Elini barokas commander manual

How Elinibarokaswatches.com contact me? Please contact us at 1-866-746-7794, Monday to Friday 9:00-17:00 EST. Or send us Can the Elinibarokaswatches.com authentic? Yes, Neini Barokas watches found Elinibarokaswatches.com are 100% authentic. They are designed and produced by 19 Dini Barokas and distributed by Iru Barokas and authorised retailers around the world. Where you can buy Erini Barokas Watches Click here to find fine, authorized retailers of Ini Barokas watches. User Guide Download User Guide Adobe Acrobat PDF Required Useful Watch Tips: It is recommended to rinse your watch with fresh water after contact with salt water. It is recommended not to use crown or pusher tow when the clock is wet and certainly not when it is immersed in water. Waterproof watches must be checked and maintained once a year. Quartz Watch is battery powered and does not require a winding. Finally, the battery needs to be replaced. The automatic clock is a mechanical clock that blows itself and does not require a battery. When worn every day, the movement of the wrist gradually causes the main source to wind, eliminating the need for an additional wrap. To start automatically, you can turn it by turning the crown clockwise, turning it in the normal operating position (unscrew the crowns first) or by swinging from side to side for 30 seconds. We recommend a casing automatic at the winder box. Manual Windwatch is a mechanical clock that does not require a battery, but which can only be wound manually. To scroll it, turn the crown clockwise when it is in a normal working position until you feel resistance. This type of wristwatch should wound every day. Important things to know: Many Ion Barokas watches are equipped with a screw under the crown to help prevent water intrusion. For clocks with a twist down, you must first carefully rotate the crown counterclockwise until it comes out. The crown must then be gently drawn to the appropriate position to set the time or date. Never the right date between 9:00 and 1:00. It is very important after setting your watch so that you gently push and screw the gevõra firmly to ensure water resistance. Failure to turn the crown down causes water damage and cancels the warranty. To serve you better, please register your Mine Barokas watch below. 5-year limited warranty We believe the watches we sell and know you too. Elini Barokas' guarantee gives you confidence knowing your watch is covered by our 5-year limited international warranty and a team of people who truly care. Your Ini Barokas watch is supported by a 5-year limited warranty from the date of purchase. This guarantees against the defects of the watch manufacturer: functionality, material and treatment. This warranty does not cover the watch strap, crystal, battery or crown, pusher craft or stalk; it does not include watch abuse, accidents, normal daily wear, weather, aging and battery replacement. If your watch needs a battery replacement, it is recommended that you send it to our service center. If replaced, Iru barokas does not guarantee that you will receive the same tracking model. If the model is not available, you will receive a watch of the same value and similar style. The replacement clock guarantee expires five years from the date of receipt of the replacement clock. For a service that is not covered by this warranty, our service center may provide the services you request for a fee, depending on the style of your clock and the type of work you have requested. These fees may change. You will be notified before the services are provided and your authorization is required. To serve you better please register your watch below. If your watch is required to be maintenance during the warranty, please contact us at 1-866-746-7794 or send us an e-mail info@elinibarokaswatches.com. Clasp/Buckle Operations has a strap buckle and a joint clasping closure identical to the belt found. It has a loop and pin that is attached through holes in the strap. there is a certain type of bracelet closure clasp that opens and folds out. It easily locks in place the latches mechanism inside. is also known as a flap over the safety clasp, this type of bracelet closure is a clasp that opens and folds out, with a flap-over closure that provides an attached safety layer. It locks into place first with a closing mechanism and then with a foldable clamp from the outside. is a hidden introduction clasped, also known as a butterfly clasped, which opens at both ends of the bracelet and resembles butterfly wings when it is fully open. Braceleth has a seamless appearance when completely closed. there is a push button hidden in the clashe is hidden or a butterfly clashe with a push-button release mechanism that easily opens the clashe. Push-button deployment clas per put is a single locking deployment clasout with a push-button mechanism that easily opens the bracelet. The push-button mechanism acts as a security function because the bracelet does not open when the push-button is not released. there is the introduction of the clasp with a push-button mechanism that opens the bracelet, with the times over the closing top, which gives another layer of security. is hidden or butterfly clasping is used for watch straps. One end of the clasping is attached to one side of the strap, the other end of the clasping requires fastening onto the holes in the strap for a comfortable fit. The clasping easily opens and closes for extra convenience and prevents the user from having to adjust the strap length after first use. Many watches by Lucien Piccard feature the introduction of clas clas< buckles for its premium leather and exotic Watches... and security. About this unit. Swiss quartz movement. Sapphitek crystal; stainless steel housing; black silicone strap. Chronograph functions in 30 minutes, 60 seconds and a day of the week; date window 4:00.Blue textured dial with silver tone and yellow hands and silver tone and white Arabic numerals; luminous; one-way black ion-plated stainless steel bezel; with black pressure and pusher craft. Waterproof 200 M (660 ft). The founders of Elini Barokas Ini come from a family with a 60-year tradition in the design, distribution and production of diamonds and jewellery. In 1989, the company was established in Antwerp, Belgium, a city at the heart of the world diamond trade. Ini's vision and success was recognizing the changing trends in global demand for diamond jewelry, thus initiating the changing production of different lines of jewelry, from fashionable gold jewelry set to precious stones and gems, to the most exclusive signature diamond-set pieces. Today, ini jewelry collection includes more than 20,000 different designs, including rings, earrings, pendants, bracelets, necklace kits, hairpins, brooches and specially made pieces, all made from a company-owned factory that employs 700 skilled workers who craft each piece by hand. In 2003, Mine decided to showcase his success in the fine jewelry industry watch market. After collecting the best Swiss watchmakers, El began producing a variety of Automatic, Quartz, and diamond watches for both men and women. With retail items spreading through five continents, Mine is proud to have fans of his signature design and watch Tokyo in Los Angeles. Retailers find Ini's creations on the biggest annual international jewels and watch fairs. Add an understated look to your outfit for this unique and detailed Mine chronograph timepiece. Show more Imagen no disponible delColor: Watch Dictionary: ATM: Measures water resistance; Indicates the atmosphere or pressure that the clock can withstand before leakage; One atmosphere equals 10 meters of water pressure. Bezel: The fastening ring will destille the casing and secure the crystal; Sometimes includes one-way or ratcheting movements, engraved or printed chapter markers, or complications such as a tachymeter. Chronograph: Works in a similar way to a stopwatch, the chronograph is a unique and prized complication because of its ability to measure the increment of the time it takes when the clock still retains traditional time-keeping abilities. The crown brush adjusts the analog clock, while the function pushers allow you to run, stop, and reset the chronograph sub-lys. Chronometer: precision station indicator tested and certified with precision to meet standards; Chronometer clocks often come their certified status. Complication: Any function added to the timepiece that does not show hours, minutes, or seconds. COSC Certified Chronometer: Refers to a clock that is christened the title chronometer. To become a chronometer, the units of time must pass a test carried out by the Controle Officiel Suisse des Chronometers (COSC), which will be translated around the Official Swiss Chronometer Testing Institute. THE COSC is a prestigious Swiss government agency that certifies the accuracy and accuracy of time units in Switzerland. Crown: The part that allows you to manipulate the movement of the watch for various purposes, such as setting hands, changing the date, head spring coil, etc. Crystal: a transparent cover on the watch's face, which gives an overview of the dial. Deployant: Type a clasping that keeps the closing mechanism hidden, creating an uninterrupted look for your bracelet or strap. Double time zone: A time zone that gives time in two time zones at the same time. GMT has the same purpose and is used alternately because it can be set to any desired time zone. Exhibition case or back: A unique complication in which a crystal window is applied behind a view of the event, allowing the view to timepiece movement. Pushers function: Manual control when movement functions complications that require greater manipulation. Greenwich Time (GMT): Also called greenwich meridian, Greenwich Meridian Line is located at the Royal Observatory in Greenwich, England. This is where all time zones are measured. Greenwich time is the average time it takes the Earth to rotate at noon. In this context, GMT is considered world time and was once the basis with which every other zone set time. Guilloche: Engraving style that contains wavy or straight lines, giving a unique effect when moving or shifting the timepiece. Ionic Plating: a process that produces a hardened surface that is durable and scratch-resistant; There is a black flat stealth finish. Jewels: In motion, metal contact causes wear and tear. Watchmakers use jewel bearings to reduce friction and help delicate parts move to work smoothly and with high accuracy. Jewels help expand the movement of life. Preferred materials are diamonds, sapphires, rubies and grenades. As a general rule, a larger number of jewellers refer to a more prestigious movement. Lugs: The north and south ends of the case, which are fastened with a strap or bracelet and often range from the dominant lines in the case. Moon phase: The lunar cycle is the cornerstone of horology, a study measuring time since ancient days. The lunar phase is a complication timepiece that shows different stages of moon cycles ranging from waxing to waning. It is displayed as a disk visible through an aperture, indicating the current Stage. Movement: assembly consisting of the basic elements and mechanisms of the watch or clock; Includes winding and setting mechanism, main spring, train, exit and regulatory elements. Power Reserve: Time to watch continues running based on the movement of the remaining wrap in your mainspring; In quartz and digital clocks, it can also indicate the amount of energy left in the battery. Push Button Dual Deployant: Similarly deployed and considered one of the most desirable and easy to use clasps, push button dual deployant works with two small hidden buttons that release the bracelet. This clasout keeps the closing mechanism hidden in an uninterrupted, seamless finish. Repeater: a complex clock mechanism that sounds for hours, quarters, or minutes or repeats them on demand; Originally designed to help the wearer say time in the dark. Retrograde: An hour, minute, second hand, or calendar hand that moves across the scale and resets to zero at the end of the cycle. Skeletonization: Reveals a complex symphony of moving rotors, gears and springs that power timepiece; The open design offers an insider's view, as unnecessary metal is cut off so that the user can actually see the movement of the skeleton. Swiss Made: Since the 16th century, Switzerland has been the epicenter of the making, producing some of the industry's greatest technological developments. Swiss enforce the law of all clocks baring the words Swiss Made. First, the movement must be assembled in Switzerland. Secondly, the movement must be resolved in Switzerland. Finally, the manufacturer must carry out a final timepiece check in Switzerland. Tachymeter: scale clocks used to determine units per hour, such as average speed at a fixed distance or distance based on speed; Usually located along the outer edge of the dial. Tritium: Miniature tubes containing gaseous tritium and layered phosphorus power luminous accents that can be seen several meters in the darkness. Tritium lighting does not require electricity, but must be charged by keeping the watch close to any light source. The longer you keep it there, the longer and lighter you'll see the trit thread. One-way rotating Bezel: Used to track past time. The bounce mechanism prevents the bezel from rotating backwards. This feature is popular with divers who depend on past time to feature to prevent a diver from running out of air. The fact that the bezel can't turn backwards prevents the media from underestimating the time elapsed. Chronograph: Works in a similar way to a stopwatch, the chronograph is a unique and prized complication because of its ability to measure the increment of the time it takes when the clock still retains traditional time-keeping abilities. The crown adjusts the analog clock, while function triggers allow you to start, stop, and reset the chronograph sub-selectors. Chronograph variations include a double chronograph with two separate stopwatch mechanisms and a flyback chronograph that allows the user to stop, reset, and trigger a single function-pin with one depression. Quartz: Although it is not as mechanically complex as other engines, quartz movement provides the most accurate and reliable time keeping. This type of movement usually draws the power of the battery and focuses around a small vibrating chip quartz crystal. When the electric current, which is equipped with the battery, is applied to the quartz crystal, the current is distorted and creates an accurate resonating frequency. Clock makers use the following frequency to measure time. Some adjustments to traditional quartz movement include introducing rotors and power cells in an effort to maintain the accuracy of quartz while eliminating the need for a battery. Quartz movements have been used as time units since the 1970s and are very accurate, reliable and affordable. The case provides the basis for all other larger view components. This house movement, retains lugs for attaching a bracelet or strap, plays host to various crowns and function pushers, and seats crystal and bezel. Cases are available in different shapes and sizes and use library materials for construction such as stainless steel, gold, ceramic, titanium, plastic and more. The dominance of stainless steel in the case of construction remains, however, hypo-allergenic metals and materials, such as titanium, continue to popularity. Metal cases often have particular finishes - such as a smooth reflective polish or circular matte brush - to increase the presentation of the timepiece and give it unique depth. Some designs allow for the case and lugs to be curved so that the look is more comfortable to fit around the wrist. The back of the housing is usually removable and is likely to screw down or pop-off. However, it is important to note that it should only be opened by a trained specialist. The exhibition feature (found behind the box) refers to an attached window that allows you to view the movement and is often found in automatic and mechanical clocks. Case size: The case measurements do not include crown crown or dunes. Round - one measurement, 8:00 to 2:00 Square - one measurement, 3am to 9am or 6am and 6pm (should be the same) Rectangle, Tonneau, Oval, Octagon, etc. - Two measurements, 3am-9am and 6am-12pm Watch Case Dimension Comparison: It can be difficult to determine how the watch's hand fits on the wrist without trying it first. Get a better feel for the size of the watch case compared to the case diameter of the following diameters of common objects: Nickel: 21.21mm Quarter: 24.26mm Half Dollar: 30.61mm Poker Chip (standard): 39mm Ping Pong Ball: 40mm Golf Ball: 42.67mm Toss Ball (ISO standard): 50mm Racquetball: 57mm Soda Can (standard): 65mm Tennis Ball: 67mm About Alligator: Alligator is a crème de la crème to hide crocodile species. Found in the southern United States and in areas of China, alligators have skin that is supple, durable and usually softer than a crocodile. While its top hide is very rugged and practically impenetrable, the alligator belly offers softer, flexible skin. It is easily known for its unique scaled texture and elegant feel. Alligators have scales that are relatively flat with some wrinkles around the edge. If you see many lines or dots on scales, or notice sudden changes in the adjacent area of the scales, you'll probably look at caiman's skin, the crocodile match. Each alligator's skin is different, which means that none of the two skins will ever be identical. Alligator skin is often scraped off and easily cleaned with a damp cloth. with a washing

cloth.
