

Framework Adjustment 56
to the
Northeast Multispecies FMP

Appendix II

**Calculation of Northeast Multispecies Annual Catch Limits,
FY 2017 – FY 2019**

This appendix documents the calculation of Northeast Multispecies Overfishing Levels (OFLs), Acceptable Biological Catches (ABCs), and Annual Catch Limits (ACLs) for FY 2017 - FY 2019. The general approach for all stocks is to first determine the OFL and then determine the ABC. The ABC in all cases is consistent with the recommendations of the SSC. The ABC is distributed to various components of the fishery, and then an adjustment is made to these “sub-ABCs” to determine the ACLs, sub-ACLs, or other sub-components. The descriptions in this Appendix reflect the Council’s *Preferred Alternative* for specifications.

For this action, the *Preferred Alternative* lists specifications for GB yellowtail flounder for FY 2016 – FY 2017 and witch flounder for FY 2017-FY 2019.

This appendix also documents and clarifies how available catches are distributed to the sub-components of the fishery. These are listed for all stocks in order to keep a clear record of the distribution. Amendment 16 authorized changes to be made in a framework action and this summary documents several changes.

Determining OFL and ABC

Stocks with Index-Based Assessments

Is not possible to project stock sizes for the following stocks:

GB Yellowtail Flounder
Witch Flounder

For index-assessed stocks an estimate of the probability of overfishing cannot be determined but the proposed ABC is based on an exploitation rate applied to the most recent estimate of stock size. As a result, if stock size does not decline then the proposed ABC would not be expected to result in overfishing. This is an unrealistic assumption – stock size could increase or decrease but is unlikely to remain constant.

Distribution of ABCs

Because the Council wants the ability to consider a different adjustment for management uncertainty for different components of the fishery, ABCs were first distributed to the components prior to applying this adjustment. A brief description of the components follows. Note that there are a few stock-specific instances (described in a later section) that may differ from this general overview.

ABC: Acceptable Biological Catch for the entire stock.

Canadian Share/Allowance: An amount from the stock that Canadian vessels are expected to harvest, as is the case for GB winter flounder and halibut (see details that follow in the next section). For GB cod, GB haddock, and GB yellowtail

flounder, this is based on the Canadian allocation under the TMGC (but see the GB yellowtail flounder discussion below).

U.S. ABC: That portion of the ABC available to U.S. fishermen after accounting for Canadian harvests.

State waters: Portion of the U.S. ABC expected to be harvested from state waters, outside of the federal management plan. This is not an allocation.

Other sub-components: Portion of the U.S. ABC expected to be harvested by unidentified non-groundfish fishery components. These are not attributed to specific components because individual amounts are small. In cases where there is no specific recreational allocation, unless otherwise specified, recreational catches are counted against this sub-component. There are a few stocks where this may not be the case, such as when the majority of recreational catches are from state waters and the recreational catch is considered part of the state waters sub-component. These instances will be specifically identified.

Scallops: That portion of U.S. ABC allocated to the scallop fishery.

Groundfish: That portion of the U.S. ABC available to the groundfish fishery (including recreational and commercial vessels if there is a specific allocation). This ABC has several sub-components:

Commercial: The portion of the U.S. ABC available to commercial vessels; this is further sub-divided into sector and common-pool portions.

Recreational: The portion of the U.S. ABC available to recreational vessels, when a specific allocation is made.

MWT: Portion of the ABC available to herring mid-water trawl vessels. Currently only applies to the two haddock stocks.

Small-Mesh Fisheries: Portion of the U.S. ABC of GB yellowtail flounder for small-mesh fisheries.

Amendment 16 provides that the distribution to various sub-components can be modified in a framework or specification action. These adjustments are often made as more experience is gained with the ACL system adopted by Amendment 16. Changes can also be required if there are large changes in ABCs, particularly because the sub-components of the fishery are not subject to specific catch controls by the FMP and a specific percentage allocation has not been defined. This is the case for state waters and other sub-component catches. Unlike the case when a specific allocation has been specified, the PDT estimates the expected catch from these two components and then compares that amount to the ABC to determine the percentage that should be set aside to account for these catches.

Further, the Council has applied the default management uncertainty buffer of 5% for witch flounder. The PDT noted that the 62 SAW witch flounder summary report on pp. 23 states that:

“Uncertainty in the catch of witch flounder has increased due to recent allegations of catch misreporting currently under litigation.”

The magnitude of catch misreporting has not been publicly quantified to date. The PDT did not have any specific recommendations at present but wished to make the Committee/Council aware of the information in the assessment report since it is related to management uncertainty. However it is not possible to quantify this potential additional source of uncertainty, or recommend an appropriate adjustment to the management uncertainty buffer, at this time.

Error! Reference source not found. summarizes the state waters and other sub-component distribution for recent years and the distribution that would result from the *Preferred Alternative*.

Groundfish ABCs and ACLs are distributed to various components of the fishery. First, expected catch by Canadian vessels is deducted from the total ABC, and the amount remaining is the portion of the ABC available to U.S. vessels (U.S. ABC). Expected catch from state waters and the other sub-component is then deducted from the U.S. ABC¹. These sub-components are not subject to specific catch controls by the Groundfish FMP. As a result, the state waters and other sub-components are not allocations, and these components of the fishery are not subject to accountability measures if the catch limits are exceeded. Because the state waters and other sub-component values are based on expected catch, there is no downward adjustment for management uncertainty that applies to fisheries with specific allocations and accountability measures.

After the state and other sub-components are deducted, the remaining portion of the U.S. ABC is the amount available to the fishery components that receive an allocation (i.e., subject to accountability measures). Allocation are made first to non-groundfish fisheries (e.g., scallop, midwater trawl, small-mesh fisheries), and the portion of the U.S. ABC remaining is the commercial groundfish allocation.

Once the U.S. ABC is distributed to the various fishery components, sub-annual catch limits (sub-ACLs) are set by reducing the amount of the ABC distributed to each component to account for management uncertainty (i.e., the likelihood that management measures will result in a level of catch greater than the catch target). For each stock, management uncertainty is estimated using the following criteria: Enforceability and precision of management measures, adequacy of catch monitoring, latent effort, and catch of groundfish in non-groundfish fisheries.

¹ For GOM cod and haddock, the state waters and other sub-component are deducted from the commercial portion of the U.S. ABC (after allocating to the recreational fishery).

Canadian Catch of Stocks (for those not jointly managed)

Since fishing year 2010, expected Canadian catch has only been considered for Eastern GB cod and haddock and GB yellowtail, which are jointly managed with Canada. However, based on the results of recent assessments in 2015 and 2016, some Canadian catch of GB winter flounder, white hake, Atlantic halibut, and witch flounder does occur. Although these stocks are not jointly managed, Canadian catch should be accounted for when distributing the ABC/ACLs to ensure that biological objectives are met and total catch does not exceed the overall ABC.

Consistent with the approach used in FW 53 and FW55, the PDT recommends using the average catch of the most recent three years available (CY 2013- CY 2015) as the expected Canadian catch. The PDT worked with NEFSC stock assessment leads to obtain catch estimates for CY 2015 to complete this evaluation and update estimates since the 2015 Groundfish Operational Assessments. This expected Canadian catch should be reduced from the total ABC for the respective stock before distributing the remaining portion of the ABC to U.S. vessels (Table 1 and Table 2).

In addition based on the results of the 2016 benchmark assessment of witch flounder, the PDT does not recommend applying the same approach used for other groundfish stocks for estimating expected Canadian expected catch for witch flounder. Recent Canadian catch of witch flounder remains low with an average of 1 mt for CY 2013- CY 2015 and less than 5 mt in each year since 2010, although past catches since 2000 have been as high as 53 mt. Therefore, the PDT recommends continuing to track Canadian catches of witch flounder but not accounting for those catches at present in the distribution of the ABC (e.g., to determine a US ABC after a reduction from the ABC for expected Canadian catch) because the risk of exceeding the overall ABC is very low. The PDT feels that the management uncertainty buffer will cover this source of catch uncertainty.

Table 1- Estimate of expected Canadian catch for several groundfish stocks, based on the three year average catch (CY 2013- CY 2015). Source: NEFSC personal communication, Nov. 11, 2016, and Draft 2016 witch flounder benchmark assessment, NEFSC, October 2016.

Stock	Expected Canadian Catch (mt)
GB winter flounder	53
White hake	42
Atlantic halibut	34

*2015	31	34.0	25	42.3	13	47	60	53.2

*2015 Canadian scallop discards of GB winter flounder were assumed to be the same as 2014

Review of State Waters and Other sub-Components

The state waters and other sub-components values were initially established in Framework 44, which implemented specifications for fishing years 2010-2012, and a few sub-components were adjusted in Framework 47 for the 2012 fishing year. The PDT completed a comprehensive review of the sub-components for Frameworks 50 and 53, and most recently reviewed and adjusted the sub-components in Framework 55.

Table 3 summarizes the major highlights from the FY 2015 final catch report. The PDT also reviewed proposed 2017 specifications to determine if additional adjustments to the sub-components are necessary in anticipation of any expected ACL changes.

Table 3- Summary of FY 2015 sub-Component Catches (as percent of sub-component caught)

	Stock	State sub-Component	Other sub-Component
	GB Cod	230%	193%
	GOM Cod	181%	--
	GOM Haddock	-	117%
	CC/GOM Yellowtail Flounder	137%	102%
<i>Sub-component 'overages'</i>	Witch Flounder	171%	-
	Northern Windowpane Flounder	-	262%
	Southern Windowpane Halibut	-	138%
	Halibut	137%	-
	Plaice	76%	71%
<i>Sub-Components with High Utilization (≥ 75%)</i>	GOM Winter Flounder	92%	-
	Northern Windowpane Flounder	84%	-
	Ocean Pout	74%	95%

	Wolffish	99%	-
<i>Sub-Components with Low Utilization ($\leq 25\%$)</i>	GB Haddock	10%	-
	GB Yellowtail Flounder	-	0%
	SNE/MA Yellowtail Flounder	15%	22%
	Redfish	4%	1%
	White Hake	2%	7%
	Wolffish	-	13%

PDT and Council Recommendations for Changes to sub-Components

Consistent with the process outlined in A16, the PDT developed recommended changes for all stocks to the state waters and other sub-components based on recent catch information (FY 2010- FY 2015), expected ACL changes and management measures for 2016/2017, stock abundance and availability, and other information². However, the Council decided to only make changes for a few stocks and retain the distribution implemented in FW55 for the majority of groundfish stocks. The following description and **Error! Reference source not found.** summarizes the Council's recommended changes for the 2017 fishing year.

1. No changes are recommended for either the state waters or other sub-component values for GB cod, GOM cod, GB haddock, GOM haddock, GB yellowtail flounder, SNE/MA yellowtail flounder, CC/GOM yellowtail flounder, American plaice, GB winter flounder, GOM winter flounder, SNE/MA winter flounder, redfish, white hake, pollock, southern windowpane flounder, ocean pout, Atlantic halibut, and wolffish.

2. Witch flounder –
 - a. *State Waters* – State waters catch in FY 2015 increased by about 2 mt over FY 2014. State sub-component catch was 17 mt more than the state sub-component value in FY 2015. There is no reason to expect a dramatic change in FY 2017 state waters catch compared to FY 2013-FY 2015. Based on its review, the PDT recommends basing the state sub-component on the most recent 3-yr average of state sub-component catch (35.2 mt). This represents an increase from the numerical value of the FY 2016 state sub-component (12 mt). Therefore, the PDT recommends increasing the 2017-2019 other sub-component to 4% of the ABC (from 2.6%).

 - b. *Other Sub-Component* – In FY 2015, 85% of the 751 mt total ACL was caught. The groundfish fishery caught 88% of its 610 mt sub-ACL. In FY 2015, other sub-component catch decreased slightly from FY 2014 and it is expected that FY 2017 catch would be similar to FY 2013- FY 2015. In addition, the PDT is aware of two research projects that could lead to a potential increase in the other sub-component catches of witch flounder in the near-term – the Industry-NEFSC sweep experiment in 2016 and the MA cod Industry-Based Survey in 2016 and 2017. The sweep experiment is complete and there is not a reason to expect higher research catch in the future (2017-2018) from that project. The PDT is unaware of the magnitude of these research catches at present. Based on its review, the PDT recommends basing the other sub-component on the most recent 3-year average of other sub-component catch (69.5 mt). This represents an

² See Groundfish PDT memorandums to the Groundfish Committed dated November 10, 2016 (Development of alternatives for Framework Adjustment 56 and sub-component analysis, version 2) and January 11, 2017 (Witch flounder specifications for FY 2017 to FY 2019).

increase from the numerical value of the FY 2016 other sub-component (59 mt). Therefore, the PDT recommends decreasing the 2017-2019 other sub-component to 8% of the ABC (from 12.8%).

3. Northern windowpane flounder –

- a. *State Waters* – The state sub-component catch increased by ~1 mt in 2015 compared to 2014. The average catch for the last 5 years has been below the current state sub-component value. The PDT recommends maintaining the 2017-2019 state sub-component at 1% of the ABC. This represents no change for the numerical value of the other sub-component, 2 mt, from FY 2016 to FY 2017.

- b. *Other Sub-Component* – The Council recommended establishing a sub-ACL for northern windowpane flounder for the Atlantic sea scallop fishery. Other sub-component catch has almost exclusively come from the scallop fishery over the last six years. The PDT recommends reducing the 2017-2019 other sub-component to 2% of the ABC (from 60%), to cover the six year average of other sub-component catch in non-scallop fisheries. This represents a decrease from the numerical value of the other sub-component from 118 mt to 4 mt from FY 2016 to FY 2017.

The distribution of ABC values by stock are shown in Table 4 and Table 6.

ACLs

Once the U.S. ABC is distributed to the various fishery components, sub-annual catch limits (sub-ACLs) are set by reducing the amount of the ABC distributed to each component to account for management uncertainty (i.e., the likelihood that management measures will result in a level of catch greater than the catch target). As defined in National Standard 1, management uncertainty may include late catch reporting, misreporting, and underreporting of catches and is affected by a fishery's ability to control actual catch.

For each groundfish stock, management uncertainty is estimated using the following criteria: enforceability and precision of management measures, adequacy of catch monitoring, latent effort, and catch of groundfish in non-groundfish fisheries.

The following default management uncertainty buffers are used for groundfish stocks:

- 3% for stocks with no state waters catch;
- 7% for zero possession stocks;
- 7% for recreational allocations; and
- 5% for all other stocks/components of the fishery.

Stock specific sub-ACL values are shown in Table 7.

Review of Management Uncertainty Buffer

The PDT last reviewed and recommended changes to the management uncertainty buffer for Framework Adjustment 50 (FW 50). During the development of FW 50, the PDT discussed whether the buffer should be increased due to possible observer bias, but did not recommend any increase because no estimate of bias is available to correctly determine the appropriate changes. The PDT made the same conclusions during the development of FW 53.

The PDT reiterated that, at this time, it is not possible to quantify observer bias, and that the direction of any bias can change from year to year. As was the conclusion in FW 53 and FW 55, the PDT concluded that no new information is available that would warrant any changes to the default management uncertainty buffers for FW 56, and is recommending no change.

Further, the Council has applied the default management uncertainty buffer of 5% for witch flounder. The PDT noted that the 62 SAW witch flounder summary report on pp. 23³ states that:

“Uncertainty in the catch of witch flounder has increased due to recent allegations of catch misreporting currently under litigation.”

The magnitude of catch misreporting has not been publicly quantified to date. The PDT did not have any specific recommendations at present but wished to make the Committee/Council aware of the information in the assessment report since it is related to management uncertainty. However it is not possible to quantify this potential additional source of uncertainty, or recommend an appropriate adjustment to the management uncertainty buffer, at this time.

Incidental Catch TACs

Part of the commercial non-sector ACL is allocated to the incidental catch TACs that limit catches of stocks of concern in the Category B (regular) DAS program and certain SAPs. The incidental catch TACs in FW53 have been carried forward into FW55 and FW56. Incidental catch TAC values for stocks of concern have remained consistent since 2010, though the list has been modified as the status of some stocks improved (see FW 44, FW47, FW50, FW53, and FW55).

The PDT plans to revisit incidental catch TACs in a future specifications action.
