Moonlight sonata piano sheet music for beginners

Sheet music is the format in which songs are written down. Sheet music begins with blank music staff paper consisting of graphs with five lines and four spaces, each representing a note. Songwriters who compose songs in standard musical notation use staff paper to create sheet music, which can then be passed on to musicians who interpret the sheet music for a musical performance. Today, making your own sheet music is easier than ever. With notation software such as Finale, or the free web-based Noteflight service, anyone can turn their musical ideas into professional music magazines. Use Noteflight to get started (see Resources). Noteflight is a free web-based music notation service that lets you write, print, and even store your sheet music as music files for playback. Noteflight has a clean, user-friendly interface that allows even a beginner to create a song in sheet music. Since Noteflight allows you to listen to what you've written, you'll experiment with different notes until you create something that sounds good, even if you're not familiar with music composition. Create a Noteflight account and sign up to start creating your sheet music. You immediately start writing your number. At the top of the page, on a toolbar, click New Score to create a blank sheet music document. Select whether you want your sheet music to be private or shared. Noteflight presents you with an empty music sheet in the key of C with a 4/4 time signature. Click Edit Title at the top of your sheet music, and then type in the name of your song, then click Edit Composer and type your name. Make the changes needed for your key signature or time signature in the Score menu with the Change time signature or Change Key Signature command. Add notes and leftovers to your sheet music by clicking on the empty music staff. A note header appears and you drag and click where you want the note to appear. You also use the floating palette to select different note duration. As you insert your notes, Noteflight will automatically res format your sheet music to maintain the correct number of beats per bar. To listen to what you've written at any time, go to the Play menu and select the playback option you want. Print your sheet music when you're done composing your song. The result is a professional score of your song composition. You also use Noteflight to create an audio file of your composition. With Noteflight, you assign actual instrument sounds to the right parts. Go to 'File' and select 'Export' to record the finished sheet music mp3 or wav file. Record a sample recording to your band. If you're just starting out using Google Sheets, the extended features and add-ons can be a little overwhelming. Here are some tips to get you on the right track to get this powerful, free alternative to Excel. What is Google Sheets? If you've heard of Google Sheets before, feel free to continue. If you've never heard of it, here's a crash course on what you need to know. We'll go through the basics and get you refreshed with what Google Sheets is and how to get started right away. Google Sheets is a free, web-based spreadsheet program offered by Google as part of its entire office suite, Google Drive, to compete with Microsoft Office. The other main services in the cloud-based suite are Documents (Word) and Slides (Powerpoint). RELATED: Google Docs guide to magazines is available on all devices and platforms: all you need is an Internet connection and a web browser (or, in the case of mobile, the applicable apps). Google does the rest and takes the brunt of the heavy lifting while running the software in the cloud. Sheets supports a variety of file types, including XLS, XLSX, XLSM, TXT, ODS, and CSV, making it easy to view and convert Microsoft Office files directly from Google Drive. And because Sheets is an online spreadsheet program, you share and collaborate with multiple people in the same document, tracking revisions, changes, and suggestions all in real time. Have you heard enough? Let's get started. Signing up for an account The first thing you need to do before using Google Sheets is to sign up for a Google Account (a @gmail account). If you already have an account, go to the next section. If not, we'll go the easy way to create a Google Account and set you up with sheets. Go to accounts.google.com, click Create account and then For Myself. On the next page, you'll need to provide some information to create an account, such as first and last names, username, and password. You also need to verify your phone number to make sure you're a real human being, not a bot. After you verify your phone number, you'll need to provide a recovery email address, date of birth, and gender on the following pages, as well as agree to the privacy statement and terms of service. Finish that and you're the proud new owner of a Google Account. Create a blank spreadsheet Now that you have a Google Account, it's time to create your first spreadsheet. Go to Google Sheets and place the cursor on the multicolored + icon in the lower-right corner. The + turns into a green pencil icon; click on it. You also type sheets.new in the address bar and enter enter to automatically create and open a new blank spreadsheet on the current tab. Import a Microsoft Excel spreadsheet Even if you're completely new to Google Sheets, you may already have a stock of Microsoft Excel files that want to be able to use it. If that's the case, you just need to upload all your Excel documents to and Google the rest. While it may not support some of the more advanced features and effects of some Excel Spreadsheets, it works pretty well and is always adding more features. When you import an Excel document, you use Google Sheets or Drive to upload your files. Both methods allow you to drag and drop a file from your computer directly to the web browser for easy uploads. Your Drive contains all your uploaded files, but for convenience, when you go to the sheets homepage, only spreadsheet files appear. On the Google Sheets home page, click the folder icon in the upper-right corner, click the Upload tab, and then drag an Excel file from your computer. Once the Excel file is uploaded, sheets are automatically converted and opened, ready to start editing, sharing, and collaborating. To open an Excel file that has already been uploaded and has already been uploaded, click the green X file next to the file name on your Google Sheets home page. Click the Excel file or edit it in sheets in the dialog box that appears. When you're done with the document, you download it as XLSX or ODS, PDF, HTML, CSV, or TSV format. Click File > Download If click the format you want, and it will download directly to where files are stored from your browser. RELATED: How to import an Excel document into Google Sheets How to collaborate on documents with others One of the best features of Google Sheets is the ability to generate a shareable link that allows anyone with the document to view, comment on, or edit your document. Instead of sending a file back and forth between contributors, you'll make edits and suggestions at once, as if you've all sounded over the same computer in real time. The only difference is that each person has to use their own text input cursor on their personal computer. In the document you want to share, click the green Share button to choose how and with whom to send a link to your file. You enter email addresses manually or on Get sharable link in the top corner to hand out the invitation yourself. In the drop-down menu, edit how much power the shared user(s) have over the file when you select one of these options: Off: Share is disabled. If you've previously shared a link with others, it won't work and all permissions they've ever had will be revoked. Anyone with the link can edit: Gives the shared users full read/write access. They still can't remove it from your Drive, though- this is only for the contents of the file. Anyone with the link can comment: Allows shared users to comment on request this is ideal for team projects. Anyone with the link can view the file: Shared users can view the file, but can't edit it in any way. This is the default action when you share a file and the best option if you're trying to share a file to download. You Do much more with these shareable links, which also work with other Drive files and on mobile. For a deeper look at how these links work and how to generate them, check out our post. RELATED: How to create shareable download links for files on Google Drive Cells protect in shared edit sheets The ability to share and collaborate on documents with Google Sheets is one of the best features, without a doubt. However, sometimes you want to maintain the integrity of certain cells and stop anyone trying to change them. So if you've shared a spreadsheet with a group of people, but want to prevent them

from editing specific cells in the file, you might revoke their access to those files. Highlight all the cells you want to protect, and then click [Data > Protect Sheets and Ranges](#) from the toolbar. The Protected Sheets and Ranges panel appears on the right. Enter a short description here, and then set permissions to adjust the cell's security permissions. By default, anyone who already has permission to edit the document can edit any cell on the page. Click the drop-down menu under Limit who can edit this range, and then click Custom to set who can edit the selected cells. Under the list of people who can edit, everyone you've shared editing permissions with has already been selected by default. Turn off anyone who doesn't want to be able to edit the selected cells, and then click Done. Every time someone tries to modify or edit the cells you've just protected, do they see a prompt informing them that the cells/sheet want to only display a warning before someone edits cells, or maybe protect an entire spreadsheet? Check out our post for more details. RELATED: [How to protect cells from editing in Google Sheets](#) How to see all the recent changes in a document When you share documents with others, it's hard to keep track of all the minor changes that happen when you're not present. There is revision history for that. Google Sheets tracks and groups all changes that occur in a document over time, keeping the clutter low. You even move a mouse-click file back to one of the previous versions in history. You view a list of all recent changes by clicking [File > Version History > View Version History](#). Changes made by each team member are different colors, making it easy to keep track of who did what while not looking. RELATED: [How to view recent changes to your Google Docs, sheets, or slides file](#) How google sheets are offline What happens if you have access to Google Sheets but don't have an Internet connection? Although Sheets is a web product, that doesn't mean you don't use it offline. You'll need to download a Chrome extension and make sure you pre-enable the file for offline use. Each the next time you connect to the Internet, create the file update. After you download the official Chrome extension, go to the Google Sheets home page and click the Hamburger > Settings menu in the upper-left corner. Once here, turn on Offline to the To position and click OK. To save storage space on your local machine, Google downloads and makes the most recently opened files available offline. To enable a file manually, click the three-dot icon, and then turn on Available Offline to On. RELATED: [How do you use Google Docs Translate Offline Words directly into Google Sheets](#) Should you translate words or phrases from one language to another without leaving the page? Well, there is a special formula that you use to translate individual words, or even a batch of them, directly into the cells of Google Sheets. The formula looks like this: =GOOGLETRANSLATE (text, source language, target language) When you want to translate text into your document, type the words to translate directly to the formula, or type in the cell with the word/phrase you want. Here we refer to the text in cell A2, we specify the input language as English (en) and output as Chinese (zh) and then press Enter and see how it does its thing. If you have a list of words in one column, all you have to do is select the cell that contains the formula, and drag the blue square to the row you want. If you've ever used Google Translate before, you know it's not accurate 100% of the time, but it works just fine as a reliable solution for common words and phrases. RELATED: [How to use Google Translate directly in Google Sheets](#), automate tedious tasks with Macros Google Sheets allows you to automate repetitive tasks with a specific set of instructions to increase productivity in your spreadsheets. When you click Record, Sheets creates a script with all the code to replicate annoying and monotonous steps. When you include a macro in Google Sheets, an Apps Script is automatically created with all the code to replicate your actions for you. This means that you create complex macros without knowing how to write code. The next time you run it, Sheets will do everything you did when you recorded the macro. Essentially, you'll teach Google Sheets how to manipulate a document with a single command. RELATED: [How to supercharge your Google Apps with the Script Editor](#) Here are a few examples of its powerful functionality: Apply formatting and styles. Create completely new spreadsheets. Use a Google Sheets feature, toolbar, menu, or feature. The sky is the limit. To get started, start a Google Sheet and click [Tools > Macros > Macros > Macros](#) Opens the recording menu at the bottom of the window, with two options for capturing your actions: Absolute references: The macro performs tasks only on the exact cells cells Record. If you curse cell B1, the macro will curse only B1, regardless of which cell you clicked on. Relative references: The macro performs tasks on the selected cells, no matter where they are in the sheet. If you italicize B1 and C1, you later reuse the same macro to cursize the cells D1 and E1. Select whether you want an absolute or relative reference, then start clicking, formatting, and teaching sheets to specify the order you want these actions to be replicated. Now you start moving cells, applying layouts, creating functions, etc. After you record all the actions for this macro, click Save. Enter a name for your macro. With Google, you can also create shortcuts for up to 10 macros. To tie a macro to a shortcut, enter a 0-9 number in the available space. When you're done, click Save. If you need to customize your macro name or shortcut, edit a macro by clicking [Tools > Macros > Manage Macros](#). In the window that opens, tweak as desired, and then click Update. The next time you press the shortcut associated with the macro, it runs without having to open the macro menu from the toolbar. If your macro is an absolute reference, run the macro by pressing the shortcut or going to [Extra > Macros > Your Macro](#), and then clicking the right option. Otherwise, if your macro is a relative reference, highlight the cells in your spreadsheet on which you want to run the macro, and then press or click it from [Extra > Macros > Your Macro](#). While this should get you started, we'll have a deeper dive into using Google Sheets macros if you want more information. RELATED: [How to automate Google sheets with macros](#) duplicates Should you delete some duplicate entries in your spreadsheet? That's no problem at all with Google Sheets' built-in feature that does just that. Easily remove duplicates from your spreadsheet without having to write a script or do it manually yourself. Highlight the table/cells that contain duplicates that you want to delete, and then click [Data > Delete Duplicates](#). If the data has a header row, check the Data has header box, and then click Delete duplicate data. The best Google Sheets add-ins Now that you've learned all the basics of Google Sheets, you can become a true power user with the addition of add-ons. Add-ins are very similar to web browser extensions, but are specific to Google Sheets and let you get additional features from third-party developers. You install tools to find facts and automatically Hand out documents to students, generate business reports, and even send emails directly from a document. If you're looking for the best add-ons to get you started, we're here for you. RELATED: [The Best Google Sheets Add-ons](#) Add-ons
