Substance use disorders occur more often in persons with disabilities than in the general population. This includes problems related to the abuse of prescription medications as well as illicit drugs. In the general population, alcoholism affects 10% of individuals and 5% are addicted to drugs.

- Moore (2002) estimates that as many as 1.5 million individuals with disabilities may need treatment for substance use disorders in any given year. The Substance Abuse and Mental Health Services Administration (SAMHSA) (2002) estimates that approximately 4.7 million American adults with a disability have a co-occurring substance abuse problem.
- Persons with any type of disability experience substance abuse at rates 2 to 4 times that of the general population.
• Substance abuse prevalence rates approach or exceed 50% for persons with traumatic brain injuries, spinal cord injuries, or mental illness.
• Conditions such as deafness, arthritis, and multiple sclerosis have shown substance abuse rates of at least double the general population estimates.
• Where persons with spinal cord injuries, orthopedic disabilities, vision impairment, and amputations consume alcoholic beverages, approximately 40-50% can be classified as heavy drinkers.

Data indicate that rates of substance abuse vary widely across disabilities.

• Spinal cord and traumatic brain injury populations have been found to have substantially higher rates of substance abuse disorders than the general population.

Narcotics Anonymous
NA offer recovery from the effects of addiction through working a twelve-step program, including regular attendance at group meetings. The group atmosphere provides help from peers and offers an ongoing support network for addicts who wish to pursue and maintain a drug-free lifestyle. Addiction from any type of drug as well as alcohol is included.
