In univariate analysis, upgrading (to either pGS 3+4 or 4+3) appears to be greater for patients with cGS = 7 (HR = 1.9, 95% CI 1.1-3.3, p = 0.013) than for patients with cGS < 7 (HR = 1.1, 95% CI 0.5-2.4, p = 0.76), as shown in Figure 2.

In the subset of patients who upgrade to pGS ≥ 7, CCP score is a statistically significant univariate predictor of outcomes (HR=1.8, 95% CI 1.3-2.5, p=0.001), as shown in Figure 3.

discussion is based on a relatively small number of events, so additional studies are needed.
