

• **FACT SHEET No. 7**

## **Pain After Surgery in Children and Infants**

Children have at least the same amount of pain from surgery as adults do, although it may not last as long because children usually heal more quickly. Children deserve protection, cannot advocate for themselves, and often may not complain of pain, so they need special consideration and pain assessment. All health professionals should know how to recognize, assess, and treat pain in children [5].

Untreated acute pain can result in chronic pain in children and adolescents [3], and failure to prevent pain in newborns can cause lifelong adverse effects, such as increased pain sensitivity [6].

Surgical pain should be prevented whenever possible. Avoid unnecessary procedures and plan the management before the surgery. Assess pain using age-appropriate validated tools. Develop standard protocols that can be adapted to individual patients, so that when surgery is required, a combination of medications are available to provide the best possible analgesia with the lowest risk and side-effects, along with non-pharmacological pain control techniques. [AAP 2001] [APAGBI 2012]

### **Local/Regional Techniques**

Local anesthetics can block pain nerves before, during, and after the surgical procedure.

- Local anesthetic infiltration at surgical site
- Local nerve block
- Plexus or nerve sheath block
- Neuraxial block (epidural, spinal)

### **Medications**

Most medications are safe in children and infants, if the dosing is adjusted for weight and for the metabolic differences in newborns and infants. All of the following drugs may be used with appropriate monitoring to treat pain and to reduce nerve sensitization, depending on the patient and type of surgery or injury.

**IASP brings together scientists, clinicians, health-care providers, and policymakers to stimulate and support the study of pain and translate that knowledge into improved pain relief worldwide.**

- Paracetamol/Acetaminophen
- Non-steroidal anti-inflammatory drugs
- Opioids
- Gabapentin
- Ketamine

### **Psychological and Physical Approaches**

Psychological and physical techniques are very important, and are also inexpensive and safe. They should be available for all patients.

- Preparation and explanation
- Distraction, imaging, and relaxation (including deep breathing) [4]
- Positioning and early gentle movement

### **Parents' Role**

- Advocating for their child's care
- Providing distraction, support, and comfort

### **Professionals' Role**

- Be aware of the child's pain.
- Think of pain prevention before it happens. Do not do unnecessary procedures
- Recognize, assess, prevent, treat

## AUTHOR

G. Allen Finley, MD FRCPC FAAP  
Professor of Anesthesia and Psychology, Dalhousie University  
Dr. Stewart Wenning Chair in Pediatric Pain Management  
Director, Centre for Pediatric Pain Research, IWK Health Centre  
Halifax, Canada

## REVIEWERS

Supranee Niruthisard, MD  
Associate Professor in Anesthesiology  
Department of Anesthesiology, Chulalongkorn University  
King Chulalongkorn Memorial Hospital  
Bangkok, Thailand

Jill Chorney, PhD, RPsych  
Associate Professor of Anesthesia & Psychology  
Dalhousie University  
Halifax, Canada

A. Stuart Wright, MD PhD FRCPC  
Assistant Professor of Anesthesia  
Dalhousie University  
Halifax, Canada

### About the International Association for the Study of Pain®

IASP is the leading professional forum for science, practice, and education in the field of pain. [Membership is open to all professionals](#) involved in research, diagnosis, or treatment of pain. IASP has more than 7,000 members in 133 countries, 90 national chapters, and 20 Special Interest Groups.

As part of the Global Year Against Pain After Surgery, IASP offers a series of Fact Sheets that cover specific topics related to postsurgical pain. These documents have been translated into multiple languages and are available for free download. Visit [www.iasp-pain.org/globalyear](http://www.iasp-pain.org/globalyear) for more information.
