Understanding and Treating Acromegaly

SOMAVERT® (pegvisomant for injection) is indicated for the treatment of acromegaly in patients who have had an inadequate response to surgery or radiation therapy, or for whom these therapies are not appropriate. The goal of treatment is to normalize serum insulin-like growth factor-I (IGF-I) levels.

IMPORTANT SAFETY INFORMATION FOR SOMAVERT

SOMAVERT is contraindicated in patients with a history of hypersensitivity to any of its components.

Patients on opioids often needed higher serum pegvisomant concentrations to achieve appropriate IGF-I suppression compared with patients not receiving opioids.
About acromegaly

Incidence and prevalence\textsuperscript{1,2}

- The incidence of acromegaly is approximately 3-4 cases per million persons per year
- < 20,000 cases in the United States
- The prevalence is about 60 cases per million
- Men and women are diagnosed equally with acromegaly
- Mean age at diagnosis = 40 years

Types of pituitary tumors\textsuperscript{1,3,4}

- Pituitary tumors account for about 15% of intracranial neoplasms
- Four main pituitary tumors are related to:

\begin{itemize}
  \item Lactotroph (prolactinoma): 40-50%
  \item Corticotroph (Cushing’s): 10-15%
  \item Thyrotroph (hyperthyroid): 1-5%
  \item Somatroph (acromegaly): 30%
\end{itemize}

SOMAVERTE\textsuperscript{\textregistered} (pegvisomant for injection) is indicated for the treatment of acromegaly in patients who have had an inadequate response to surgery or radiation therapy, or for whom these therapies are not appropriate. The goal of treatment is to normalize serum insulin-like growth factor-I (IGF-I) levels.

The most common adverse events (>6% and at frequencies greater than placebo) in 1 of the 3 active treatment arms in a placebo-controlled study (N=112) included infection (23%), pain (14%), nausea (14%), diarrhea (14%), abnormal liver function tests (12%), flu syndrome (12%), and injection-site reaction (11%).
What is acromegaly?  
• Acromegaly (ack-row-meg-uh-lee) is a rare disease. It happens when there is too much growth hormone and the body tissues and organs grow too much.

What is the pituitary gland?  
• The pituitary gland is a tiny organ in the brain. It makes many hormones, including growth hormone. 
• It helps your body maintain normal functions, such as growth in childhood, as well as healthy bones and muscles.

What are pituitary tumors?  
• A pituitary tumor happens when cells in the pituitary gland grow out of control.
• For many patients with acromegaly, the tumor causes their pituitary gland to produce too much growth hormone.

Most pituitary tumors are not malignant
SOMAVERT® (pegvisomant for injection)

In the 12-week fixed-dose pivotal trial...

**SOMAVERT normalized IGF-I levels compared to placebo at each dose**

![Graph showing percentage of patients achieving a normal serum IGF-I at week 12](#)

- Most adverse events did not appear to be dose dependent

**Study description:** Data from the randomized, double-blind, multicenter, fixed-dose, placebo-controlled, 12-week study in 112 patients with acromegaly who were previously treated with surgery, radiation therapy, and/or drug therapy.6

---

**Important safety information regarding liver test monitoring**

Baseline serum alanine aminotransferase (ALT), aspartate aminotransferase (AST), serum total bilirubin (TBIL), and alkaline phosphatase (ALP) levels should be obtained prior to initiating therapy with SOMAVERT. Monitor liver tests based on baseline values and changes during therapy according to the schedule in the full Prescribing Information.

Asymptomatic, transient elevations in transaminases up to 15 times ULN have been observed in <2% of subjects among two open-label trials (with a total of 147 patients). These reports were not associated with an increase in bilirubin. Transaminase elevations normalized with time, most often after suspending treatment. If a patient develops liver test elevations, or any other symptoms of liver dysfunction while receiving SOMAVERT, please see Liver Tests section of the full Prescribing Information.
What causes the signs and symptoms of acromegaly? \(^8\)

- When there is too much growth hormone (GH) in your body, it triggers the body to make too much insulin-like growth factor I (IGF-I)
- This causes organs and tissues to grow too much
- Other signs and symptoms of acromegaly may also appear

Why is it important to control my IGF-I levels if I have acromegaly? \(^9\)

- Keeping IGF-I levels within the normal range for people your age generally:
  - Suggests that your disease is improving or beginning to improve
  - Helps to improve the signs and symptoms of acromegaly

What treatments may help me manage the symptoms of acromegaly? \(^10\)

- For most patients, the first treatment is surgery to remove the tumor or reduce its size
- Many patients also need prescription medicines to help normalize their IGF-I levels
Managing signs and symptoms of acromegaly

In the 12-week fixed-dose pivotal trial...

**SOMAVERT demonstrated clinically significant improvement in signs and symptoms at each dose**

![Graph: Improvement in total signs and symptoms score for all dose levels of SOMAVERT vs placebo at week 12]

- Total score for signs and symptoms was defined as the sum of all scores from 0=absent to 8=worst for the following symptoms: fatigue, excessive perspiration, headache, arthralgia, and soft tissue swelling.
- At 12 weeks, mean % change from baseline increased (worsened) 16% for placebo, and decreased (improved) 8% for 10 mg, 20% for 15 mg, and 33% for 20 mg.
- At 12 weeks, the mean ring size score improved in patients treated with 15 mg or 20 mg of SOMAVERT, compared to placebo.

**Study description:** Data from the randomized, double-blind, multicenter, fixed-dose, placebo-controlled, 12-week study in 112 patients with acromegaly who were previously treated with surgery, radiation therapy, and/or drug therapy.

Total score for signs and symptoms was based on scores for 5 symptoms, each graded in severity from 0 (absent) to 8 (worst). Thus, the total possible score ranged from 0-40. The 5 symptoms graded were fatigue, excessive perspiration, headache, arthralgia, and soft tissue swelling. The mean change from baseline for each dose was calculated by averaging the change in total score at 12 weeks across all patients in that dosing arm. Mean baseline total score for signs and symptoms in all dose groups combined was 15.2.

In a derived post-hoc analysis of the same study...

**91% of patients who achieved normalized IGF-I levels at 12 weeks also experienced improvements in their total acromegaly signs and symptoms score.**

**Study description:** In a derived post-hoc analysis, of the 57 patients who reached a normal IGF-I level and had at least 1 sign or symptom of acromegaly at that time, 91% (52 out of 57 patients) reported improvement in these signs and symptoms during the study.

**IMPORTANT SAFETY INFORMATION FOR SOMAVERT**

Patients on opioids often needed higher serum pegvisomant concentrations to achieve appropriate IGF-I suppression compared with patients not receiving opioids.
Do you suffer from...1,8

- Pain in the joints (such as knees or hips)
- Headaches
- Fatigue (weak muscles)
- Sweating more than normal
- Swelling in your hands or feet
- Increased ring size

Talk to your healthcare professional about your signs and symptoms of acromegaly.

It is important to monitor your symptoms and discuss them with your healthcare professional at each visit.

Please see the Patient Take-Home Information Sheet on the last 2 pages of this booklet.
Study description: An open-label extension to the 12-week pivotal clinical study included 109 subjects (including 6 new patients) with mean treatment exposure of 42.6 weeks (range, 1 day–82 weeks). A total of 100 (92.6%) of the 108 subjects with available IGF-I data had a normal IGF-I concentration at any visit during the study.6

IMPORTANT SAFETY INFORMATION FOR SOMAVERT
In subjects with systemic hypersensitivity reactions, caution and close monitoring should be exercised when re-initiating SOMAVERT therapy. The maximum indicated daily maintenance dose for SOMAVERT is 30 mg.

Lipohypertrophy has been reported in patients treated with SOMAVERT; therefore, injection sites should be rotated daily.
What can I expect from treatment with SOMAVERT?6

The goal of treatment with SOMAVERT is to reach a normal IGF-I level in the blood

In 2 clinical trials, the majority of patients treated with SOMAVERT achieved normal IGF-I levels for their age6

• **82%** of patients treated with 20 mg/day of SOMAVERT achieved normal IGF-I levels in a short-term study at 12 weeks6*
  — In the same short-term study, the total signs and symptoms of acromegaly improved in patients who took SOMAVERT compared with those who didn’t take any medicine
  — This study showed how patients rated the change in their symptoms over time, which included joint pain, headaches, fatigue, excessive sweating, and soft tissue swelling

• **93%** of patients treated with SOMAVERT achieved normal IGF-I levels in a long-term extension study (at 43 weeks)6
  — This data comes from an extension study that followed the original clinical trial and included many of the same patients. These patients had their dose of SOMAVERT changed until it worked best for them

*This data is from a 12-week clinical trial that involved 112 patients with acromegaly: 31 patients received no medicine; 80 were treated with SOMAVERT at one of three doses. Results for patients achieving normal IGF-I levels for their age were as follows: 10% of patients taking no medicine; 39% of those on 10 mg/day of SOMAVERT; 75% of those on 15 mg/day; 82% of those on 20 mg/day.

**IMPORTANT SAFETY INFORMATION**

Blood sugar levels may go down when taking SOMAVERT. Be sure to tell your doctor if you use insulin or other medicines (oral hypoglycemic medicines) for diabetes. The dose of these medicines may need to be reduced when you use SOMAVERT.

The most common side effects with SOMAVERT are infection, pain, nausea, diarrhea, abnormal liver function tests, flu-like symptoms, and reaction at the injection site. These are not all of the possible side effects of SOMAVERT. For more information, speak to your doctor.
How SOMAVERT® (pegvisomant for injection) works

SOMAVERT is a growth hormone receptor antagonist (GHRa)\(^6\)

SOMAVERT selectively binds to GH receptors on cell surfaces
- Blocks the binding of endogenous GH
- Reduces IGF-I production

**Growth Hormone**

- GH
- GH receptor
- IGF-I

**Growth Hormone Receptor antagonist (SOMAVERT)**

- GH
- GHRa
- GH receptor

**IMPORTANT SAFETY INFORMATION FOR SOMAVERT**

Patients with acromegaly and diabetes mellitus being treated with insulin and/or oral hypoglycemic agents may require dose reductions of these therapeutic agents after the initiation of therapy with SOMAVERT.

In subjects with systemic hypersensitivity reactions, caution and close monitoring should be exercised when re-initiating SOMAVERT therapy.
How does SOMAVERT work?[^6]

SOMAVERT is a prescription medicine for acromegaly. It is for patients whose disease has not been controlled by surgery or radiation, or patients for whom these options are not appropriate. The goal of treatment with SOMAVERT is to have a normal IGF-I level in the blood.

**IMPORTANT SAFETY INFORMATION**

Your doctor may do blood tests before and during your treatment with SOMAVERT to check that the IGF-I levels in your blood are normal and/or that your liver is working correctly. Your dose of SOMAVERT may be changed based on the results of these tests.

If you have stopped SOMAVERT because of an allergic reaction, your doctor will carefully monitor what happens if you start SOMAVERT again.

[^6]: This reference seems to be missing, but it is typically followed by additional information or a page number in a formal document.
SOMAVERT® (pegvisomant for injection) Safety Information

INDICATION
SOMAVERT® (pegvisomant for injection) is indicated for the treatment of acromegaly in patients who have had an inadequate response to surgery or radiation therapy, or for whom these therapies are not appropriate. The goal of treatment is to normalize serum insulin-like growth factor-I (IGF-I) levels.

IMPORTANT SAFETY INFORMATION FOR SOMAVERT
SOMAVERT is contraindicated in patients with a history of hypersensitivity to any of its components.

Patients on opioids often needed higher serum pegvisomant concentrations to achieve appropriate IGF-I suppression compared with patients not receiving opioids.

Patients with acromegaly and diabetes mellitus being treated with insulin and/or oral hypoglycemic agents may require dose reductions of these therapeutic agents after the initiation of treatment with SOMAVERT.

Important safety information regarding liver test monitoring
Baseline serum alanine aminotransferase (ALT), aspartate aminotransferase (AST), serum total bilirubin (TBIL), and alkaline phosphatase (ALP) levels should be obtained prior to initiating therapy with SOMAVERT. Monitor liver tests based on baseline values and changes during therapy according to the schedule in the full Prescribing Information.

Asymptomatic, transient elevations in transaminases up to 15 times ULN have been observed in <2% of subjects among two open-label trials (with a total of 147 patients). These reports were not associated with an increase in bilirubin. Transaminase elevations normalized with time, most often after suspending treatment. If a patient develops liver test elevations, or any other symptoms of liver dysfunction while receiving SOMAVERT, please see Liver Tests section of the full Prescribing Information.

In subjects with systemic hypersensitivity reactions, caution and close monitoring should be exercised when re-initiating SOMAVERT therapy.

The most common adverse events (>6% and at frequencies greater than placebo) in 1 of the 3 active treatment arms in a placebo-controlled study (N=112) included infection (23%), pain (14%), nausea (14%), diarrhea (14%), abnormal liver function tests (12%), flu syndrome (12%), and injection-site reaction (11%).

Lipohypertrophy has been reported in patients treated with SOMAVERT; therefore, injection sites should be rotated daily.

The maximum indicated daily maintenance dose for SOMAVERT is 30 mg.

Rx only
**INDICATION**

SOMAVERT is a prescription medicine for acromegaly. It is for patients whose disease has not been controlled by surgery or radiation, or patients for whom these options are not appropriate. The goal of treatment with SOMAVERT is to have a normal IGF-I level in the blood.

**IMPORTANT SAFETY INFORMATION FOR PATIENTS**

Do not use SOMAVERT® (pegvisomant for injection) if you are allergic to SOMAVERT or anything that is in it.

Be sure to tell your doctor if you use narcotic painkillers (opioid medicines) because the dose of SOMAVERT may need to be changed.

Blood sugar levels may go down when taking SOMAVERT. Be sure to tell your doctor if you use insulin or other medicines (oral hypoglycemic medicines) for diabetes. The dose of these medicines may need to be reduced when you use SOMAVERT.

Some people who have used SOMAVERT have developed liver problems. These problems generally disappeared when those people stopped taking SOMAVERT.

Stop the drug right away and call your doctor if you get any of these symptoms:

- Your skin or the white part of your eyes turns yellow (jaundice)
- Your urine turns dark
- Your bowel movements (stools) turn light in color
- You do not feel like eating for several days
- You feel sick to your stomach (nausea)
- You have unexplained tiredness
- You have pain in the stomach area (abdomen)

Your doctor may do blood tests before and during your treatment with SOMAVERT to check that the IGF-I levels in your blood are normal and/or that your liver is working correctly. Your dose of SOMAVERT may be changed based on the results of these tests.

If you have stopped SOMAVERT because of an allergic reaction, your doctor will carefully monitor what happens if you start SOMAVERT again.

The most common side effects with SOMAVERT are infection, pain, nausea, diarrhea, abnormal liver function tests, flu-like symptoms, and reaction at the injection site. These are not all of the possible side effects of SOMAVERT. For more information, speak to your doctor.

Inject SOMAVERT in a different place on your body each day. This can help prevent skin problems such as lumpiness or soreness. SOMAVERT has not been studied in pregnant women. It is not known if SOMAVERT passes into the mother’s milk or if it can harm the baby.

You are encouraged to report negative side effects of prescription drugs to the FDA. Visit www.fda.gov/medwatch or call 1-800-FDA-1088.

The recommended loading dose of SOMAVERT is 40 mg given subcutaneously, under physician supervision (2.1). After proper injection instruction, on day after loading dose, patients or caregivers begin daily subcutaneous injections of 10 mg (2.1). Adjust dosage in 5 mg increments or decrements until serum IGF-I concentrations are maintained within age-adjusted normal range. Do not adjust dosage based on growth hormone (GH) levels or signs of acromegaly (2.1). Dosage range is 10 to 30 mg once daily (2.1). Perform liver tests prior to first dosage and if greater than 3 time upper limit of normal should work-up prior to SOMAVERT administration (2.2). Follow reconstitution and injection procedures (2.3, 2.4).

**Dosage and Administration**

- Administer a 40 mg loading dose subcutaneously under physician supervision (2.1).
- After proper injection instruction, on day after loading dose, patients or caregivers begin daily subcutaneous injections of 10 mg (2.1).
- Adjust dosage in 5 mg increments or decrements until serum IGF-I concentrations are maintained within age-adjusted normal range. Do not adjust dosage based on growth hormone (GH) levels or signs of acromegaly (2.1).
- Dosage range is 10 to 30 mg once daily (2.1).
- Perform liver tests prior to first dosage and if greater than 3 time upper limit of normal should work-up prior to SOMAVERT administration (2.2).
- Follow reconstitution and injection procedures (2.3, 2.4).

### Dosage Forms and Strengths

For injection: 10, 15, 20, 25 or 30 mg (as protein) lyophilized powder in single-use vial for reconstitution (3).

### Contraindications

None (4)

### Warnings and Precautions

- Liver Test Elevations: Should have more frequent liver tests and/or discontinue SOMAVERT (5.2).

### Adverse Reactions

To report SUSPECTED ADVERSE REACTIONS, contact Pfizer at (phone 1-800-438-1985 and www.pfizer.com) or FDA at 1-800-FDA-1088 or www.fda.gov/medwatch.

### Drug Interactions

- Insulin and/or Oral hypoglycemic Agents: Patients with acromegaly and with diabetes mellitus may require careful monitoring and dose reductions of insulin and/or oral hypoglycemic agents.
- Opioids: Patients on opioids may need higher SOMAVERT doses to achieve appropriate IGF-I suppression. (7.2)

### Use in Specific Populations

- Pregnancy
- Nursing Mothers
- Pediatric Use
- Geriatric Use
- Renal Impairment

### Overdosage

Contact your healthcare provider.

### Descriptions

SOMAVERT is a growth hormone receptor antagonist indicated for the treatment of acromegaly in patients who have had an inadequate response to surgery or radiation therapy, or for whom these therapies are not appropriate. The goal of treatment is to normalize serum insulin-like growth factor-I (IGF-I) levels.

### Indications and Usage

SOMAVERT is indicated for the treatment of acromegaly in patients who have had an inadequate response to surgery or radiation therapy, or for whom these therapies are not appropriate. The goal of treatment is to normalize serum insulin-like growth factor-I (IGF-I) levels.

### Dosage and Administration

The recommended loading dose of SOMAVERT is 40 mg given subcutaneously, under healthcare provider supervision. Provide proper training in subcutaneous injection technique to patients or their caregivers so they can receive once daily subcutaneous injections. On the next day following the loading dose, instruct patients or their caregivers to begin daily subcutaneous injections of 10 mg of SOMAVERT.

Titrating the dose to normalize serum IGF-I concentrations (serum IGF-I concentrations should be measured every four to six weeks). The dose should not be based on growth hormone (GH) concentrations or signs and symptoms of acromegaly. It is unknown whether patients who remain symptomatic while achieving normalized IGF-I concentrations would benefit from increased SOMAVERT dosage.

- Increase the dosage by 5 mg increments every 4-6 weeks if IGF-I concentrations are elevated.
- Decrease the dosage by 5 mg decrements every 4-6 weeks if IGF-I concentrations are below the normal range.
- IGF-I levels should also be monitored when a Somavert dose given in multiple injections is converted to a single daily injection (see CLINICAL PHARMACOLOGY (12)).

The recommended dosage range is between 10 to 30 mg given subcutaneously once daily and the maximum daily dosage is 30 mg given subcutaneously once daily.

### 2.2 Assess Liver Tests Prior to Initiation of SOMAVERT

Prior to the start of SOMAVERT, patients should have an assessment of baseline levels of liver tests (serum alanine aminotransferase [ALT], aspartate aminotransferase [AST], serum total bilirubin [TBIL], and alkaline phosphatase [ALP]). For recommendations regarding initiation of SOMAVERT based on baseline liver tests and recommendations for monitoring of liver tests while on SOMAVERT, refer to Table 1 in Warning and Precautions (5.2).

### 2.3 Loading Dose Injection Procedure

The following instructions are for the healthcare provider to reconstitute and prepare the 40 mg loading dose. The healthcare provider will need to reconstitute 1 vial of lyophilized powder of SOMAVERT containing 20 mg of pegvisomant with supplied diluent (two vials of lyophilized powder and two vials of diluent will be needed for the 40 mg loading dose). The healthcare provider will also need to inject the reconstituted SOMAVERT solution twice into the patient’s upper arm, upper thigh, abdomen, or buttocks (each injection in a different area).

(a) Before administering the loading dose, remove the first package (1 vial of lyophilized powder of SOMAVERT containing 20 mg of pegvisomant and 1 vial containing the diluent) from the refrigerator about 10 minutes prior to the planned injection time.

(b) Withdraw 1 mL of the supplied diluent (Sterile Water for Injection) and inject slowly onto the sides of the vial containing lyophilized powder of SOMAVERT. Do not inject the diluent directly on the powder.

(c) Do not invert the vial or shake the solution as this may cause denaturation of the pegvisomant protein. Slowly swirl the solution to ensure that all of the lyophilized powder has gone into solution. If foaming of the reconstituted SOMAVERT solution is seen, the solution is likely damaged and therefore inappropriate to inject.

(d) Visually inspect the reconstituted SOMAVERT solution for particulate matter and discoloration prior to administration. The reconstituted solution should be clear. If the solution is cloudy, do not use it. Once reconstituted, the solution will contain 20 mg of pegvisomant in 1 mL of solution.

(e) Withdraw the 1 mL reconstituted SOMAVERT solution. The solution must be administered within 6 hours of reconstitution.

(f) Inject the first reconstituted SOMAVERT solution (20 mg/mL) subcutaneously into the patient’s upper arm, upper thigh, abdomen, or buttocks using a 90-degree angle.

(g) Repeat steps (a) to (e) to reconstitute the second Somavert dose of 20 mg/mL.

(h) Finally, inject the second reconstituted SOMAVERT solution (20 mg/mL) subcutaneously into the patient’s upper arm, upper thigh, abdomen, or buttocks using a 90-degree angle (different area than the first injection).

### 2.4 Maintenance Dose Injection Procedure

For patient or caregiver instructions for reconstitution and administration of daily doses (10 to 30 mg), see the Patient’s Instructions for Use.

(a) Before administering the dose, remove one package (1 vial of lyophilized powder of SOMAVERT containing 10, 15, 20, 25 or 30 mg of pegvisomant and 1 vial containing the diluent) from the refrigerator about 10 minutes prior to the planned injection time.

(b) Withdraw 1 mL of the supplied 5 mL diluent (Sterile Water for Injection) and inject slowly onto the sides of the vial containing lyophilized powder of SOMAVERT. Do not inject the diluent directly on the powder.

(c) Do not invert the vial or shake the solution as this may cause denaturation of the pegvisomant protein. Slowly swirl the solution to ensure that all of the lyophilized powder has gone into solution. If foaming of the reconstituted SOMAVERT solution is seen, the solution is likely damaged and therefore inappropriate to inject.

(d) Visually inspect the reconstituted SOMAVERT solution for particulate matter and discoloration prior to administration. The reconstituted solution should be clear. If the solution is cloudy, do not use it. Once reconstituted, the solution will contain 10, 15, 20, 25 or 30 mg of pegvisomant in 1 mL of solution.
e) Withdraw the 1 mL reconstituted SOMAVERT solution. The solution must be administered within 6 hours of reconstitution.

f) Inject the reconstituted SOMAVERT solution subcutaneously into the upper arm, upper thigh, abdomen, or buttocks using a 90-degree angle.

3 Dose forms and Strengths

For injection: 10 mg, 15 mg, 20 mg, 25 mg, and 30 mg lyophilized powder in a single-use vial for reconstitution with supplied Sterile Water for Injection, in a separate glass vial.

4 CONTRAINDICATIONS

None.

5 WARNINGS AND PRECAUTIONS

5.1 Hypoglycemia associated with GH lowering in patients with Diabetes Mellitus

GH opposes the effects of insulin on carbohydrate metabolism by decreasing insulin sensitivity; thus, glucose tolerance may improve in some patients treated with SOMAVERT. Patients should be carefully monitored and dosed of anti-diabetic drugs reduced as necessary to avoid hypoglycemia in patients with diabetes mellitus.

5.2 Liver Test Elevations

Baseline serum alanine aminotransferase (ALT), aspartate aminotransferase (AST), serum total bilirubin (TBIL), and alkaline phosphatase (ALP) levels should be obtained prior to initiating therapy with SOMAVERT. Table 1 lists recommendations regarding initiation of treatment with SOMAVERT, based on the results of these liver tests (LTs).

Asymptomatic, transient elevations in transaminases up to 15 times ULN have been observed in < 2% of subjects among two open-label trials (with a total of 147 patients). These reports were not associated with an increase in bilirubin. Transaminase elevations normalized with time, most often within 4 to 12 weeks of initiation of therapy, and were not associated with any identifiable biochemical, phenotypic, or genetic predictors.

In a 12-week randomized, placebo-controlled, double-blind, fixed-dose study of SOMAVERT in subjects with acromegaly, 32 subjects received placebo and 80 subjects received SOMAVERT once daily as 10 mg/day. The subject recovered while on treatment. Among two patients with minimal associated increases in ALP levels (i.e., less than 3 times ULN), the transaminase elevations did not appear to be related to the dose of SOMAVERT administered, generally occurred within 4 to 12 weeks of initiation of therapy, and were not associated with any identifiable biochemical, phenotypic, or genetic predictors.

Table 1. Recommendations of Initiating SOMAVERT Based on Baseline LTs and Periodic Monitoring of LTs During SOMAVERT Treatment

<table>
<thead>
<tr>
<th>Baseline LT Levels</th>
<th>Recommendations</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normal</td>
<td>• May treat with SOMAVERT.</td>
</tr>
<tr>
<td></td>
<td>• Monitor LTs at monthly intervals during the first 6 months of treatment, quarterly for the next 6 months and then bi-annually for the next year.</td>
</tr>
<tr>
<td>Elevated, but less than or equal to 5 times ULN</td>
<td>May treat with SOMAVERT; however, monitor LTs monthly for at least one year after initiation of therapy and then bi-annually for the next year.</td>
</tr>
<tr>
<td>Greater than 3 times ULN</td>
<td>• Do not treat with SOMAVERT until a comprehensive workup establishes the cause of the patient’s liver dysfunction.</td>
</tr>
<tr>
<td></td>
<td>• If the decision is to treat, LTs and clinical symptoms should be monitored very closely.</td>
</tr>
</tbody>
</table>

If a patient develops LT elevations, or any other signs or symptoms of liver dysfunction while receiving SOMAVERT, the following patient management is recommended (Table 2). Table 2. Clinical Recommendations Based on Liver Test Results While on SOMAVERT

<table>
<thead>
<tr>
<th>LT Levels and Clinical Signs/Symptoms</th>
<th>Recommendations</th>
</tr>
</thead>
<tbody>
<tr>
<td>Greater than or equal to 3 but less than 5 times ULN (without signs/symptoms of hepatitis or other liver injury, or increase in serum TBIL)</td>
<td>• May continue therapy with SOMAVERT. However, monitor LTs weekly to determine if further increases occur (see below).</td>
</tr>
<tr>
<td></td>
<td>• Perform a comprehensive hepatic workup to discern if an alternative cause of liver dysfunction is present.</td>
</tr>
<tr>
<td>At least 5 times ULN, or transaminase elevations at least 3 times ULN associated with any increase in serum TBIL (with or without signs/symptoms of hepatitis or other liver injury)</td>
<td>• Discontinue SOMAVERT immediately.</td>
</tr>
<tr>
<td></td>
<td>• Perform a comprehensive hepatic workup, including serial LTs, to determine if and when serum levels return to normal.</td>
</tr>
<tr>
<td></td>
<td>• LTs normalize (regardless of whether an alternative cause of the liver dysfunction is discovered), consider cautious re-initiation of therapy with SOMAVERT, with frequent LT monitoring.</td>
</tr>
<tr>
<td>Signs or symptoms suggestive of hepatitis or other liver injury (e.g., jaundice, bilirubinuria, fatigue, nausea, vomiting, right upper quadrant pain, ascites, unexplained edema, easy bruisingability)</td>
<td>• Immediately perform a comprehensive hepatic workup.</td>
</tr>
<tr>
<td></td>
<td>• If liver injury is confirmed, the drug should be discontinued.</td>
</tr>
</tbody>
</table>

6 Adverse Reactions

Clinical significant adverse reactions that appear in other sections of this labeling include:

- Hypoglycemia associated with GH lowering in patients with Diabetes Mellitus [see Warnings and Precautions (5.1)]
- Liver test elevations [see Warnings and Precautions (5.2)]
- Cross-reactivity with GH assay [see Warnings and Precautions (5.3)]
- Lipohypertrophy [see Warnings and Precautions (5.4)]
- Systemic hypersensitivity [see Warnings and Precautions (5.5)]

Elevations of serum concentrations of ALT and AST greater than ten times the ULN were reported in two patients (0.8%) exposed to SOMAVERT in pre-approval clinical studies. One patient was rechallenged with SOMAVERT, and the recurrence of elevated transaminase levels suggested a probable causal relationship between administration of the drug and the elevation in liver enzymes. A liver biopsy performed on the second patient was consistent with chronic hepatitis of unknown etiology. In both patients, the transaminase elevations normalized after discontinuation of the drug.

Advantages clinical trials are conducted under widely varying conditions, adverse reactions rates observed in clinical trials of a drug cannot be directly compared to rates in clinical trials of another drug and may not reflect the rates observed in practice.

In a 12-week randomized, placebo-controlled, double-blind, fixed-dose study of SOMAVERT in subjects with acromegaly, 32 subjects received placebo and 80 subjects received SOMAVERT once daily as 10 mg/day. The subject recovered while on treatment. Among two patients with minimal associated increases in ALP levels (i.e., less than 3 times ULN), the transaminase elevations did not appear to be related to the dose of SOMAVERT administered, generally occurred within 4 to 12 weeks of initiation of therapy, and were not associated with any identifiable biochemical, phenotypic, or genetic predictors.

6.1 Clinical Trials Experience

Because clinical trials are conducted under widely varying conditions, adverse reactions rates observed in clinical trials of a drug cannot be directly compared to rates in clinical trials of another drug and may not reflect the rates observed in practice.

In a 12-week randomized, placebo-controlled, double-blind, fixed-dose study of SOMAVERT in subjects with acromegaly, 32 subjects received placebo and 80 subjects received SOMAVERT once daily as 10 mg/day. The subject recovered while on treatment. Among two patients with minimal associated increases in ALP levels (i.e., less than 3 times ULN), the transaminase elevations did not appear to be related to the dose of SOMAVERT administered, generally occurred within 4 to 12 weeks of initiation of therapy, and were not associated with any identifiable biochemical, phenotypic, or genetic predictors.

</table>

\*Table includes only those events that were reported in at least 2 patients and at a higher incidence in patients treated with SOMAVERT than in patients treated with placebo.

The data above reflect the percentage of patients whose test results were considered positive for antibodies to SOMAVERT. The detection of antibody formation is highly dependent on the sensitivity and specificity of the assay. Additionally, the observed incidence of antibody positivity in an assay may be influenced by several factors including sample handling, timing of sample collection, concomitant medications, and underlying disease. For these reasons, comparison of the incidence of antibodies to SOMAVERT with the incidence of antibodies to other products may be misleading.

6.2 Immunogenicity

In pre-marketing clinical studies, approximately 17% of the SOMAVERT-treated patients developed low titer, non-neutralizing anti-GH antibodies. Although the presence of these antibodies did not appear to impact the efficacy of SOMAVERT, the long-term clinical significance of these antibodies is not known. No assay for anti-p pegvisomant antibodies is commercially available for patients receiving SOMAVERT.

The data above reflect the percentage of patients whose test results were considered positive for antibodies to SOMAVERT. The detection of antibody formation is highly dependent on the sensitivity and specificity of the assay. Additionally, the observed incidence of antibody positivity in an assay may be influenced by several factors including sample handling, timing of sample collection, concomitant medications, and underlying disease. For these reasons, comparison of the incidence of antibodies to SOMAVERT with the incidence of antibodies to other products may be misleading.

6.3 Postmarketing Experience

The following adverse reactions have been identified during post-approval use of SOMAVERT. Because these reactions are reported voluntarily from a population of uncertain size, it is not always possible to reliably estimate their frequency or establish a causal relationship to drug exposure.

Systemic hypersensitivity reactions including anaphylactic reactions, laryngospasm, angioedema, generalized skin reactions (rash, erythema, pruritus, urticaria) have been reported in post-marketing use. Some patients required hospitalization. Symptoms did not re-occur in all patients after re-challenge. See Warnings and Precautions (5.5).

Registry of Patients with Acromegaly Treated with SOMAVERT

ACROSTUDY is an international observational registry that captures long term safety data in patients with acromegaly treated with SOMAVERT, as used in clinical practice. Treatment dose and schedule were at the discretion of each treating physician. Although safety monitoring as per the recommended schedule was mandatory, not all assessments were performed at all time points for every patient. Because of this, comparison of rates of adverse events to those in the original clinical trial is not appropriate. In an interim report, there were 1288 patients enrolled (mean duration of treatment 3.7 years).
At the start of SOMAVERT treatment 648 patients were on SOMAVERT monotherapy for acromegaly. Of the 454 patients who had a normal AST and ALT at baseline, 4 patients had elevated tests >3 times ULN, two of whom had elevated tests >5 times ULN. Lipohypertrophy was reported in 6 (0.5%) patients. MRIIs were compared to any previous ones, and a change in tumor volume was reported as significant locally only if the diameter increased by more than 3 mm for microadenomas or volume increased by more than 20% for macroadenomas. All MRI changes considered significant at the local reading were reanalyzed centrally. Of the 747 patients who had a MRI reported at baseline and at least once during follow up in the study, 51 (7%) were reported to have an increase by local MRI. Of these, 16 patients (2%) had confirmation of this increase, 6 patients had a decrease, 12 had “no change”, there was 1 with insufficient data and 16 patients did not have a central MRI reading.

7 DRUG INTERACTIONS

7.1 Insulin and/or Oral hypoglycemic Agents

After initiation of SOMAVERT, patients with acromegaly and diabetes mellitus treated with insulin and/or oral hypoglycemic agents may require dose reductions of insulin and/or oral hypoglycemic agents [see Warnings and Precautions (5.1)].

7.2 Opioids

In clinical studies, patients taking opioids often needed higher SOMAVERT doses to normalize IGF-I concentrations compared with patients not receiving opioids. The mechanism of this interaction is not known.

8 USE IN SPECIFIC POPULATIONS

8.1 Pregnancy

Pregnancy Category C. There are no adequate and well-controlled studies in pregnant women. Early embryonic development and teratology studies were conducted in pregnant rabbits with pegvisomant at subcutaneous doses of 1, 3, and 10 mg/kg/day. There was no evidence of teratogenic effects associated with pegvisomant treatment during organogenesis. At the 10-mg/kg/day dose (10 times the maximum human therapeutic dose based on body surface area), a reproducible, slight increase in post-implantation loss was observed in both studies. Because animal reproduction studies are not always predictive of human responses, SOMAVERT should be used during pregnancy only if clearly needed.

8.3 Nursing Mothers

It is not known whether pegvisomant is excreted in human milk. Because many drugs are excreted in milk, caution should be exercised when SOMAVERT is administered to a nursing woman.

8.4 Pediatric Use

The safety and effectiveness of SOMAVERT in pediatric patients have not been established.

8.5 Geriatric Use

Clinical studies of SOMAVERT did not include sufficient numbers of patients aged 65 and over to determine whether they respond differently from younger patients. In general, dose selection for an elderly patient should be cautious, usually starting at the low end of the dosing range, reflecting the greater frequency of decreased hepatic, renal, or cardiac function, and of concomitant disease or other drug therapy.

8.6 Renal Impairment

SOMAVERT was not studied in patients with renal impairment and the safety and efficacy in these patients is not known.

10 OVERDOSAGE

In one reported incident of acute overdose with SOMAVERT during pre-marketing clinical studies, a patient self-administered 80 mg/day (2.7 times the maximum recommended maintenance dosage) for seven days. The patient experienced a slight increase in fatigue, had no other complaints, and rapidly improved after discontinuation of therapy. There was no evidence of a toxic effect of pegvisomant following acute overdose. The mean apparent volume of distribution of pegvisomant is 7 L (12% coefficient of variation), suggesting that pegvisomant does not distribute extensively into tissues. After a single subcutaneous administration, exposure (Cmax, AUC) to pegvisomant increases disproportionately with increasing dose. Mean ± SEM serum pegvisomant concentrations after 12 weeks of therapy with daily doses of 10, 15, and 20 mg were 6600 ± 1330, 16000 ± 2200, and 27000 ± 3100 ng/mL, respectively.

12 CLINICAL PHARMACOLOGY

12.1 Mechanism of Action

Pegvisomant selectively binds to growth hormone (GH) receptors on cell surfaces, where it blocks the binding of endogenous GH, and thus interferes with GH signal transduction. Inhibition of GH action results in decreased serum concentrations of IGF-I, as well as other GH-responsive serum proteins such as free IGF-I, the acid-labile subunit of IGF-I (ALS), and insulin-like growth factor binding protein-3 (IGFBP-3).

12.2 Pharmacodynamics

Pegvisomant binds selectively to the GH receptor, and does not cross-react with 19 other cytokine receptors tested, including prolactin. Pegvisomant leads to decreased serum concentrations of IGF-I, free IGF-I, ALS, and IGFBP-3 [see Clinical Studies (14, Figure 1)].

12.3 Pharmacokinetics

Distribution: The mean apparent volume of distribution of pegvisomant is 7 L (12% coefficient of variation), suggesting that pegvisomant does not distribute extensively into tissues. After a single subcutaneous administration, exposure (Cmax, AUC) to pegvisomant increases disproportionately with increasing dose. Mean ± SEM serum pegvisomant concentrations after 12 weeks of therapy with daily doses of 10, 15, and 20 mg were 6600 ± 1330, 16000 ± 2200, and 27000 ± 3100 ng/mL, respectively.

13 NONCLINICAL TOXICOLOGY

13.1 Carcinogenesis, Mutagenesis, Impairment of Fertility

Carcinogenesis

Pegvisomant was administered subcutaneously to rats daily for 2 years at doses of 2, 8 and 20 mg/kg (about 2, 10 and 25-fold a single 20 mg dose in humans on an AUC basis). Long term treatment with pegvisomant at 8 and 20 mg/kg caused an increase in malignant fibrous histiocytoma at injection sites. Injection site tumors were not seen in female rats at the same doses. The increased incidence of injection site tumors was most probably caused by irritation and the high sensitivity of the rat to repeated subcutaneous injections.

Mutagenesis

Pegvisomant did not cause genetic damage in standard in vitro assays (bacterial mutation, human lymphocyte chromosome aberration).

Impairment of Fertility

Pegvisomant was found to have no effect on fertility or reproductive performance of female rabbits at subcutaneous doses up to 10 mg/kg/day (10-fold the recommended human dose on a body surface area basis)
A total of one hundred twelve patients (63 men and 49 women) with acromegaly participated in a 12-week, randomized, double-blind, multi-center study comparing placebo and SOMAVERT. The mean ± SD age was 48±14 years, and the mean duration of acromegaly was 8±8 years. Ninety three had undergone previous pituitary surgery, of which 57 had also been treated with conventional radiation therapy. Six patients had undergone irradiation without surgery, nine had received only drug therapy, and four had received no previous therapy. At study start, the mean ± SD time since the subjects’ last surgery and/or irradiation therapy, respectively, was 6.8 ± 0.93 years (n=63) and 5.6 ± 0.57 years (n=93).

Subjects were qualified for enrollment if their serum IGF-I, drawn after the required drug washout period, was ≥1.3 times the upper limit of the age-adjusted normal range. They were randomly assigned at the baseline visit to one of four treatment groups: placebo (n=32), 10 mg/day (n=28), 15 mg/day (n=26), or 20 mg/day (n=28) of SOMAVERT subcutaneously IGF-I. The primary efficacy endpoint was IGF-I percent change in IGF-I concentrations from baseline to week 12. The three groups that received SOMAVERT showed statistically significant (p<0.01) reductions in serum levels of IGF-I compared with the placebo group (Table 4).

* P<0.01; n=number of patients; SD = standard deviation

There were also reductions in serum levels of free IGF-I, IGFBP-3, and ALS compared with placebo at all post-baseline visits (Figure 1).

![Figure 1. Effects of SOMAVERT on Serum Markers (Mean ± Standard Error)](image)

In the open-label extension to the clinical study, 109 subjects (including 6 new patients) with mean treatment exposure of 42.6 weeks (range 1 day – 82 weeks), 93 (85.3%) subjects had an adverse event. 16 (14.7%) had an SAE, and 4 (3.7%) discontinued due to an AE (headaches, elevated liver function tests, pancreatic cancer, and weight gain). A total of 100 (92.6%) of the 108 subjects with available IGF-I data had a normal IGF-I concentration at any visit during the study.

**16 HOW SUPPLIED/STORAGE AND HANDLING**

SOMAVERT (pegvisomant) is supplied in the following strengths and package configurations:

<table>
<thead>
<tr>
<th>Package Configuration</th>
<th>NDC 6 mL vial</th>
<th>NDC 8 mL vial</th>
</tr>
</thead>
<tbody>
<tr>
<td>Single 10 mg dose vial</td>

<tr>
<td>Single 30 mg dose vial</td>
<td>NDC 0009-5200-01</td>
<td>NDC 0009-5200-02</td>
</tr>
</tbody>
</table>

Each package of SOMAVERT also includes a single-dose vial containing Sterile Water for Injection, USP. Storage: Prior to reconstitution, SOMAVERT should be stored in a refrigerator at 2 to 8°C (36 to 46°F). Do not freeze.

**17 PATIENT COUNSELING INFORMATION**

See FDA-approved patient labeling (Patient Information and Instructions for Use). Inform patients (and/or their caregivers) of the following information to aid in the safe and effective use of SOMAVERT:

**Not to use SOMAVERT if they are allergic to SOMAVERT or anything in it.**

- They will need blood testing to check IGF-I levels and liver tests before and during treatment with SOMAVERT and that the dose of SOMAVERT may be changed based on the results of these tests.
- SOMAVERT has not been studied in pregnant women and instruct them to notify their healthcare provider as soon as they are aware that they are pregnant.
- It is not known whether SOMAVERT is excreted in human milk and instruct them to notify their healthcare provider if they plan to do so.

Advise patients (and/or their caregivers) of the following adverse reactions:

- The most common reported adverse reactions are injection site reaction, elevations of liver tests, pain, nausea, and diarrhea.
- If they have liver test elevations they may need to have more frequent liver tests and/or discontinue SOMAVERT. Instruct patients to immediately discontinue therapy and contact their physician if they become jaundiced.
- GH-secreting tumors may enlarge in people with acromegaly and that these tumors need to be watched carefully and monitored by MRI imaging.
- Thickening under the skin may occur at the injection site that could lead to lumps and that switching sites may prevent or lessen this.
- If they have diabetes mellitus, they may require careful monitoring and dose reductions of insulin and/or oral hypoglycemic agents while on SOMAVERT.
- If they take opioids, they may need higher SOMAVERT doses to achieve appropriate IGF-I suppression.
Before you use SOMAVERT, tell your healthcare provider if you:

What should I tell my healthcare provider before I use SOMAVERT?

It is not known if SOMAVERT is safe and effective in children.

SOMAVERT is a prescription medicine used to treat people who have too much growth hormone (acromegaly). SOMAVERT is used to treat people who are not able to be treated or have not already been helped by surgery or radiation.

It is not known if SOMAVERT is safe and effective in children.

What is SOMAVERT?

SOMAVERT is a prescription medicine used to treat people who have too much growth hormone (acromegaly). SOMAVERT is used to treat people who are not able to be treated or have not already been helped by surgery or radiation.

What should I tell my healthcare provider before I use SOMAVERT?

Before you use SOMAVERT, tell your healthcare provider if you:

- are allergic to pegvisomant or any of the ingredients in SOMAVERT.

- have diabetes

- have or have had liver problems

- are pregnant or plan to become pregnant. It is not known if SOMAVERT will harm your unborn baby. Tell your healthcare provider if you become pregnant while using SOMAVERT.

- are breastfeeding or plan to breastfeed. It is not known if SOMAVERT passes into your breast milk. You and your healthcare provider should decide if you will take SOMAVERT or breastfeed.

Tell your healthcare provider about all the medicines you take, including prescription and non-prescription medicines, vitamins, and herbal supplements.

SOMAVERT may affect the way other medicines work, and other medicines may affect how SOMAVERT works. Especially tell your healthcare provider if you take:

- insulin or other medicines used to treat diabetes

- narcotics (opioid medicines). Your healthcare provider may change your dose of SOMAVERT if you take opioids.

If you are not sure, ask your healthcare provider or pharmacist whether you take these medicines.

Know the medicines you take. Keep a list of all the medicines you take to show your healthcare providers and pharmacists when you get a new medicine.

How should I use SOMAVERT?

- Read the Instructions for Use at the end of this Patient Information for information about the right way to use SOMAVERT.

- Your healthcare provider should do blood tests to check your liver and insulin-like growth factor-I (IGF-I) levels before you start and while you use SOMAVERT. Your healthcare provider may need to change your dose of SOMAVERT.

- SOMAVERT is given 1 time each day as an injection under your skin (subcutaneous). Some people may need to give 2 injections for their dose each day. Your healthcare provider will tell you if you need to give 2 injections for your dose.

- Your first injection of SOMAVERT should be given by your healthcare provider.

- Your healthcare provider will teach you or your caregiver how to use SOMAVERT.

- If you use too much SOMAVERT, call your healthcare provider right away.

- If you miss a dose of SOMAVERT, just take the next dose at the regular time. Do not take 2 doses at the same time. If you are not sure about your dosing, ask your healthcare provider.

What are the possible side effects of SOMAVERT?

SOMAVERT may cause serious side effects, including:

- changes in your blood sugar level. Your healthcare provider may change your dose of diabetes medicine while you take SOMAVERT.

- liver problems. Stop injecting SOMAVERT right away and call your healthcare provider if you have any of the following symptoms of liver problems:
  - yellowing of your eyes (jaundice)
  - dark, amber-colored urine
  - feeling very tired (fatigue or exhaustion)
  - nausea and vomiting
  - pain in your stomach area (abdomen)
  - generalized swelling
  - bruising easily

- skin thickening at your injection site that could lead to lumps (lipohypertrophy)

- allergic reactions. Call your healthcare provider right away if you have any of the following symptoms of a serious allergic reaction:
  - swelling of your face, tongue, or throat
  - wheezing or trouble breathing
  - skin rash, redness, or swelling
  - severe itching
  - dizziness or fainting

The most common side effects of SOMAVERT include:

- pain
- infection
- nausea
- flu syndrome
- injection site reaction
- diarrhea
- abnormal liver tests. If your liver test results are too high you may have to have more frequent liver tests.

These are not all of the possible side effects of SOMAVERT. For more information, ask your healthcare provider or pharmacist.

Tell your healthcare provider if you have any side effect that bothers you or that does not go away.

Call your doctor for medical advice about side effects. You may report side effects to FDA at 1-800-FDA-1088.

How should I store SOMAVERT?

- Before you mix the SOMAVERT powder and the liquid:
  - Store SOMAVERT in a refrigerator between 36°F to 46°F (2°C to 8°C).
  - Do not freeze SOMAVERT.

- After you mix the SOMAVERT powder and liquid:
  - Keep the mixed SOMAVERT at room temperature between 59°F to 77°F (15°C to 25°C).
  - Keep SOMAVERT inside the vial or the syringe until you are ready to inject it.
  - You must use the mixed SOMAVERT within 6 hours after you mix it.
  - If you have not used the mixed SOMAVERT within 6 hours, throw the SOMAVERT away.

Keep SOMAVERT and all medicines out of the reach of children.

What are the ingredients in SOMAVERT?

Active ingredient: pegvisomant, including polyethylene glycol

Inactive ingredients: glycine, mannitol, sodium phosphate dibasic anhydrous, and sodium phosphate monobasic monohydrate
INSTRUCTIONS FOR USE
SOMAVERT® (SOM-ah-vert)
(pegvisomant for injection)

Note:
• SOMAVERT is for use under the skin only (subcutaneous).
• Do not share your SOMAVERT syringes or needles with anyone else. You may give an infection to them or get an infection from them.

Supplies you need to give each injection of SOMAVERT. See Figure A.
• 1 package of SOMAVERT that contains:
  ○ 1 vial of powdered SOMAVERT medicine (powder vial)
  ○ 1 vial of liquid (diluent) labeled “Sterile Water for Injection, USP” to mix the powdered medicine
The vials in the package of SOMAVERT have stoppers that are not made with natural rubber latex.
The SOMAVERT package does not come with syringes and needles.
• a 1 mL syringe with a 21 gauge to 27 gauge needle that is at least 1 inch long. This is the syringe and needle needed to mix the medicine (diluent syringe).
• a 1 mL insulin syringe with attached needle. This is the syringe needed for your injection.
• 2 alcohol swabs
• 1 small clean, dry cotton pad
• 1 sharps disposal container for throwing away used needles and syringes. See “Disposing of used needles and syringes” at the end of these instructions.
• a clean, flat surface to work on, like a table

Preparing and mixing your SOMAVERT medicine
The SOMAVERT medicine comes as a dry powder. Before you use SOMAVERT, you must mix the dry powder with the vial of diluent that comes in the SOMAVERT package.
Do not use any other liquid to mix the medicine.
Note: If you need to give 2 injections for your SOMAVERT dose, you need 2 packages of SOMAVERT to prepare 2 separate vials of medicine.

Step 1. Remove 1 package of SOMAVERT from the refrigerator about 10 minutes before you plan to give your SOMAVERT injection. Let the SOMAVERT stand at room temperature to warm up the medicine.
Step 2. Wash your hands with soap and warm water. Dry your hands well.
Step 3. Remove the plastic caps from the tops of the powder vial and the diluent vial. See Figure B.
Do not touch the rubber vial stoppers. The stoppers are clean. If the stoppers are touched by anything, you must clean them with an alcohol swab before use.

Step 4. Carefully remove the cap from the diluent syringe with the larger needle and set the cap aside on the table. See Figure C.

Step 5. Pull the plunger of the diluent syringe out to the 1 mL mark. With 1 hand, firmly hold the vial of diluent. With the other hand, push the needle of the diluent syringe straight through the center of the rubber stopper and deep into the vial. Gently push the plunger in until the air is injected into the vial. See Figure D.

Step 6. Firmly hold the diluent vial and syringe together, with the needle still deeply inserted into the vial. Carefully turn the vial and diluent syringe together upside down. Hold them at eye level. See Figure E.

Step 7. Slide 1 hand carefully down the diluent vial so you can firmly hold the neck of the vial with your thumb and forefinger. Hold the upper part of the syringe with your other fingers. With the other hand, slowly pull the plunger out to the 1 mL mark on the diluent syringe. See Figure F.

Step 8. Check the diluent syringe for air bubbles. If you see bubbles, tap the diluent syringe barrel until the bubbles rise to the top of the syringe. Carefully push the plunger in to push only the air bubbles back into the vial. See Figure G. If you push too much of the liquid back into the vial, pull the plunger out again to the 1 mL mark.
Step 9. Make sure that 1 mL of diluent remains in the diluent syringe. Pull the needle out of the vial. The vial should still have diluent in it. Do not use the leftover diluent in the vial.

Step 10. Push the needle of the diluent syringe straight through the stopper of the vial of powdered SOMAVERT. Tilt the diluent syringe to the side and gently push the plunger in to inject the diluent down the inner side of the SOMAVERT powder vial. Be sure the diluent does not fall directly on the powder, but flows down the inside wall of the vial. See Figure H.

Step 11. When the diluent syringe is empty, pull the needle out of the powder vial. Throw away the diluent vial with the leftover liquid in it. Throw away the diluent syringe and needle in the sharps container as your healthcare provider told you. See “Disposing of used needles and syringes” at the end of these instructions.

Step 12. Hold the medicine vial of SOMAVERT upright between your hands and gently roll it to dissolve the powder into a solution. See Figure I.

Figure I
- Do not shake the medicine vial. Shaking may destroy the medicine.
- The liquid medicine should be clear after the powder is dissolved. Do not use the vial if:
  - the liquid medicine looks cloudy, hazy, or slightly colored or
  - you see solid particles in the liquid medicine or
  - you see foam in the vial

Tell your pharmacist and ask for another vial. Do not throw the vial away because the pharmacist may ask that you return it.

- Inject SOMAVERT within 6 hours of mixing it. If you wait more than 6 hours, you must throw away the medicine without injecting it.
- Each mixed medicine vial contains 1 dose of SOMAVERT. Do not split the liquid medicine into multiple doses.

Preparing your SOMAVERT injection syringe:
Step 13. Clean the rubber stopper of the vial of SOMAVERT with an alcohol swab.
- Carefully remove the cap from the insulin syringe and set the cap on the table.
- Pull the insulin syringe plunger out to the 1 mL mark. With 1 hand, firmly hold the vial. With the other hand, push the needle straight through the center of the rubber stopper and deep into the vial. Gently push the plunger in until the air is injected into the medicine vial. See Figure J.

Figure J

Step 14. Firmly hold the medicine solution vial and insulin syringe together, with the needle still deeply inserted into the vial. Carefully turn the vial and syringe together upside down. Hold them at eye level. See Figure K.

Figure K

Step 15. Slide 1 hand carefully down the medicine solution vial so you can firmly hold the neck of the vial with your thumb and forefinger. Hold the upper part of the syringe with your other fingers. With the other hand, slowly pull the plunger out to the 1 mL mark on the insulin syringe. See Figure L.

Figure L

Step 16. Check the insulin syringe for air bubbles. If you see bubbles, tap the insulin syringe barrel until the bubbles rise to the top of the syringe. Carefully push the plunger in to push only the air bubbles back into the vial. See Figure M.

Figure M

Step 17. Withdraw the entire 1 mL of medicine solution from the vial. If your dose of SOMAVERT is less than 1 mL, your healthcare provider will tell you how much medicine solution to withdraw. Slowly withdraw the needle to keep the tip in the liquid until you get all the medicine solution you need out of the vial. See Figure N.

Note:
- If your dose of SOMAVERT is less than 1 mL, your healthcare provider will tell you how much medicine solution to withdraw.
- If your dose of SOMAVERT is more than 1 mL, your healthcare provider will tell you how much more medicine solution to withdraw from a second vial into another syringe, and where to give your second injection.

Set the syringe and needle on the table without anything touching the needle.

Figure N

Selecting your SOMAVERT injection site:
Step 18. SOMAVERT is injected under the skin (subcutaneous). Injection sites may include your upper arm, upper thigh, stomach area (abdomen) and buttocks. See Figure O.
Figure O

- Choose your injection site from 1 of the areas your healthcare provider told you to use.
- Choose a different injection site each day so lumps do not develop in your skin. Keep a record of each day’s injection site as you inject your daily dose of SOMAVERT.
- Do not use an area of your body that has:
  - a rash
  - broken skin
  - bruising
  - lumps in your skin
- If you need to give 2 injections for your dose of SOMAVERT, choose a different site for your second injection.

Giving your SOMAVERT injection:

Step 19. Clean your injection site with an alcohol swab. See Figure P. Let your skin dry before you inject your medicine.

Figure P

Step 20. With 1 hand, gently pinch up your skin at your injection site. See Figure Q.

Figure Q

Step 21. Carefully pick up the insulin syringe with your other hand and hold it like a pen. In a single, smooth motion, push the needle straight down and completely into your skin (at a 90-degree angle).
  - Keep the needle pushed all the way into your skin while you slowly push the syringe plunger in with the index finger of your other hand. See Figure R.
  - Keep the needle all the way into your skin until all of the medicine is injected under your skin and the insulin syringe is empty.

Figure R

Step 22. Release your pinched skin and pull the needle straight out. See Figure S.

Figure S

Step 23. Do not rub your injection area. A small amount of bleeding may happen. If you have a small amount of bleeding, press a small clean, dry cotton pad over the area and press gently for 1 or 2 minutes, or until the bleeding has stopped. See Figure T.

Figure T

Disposing of used needles and syringes:

- Put your used needles and syringes in a FDA-cleared sharps disposal container right away after use. See Figure U. Do not throw away (dispose of) loose needles and syringes in your household trash.

Figure U

- If you do not have a FDA-cleared sharps disposal container, you may use a household container that is:
  - made of a heavy-duty plastic,
  - can be closed with a tight-fitting, puncture-resistant lid, without sharps being able to come out,
  - upright and stable during use,
  - leak-resistant, and
  - properly labeled to warn of hazardous waste inside the container.
- When your sharps disposal container is almost full, you will need to follow your community guidelines for the right way to dispose of your sharps disposal container. There may be state or local laws about how you should throw away used needles and syringes. For more information about safe sharps disposal, and for specific information about sharps disposal in the state that you live in, go to the FDA’s website at: http://www.fda.gov/safesharpsdisposal.
- Do not dispose of your used sharps disposal container in your household trash unless your community guidelines permit this. Do not recycle your used sharps disposal container.

This Patient Information and Instructions for Use has been approved by the U.S. Food and Drug Administration.
