Overview

GrabIt is a WordPress plugin capable of downloading rich HTML pages with images, styles and fonts and creating editable short code content blocks in WordPress for later use in posts and pages.

Requirements

GrabIt plugin requires minimum WordPress 3.8 and PHP 5.3.

Additional requirements are:

- XML PHP extensions: DOM and SimpleXML
- cURL or Stream Context (allow_url_fopen=On)

Installation

Installation process is pretty simple.

1. Download **GrabIt** Plugin to your desktop.
1. Extract the Plugin folder to your desktop.
1. With your FTP program, upload the Plugin folder to the wp-content/plugins folder in your WordPress directory online.
1. Go to Plugins screen and find **GrabIt** in the list.
1. Click Activate Plugin to activate it.

Alternatively you can upload **GrabIt** zip package via Plugin Manager in WordPress.

1. Download **GrabIt** Plugin to your desktop.
1. Go to Plugins screen and click "Add New"
1. On the "Add Plugins" screen click "Upload Plugin"
1. Attach your zip file and click "Install Now".
1. Go to Plugins screen and find **GrabIt** in the list.
1. Click Activate Plugin to activate it.

Disclaimer

Please be aware, the plugin is based on new technologies that were not used that way before so it has some limitations that depend on browsers and third-party servers. This means that it may not work well with all the pages or blocks you would want to insert and at the moment it may not be possible to fix it for every website existing on the web. We recommend you to try it in different browsers for better results and try different options if it doesn't work with defaults. We are working hard on making it better, so please feel free to ask questions and provide URLs for us to try.

Grablt list of contents

You can start using plugin from this page. Here you can see a list of shortcodes you have added. On this page you can:

1. Create a new shortcode with Grablt contents
1. Edit existing contents
1. Delete block content and all it's contents (including images and fonts)

Version 1.032

GrabIt create new block

On create new content page you can put a URL to your page and preview options (we recommend to try with default options first).

After entering your page URL please click “preview” button to select necessary content.

Grab any content - image, text, sections, URLs from any website and embed it on your own site

Version 1.032

it

<http://originbuilder.co/grab>

You will see an editor with **partially** editable content added inside

Once you are done editing click "Save" button at the bottom.

At the end you can return to the list of pages and copy shortcode that can be inserted to any page or post of your WordPress website.

Useful tips

With some pages the plugin may fail to download images or fonts. In this case just disable “Download images” or “Download fonts” correspondingly.

Please note that you need to put full URL to the page you want to download including schema (<http://> or <https://>)

In some cases “Enable JavaScript” option may help to see the contents you need. Often images are “lazy loaded” with javascript on a specific website or there is some dynamic content.
