

## Why Paperspace?

Traditionally, VDI has been a technology reserved for the Fortune 500. That all changed when we created Paperspace. Our goal was to make this same technology available to everyone, especially those that would benefit from it most. Educational institutions are a prime example because they share many of the same challenges of large enterprise companies, but not the same IT budgets. As a result, "on-prem" VDI is often out of the question. Paperspace abstracts all of this complexity away behind a simple but powerful interface. Here are some of the things you can do:

- Create unlimited machines without buying a single server
- Easily integrate with Active Directory
- Create pre-configured templates
- Backup everything with the click of a button
- Provide access to applications from anywhere

**Learning Management** - Enabling easy distribution of media-rich training content and management tools to educators on any platform.

**Student Apps & Labs** - Deliver any application to students via their own devices or lab computers.

*"Paperspace is drop-dead simple VDI. We always wanted to run a virtual desktop farm for our labs and student computers but when we ran the numbers, it was always too costly and complex for us to take on. Here we have the same functionality without managing any of the hard stuff. Couldn't recommend it more highly to any high-school, college or university."*
