Alternative Medicine

More and more adults in the U.S. are complementing traditional medical care with health treatments long used by cultures around the world. Mind and body practices such as yoga, meditation and chiropractic care have grown in popularity over the past decade. Meditation, used to help manage conditions ranging from high blood pressure and headaches to anxiety and depression, more than tripled in use among adults between 2012 to 2017, rising from 4.1 percent to 14.2 percent. Other holistic and wellness approaches include aromatherapy, therapeutic massage, and acupuncture, the insertion of fine needles into the skin to treat pain, arthritis and gastrointestinal problems.

The use of natural products, including dietary supplements such as fish oil and herbal medicines administered in teas, lozenges or ointments, is also increasingly widespread. However, it is important to remember that supplemental products are regulated as food, not drugs, by the Food & Drug Administration (FDA); companies do not have to provide the FDA with evidence of a product’s safety before marketing it unless it contains a new dietary ingredient. Some ingredients found in supplements may interact badly with prescription medicines; for example, St. John’s wort can increase the breakdown of certain medicines and reduce their effectiveness. A physician should always be consulted before adding any supplements to a diet.
