## Spotify windows 8. 1 64 bit

PlanPremiumCountryU.S.DevicePCOperating SystemWindows 8.1 64 bitMy Question or problem:I have been looking for solutions for the past two days in this community for Spotify update version 1.0.98.78.gb45d2a6b-12. And usually finding a solution within a few hours, even some work around's that puts me back up and running, now it has become a real problem just to make it now in this complex, this complex is a mess now trying to find solutions to the issues to resolve. A desktop user now receives an operating system error message about the program has stopped working, and Microsoft is looking for a solution and then the application closes, and the user cannot use it anymore without this same error message, and without doing a clean reinstallation of the desktop application every time. I finally got the new update for the desktop application installed and running, only for the issue to return during the next reboot or log in to my machine. I have finally given up looking for a solution for none of them are working, i.e. Shut down, log out again, uninstall, reinstall, install from another directory the full updated desktop installer, run the installation as an administrator, which is a strange suggestion to make users do, most major programs on Windows always ask the user to do this all the time, run the installer as an administrator, but the Spotify desktop app does not trigger this important desktop message for the Windows user? I install all programs on this PC as an administrator, no one else uses it more than me. Finally I have given up looking for a solution now, no one here seems to know what the \*\*bleep\*\* they are talking about anything with this issue from the latest desktop application update. All suggestions only work until the next reboot or login to the machine, and a new clean reinstallation of the updated desktop application is necessary for it to work. As a last resort, I removed all files from Spotify and reinstalled an older installer from the Spotify version, as I save them when they are downloaded to the desktop update app when an update is released, and backed them up in case a Spotify update goes on the fritz, as it is currently doing. The old Spotify installer in December works great without problems, now I've employed an old working trick around to stop the Spotify desktop app from doing its automatic update process before this happens again every with an update to the app just as the new music falls. What a great plan they have, I-up the desk just as the new music falls on Friday, great planning there are guys. The last 4 or 5 updates to the Windows Spotify desktop app have had one problem after another regarding an update now, will this be a current trend until the desktop app no longer works? Spotify has changed that Spotify desktop apps get a new bug-free update version clean, and/or is Spotify developers who only work on Windows Windows desktop store app only now? I was just asking to see if maybe I should switch music streaming services. Which would really suck, since I've been using Spotify since it was officially released in the US and was even a rock star at one point, until I moved everything to a truly new Spotify account instead of a fake one created for linked Facebook users, and I lost my Rock Star status from my old user record when I threw it to Facebook. I was wondering if I should cut my losses and start over with another music streaming service, there's a lot of them out there now, you know? Totally disillusioned with the Spotify service now, Spotify user since 2011. • 8 Update 2 (91.690): 72.0.3815. (64.17) à: 8 Update 2 (91.69) s: 72.0.3815.
