Instagram for android 4. 0. 4

When you think about social media apps, one of the first probably comes to mind on Instagram. Launched in October 2010 as an iOS exclusive, Instagram has grown rapidly to be the most popular platform for sharing photos and videos with people around the world. Whether you need an app update or want to be at the front of the latest news surrounding it, here's everything you need to know about Instagram.

November 30, 2017 - Introducing the new list of close friends Have you heard of a Finstagram? It means fake Instagram (creative, right?) and if you're over 30 you probably don't have one. Essentially they are Instagram accounts created by private people and only accept a very small number of close friends to view their content. Why do this? Well, you might want to post jokes, something that isn't that aesthetically pleasing, or even something offensive that might make you report, but if you only have a few close friends involved, it really doesn't matter. Now Instagram is jumping with its own version of Finstagram: something called a close friends list, a new feature that will be exclusive to Stories. Once you've shot and edited your story and are ready to publish it, a green circle with a white star will appear on your page. Tap this and you'll see your list of close friends, where you can easily share your content with only certain people. If you're someone on someone else's list of close friends, if that person posts a story, you'll see a green ring around their icon. This means that there is a list story of a close friend for you and only a couple of others.

September 5, 2018 - IG Shopping rumored to be Instagram's next standalone app After the launch of IGTV earlier this year, a new report by The Verge claims that Instagram's second standalone app will focus on online shopping and could be called IG Shopping. Details of IG Shopping are still fairly scarce, and according to the report, the app could be canceled before it's released. However, in case it's fruitful, IG Shopping will allow users to easily buy items from companies they follow on Instagram's main app. Instagram already allows its users to buy articles from posts on their main feed, but similar to the IGTV app, IG Shopping would allow for a more focused area that is just about buying stuff and nothing else. It's unclear when Instagram plans to launch IG Shopping, but we'll let you know if there are any additional details.

August 28, 2018 - Instagram users can apply for verification and finally use 2FA code-based Verified Check Mark has always been a badge on social media, and as of today, Instagram is making it easier to get your own. Even though there was previously no way to start the check - you basically had to wait and wait for random Instagram to give you the badge - - you can finally request verification through the configuration. As with most of Instagram's new features, this will be a slow rollout, presumably hitting iOS users first and coming to Android users a few days or even weeks later. In case you're curious to check it out, it should appear near the bottom of the Settings list in your own menu titled Verification Request. In addition, Instagram accounts with large followers will begin to display an Account Information tab, which is displayed when the user first joined Instagram, the account's country of origin, previous usernames, and even ads that the user is running, among other details. All this in the name of transparency and help remove fake or misleading accounts. As for secure logins, Instagram has offered two-factor authentication for a while, but so far the only way to receive a code was via SMS, rather than the much safer method of generating a code through an app like Google Authenticator or Authy. Starting today and deploying to users over the next few weeks, you'll soon be able to generate the sign-in code through the app you want to choose by going to the Two-Factor Authentication menu in Settings.

Since early August, Instagram users have reported a strange hack: users will be connected to their account, and once they log back in, their username will no longer exist. Your handle will be changed, along with your profile picture, as well as the email and phone number that is connected to your account, making it impossible to access your information. Once the accounts have been hacked, the image is normally set to a Disney or character. The email associated with the accounts is changed to a Russian .ru e-mail address. Your bios and personal information are also removed. To prevent things like this from happening on your Instagram account, we recommend starting two-factor authentication. Many users who have been affected by the hack did not have two-factor authentication turned on - however, it's worth noting that even having this extra security step might not completely keep your IG profile safe.

July 19, 2018 - Instagram now shows you when your friends are online If you often send direct messages to other Instagram users, now that there's never been a way to know if your friends/followers are online and actively use the app. Fortunately, this changes today! As part of a new update, Instagram will now show you when others are online. On the DMs inbox page and browsing the friends list to share a from your main feed, you'll start seeing a green flag next to profile pictures of other users if they're in the app at that time. With this, it will be much easier to know if you will receive an immediate response from someone if you send them a private message.

June 28, 2018 — A lite version of Instagram is now available at Over the years, companies like Facebook, Twitter and Spotify have released lite versions of their apps that offer all the basic features/experiences, while being easier to run on slower hardware, taking up less storage space, and using less data. Following this idea, Instagram Lite has just launched in Mexico and aims to offer all the best Features of Instagram, while being much more accessible to people in developing markets. Instagram Lite weighs in at just 573KB and allows you to post and view photos on your feed, use Instagram Stories, use all the regular photo editing tools, and more. There's no way to send direct messages yet, but that's something to come soon. In addition, while Instagram Lite is currently limited to users in Mexico, there are plans to expand it to other markets in the near future. You can access IGTV through Instagram's main app or through the standalone IGTV one, and once you're there, you can watch through videos for you, Following, Popular, and Continue Watching. All video content on IGTV is meant to be shared/created vertically, and while that might sound bonkers at first, Instagram says IGTV is built by how you actually use your phone:

vertical and full screen. Anyone can create IGTV content and upload videos via the Instagram app to their phone or through a web client. Download: IGTV (free) When using Instagram, most of your time is likely to be downloaded on the Home tab. This is the page you're taken every time you open the app and it acts as a central hub for everything Instagram has to offer. At the top, you'll see three icons. From left to right, these are for taking a photo for Instagram Stories, opening IGTV and going to your inbox for direct messages. Below are the circles for people you follow so you can see any of their Instagram Stories posts. Below all this is your main feed. Here you can browse endlessly through posts by people and hashtags you follow. In each post there are buttons to like it, leave a comment, send it privately to one of your contacts, and add it to the Saved page (below). Find new things on the Explore page by tapping the magnifying glass icon at the bottom, you'll be redirected to the Explore page. In Explore, you can scroll through photos/videos of people and hashtags that may not but Instagram thinks you'll be interested. You can search for a specific person or hashtag at the top, and below are recommended categories to filter the page, including things like humor, animals, TV and movies, among others. By default, this is set to For you. Play around Photo Editing tools has been a big part of Instagram for years, and in 2018, that hasn't changed quite a bit. After selecting a photo you want to publish, you can browse through a list of numerous filters. As you tap each, you'll instantly see how it will affect the look of the image. If you don't like any of the filters you're seeing, keep swiping left until you see the Manage button. Tap this and you can add even more to your collection. In addition to filters, tapping the Edit button at the bottom will allow you to fine-tune your photos even more with controls for brightness, contrast, fade, highlights, etc. And, if all else fails, tapping the sun icon at the top of the center will allow you to control the Lux for your site and instantly upgrade up the saturation and brightness for a much more vibrant looking photo. Take advantage of the Saved feature If you come against an Instagram post that you particularly like, it's easy to save it later without notifying anyone. When looking at the mail you want to save, tap the bookmarks icon on the right. Once you do this, head to your profile, tap that same icon once again, and it will be right there for your viewing pleasure. No one is notified when you add their photos to the Saves section, and if you want to go one step further, you can create a collection to categorize the posts you add here. Be sure to check out IGTV This past June, Instagram added one of the biggest new features to its app in years - IGTV. IGTV is Instagram's take on long-form video, and unlike something like YouTube, it's designed around making people create and share vertical video content. You can access IGTV through the main Instagram app or by downloading the independent IGTV, and when you open it, you can browse through videos of people you follow and what is currently trending/popular. IGTV clearly has a long way to go before it's on the same level as YouTube, but even this principle in your life has a lot for it. The interface is easy to understand, it integrates nicely into an app that billions of people are already using, and anyone can make their own IGTV content and manage it through their phone or a web client.
