Universiteit Utrecht

## Empirical observation

Person features show an **asymmetry** in their **diachronic development**:

- in personal pronouns and possessives forms, person features tend to be **stable**, *i.e.* pronominal and possessive paradigms show diachronically comparable partitions;
- in demonstrative forms, person features can undergo a **reorganisation** which leads to diachronically different partitions.

# Pronouns & possessives *vs* demonstratives I

**Personal pronouns (1) & possessives (2): no featural reorganisation** → in Romance: stably ternary = they contrastively encode three persons.

(1) a. Personal pronouns

<i>Before</i>	1	2	3
<i>After</i>	1	2	3

(2) a. Possessives

<i>Before</i>	1.POSS	2.POSS	3.POSS
<i>After</i>	1.POSS	2.POSS	3.POSS

b. Latin > Galician (Dubert & Galves 2016, 420)

Latin	ego	tu	(ille)
Galician	eu	ti	el

b. Latin > Italian

Latin	meus	tuus	suus
Italian	mio	tuo	suo

## Pronouns & possessives *vs* demonstratives II

**Demonstrative systems: featural reorganisation** → in Romance: original ternary systems frequently evolve into participant-based (3) or into speaker-based binary systems (4):

(3) a. Demonstratives (participant-based)

<i>Before</i>	near 1	near 2	far from 1/2
<i>After</i>	near 1/2		far from 1/2

(4) a. Demonstratives (speaker-based)

<i>Before</i>	near 1	near 2	far from 1/2
<i>After</i>	near 1	far from 1	

b. Catalan (Ledgeway & Smith 2016, 886, 892)

Cat/1	aquest	aqueix	aquell
Cat/2	aquest		aquell

b. Rioplatense Spanish (A. Saab, *p.c.*)

RS/1	este	ese	aquel
RS/2	este	ese	

# Proposal

The diachronic asymmetry can be derived **structurally**, via the architecture of person features in indexical forms.

## Main ingredients:

- Harbour (2016)'s person system;
- derivations for the different person indexicals;
- Polinsky (2018)'s intuition that stability is linked to structural salience.

→ Person features are only structurally salient in personal pronouns and in the indexical part of possessives (stable), but not in the indexical part of demonstratives (unstable).

## Disclaimers

- **Semantics of person**, not its morphological exponents: person paradigms do show morphological change (e.g. loss of number and gender features, lexical variation).
- Main focus: forms in which **person features are interpretable and valued**, i.e. excluding all agreement forms.
- Empirical domain:
  - **diachrony** = Romance data (Jungbluth & Da Milano 2015 and Ledgeway & Maiden 2016; cf. there for full overviews);
  - **contact** = APiCS (*Atlas of Pidgin and Creole Language Structures*, Michaelis et al. 2013).

# Roadmap

- Person indexicals
  - Personal pronouns
  - Possessives
  - Demonstratives
- (In)stability: A structural account

# Roadmap

- Person indexicals
  - Personal pronouns
  - Possessives
  - Demonstratives
  
- (In)stability: A structural account

## Personal pronouns: Diachrony and contact I

Personal pronouns in Romance languages retained the ternary partition of deictic space from Latin → no featural reorganisation:

(5) Personal pronouns in diachrony (32/32)

<i>Before</i>	1	2	3
<i>After</i>	1	2	3

## Personal pronouns: Diachrony and contact I

Personal pronouns in Romance languages retained the ternary partition of deictic space from Latin → no featural reorganisation:

(5) Personal pronouns in diachrony (32/32)

<i>Before</i>	1	2	3
<i>After</i>	1	2	3

Personal pronouns in pidgins/creoles mostly retain their major lexifiers' partitions [APiCS 15, revised] → no reorganisation, but for:

- **6/74 varieties:** different values for **clusivity** (5 lost, 1 acquired).
- (3/74: compositional clusivity; 8/74: person syncretism [APiCS 16]).

(6) a. Personal pronouns in the APiCS I (62/74)    b. Personal pronouns in the APiCS II (3/74)

<i>Before</i>	1	2	3
<i>After</i>	1	2	3

<i>Before</i>	1EXCL	1INCL	2	3
<i>After</i>	1EXCL	1INCL	2	3

## Personal pronouns: Diachrony and contact II

Wider typological investigation: Nichols 1992:

- the inclusive/exclusive opposition is very **stable genetically** (and slightly less so areally);
- only attested examples of **instability** = linked to **contact** (cf. also Siewierska 2004, 7.3 & references therein):
  - tripartition > quadripartition: Central Khoisan < Southern Khoisan; Numic & Washo < Penutian; Kwaza < Tupi-Guarani; Gujarati, Marathi & Sindhi < Dravidian Ls; Aneêm < Austronesian Ls; Gimira, Amaaro & Dasenech (Ethiopian Omotic-Cushitic) < Nilo-Saharan Ls;
  - quadripartition > tripartition: Warlpiri (younger speakers).

## Personal pronouns: Generalisations

The indexical value of personal pronouns:

- is stable in diachrony and
- tends to be remarkably stable in contact situations (limited examples of switches between tri- and quadripartitions, but no reduction is attested).

## Person features: The system

Cf. Harbour 2016, with minor revisions.

- **Ontology** (i.e. discourse-related atoms): speaker =  $i$ , hearer =  $u$ , other =  $o$ .
- Accessed by the grammar *via* two binary features,  $[\pm A]$  and  $[\pm P]$ , that can (successively) apply to the categorial head  $\pi$ :
  - **categorial head**:  $\llbracket \pi \rrbracket = \{i_o, iu_o, u_o, o_o\}$
  - **two features**:
    - a.  $\llbracket \text{Author} \rrbracket = \{i\} \rightarrow [A]$
    - b.  $\llbracket \text{Participant} \rrbracket = \{i, iu, u\} \rightarrow [P]$
  - each feature must have either of **two values**:
    - a. + (action: disjoint addition)
    - b. – (action: joint subtraction)

## Personal pronouns: Derivation

The two features can (successively) compose with  $\pi$ , to partition it:

		$\pi$		(Unary)
	(+Participant( $\pi$ ))		(-Participant( $\pi$ ))	(Binary/P)
	(+Author( $\pi$ ))		(-Author( $\pi$ ))	(Binary/A)
(+Part(+Auth( $\pi$ )))		(+Part(-Auth( $\pi$ )))	(-Part( $\pm$ Auth( $\pi$ )))	(Ternary)
(+A(-P( $\pi$ )))	(+A(+P( $\pi$ )))	(-Auth(+Part( $\pi$ )))	(-Auth(-Part( $\pi$ )))	(Quatern.)

## Personal pronouns: Derivation

The two features can (successively) compose with  $\pi$ , to partition it:

		$\pi$		(Unary)
	(+Participant( $\pi$ ))		(-Participant( $\pi$ ))	(Binary/P)
	(+Author( $\pi$ ))		(-Author( $\pi$ ))	(Binary/A)
(+Part(+Auth( $\pi$ )))		(+Part(-Auth( $\pi$ )))	(-Part( $\pm$ Auth( $\pi$ )))	(Ternary)
(+A(-P( $\pi$ )))	(+A(+P( $\pi$ )))	(-Auth(+Part( $\pi$ )))	(-Auth(-Part( $\pi$ )))	(Quatern.)

### Pronouns: Generalisations:

- ✓ no reductions to bi-/monopartitions  $\rightarrow$  personal pronouns derived directly by the successive composition of **both person features** with  $\pi$ ;
- ✓ tri-  $>$  quadripartitions, or quadri-  $>$  tripartitions  $\rightarrow$  changes in the **composition ordering**.

(+Part(+Auth( $\pi$ )))	(+Part(-Auth( $\pi$ )))	(-Part( $\pm$ Auth( $\pi$ )))	(Ternary)
(+A(-P( $\pi$ )))	(+A(+P( $\pi$ )))	(-Auth(-Part( $\pi$ )))	(Quatern.)

# Roadmap

- Person indexicals
  - Personal pronouns
  - Possessives**
  - Demonstratives
  
- (In)stability: A structural account

## Possessives: Diachrony and contact

Possessive forms in Romance languages retained the ternary partition of deictic space from Latin → no featural reorganisation:

(7) Possessive forms in diachrony (23/23)

<i>Before</i>	1.POSS	2.POSS	3.POSS
<i>After</i>	1.POSS	2.POSS	3.POSS

- **Analytic possessives** = P+pronoun (PPs): available, but restricted.

## Possessives: Diachrony and contact

Possessive forms in Romance languages retained the ternary partition of deictic space from Latin → no featural reorganisation:

(7) Possessive forms in diachrony (23/23)

<i>Before</i>	1.POSS	2.POSS	3.POSS
<i>After</i>	1.POSS	2.POSS	3.POSS

- **Analytic possessives** = P+pronoun (PPs): available, but restricted.

Possessive forms in pidgins/creoles tend to retain the major lexifiers' deictic structure (cf. personal pronouns) [APiCS 37, revisited]:

	Possessive adjectives ( <i>APiCS</i> : 76 varieties)	Only	Option	Tot.
1.	Unmarked personal pron. [type: <i>mi</i> 'my', Beliz. C.]	8	38	46
2.	P+pronoun (analytic) [type: <i>fu mi</i> 'my', Beliz. C.]	<b>12</b>	34	46
3.	Genitive pron. (synthetic) [type: <i>ma</i> 'my', Beliz. C.]	9	<b>32</b>	41

## Possessives: Generalisations

- The indexical value of possessive forms does not typically undergo diachronic or contact-induced change (cf. personal pronouns)
  - derive it like personal pronouns = via composition of  $[\pm A]$  and  $[\pm P]$  with  $\pi$ .
- Morphological variation ( $\neq$  personal pronouns): pronominal possessors can be expressed as:
  - PPs (P+personal pronoun), type: *fu mi*;
  - synthetic (genitive) forms, type: *ma*;
  - unmarked personal pronoun, type: *mi*.

## Possessives: Derivation

The indexical base of possessives is an inherently Case-marked personal pronoun (reversing Caha (2009)'s rationale).

- Indexical base derived as personal pronouns → diachronic symmetry.
- Inherent Case: underlyingly construed as a PP (Řezáč 2008).

→ **Indexical base of possessives = PP (P+pronoun):**

- spelled out as such: P+pronoun (analytic), type: *fu mi*;
- spelled out synthetically: genitive possessive forms (synthetic; & possibly DP-internal agreement slot), type: *ma*;
- spelled out synthetically + syncretism: unmarked personal pronouns, type: *mi*.

$[_{PP} \mathbf{P} (+Part(+Auth(\pi)))]$	$[_{PP} \mathbf{P} (+Part(-Auth(\pi)))]$	$[_{PP} \mathbf{P} (-Part(\pm Auth(\pi)))]$
$[_{PP} \mathbf{P} (+A(-P(\pi)))]$	$[_{PP} \mathbf{P} (+A(+P(\pi)))]$	$[_{PP} \mathbf{P} (-Auth(+Part(\pi)))]$
		$[_{PP} \mathbf{P} (-Auth(-Part(\pi)))]$

# Roadmap

- Person indexicals
  - Personal pronouns
  - Possessives
  - Demonstratives
  
- (In)stability: A structural account

# Demonstratives

Exophoric demonstratives → locate objects/areas in the external world w.r.t. **deictic centre**.

According to the deictic centre(s) involved:

speaker	hearer	other	→ Binary system, speaker-oriented
speaker	hearer	other	→ Binary system, participant-oriented
speaker	hearer	other	→ Ternary system

Assumptions:

- discourse participants as deictic centres: demonstratives systems are primarily defined by **person features**;
- demonstratives express a **spatial relation** to person, rather than person.

## Demonstratives: Diachrony

Some Romance **ternary** demonstrative systems evolved **into** participant-based (8) or speaker-based **binary** systems (9):

- (8) **Participant-based** binary dems (53/239) [45/153 nom.; 8/86 adv.]  
e.g. Tarantino (demonstrative adj., Ledgeway & Smith 2016, 886)

Tar/1	sto [near 1]	SSO [near 2]	quid [far from 1/2]
Tar/2		sto [near 1/2]	quid [far from 1/2]

- (9) **Speaker-based** binary dems (72/239) [37/153 nom.; 35/86 adv.]  
e.g. Occitan (demonstrative adv., Ledgeway & Smith 2016, 895)

Occ/1	aicí [near 1]	aquí [near 2]	alai [far from 1/2]
Occ/2	aicí [near 1]		aquí [far from 1]

Instability of the **hearer-related domain**:

**binary/P** same exponent as the speaker-related one;

**binary/A** no longer consistently referred to by only one form.

## Demonstratives: Contact

The demonstrative systems of pidgins'/creoles' major lexifiers show different patterns of evolution [*APiCS* 33, revisited]:

### Nominal demonstratives, 73 contact varieties

Major lexifier type (one per contact variety)	Same contrasts ( $n=46$ )	More contrasts ( $n=3$ )	Fewer contrasts ( $n=24$ )
3-way contrast ( $n=26$ )	5 [19.23%]	—	<b>21</b> [80.77%]
2-way contrast ( $n=38$ )	<b>32</b> [84.21%]	3 [7.89%]	3 [7.89%]
No contrast ( $n=9$ )	<b>9</b> [100%]	—	—

### Adverbial demonstratives, 61 contact varieties

Major lexifier type (one per contact variety)	Same contrasts ( $n=39$ )	More contrasts ( $n=2$ )	Fewer contrasts ( $n=20$ )
3-way contrast ( $n=24$ )	4 [16.67%]	—	<b>20</b> [83.33%]
2-way contrast ( $n=37$ )	<b>34</b> [91.89%]	2 [5.41%]	1 [2.70%]

→ Ternary > speaker-based binary systems.

## Demonstratives: Generalisations

- ✓ Contrary to personal pronouns and possessives, demonstrative forms can show a **reduction of person features**:
  - reduction of ternary systems to (mostly) binary ones, *vs* stability of binary and unary systems;
  - instability of the hearer-related domain.

## Demonstratives: Derivation I

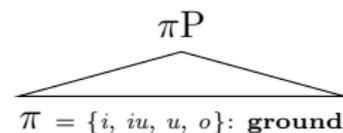

Indexical part of demonstratives: **two-step** functional application of person features to  $\pi$ :

1. a space function,  $\chi$ , applies to  $\pi$ : define the discourse space;
2.  $[\pm A]/[\pm P]$  can apply to the result of  $(\chi(\pi))$ : yield a subregion.

→ Cf. Svenonius 2006 *seqq.* for **spatial Ps** with AxPartP and Zwarts 1997 *seqq.* for vectors.

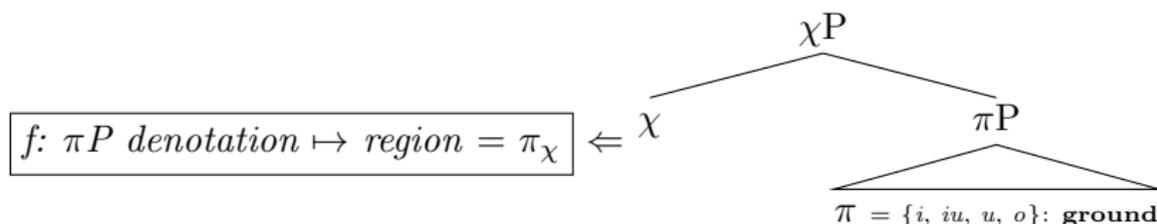

## Demonstratives: Derivation II

‘This/here’ =  $(x)$ /PLACE near  $i$  in the space of  $\pi$ .

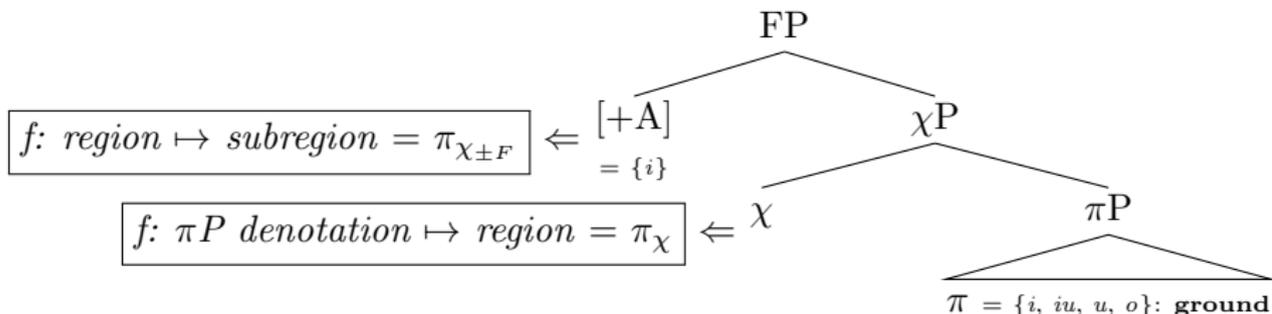

## Demonstratives: Derivation II

‘This/here’ =  $(x)$ /PLACE near  $i$  in the space of  $\pi$ .

## Demonstratives: Derivation II

‘This/here’ =  $(x)$ /PLACE near  $i$  in the space of  $\pi$ .

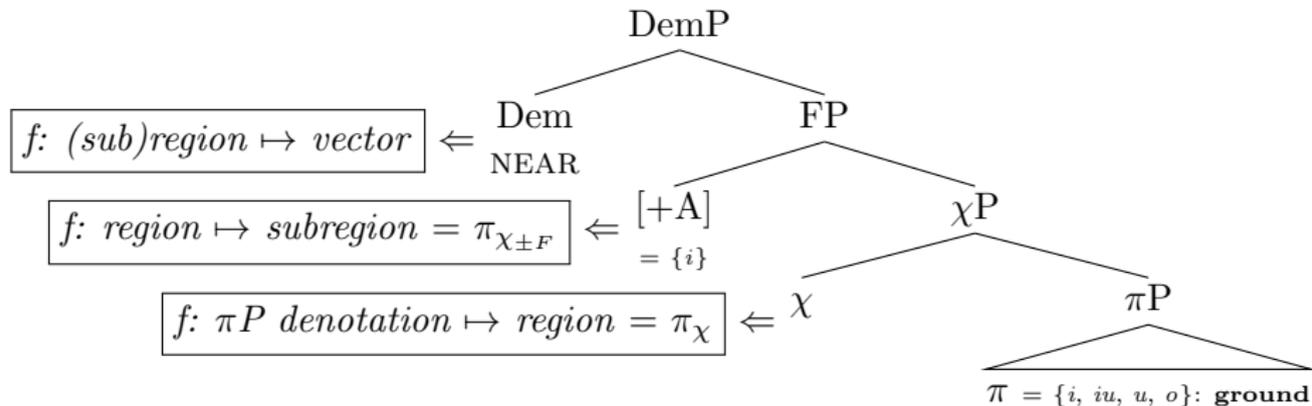

Full featural schema:

near 1	far from 1	=	$(+A(\chi(\pi)))$	$(-A(\chi(\pi)))$	
near 1/2	far from 1/2	=	$(+P(\chi(\pi)))$	$(-P(\chi(\pi)))$	
near 1	near 2	far from 1/2	$(+P(+A(\chi(\pi))))$	$(+P(-A(\chi(\pi))))$	$(+P(\pm A(\chi(\pi))))$

## Demonstratives: Derivation II

‘This/here’ =  $(x)$ /PLACE near  $i$  in the space of  $\pi$ .

Full featural schema:

near 1	far from 1	=	$(+A(\chi(\pi)))$	$(-A(\chi(\pi)))$	
near 1/2	far from 1/2	=	$(+P(\chi(\pi)))$	$(-P(\chi(\pi)))$	
near 1	near 2	far from 1/2	$(+P(+A(\chi(\pi))))$	$(+P(-A(\chi(\pi))))$	$(+P(\pm A(\chi(\pi))))$

# Roadmap

- Person indexicals
  - Personal pronouns
  - Possessives
  - Demonstratives
- (In)stability: A structural account

# Proposal

Recap:

- Personal pronouns =  $(\pm F(\pi))$  (cf. Harbour 2016);
  - indexical base of possessive forms =  $[_{PP} \mathbf{P} (\pm F(\pi))]$ ;
  - indexical base of demonstrative forms =  $(\pm F(\chi(\pi)))$ .
- Evidence: **agreement** facts (no agreement with person (number, gender) features in the indexical base of possessives & demonstratives).

**Diachronic asymmetry:** person features = **stable** in personal pronouns & possessives *vs* **unstable** in demonstrative forms.

- **Proposal:** (in)stability  $\leftrightarrow$  structural salience.

The most salient ( $\rightarrow$  stable) feature is the **first to compose** with the root of its functional sequence.

## Stability and structural salience

Link inspired by Polinsky (2018, 63-65): heritage speakers:

- ✓ retain elements at the **top** of the relevant domains ('salient')
- × lose elements that occupy **lower** projections ('non-salient') in the same domains.
  
- Elements at the top are typically **indexical** (idea: indexicality contributes to the salience of linguistic elements).
- Structural formalisation: “sensitivity to the topmost projection of a domain” (Polinsky 2018, 63).

## Stability and structural salience

Link inspired by Polinsky (2018, 63-65): heritage speakers:

- ✓ retain elements at the **top** of the relevant domains ('salient')
- × lose elements that occupy **lower** projections ('non-salient') in the same domains.
  
- Elements at the top are typically **indexical** (idea: indexicality contributes to the salience of linguistic elements).
- Structural formalisation: “sensitivity to the topmost projection of a domain” (Polinsky 2018, 63).

→ Claim revisited here: **a feature is salient if it is the first to apply to the root of its functional sequence.**

## Personal pronouns and possessives

Personal pronouns and the indexical base of possessive forms are **straightforwardly** derived by the composition of the person features with  $\pi$ .

$(+Part(+Auth(\pi)))$	$(+Part(-Auth(\pi)))$	$(-Part(\pm Auth(\pi)))$
$(+A(-P(\pi)))$	$(+A(+P(\pi)))$	$(-Auth(+Part(\pi)))$
		$(-Auth(-Part(\pi)))$

$[_{PP} \mathbf{P} (+Part(+Auth(\pi)))]$	$[_{PP} \mathbf{P} (+Part(-Auth(\pi)))]$	$[_{PP} \mathbf{P} (-Part(\pm Auth(\pi)))]$
$[_{PP} \mathbf{P} (+A(-P(\pi)))]$	$[_{PP} \mathbf{P} (+A(+P(\pi)))]$	$[_{PP} \mathbf{P} (-Auth(+Part(\pi)))]$
		$[_{PP} \mathbf{P} (-Auth(-Part(\pi)))]$

$$(10) \quad (\pm F (\pi))$$

→ **Salient:**  $\pi$ 's featural content is **stable**/less prone to change.

## Demonstratives

The indexical base of demonstrative forms is derived by a **two-step** functional application:

- person features (can) apply to  $\pi$  only after  $\chi$  has applied to it (region  $\mapsto$  sub-region).

$(+A(\chi(\pi)))$	$(-A(\chi(\pi)))$
$(+P(\chi(\pi)))$	$(-P(\chi(\pi)))$
$(+P(+A(\chi(\pi))))$	$(+P(-A(\chi(\pi))))$
$(+P(\pm A(\chi(\pi))))$	

$$(11) \quad (\pm F (\chi (\pi)))$$

→ Person features in demonstrative forms are not the first to compose with  $\pi$ , i.e. **not** structurally **salient** →  $\pi$ 's person featural content is **unstable**/more prone to change.

## Implementation

Due to the increase in complexity (recursion of compositions), one (or more) **non-salient feature(s) can be delinked** from their functional sequence.

- In **ternary** demonstrative systems, one (or more) person features can be delinked from the ( $\chi(\pi)$ ) sequence.
- However, those features are still available in the person pronominal and possessive systems of the same language, where they directly compose with  $\pi$ .
  - Principled explanation for the asymmetry.
  - Delinked features are still available: they can be re-linked.

## Where and how

✓ Structural considerations define where change can happen → demonstratives, rather than personal pronouns and possessives.

**But how?** Formal markedness can partially predict the reorganisation patterns.

- Recall the generalisations on change:
  - ternary systems are the most unstable ones ↔ how many **active features**?
  - the hearer-related domain is the most unstable one ↔ **uniform** or **non-uniform** feature values?

# Conclusions

- Diachronic asymmetry: person features in personal pronouns and possessives *vs* demonstratives:
  - diachronic and contact data;
  - derivation of person indexicals:
    - i. personal pronouns =  $(\pm F(\pi))$  (cf. Harbour 2016);
    - ii. indexical base of possessive forms =  $[_{PP} \mathbf{P} (\pm F(\pi))]$ ;
    - iii. indexical base of demonstrative forms =  $(\pm F(\chi(\pi)))$ .

## Conclusions

- Diachronic asymmetry: person features in personal pronouns and possessives *vs* demonstratives:
  - diachronic and contact data;
  - derivation of person indexicals:
    - i. personal pronouns =  $(\pm F(\pi))$  (cf. Harbour 2016);
    - ii. indexical base of possessive forms =  $[_{PP} \mathbf{P} (\pm F(\pi))]$ ;
    - iii. indexical base of demonstrative forms =  $(\pm F(\chi(\pi)))$ .
- Structure and salience (first merge) & salience and stability (cf. Polinsky 2018) → person features in personal pronouns and possessives are structurally salient = stable; *vs* in demonstratives are not structurally salient = unstable (possibly delinked from the  $(\chi(\pi))$  functional sequence).

# Thank you!
