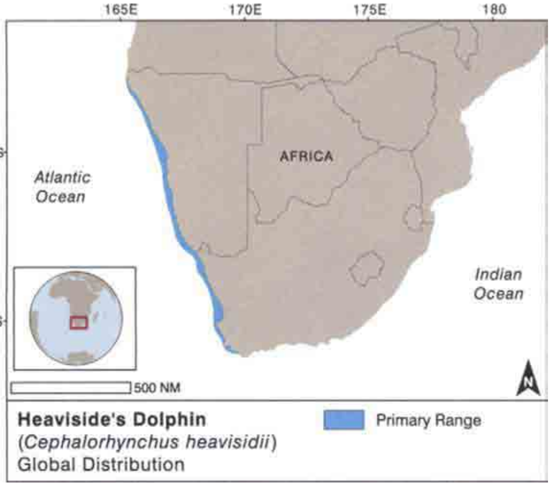
Taxonomic information Order Cetacea, Suborder Odontoceti, Family Delphinidae.

Species characteristics Heaviside's dolphin is one of the most poorly-known of all dolphins. The shape of the body is similar to that in other *Cephalorhynchus* dolphins: stocky, with a short blunt snout, and blunt-tipped flippers. The dorsal fin is basically triangular (very different from the rounded fins of the other genus members), but it is significantly taller than in most porpoises. The trailing edge of the dorsal fin often has a slight outward bulge. The flukes are similar in size and shape to those of other dolphins.

The body is predominantly various shades of gray, with a dark cape, which starts at the blowhole, remains extremely narrow in the thoracic region and then widens to dip low on the sides below the dorsal fin. Most of the thoracic region is light gray. The area around the eye and much of the face is often a darker shade of gray. There is a white ventral patch that begins just behind the flippers, and splits into three arms behind the umbilicus. The middle arm encloses the urogenital area and the side arms extend only to below the midline (this is reminiscent of the pattern in killer whales). There is also a

One of the smallest of all cetaceans, Heaviside's dolphin has a narrow cape that dips down deeply below the dorsal fin. South Africa. PHOTO: T. PUSSER

A leaping Heaviside's dolphin shows the ventral color pattern that is somewhat reminiscent of that of the killer whale—a possible case of mimicry. South Africa. PHOTO: T. PUSSER



Two Heaviside's dolphins ride the bow wave of a vessel off South Africa. PHOTO: COURTESY S. LEATHERWOOD

white diamond-shaped patch between the anterior insertions of the flippers, and separate white spots in the axillae. Several predominantly-white individuals have been seen.

Heaviside's dolphins have 22–28 small, sharp teeth in each tooth row.

Adults of this species are up to at least 1.7 m in length, and up to at least 75 kg in weight. Newborn size is unknown, but is likely to be 80–85 cm.

Recognizable geographic forms None.

Can be confused with The only other small cetaceans within this species' range are larger dolphins (e.g., dusky, common, and southern right whale dolphins). Their larger size, different color patterns, and falcate dorsal fins (or absence of a fin in the southern right whale dolphin) should make them easy to distinguish from Heaviside's dolphins.

Distribution This species of dolphin is restricted to southwest Africa (Namibia and South Africa), with records from about 17°S to the southern tip of Africa. It is commonly seen along the west coast of South Africa in the Capetown region. As is true of the other species in the genus, it is a coastal animal that inhabits mostly shallow waters < 100 m deep.

Ecology and behavior Very little is known of the biology of this species. They are seen mostly in small groups of less than 10, with pairs and trios being most common. Heaviside's dolphins are generally active and sometimes boisterous; they are known to ride bow waves. The animals are quick and agile, often zooming around vessels

A Heaviside's dolphin leaps off southwestern Africa. These animals are fast swimmers and can be quite acrobatic. PHOTO: T. PUSSER

Heaviside's dolphin has a uniquely shaped, triangular dorsal fin and is usually found within sight of land off southwestern Africa. PHOTO: T. PUSSER

and repeatedly leaping out of the water. Preliminary studies of genetic structure suggest that there might be a single population of this species, but further studies are needed to confirm if this is really true.

Essentially nothing is known of the reproductive biology of Heaviside's dolphin. Some calves are born in the southern summer (November to January).

Feeding and prey The main diet of Heaviside's dolphin consists of demersal fish, such as hake. Some other pelagic schooling fishes and cephalopods (including octopus) are also taken.

Typical surfacing profile of Heaviside's dolphin, showing the triangular dorsal fin and uniquely-shaped cape. Capetown, South Africa. PHOTO: L. MORSE

Threats and status In general, Heaviside's dolphin appears to be facing fewer threats than the other members of its genus. Some animals are known to be taken incidentally in fisheries, such as in beach seines, purse seines, trawls, and gillnets—the latter are of particular concern. Some animals are apparently illegally taken (shot or harpooned) for human consumption as well. The major concern has to do with the limited range of the population, and its vunerable coastal habitat. Although there are no estimates of abundance, the species does not appear to be particularly rare.

IUCN status Data Deficient.

References Best and Abernethy 1994; Dawson 2002; Pichler et al. 2001; Van Vuuren et al. 2002.

Hector's Dolphin—*Cephalorhynchus hectori*

(van Beneden, 1881)

Recently-used synonyms *Cephalorhynchus albifrons.*

Common names En.–Hector's dolphin; Sp.–*delfín de Hector*; Fr.–*dauphin d'Hector*.

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Delphinidae. There are two subspecies recognized, *C. hectori hectori* along the South Island of New Zealand, and *C. hectori maui* along the west coast of the North Island.

Species characteristics The typical robust *Cephalorhynchus* body shape is evident in this species. The head is blunt, with only the slightest hint of a beak. The dorsal fin is low (although relatively broad) and rounded (some people say it reminds them of Mickey Mouse ears), with the leading edge rising at a shallow angle from the back. The flippers are rounded and paddle-shaped, with blunt tips. The flukes are unremarkable.

The predominant color of Hector's dolphin is light gray. The dorsal fin, flukes, flippers, area around the blowhole, and much of the face are dark gray to black. A dark "collar" extends from the area above the eyes to behind the blowhole. Ventrally, the animals are largely white. The lower part of the head, starting just behind the black lower jaw tip is white, as is the area from just behind the flippers to the urogenital area. Arms of white from this patch also extend part way up the sides. The white ventral patches can be invaded by black between the flippers, or can be completely separated by a continuous black area. There are also small white axillary and dark gray urogenital patches (the latter are smaller and not apparent in some females).

The mouths of Hector's dolphins contain 24–31 fine, pointed teeth in each row.

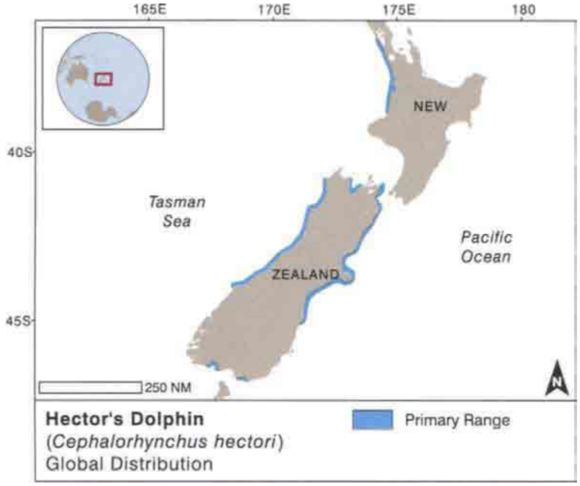
Hector's dolphin adults reach lengths of 1.63 m (females) and 1.46 m (males)—females are somewhat larger than males. Newborns are about 60–70 cm long. Weights of up to 57 kg have been reported.

The exquisite color patterning of Hector's dolphin can only be fully appreciated at close range in good light. PHOTO: S DAWSON

Recognizable geographic forms

South Island Hector's dolphin (C. hectori hectori)—The nominal form of the species occurs in three populations around the South Island of New Zealand. It is slightly shorter than the North Island subspecies, with adults reaching 1.53 m (females) and 1.44 m (males). There is a dark, heart-shaped patch around the penile opening of males.

North Island Hector's dolphin, sometimes called Maui's dolphin (C. hectori maui)—This genetically-separate form of Hector's dolphin occurs only off the North Island. It is



slightly longer than the South Island subspecies, with adults reaching 1.63 m (females) and 1.46 m (males). Also, the dark, heart-shaped patch around the penile opening of males is either reduced or absent. Other external differences have not yet been described.

Can be confused with Other dolphins (common, dusky, bottlenose, southern right whale, etc.) are found around New Zealand, but should be easy to distinguish from the small Hector's dolphin, largely on the basis of dorsal fin shape. These other species all have pointed fins, as opposed to the round ones of Hector's. Hector's dolphin is also significantly smaller than other species of dolphins in New Zealand. Coloration in the Hector's dolphin is also unique.

Distribution The Hector's dolphin is endemic to New Zealand giving it one of the most restricted distributions of any cetacean. The animals are found in shallow coastal waters, almost always within about 8 km of shore and < 75 m deep. Dolphins are strongly concentrated in shallow, turbid waters close to shore in summer months, and are more widely dispersed in winter. They are most common off the South Island and the west coast of the North Island. There are three genetically-separate populations in the South Island, and the single, small North Island population has recently been named as a separate subspecies (*C. h. maui*).

Ecology and behavior The habits and biology of Hector's dolphin have been well-studied in the last couple of decades, and this is undoubtedly the best-known species of the genus. Hector's dolphins live in groups of 2–8 individuals. Larger aggregations of up to 50 can be seen at times. These are generally the result of several smaller groups coalescing, but they usually do not last long. Hector's dolphins are active, sometimes acrobatic animals, on occasion leaping out of water quite energetically. They are known to engage in bowriding activity. Photo-identification studies have demonstrated that at least some individuals are resident in small areas (about 30 km of coastline) year-round. No two sightings of an individual have been more than 106 km apart. The social organization is rather fluid, and long-term associations between individuals are rare. The sounds produced by this species are mostly high-frequency, narrow-band pulses, very similar to those made by the true porpoises (phocoenids).

Life history has been better-studied than for the other species in the genus. The mating and calving season is in the southern spring through summer. Gestation lasts 10–11 months. Sexual maturity is reached at ages between 5 and 9 years, and adult females give birth every 2–4 years. They can live to be at least 20 years of age.

Feeding and prey Hector's dolphins engage in opportunistic feeding on several species of small fish and squid. The diet is more varied on the east coast of the South Island (8 species make up 80% of the diet) than on the west coast (only 4 species make up 80%).

Threats and status Recent surveys show that the South Island Hector's dolphin populations collectively number about 7,300 individuals, including about 900–1,100 animals at Banks Peninsula. The North Island population is estimated to number no more than about 100 animals, and both numbers and range have apparently been declining rapidly over the past 30 years. Hector's dolphin faces serious pressures from human activities. Like its congeners, gillnets are the major concern (with trawl fisheries also causing some mortality), but unlike the other species, the main problem in some areas is recreational gillnet fishing. Up to 57 individuals per year were known to have been caught in a small part of the range in the mid-1980s. That number has been reduced through legislation and the creation of two marine mammal sanctuaries (including the Banks Peninsula Marine Mammal Sanctuary). Despite these laudable efforts, the

species is still facing serious problems and most populations are still thought to be in decline. The nominal subspecies is listed as Endangered, with the North Island subspecies considered to be Critically Endangered.

IUCN status Endangered (*C. hectori hectori*); Critically Endangered (*C. hectori maui*).

Chilean Dolphin—*Cephalorhynchus eutropia*

(Gray, 1846)

Recently-used synonyms *Cephalorhynchus albiventris.*

Common names En.–Chilean dolphin; Sp.–*delfín chileno*; Fr.–*dauphin noir du Chili*.

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Delphinidae.

Species characteristics This little-known dolphin is robust, with a short, poorly-defined beak, like other members of the genus. The head is slightly more pointed than in other *Cephalorhynchus* dolphins. The dorsal fin is moderately low, wide-based, and rounded. It is somewhat larger than in the Commerson's dolphin, and leans slightly backwards. The flippers are paddle-shaped, with rounded tips, much like those of other members of the genus. The flukes are not unlike those of most other dolphin species.

The color of the Chilean dolphin is mostly medium gray, with a darker gray band extending from the blowhole to above the eye. There is often darker gray on the sides of the face, and in a wide band from around the eye to the flipper. On the belly are large white patches from behind the flippers to the urogenital area, and from ahead of the flippers to the beak tip. These patches are separated by a dark gray band between the flippers. There are also small white patches in the axillae, and thin gray patches around the urogenital area (the latter are sexually- and individually-variable).

Chilean dolphins have 29-34 small pointed teeth in each row.

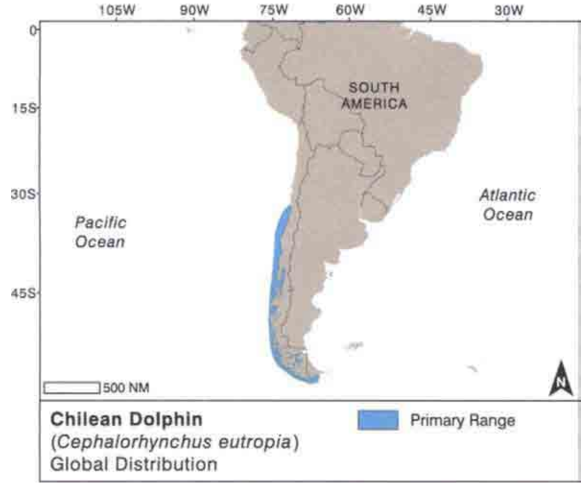
Adults of this species reach at least 1.7 m (size at sexual maturity has not been sufficiently documented). Length at birth is unknown, but is probably somewhat less than 1 m. Chilean dolphins reach weights of at least 63 kg.

Recognizable geographic forms None.

Can be confused with Chilean dolphins can be confused with Commerson's dolphins in the small area where they overlap, around the southern tip of South America. The large white areas on South American Commerson's dolphins will be the best clue. Burmeister's porpoises may also be confused with this species in some cases. Here, dorsal fin shape will be the best character to distinguish them (rounded in Chilean dolphins, and concave, slender, and almost banana-shaped in Burmeister's porpoises).

Distribution This dolphin is found only along the Chilean coast, from about 30°S to Cape Horn, at the southern tip of South America. As is true of other mem-

The Chilean dolphin is a small, coastal species with a distinctly rounded dorsal fin. These animals can be quite acrobatic at times. PHOTO: S. HEINRICH



A leaping Chilean dolphin in Chilean waters—probably a juvenile or subadult. PHOTO: F. VIDDI

bers of the genus, it is found in shallow coastal waters, and sometimes enters estuaries and rivers. In southern Chile it is found mostly within about 500 m from shore in waters < 20 m deep. It occurs in the inshore channels and fjords of the west coast of Tierra del Fuego, such as the Strait of Magellan and Beagle Channel.

Ecology and behavior Until recently, there have been very few sightings of these animals by researchers, and this is the least-known member of the *Cephalorhynchus* genus. Groups tend to be small, between 2 and 15 members, but much larger aggregations have been recorded. They have been observed to form mixed groups with Peale's dolphins on several occasions. Although active, they tend to be shy and somewhat difficult to approach (possibly as a result of having been hunted), and generally appear to avoid boats. They only occasionally ride bow waves. Their movements appear to be quite limited, with most dolphins being resident to a small area. Individuals, which have been identified by markings on the back and dorsal fin, concentrate their activites in discrete bays and channels.

Most sightings of young Chilean dolphins have been from October to April. Sexual maturity may be reached at 5–9 years. Little else is known of their reproductive biology, and longevity is not known.

Feeding and prey Chilean dolphins feed on shallow-water fishes (like sardines and anchovies), cephalopods, and crustaceans. They have also been seen to eat young released salmon. Green algae have been found in stomachs, but this may have been ingested incidentally.

A female Chilean dolphin shows its ventral color patterning, which has an interesting resemblance to that of the killer whale. PHOTO: S. HEINRICH

Threats and status Chilean dolphins have been hunted for many years for food and crab bait. Up to 1,300–1,500 per year were harpooned in the late 1970s and early 1980s. Such activities are now illegal, but enforcement is difficult. Gillnet catches also affect the species, which is thought to number in the high hundreds or low thousands. Aquaculture farms for salmon and mussels may also result in some threats to Chilean dolphins, at least

Two Chilean dolphins at the surface. Notice the very short beak and rounded dorsal fin. PHOTO: S. HEINRICH

Chilean dolphins are not necessarily shy of boats, and will closely approach vessels at times. PHOTO: F. VIDDI

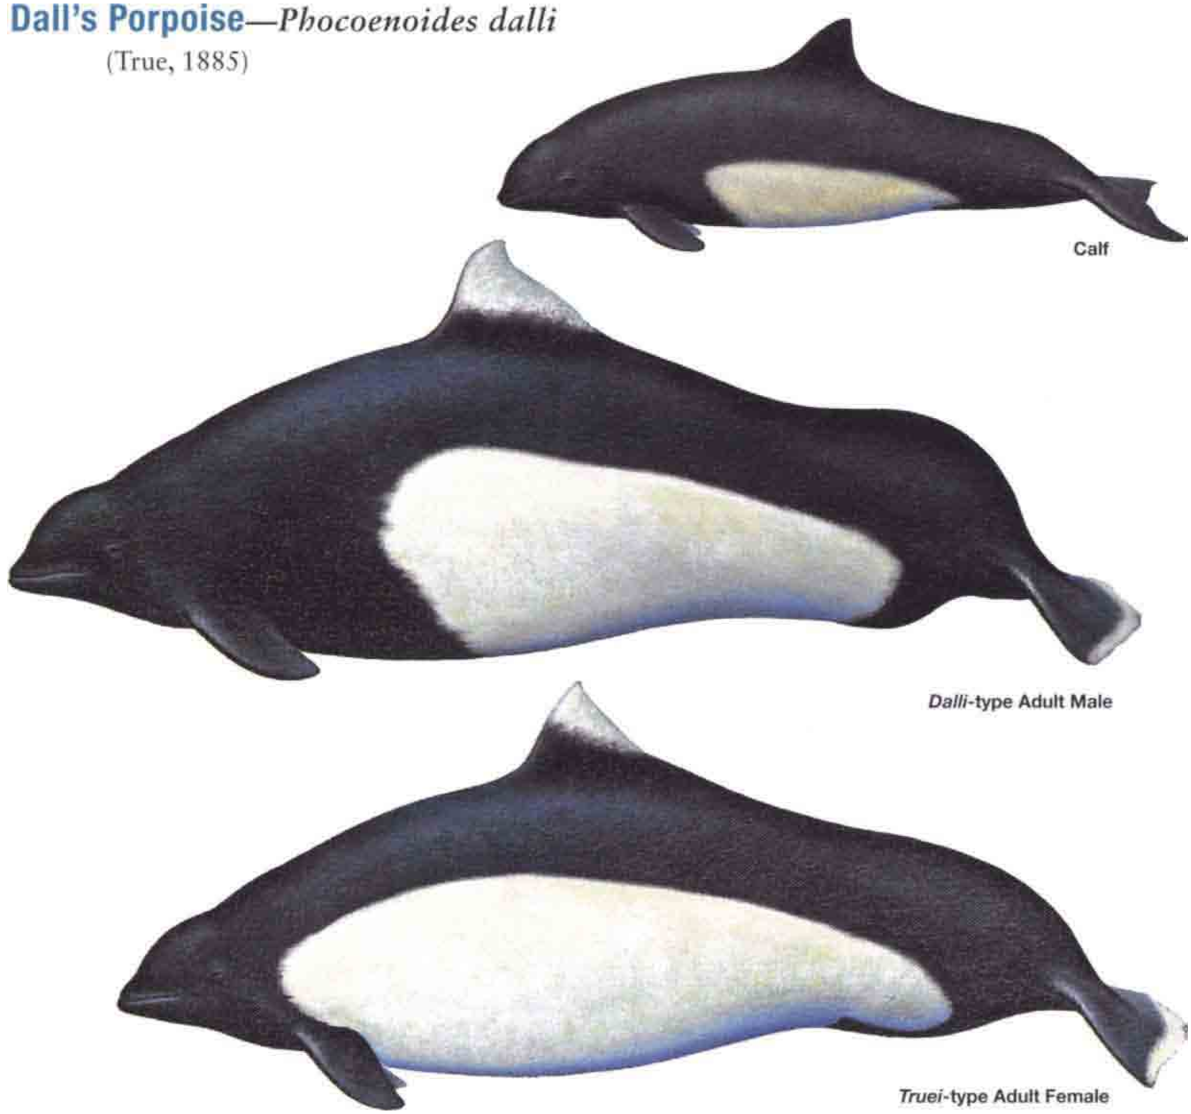
partly by restricting their movements and eliminating available habitat. The only reliable abundance estimate available is of 59 dolphins for an area of southern Chile. Although, the status of virtually all populations is unknown, some are almost certainly threatened with extirpation.

IUCN status Data Deficient.

References Dawson 2002; Goodall 1994; Goodall et al. 1988; Pichler et al. 2001.

Dall's Porpoise—*Phocoenoides dalli*

(True, 1885)



Recently-used synonyms *Phocoenoides truei*.

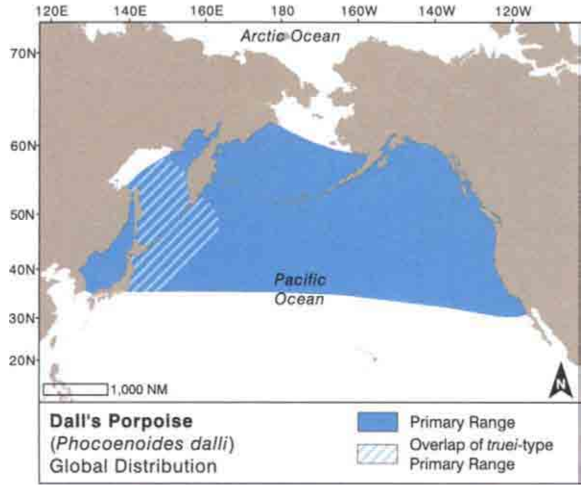
Common names En.—Dall's porpoise; Sp.—*marsopa de Dall*; Fr.—*marsouin de Dall*.

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Phocoenidae. Although, there has been some controversy, most marine mammal biologists consider that the two major color forms represent separate subspecies: *P. d. dalli* in the northern North Pacific, and *P. d. truei* in the northwestern North Pacific.

In the waters of the Northeast Pacific, hybrids between Dall's and harbor porpoises are relatively common, and these animals usually result from a Dall's mother and a harbor porpoise father. The hybrids appear to be intermediate between the two species in most aspects of morphology and behavior. Such hybrids may occur in other areas as well.

Species characteristics Dall's porpoises are robust animals, with a wide-based triangular dorsal fin (with a falcate tip), and small flippers placed quite near the head. The flukes and dorsal fin may be canted forward in some individuals (see below). The small head has a short beak, with no demarcation from the melon. From above, the head appears nearly triangular.

Dall's porpoises are strikingly marked, with a black body and bright white lateral patches that are continuous ventrally, although young animals have muted color patterns of dark and light gray instead of black and white. The flank patch extends up the sides about midway, from the urogenital area forward to around the level of the dorsal fin, or even to around the area of the flipper insertions. Some individuals may have flecks of black on the white flank patch (occasionally quite extensive). In addition, there is white to light gray "frosting" on the upper portion of the dorsal fin and the trailing edges of the flukes. There



are two commonly-occurring color types, *dalli*-type (with a smaller flank patch) and *truei*-type (which has a larger flank patch). Some individuals may have a small area of white to gray flecking on the ventral part of the tail stock, just ahead of the fluke insertion.

All-white (possibly albino) and all-black (melanistic) individuals have been observed in various places throughout the range. Rarely, porpoises intermediate between the *dalli*- and *truei*-types occur as well.

Dall's porpoise has the smallest teeth of any cetacean. There are 23–28 tiny spade-shaped teeth in each tooth row. They look rather like grains of rice.

Newborn Dall's porpoises are about 1 m long. Adults are about 1.7–2.2 m (females) or 1.8–2.4 m (males), with significant variation among different populations. The Sea of Japan population animals are the largest, and body length appears to decrease as one moves from west to east across the North Pacific. Maximum weight is about 200 kg.

Neonate—About 1/2 adult length; head relatively large; slate gray in color, with no frosting on the flukes or dorsal fin; flank patch light to moderate gray.

Juvenile—About 2/3–3/4 adult length; color pattern has developed to dark and light gray; light gray frosting beginning to develop on dorsal fin and flukes.

Subadult/Adult female—3/4 to full adult size; color pattern basically black and white, with prominent light gray to white frosting.

Adult male—Adult size; color pattern highly contrasting black and white, with extensive frosting; dorsal fin strongly canted; moderate to large post-anal hump; peduncle deepened; flukes generally have convex trailing edge; head often appears exceedingly small.

Recognizable geographic forms The exact taxonomic status of the two morphotypes of Dall's porpoise has long been a source of controversy. Recent studies support the concept that, although they are largely reproductively and genetically distinct, they are not separate species. They are currently considered to be subspecies:

Dalli-*type Dall's porpoise* (P. d. dalli)—The nominal subspecies occurs in several populations throughout the entire range in the North Pacific, Sea of Japan and Bering and Okhotsk seas. The white flank patch extends forward only to the level of midpoint of the dorsal fin (Sea of Japan population) or the level of the leading edge of the dorsal fin (other populations). Adult females of different populations in the western Pacific average 1.76–1.96 m and males 1.81–2.05 m. Maximum total length is about 2.39 m (for Sea of Japan/Okhotsk Sea specimens).

Truei-*type Dall's porpoise* (P. d. truei)—The single population of the *truei*-type is found only in the west-

A Dall's porpoise "rooster-tailing" in Southeast Alaskan waters. This behavior is so unique to this species that experienced observers can often identify the species from a great distance, simply by the distinctive splashes. PHOTO: T. A. JEFFERSON

Two Dall's porpoises ride the bow wave of a research vessel in the eastern Pacific. When viewed at close range like this, nearly all of the species' diagnostic characters are visible and there is no problem in identifying them. PHOTO: C. OEDEKOVEN/ SWFSC/CSCAPE

ern part of the range, in the Okhotsk Sea, and along the Pacific coast of Japan, occasionally reaching as far north as the western Kamchatka Peninsula and western Aleutian Islands. In this form, the white flank patch extends much further forward than in the *dalli*-type—to about the level of the insertion of the flipper. Adult females average 1.89 m and males 2.02 m. Maximum total length is only about 2.20 m, significantly shorter than in the other subspecies.

Can be confused with Dall's porpoises are likely to be confused only with harbor porpoises, and even then, only if seen at a great distance. When seen well, the differences in color pattern and dorsal fin shape will be readily apparent. Highly experienced biologists may be able to discern the two species based on their surfacing behavior, with Dall's porpoises lifting their tail stocks higher above the surface and rolling more "squarely." On the other hand, inexperienced observers sometimes mistake them for "baby killer whales".

Distribution Dall's porpoises are found only in the North Pacific Ocean and adjacent Bering, Okhotsk, and Japan seas. They inhabit deep waters of the warm temperate through subarctic zones, between about 30°N and 62°N. They may occasionally occur as far south as about 28°N off the coast of Baja California, during unusually cold-water periods. They occur far offshore in oceanic zones, as well as very nearshore where deep water approaches the coast. They are even commonly seen in the inshore waters of Washington, British Columbia, and Alaska. There is apparently a single *truei*-type population that migrates between the Pacific coast of Japan and the Okhotsk Sea; *dalli*-types predominate in all other areas of the range.

Ecology and behavior This may be the fastest swimmer of all small cetaceans, at least for short bursts. When swimming rapidly, Dall's slice along the surface, producing a characteristic V-shaped "roostertail" of spray. At other times, the animals move slowly and roll at the surface with a distinctive squarish profile, creating little or no disturbance (i.e., "slow rolling"). They are avid bowriders, moving back and forth with jerky movements, and often coming from seemingly nowhere to appear at the bow of a fast-moving vessel. They tend to lose interest in vessels that are moving at only slow to moderate speeds. Breaching, porpoising, and other kinds of aerial behavior are extremely rare in this species.

Dall's porpoises are found mostly in small groups of 2–12. Although aggregations of up to several thousand have been reported, these are extremely rare. Groups appear to be fluid, often forming and breaking up for feeding and playing.

The International Whaling Commission currently recognizes eight stocks of this species, based on pollutant loads, parasite faunas, and distribution patterns of cow/calf pairs. Other than color type (*dalli*-type or *truei*-type), the stocks cannot be reliably distinguished by appearance at sea.

Most Dall's porpoise calves are born in late spring and summer, and there is great geographic variation in age and length at sexual maturity among populations. Maturity occurs at lengths of 1.72–1.87 m and ages of 4–7 years for females, and 1.75–1.96 m and 3.5–8 years for males. Gestation lasts 10–12 months and lactation is thought to last less than one year. This species regularly interbreeds and hybridizes with harbor porpoises in the waters of the Northeast Pacific.

Feeding and prey Dall's porpoises are apparently opportunistic feeders, taking a wide range of surface and midwater fish and squid, especially soft-bodied species like lanternfish (myctophids) and gonatid squid. Occasional krill, decapods, and shrimps found in stomachs are not considered normal prey.

Threats and status Dall's porpoise is one of the primary species taken directly by Japanese fishermen for human consumption. Porpoises are harpooned as they ride the bow waves of catcher boats, and in the past few decades the annual catch has been as high as 40,853 (1988). In addition, Dall's porpoises have been taken incidentally in large numbers in several North Pacific driftnet fisheries, although several of these fisheries are now defunct. This was the primary species taken as marine mammal bycatch in the Japanese mothership and land-based salmon driftnet fisheries that operated in the North Pacific from the 1950s through 1990. Smaller incidental catches occur in several fisheries using gillnets and trawls in Russian, and US and Canadian west coast waters. Environmental contaminants are also thought to be a threat, and high levels of organochlorines may reduce testosterone levels in males and reduce calf survival, thereby influencing reproduction and survival. Dall's porpoises are common in many parts of the North Pacific and the density is high in many areas. The total abundance of the species is probably over 1.2 million individuals, and there are estimated to be about 104,000 along the Pacific coast of Japan, 554,000 in the Okhotsk Sea, 83,000 in Alaska, and 100,000 along the west coast of the US.

IUCN status Lower Risk/Conservation Dependent.

Harbor Porpoise—*Phocoena phocoena*

(Linnaeus, 1758)

Recently-used synonyms *Phocoena communis, Phocoena vomerina, Phocoena relicta.*

Common names En.—harbor porpoise; Sp.—*marsopa común*; Fr.—*marsouin commun*.

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Phocoenidae. Four subspecies are recognized: *P. p. phocoena* in the North Atlantic, *P. p. vomerina* in the eastern North Pacific, *P. p. relicta* in the Black Sea, and an unnamed subspecies in the western North Pacific.

In the waters of the Northeast Pacific, hybrids between harbor and Dall's porpoises are relatively common, and these animals usually result from a Dall's mother and a harbor porpoise father. The hybrids appear to be intermediate between the two species in most aspects of morphology and behavior. Such hybrids may occur in other areas as well.

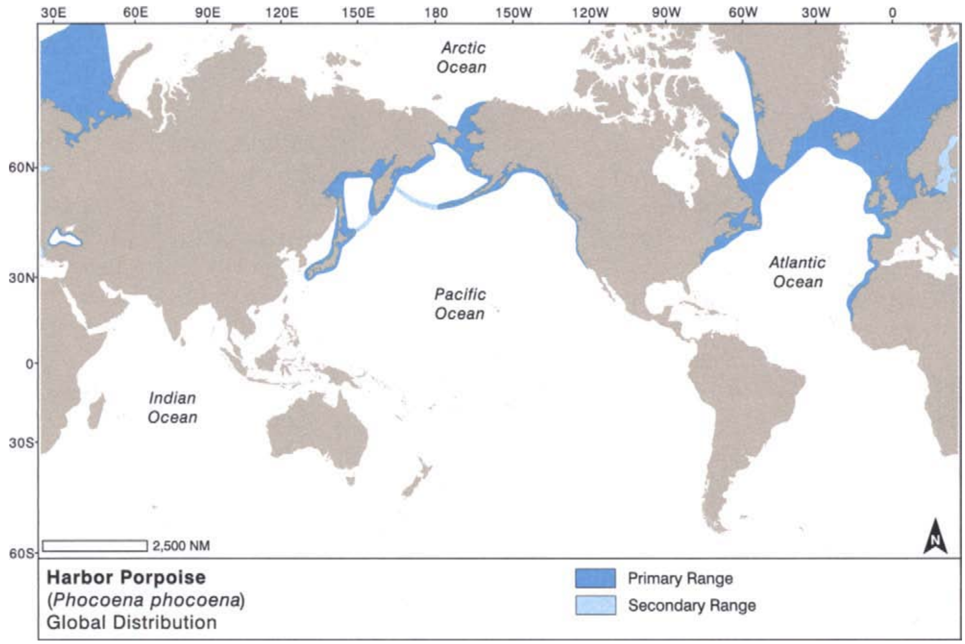
A harbor porpoise surfaces on a very calm day off the west coast of North America.
PHOTO: D. BUTCHER, COURTESY S. LEATHERWOOD

Species characteristics The harbor porpoise is a relatively stocky animal, with a blunt, short-beaked head. The body can be quite rotund, due to a large allocation of body mass to blubber (up to 37%, by weight, in calves). Placed about midway along the back is a short, wide-based, triangular dorsal fin, generally with small bumps (often called denticles or tubercles) on the leading edge. The flippers are small and somewhat rounded at the tips. The flukes have a concave trailing edge, and are divided by a prominent median notch; the tips are rounded. The straight mouthline slopes upward towards the eye.

The color pattern is relatively simple. Countershading is apparent in the harbor porpoise's color pattern; the animals are generally medium to dark gray on the back and white on the belly. The sides are intermediate, with the border area often splotched with various shades of gray. The flippers and lips are dark, and there is a dark gray gape-to-flipper stripe, which is variable in width. The throat often has a series of dark streaks that extend from the lip patch back to the area between the flippers. While the color pattern is variable, there does not seem to be any consistent difference between the sexes or among populations.

Nineteen to 28 small, spatulate, blunt teeth line each tooth row.

Maximum known length for various populations in the North Atlantic ranges from about 1.46–1.89 m, and for males about 1.32–1.78 m. Most adult harbor porpoises are less than 1.8 m long; maximum length is about 2.0 m. Females grow somewhat larger than males. Weights range from 45–70 kg for adults. Newborns are 70–90 cm long, depending on population.



Recognizable geographic forms There is significant geographic variation in various external features, and the Black Sea population of harbor porpoises (now considered a separate subspecies, *P. p. relicta*) is apparently genetically distinct from its nearest neighbors in the eastern North Atlantic (and those that occur occasionally in the Mediterranean Sea). The Black Sea porpoise appears to represent a dwarf form, not reaching lengths greater than about 1.50 m. However, for the most part, reliably-recognizable geographic forms have not been documented in this species.

Can be confused with Harbor porpoises, if seen clearly, should not be confused with any of the various species of dolphins that share their range. The only other porpoise that overlaps in the North Pacific, Dall's porpoise, can be confused with this species when backlit fins are seen at a distance. However, the black and white color pattern and slight difference in dorsal fin shape of Dall's porpoise will be unmistakable when seen well. Also, the behavior of the two species tends to be different, with Dall's either roostertailing or bringing the tail stock higher out of the water when rolling. No other porpoises occur in the North Atlantic, and there should be little problem with identification there.

Distribution Harbor porpoises are found in cool temperate to subpolar waters of the Northern Hemisphere. They are usually found in shallow waters, most often near shore, although they occasionally travel over deeper off-

A typical view of two harbor porpoises moving slowly in Monterey Bay. The low, broad-based dorsal fin and bland color pattern are visible. PHOTO: T. A. JEFFERSON shore waters. Their preferred habitats are characterized by a diversity of water depths, substrate types, and prey resources. In the North Pacific, they range from central California and northern Honshu, Japan, to the southern Beaufort and Chukchi seas. In the North Atlantic, they are found from the southeastern United States to southern Baffin Island (they apparently do not enter Hudson Bay) in the west, and Senegal, West Africa, to Novaya Zemlya in the east. They also occur around southeast and western Greenland, Iceland, and the Faroe Islands. There is also a single stranding record from the Azores. There is a population (or possibly two) in the Black Sea and the Sea of Azov, but they do not regularly occur throughout most of the Mediterranean, except in the northern Aegean Sea. This is the only cetacean species regularly found in the Baltic Sea. Major populations in the North Pacific and North Atlantic are isolated from each another, and many provisional stocks have been recognized.

Ecology and behavior Most harbor porpoise groups are small, generally consisting of less than five or six individuals. They do, at times, aggregate into large, loose groups of 50 to several hundred animals, mostly for feeding or migration.

An atypical view of a harbor porpoise surfacing alongside a vessel. In the vast majority of cases, these animals do not lift their heads above the surface. PHOTO: P. BERGGREN

Harbor porpoises generally are not very showy at the surface—fortunately their dorsal color pattern and dorsal fin shape allow them to be distinguished from the Dall's porpoise, which overlaps in the North Pacific. Monterey Bay, California. PHOTO: T. A. JEFFERSON

Behavior tends to be inconspicuous, compared to most dolphins and porpoises. Harbor porpoises almost never approach boats to ride bow waves, and often actively avoid vessels. When moving slowly they tend to surface in a slow gentle roll. However, when moving fast, they may surface in a behavior often called "pop-splashing" (which looks somewhat different from the "roostertailing" of Dall's porpoises). Breaches and other leaps are rarely seen, although they do exhibit aerial behavior on occasion. Harbor porpoises sometimes lie nearly motionless at the surface for brief periods between submergences, although it is not known why they do this. They are capable of diving to at least 220 m, and for over 5 min. (although most dives last about 1 min.).

Reproductive biology has been quite well studied in some parts of the range. Sexual maturity is generally reached at 3–4 years of age (at lengths ranging from about 1.2–1.5 m), with some geographic and density–dependent variation. Most calves are born from late spring through midsummer (April to August). Gestation lasts 10–11`months and calves are weaned by 1 year of age. Harbor porpoises have some of the largest testes known among any mammal (relative to body size), and the mating system is thought to be promiscuous, involving sperm competition.

In the North Atlantic Ocean (including the Black and Azov seas), fourteen populations are recognized, and in the North Pacific, at least 10 different stocks occur. Harbor porpoises regularly interbreed and hybridize with Dall's porpoises in the waters of Greater Puget Sound. These are very short-lived animals. Most harbor porpoises do not live much beyond 10 years, but some do reach at least 24 years.

Feeding and prey Harbor porpoises eat a wide variety of fish and cephalopods, and the main prey items appear to vary regionally. Small, non-spiny schooling fish (such as herring and mackerel) are the most common prey in many areas, and many prey species are benthic or demersal.

Threats and status The harbor porpoise faces many threats at the hands of humans. The species has been hunted in many areas of its range, and the major kills have been in the Bay of Fundy, Danish Baltic Sea, Black Sea, and Greenland. Today, the most significant threat in most areas is incidental catches in fishing nets, primarily various types of gillnets. Kills of over 1,000 per year have been documented for the Gulf of Maine, West Greenland, North Sea, and Celtic Shelf, but smaller kills occur in many other areas (probably in virtually every part of the species' range). In addition to gillnets, har-

A hybrid between a harbor and Dall's porpoise in the inshore waters of Greater Puget Sound. Such hybrids have been found to occur regularly in these waters, where both parent species are common. PHOTO: J. DURBAN

Harbor porpoise are often caught in herring weirs off the eastern coast of Canada. Although sometimes killed by the fishermen, many of these animals have been released alive, and scientists have learned much from them. PHOTO: J. Y. WANG

bor porpoises are also taken in some areas in trawls, Japanese set nets, herring weirs, pound nets, and cod traps. Finally, other types of threats include vessel traffic, noise, and depletion of prey by overfishing. The effects of environmental contaminants may also pose a threat, especially in heavily-industrialized areas. Detrimental effects of exposure to environmental contaminants have been documented. Globally, the species is not rare, nor in any immediate danger of extinction (although certain populations, such as that in the Black Sea, may very well be). Abundance has been estimated for selected portions of the species' range: 73,000 along the US west coast, 89,000 in Alaskan waters, 89,000 in the Gulf of Maine/ Bay of Fundy, 27,000 in the Gulf of St. Lawrence, 28,000 in Iceland, 11,000 in Norway, 36,000 in the Kattegat and vicinity, 600 in the Baltic Sea, 268,000 in the North Sea area, 36,000 in Ireland and the western UK, and between 3,000 and 10,000 in the Black Sea/Sea of Azov. Abundance in the western North Pacific is not known, but is probably lower than for the other ocean basins. Taken together, these numbers suggest the global abundance of the harbor porpoise is probably greater than 675,000 individuals.

IUCN status Vulnerable.

Spectacled Porpoise—*Phocoena dioptrica*

Lahille, 1912

Adult Female

Adult Male

Recently-used synonyms *Australophocaena dioptrica*, *Phocoena obtusata*.

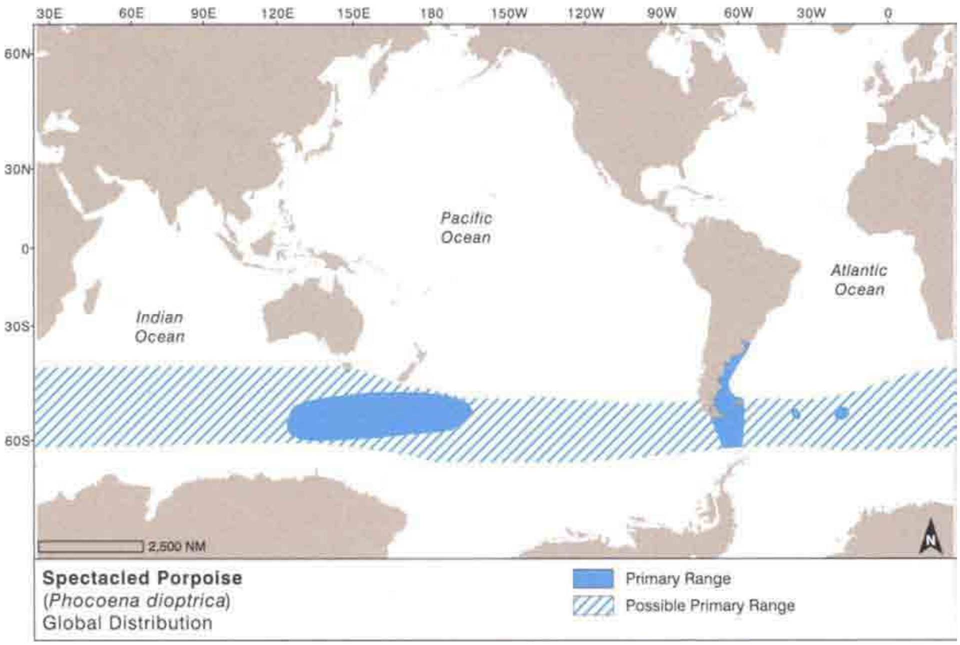
Common names En.—spectacled porpoise; Sp.—*marsopa de anteojos*; Fr.—*marsouin de Lahille*. This species was briefly considered to be in its own genus, *Australophocaena*, but due to findings of recent genetic and morphometric studies, it is now again placed in the genus *Phocoena*.

A young spectacled porpoise that was live-stranded in southern Australia swims in its tank, providing an unusual view. PHOTO: C. KEMPER

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Phocoenidae.

Species characteristics The spectacled porpoises' overall body shape is typically porpoise-like, robust with a blunt head, showing only a hint of a beak. The dorsal fin is moderate-sized to large and rounded, with a convex trailing edge (which is uncommon in small cetaceans). In adult males, the dorsal fin becomes oval-shaped and extremely large—so much so as to look disproportionate to the body. The leading and trailing edges are both convex. The flippers are small, with rounded tips.

The two-tone color pattern of spectacled porpoises is very distinctive. Above a line that runs down the side at the level of the eye, they are dark gray to black (except that the line sweeps upward at the tail stock, just before the flukes). Below this line, they are white, with the exception of black lips and a dark gape-to-flipper stripe (the latter is apparently not present on all adults). There is a black patch, surrounded by a fine white line (the "spectacle") around the eye. There is a faint blowhole stripe extending to the apex of the melon. The flukes are gray above and white below; the flippers are variably colored, either all dark or grayish-white with gray edges. A pale saddle on the back around the dorsal fin has recently been confirmed on sightings of live animals at sea



(this probably fades extremely rapidly after death). Young animals have muted gray color patterns, and adult males appear to be darker on the back than females.

Inside the mouth are 17–23 (upper) or 17–20 (lower) spade-shaped teeth in each row.

Although few specimens have been measured, adult male spectacled porpoises reach lengths of at least 2.24 m (length at puberty is unknown) and adult females are up to about 2.04 m. They can reach weights of at least 115 kg. Newborns are probably about 1 m.

Calf—Much smaller than adults (about 1/2 size); with a muted color pattern of light and dark gray.

Juvenile—Slightly smaller than adult size (2/3 to 3/4), with a relatively small dorsal fin.

Adult female—Adult size (up to 2.1 m); dorsal fin with relatively shallow leading edge and < 12 cm tall.

Adult male—Adult size (up to 2.3 m); dorsal fin with steeper leading edge and extremely large (up to 25 cm tall).

Recognizable geographic forms None.

Can be confused with The spectacled porpoise is not likely to be confused with other species when seen well. But at a distance, there can be some confusion with Commerson's dolphin and Burmeister's porpoise, which both share portions of its range. These three species can best be distinguished by careful attention to dorsal fin shape and color pattern differences. Adult male spectacled porpoises, with their absurdly-large dorsal fins, should be easy to identify. The dorsal saddle of the spectacled porpoise, although faint and difficult to see, will provide a good diagnostic character, when observed.

Distribution Previously known primarily from the southern coast of eastern South America, from Uruguay to Tierra del Fuego, this species is apparently also found offshore in the Southern Hemisphere. There are records from the Falkland Islands, South Georgia, Kerguelen Islands, Heard Island, Macquarie Island, the Aukland

An exceptionally clear view of a spectacled porpoise near a research vessel in the southern ocean. The white flippers and gray upper flukes are clearly seen. Notice the faint light saddle patch, which may only be apparent in good lighting. Southeast of Tasmania. PHOTO: P. A. OLSON

An adult male spectacled porpoise in subantarctic waters, easily identifiable as such by the massive dorsal fin. PHOTO: K. SEKIGUCHI

In the distance, even if an adult male is not present, the small size of the spectacled porpoise and its peculiar dorsal fin (convex on both leading and trailing edges) will allow for identification. Closer up, the pale saddle becomes evident, along with the black-above and white-below color pattern. PHOTO: C. OLAVARRA

Three spectacled porpoises surface slowly in subantarctic waters south of Australia. The furthest animal is an adult male, based on the large dorsal fin. The other two are a cow/calf pair. PHOTO: K. SEKIGUCHI

Even a fleeting look at the uniquely-shaped dorsal fin of the spectacled porpoise is unmistakable in the Southern Ocean. The faint saddle patch is evident here as well. Southeast of Tasmania. PHOTO: P. A. OLSON

Islands, and Tasmania. Although rarely seen at sea (there are only a few dozen live sightings), this information suggests that the spectacled porpoise may be circumpolar in the subantarctic zone (with water temperatures of at least 1-10°C). Sightings have occurred in oceanic waters and around oceanic islands, as well as in some rivers and channels, but the at-sea ecology of these animals is very poorly-known. The southernmost sighting available is from 64°34'S.

Ecology and behavior This is one of the world's most poorly-known cetaceans. In the few known sightings, group sizes were small, mostly singles, pairs, or trios, with groups ranging up to five individuals (average about 2). Cow/calf pairs generally are accomplanied by a single adult male. These animals are very inconspicuous when surfacing slowly and do not generally ride bow waves. They are capable of fast swimming, and they do approach vessels on occasion. There is virtually nothing known about potential migrations or seasonal movements.

From the small amount of information, births appear to occur in the southern spring to summer. Essentially nothing else is known of this species' behavior and biology.

Feeding and prey Only four stomachs have been examined, and the contents included anchovies, stomatopods, and a small amount of algae (the latter probably ingested incidentally).

Threats and status Not much is known about the status of this species. However, like all phocoenids, spectacled porpoises are caught in gillnets. At least one record of a capture in a midwater trawl is also known. In the past, this species was apparently harpooned by Tierra del Fuegan natives, as well as fishermen and whalers. There are no estimates of abundance available for this species.

IUCN status Data Deficient.

Burmeister's Porpoise—*Phocoena spinipinnis*

Burmeister, 1865

Recently-used synonyms None.

Common names En.—Burmeister's porpoise; Sp.—*marsopa espinosa*; Fr.—*marsouin de Burmeister*.

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Phocoenidae.

Species characteristics The unique dorsal fin of Burmeister's porpoise rises at a very shallow angle from behind the midpoint of the back, and the trailing edge is straight to convex. Additionally, there are tubercles along the leading edge of the fin (this characteristic gave the species its scientific name). Other than this, the species has a rather typical phocoenid body form, with a blunt, nearly beakless head and broad-based flippers with rounded tips.

Coloration is charcoal to dark gray, with a light gray to whitish abdominal field, including light streaks on the chin and belly. Burmeister's porpoises have well-defined dark eye patches, dark lips, and dark chin-to-flipper stripes (defined by lighter areas above and below). These flipper stripes are individually-variable and asymmetrical; they are narrower and extend further forward on the right side.

Teeth number 10–23 in each upper tooth row and 14–23 in each lower row. As in other phocoenids, the teeth are spatulate.

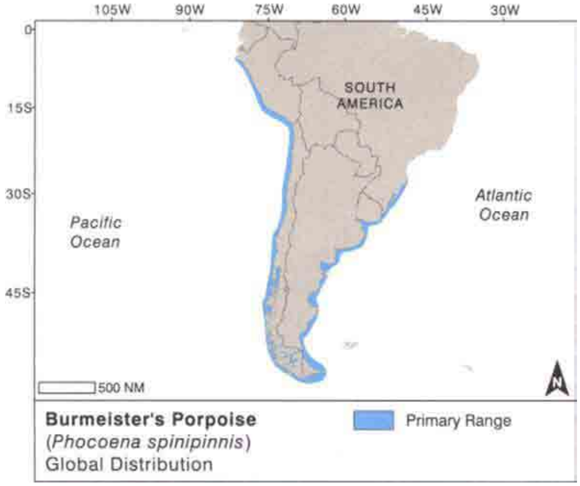
Most adults are up to 1.85 m in length, although animals from Uruguay up to 2.0 m have been recorded. Males are larger than females. Newborns are 0.8–0.9 m. Maximum weight is about 85 kg.

Recognizable geographic forms None.

The muted color patterns on the belly of a Burmeister's porpoise are probably never visible on a live animal at sea. Peru. PHOTO: R. L. PITMAN

A Burmeister's porpoise caught in Peruvian waters. The typical phocoenid body shape and distinctive dorsal fin are visible. PHOTO: R. L. PITMAN

Can be confused with From a distance, Burmeister's porpoises can be confused with South American fur seals and South American sea lions, which often stick their fins in the air (these can look like Burmeister's porpoise dorsal fins). They can also be confused with Chilean dolphins off the west coast of South America. Dorsal fin shape will be the best clue to distinguish these two species of small cetaceans. Differences in coloration, dorsal fin shape, and swimming style should allow Burmeister's porpoises to be distinguished easily from Commerson's dolphins and spectacled porpoises, and head and dorsal fin shape will be the best characteristic to allow distinction from franciscana.



Distribution Burmeister's porpoises are distributed in shallow, coastal waters of South America, from southern Brazil (about 28°48'S), south to Cape Horn in Tierra del Fuego, and thence north to northern Peru (to about 5°01'S). It is unclear whether the distribution is continuous between the Atlantic and Pacific oceans. They occur in the inshore bays, channels, and fjords of Tierra del Fuego and southern Chile, and have even been seen upstream in some rivers. Although most sightings are within view of shore, Burmeister's porpoises have been observed up to 50 km from the coast.

Ecology and behavior Very little is known about the natural history of this species. Most sightings are of less than six individuals, but aggregations of up to 70 have been reported. Behavior of the Burmeister's porpoise is generally inconspicuous; they surface with little surface disturbance. They may swim quickly away from approaching vessels, and are not known to ride bow waves.

There appears to be a protracted summer calving peak; most births in Peru apparently occur in late summer to fall. Pregnancy lasts 11–12 months. In Peru, males reach sexual maturity at about 1.60 m and females at about 1.55 m in length.

Recent genetic studies have indicated that porpoises in Peru form separate populations from those in southern Chile and in Argentina. The possibility of multiple populations in Peruvian waters is also considered likely.

Feeding and prey Feeding is on demersal and pelagic fish species, such as anchovies and hake, as well as squid and shrimps.

Threats and status Burmeister's porpoises are taken incidentally in fishing nets, especially gillnets throughout their range. In southern Chile, porpoises may be killed directly by harpooning. Most of these kills are not known to be large (although monitoring, in most cases, is sparse). However, in Peru, up to 2,000 porpoises per year are taken, both incidentally and directly, and in addition to being used as shark bait, the meat may be used for human consumption. In addition, to these more immediate threats, it is likely that environmental contaminants are having detrimental impacts on at least some Burmeister's porpoise populations. There are no estimates of abundance or trends for this species, but at least the stock in Peruvian waters is likely threatened by the high levels of capture there.

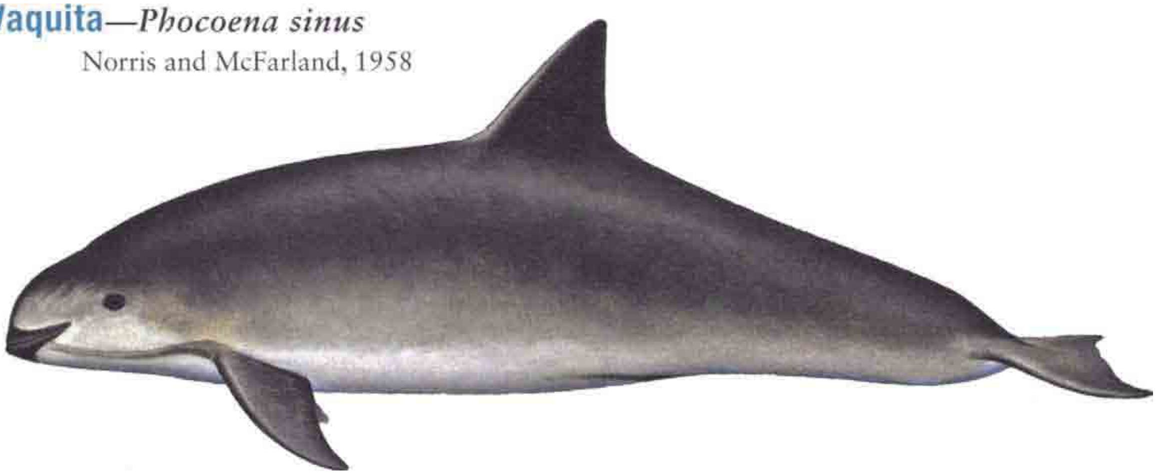
Vaquita—*Phocoena sinus*

Norris and McFarland, 1958



Recently-used synonyms None.

Common names En.—vaquita or Gulf of California (harbor) porpoise; Sp.—*vaquita marina*; Fr.—*marsouin du golfe de Californie* or *vaquita*.

Taxonomic information Order Cetacea, Suborder Odontoceti, Family Phocoenidae.

Species characteristics The vaquita is among the smallest of all marine cetaceans. Although morphologically it shares much in common with other phocoenids, it has a taller, more falcate dorsal fin and larger flippers. The dorsal fin is more like that of a dolphin, than a porpoise. Like other porpoises, however, it is stocky, with a blunt beakless head.
