

# Grape Launches Layer One Ecosystem to Power AI Driven Decentralized Internet

Grape is proud to announce the launch of its Layer One Ecosystem, powered by its DAG based distributed ledger technology, Vine.

NEWS RELEASE BY GRAPE

Victoria ,Seychelles | May 25, 2023 10:51 AM Eastern Daylight Time

**VINE** - a proprietary asynchronous basis that allows reaching unprecedented TPS

The Grape team's core vision is both true decentralization and global [mass adoption of blockchain](#) and web3. For this reason, Grape set out to solve the core issues preventing both. Issues such as web3 and cryptocurrency being difficult to use or understand for the average person, the fact that almost none of the technologies used in Web3 are truly decentralized and the issue that there is not a seamless ecosystem that can handle the demand needed for complex decentralized applications.

Grape is actively solving these barriers through:

1. **A Complete Ecosystem** - Bringing all of the necessary technologies into one ecosystem (decentralized file storage, adaptable smart contracts, dag layer one, AI tools, etc..) to create a single environment for the creation of decentralized assets and applications.

2. **True Decentralization** - Creating a DAG core without supernodes or back doors, making it completely user powered and therefore 100% decentralized.
3. **Power for the Future** - The Grape team wanted to allow for the limitless creation of complex applications and content on Grape, so creating a system without hard limits on transaction processing was top priority. This has been achieved through Vine and its advanced node system. Each user node adds an additional 1,000 transactions per second in processing power to Vine. This means that by adding only 15 individual user nodes to Vine, it can be as decentralized as a coin like **Bitcoin**, with the ability to process as many transactions as major centralized systems, like Visa at 15,000 TPS. Increasing the amount of user nodes, Vine can easily power 700,000+ transactions per second while maintaining absolute decentralization. Nodes can be created easily via the wallet.
4. **Mass adoption** - The Grape team believes that hyper simplicity, compatibility and usability are all key to the mass adoption of web3 and cryptocurrency. For this reason, Grape is building ANNE, their AI Neural Network Engine which will power their AI smart contract generator. Using this, users will be able to create complex decentralized websites and Dapps in minutes to hours, rather than months and years. The Grape team believes that by making blockchain and web3 easy to use, mass adoption is inevitable. By allowing anyone to produce Dapps with text commands, the amount of decentralized sites and applications can go from hundreds a year to hundreds of thousands a year. Creating adoption and perpetual growth, while fostering ideas.
5. **Compatibility** - The Grape team believes that making things as seamless and compatible with the industry is important for the future. Things like EVM compatibility and integration into commonly used **Web2 systems** are being built into Grape's core without compromising security and decentralization.
6. **Finance3** - Grape hopes to drive the decentralized finance revolution through key partnerships that combine the convenience of fiat with the privacy of cryptocurrency.

## Taking Part in Grape

Grape is offering two opportunities for users to get GRP before its full launch.

## Grape Distribution

The first is through their seven whitelist distribution rounds, where a limited number of people are able to take part in the distribution.

*Distribution site: [Buy.grap3.com](http://Buy.grap3.com)*

## **Grape Airdrop**

The second opportunity is through their airdrop. Those interested can increase their chances of getting up to \$1 million USD in GRP. It involves joining their socials, tweeting about them, joining the testnet, and email blasts. For an even better chance at whitelisting and a super drop, users should also invite people to help build the Grape community.

*Grape Airdrop - <https://guild.xyz/grape>*

By participating early on in Grape's platform, users can secure the lowest prices and potentially benefit from their substantial airdrops.

## **About Grape**

Grape is a decentralized layer one ecosystem that aims to provide developers with the tools and infrastructure they need to create complex, future-proof web3 applications. The contact information and social media pages below provide more information about this growing project.
