Appendix I: Dead or Injured Animal Reports

GENERAL SIGHTING INFORMATION

General Sighting Information	
Observer Names	Lorena Figueroa
Observer Affiliation	RPS
Vessel Name	M/V Bella Marie
Sighting Coordinates (decimal degrees)	40.58032, -73.73928
Species Identification	Unidentifiable dolphin
Confidence of Identification (Sure / Unsure / Best Guess)	Best guess
Date of Observation	07-04-2023
Time of Observation (UTC)	15:45 UTC
Vessel Speed During and Leading Up to the Incident (knots)	3.67 kts
Vessel Heading	24 degrees
Vessel Operations Being Conducted	HRG survey lines
Status of Sound Sources (if applicable)	Active
Vessel Strike Avoidance Measures Implemented	None, unrequired
Water Temperature (°C)	22°C
Water Depth (m)	7.2 m
Beaufort Sea State	B1
Wind Speed (kts) / Wind Direction (compass)	6 kts / SW
Ocean Current Speed (kts) / Direction (compass)	Unknown speed / E
Cloud Cover (%)	50 %
Visibility (km)	> 5 km
Animal Collected? (Yes/No)	No
If collected – Date and Time	N/A
Photograph or Video Taken? (Yes/No)	Yes
If Vessel Strike, Size and Length of animal that was struck	N/A

Location of Animal & Relevant Events within 24 hours (As detailed as possible)
The Bella Marie departed the Guy Lombardo Marina at 09:54 UTC, arriving on site (Atlantic Beach) at 10:45 UTC. Operations started at 11:22 UTC, consisting of High-Resolution Geophysical acquisition lines. The vessel was at survey speed of 3.67 knots, while in acquisition. At 15:45 UTC, an unknown object was observed floating stationary approx. 700 meters off the vessel's starboard bow. At first sight, only a white object could be seen, and one bird standing on top of it. Upon coming closer as the survey line progressed, approx. 200 meters from the object, it became apparent that it was a dead animal, possibly a dead dolphin.

** Describe location (where on board or general direction and distance from the vessel if overboard) of animal and events 24 hours leading up to, including and after, the incident (incl. vessel speeds, vessel activity, and status of all sound source use)*

PROTECTED SPECIES DETAILS

Full Sighting Narrative (As detailed as possible)
At 15:45 UTC, an unknown object was observed floating stationary approx. 700 meters off the vessel's starboard bow. At first sight, only a white object could be seen, and one bird next to it. The vessel was approaching as the survey line progressed, approx. 200 meters from the object. It then became apparent that it was a dead animal, possibly a dead dolphin in an advanced state of decomposition. The vessel's initial heading was 26 degrees. The carcass was surrounded by three seagulls. It had a light grey coloration and a large white patch that seemed to be where portions of the skin had come off. The carcass looked bloated and the intestines were exposed, still attached to the body and floating. Something that appeared to be a fin, was also visible on the top side. The carcass was left behind as the vessel moved ahead during the survey line, the closest distance to the animal being 180 meters off the starboard bow. The animal was still floating when the vessel turned around in the opposite heading for the next survey line; being observed last at 16:07 UTC, 500 meters off the starboard stern. When the vessel returned in the initial heading for another survey line, the carcass was no longer found.

**Describes HOW the sighting occurred, various timing of observations, and timing of reporting.*

Animal Description / Identification Characteristics & Condition (As detailed as possible)
The carcass was between 2 to 3 meters in length, had a light grey coloration, and a large white patch that seemed to be where portions of the skin had come off. The carcass looked bloated and the intestines were exposed, still attached to the body and also floating. The carcass presented an advanced state of decomposition. Something that appeared to be a fin, was also visible on the top side. Based on the position of the fin and the intestines, it seemed like the animal was floating on one side, with its head towards the right side (as shown in the photographs). There were no visible signs of entanglement. Nevertheless, upon close view of the photographs, there were three or four marks below the fin, but it was not possible to determine what caused them. One seagull was observed floating by the carcass as if feeding on it.

**Describes the animal itself, and any identifying characteristics observed. Do not include general species characteristics that are not actually observed. Note tar, oil, gear or debris entanglement, wounds, or mutilations, propeller damage, papilloma's, old tag locations etc.*

Marine Mammal Description	
Length (cm/m/in/ft)	2 to 3 m
Weight (if possible, kg or lbs)	Unknown
Sex (M/F) – *if possible*	Unknown
How sex was determined	N/A
Confidence of Identification (Sure / Unsure / Best Guess)	Best guess
Genetic Sample Collected? (Yes/No)	No
If So – Sample transmitted to	N/A
Sample transmission date	N/A
Description of Injuries Observed	None
Fate of animal	Dead
