Check the height of the Toyota Tacoma clutch pedal before adjusting it. The corresponding factory specifications are 170 to 180mm (or 6.69 to 7.08 inches) from floor to top of the pedal (if step). You can adjust this up or down as long as the height of the pedal remains in accordance with the specified guidelines. Look at the top of the clutch pedal for the adjustment button. Change the freeplay of the clutch pedal in the Toyota Tacoma by loosening the lock nut and turning the push rod until you can get it within the recommended range of 5 to 15mm. Squeeze the nut and readjust the height of the pedal if necessary. Find out the launch point of the Toyota Tacoma clutch. If it does not fit the required specifications, you may need to adjust it. Start by pulling the parking brake lever and installing a wheel stopper. Start the Tacoma engine, let it idling, and then slowly change the truck into reverse. When you feel the gear start to connect, press the clutch and check the distance between when the gear noise stops and the point you stepped on the pedal to the end. The launch point, so it's called, should be at least 1 inch. Double-check if the launch point is not where it should be. Check the height of the pedal again, check the game in the push rod and pedal, bleed the clutch lines to rid the system of any air bubbles, and also check the clutch cover and disc as well. Make the necessary adjustments, replace all components that you can't adjust, and test the Tacoma clutch release point again. or measuring tape pliers
