

DY'ON[®]

Blue Colorant

GENERAL INFORMATION

DY'ON is a blue, water-soluble dye. Used in spray solution, it furnishes a dark blue tint to vegetation, when sprayed. This allows coverage without skips.

POND AND LAKE DYE:

To enhance natural beauty and to conceal unsightly weeds, algae and sediment use 1-2 quarts per acre foot of water. Apply directly into the water along the water edge. Actual color will vary with water quality and chemical composition. If needed, apply additional DY'ON to obtain preferred color. DY'ON is harmless to fish and wildlife. Chlorine bleaches color, so DY'ON is not recommended for use in chlorinated water.

SPRAY INDICATOR:

Add 1-2 pints of DY'ON to 100 gallons of water. Local conditions and water quality may require more or less dye, but more dye can be added to spray tank if insufficient color is produced. Chlorinated water sources may especially call for additional dye to obtain desired color in spray solution.

NOTICE TO BUYER:

Seller warrants this product conforms to the label description and based on tests believed to be reliable. However, field conditions vary widely, so the user should determine the suitability of Dy'on for the particular application. No other warranty expressed or implied is made by seller. Buyer assumes all risk for any use condition not reasonably foreseeable to Seller.
