Reveal 7.1 SP7 Release Notes

Features

Users can delete document folders from the web interface

A user with the new “Manage Document Folders” permission has the capability to delete document folders using the web interface:

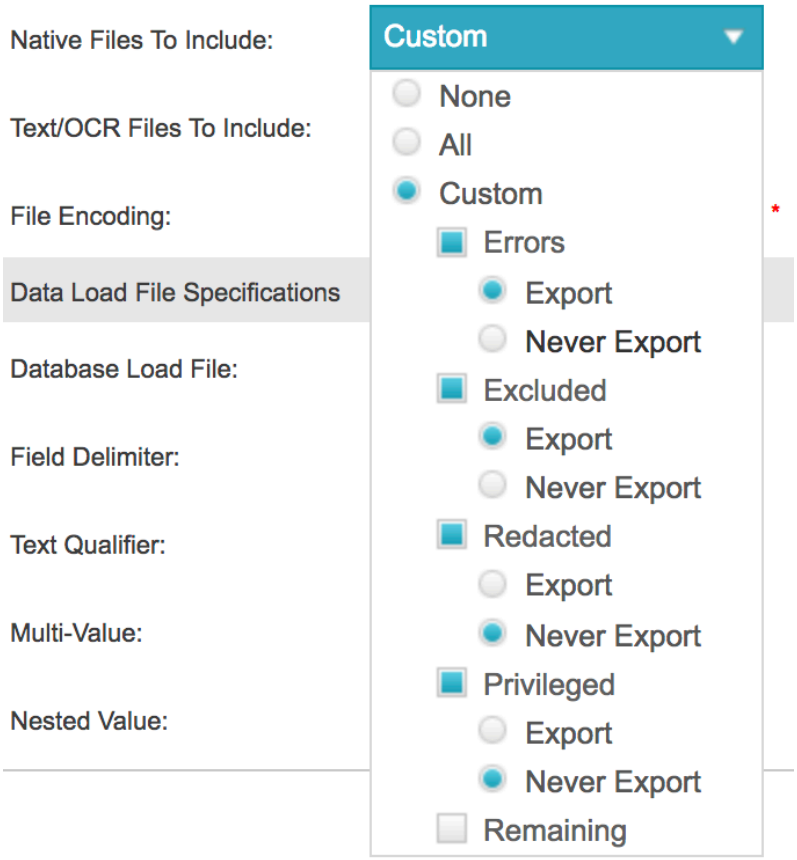

Production jobs provide granular execution status

We have modified the production module to provide the user with more advanced and granular status information. When a production job is being executed, the document counts and job completion percentage will be updated at least every 100 documents or one percent of the overall document count. For instance, if a production job is 10,000 documents the execution status will be updated every 100 documents while a job of 200 documents will update every 2 documents.

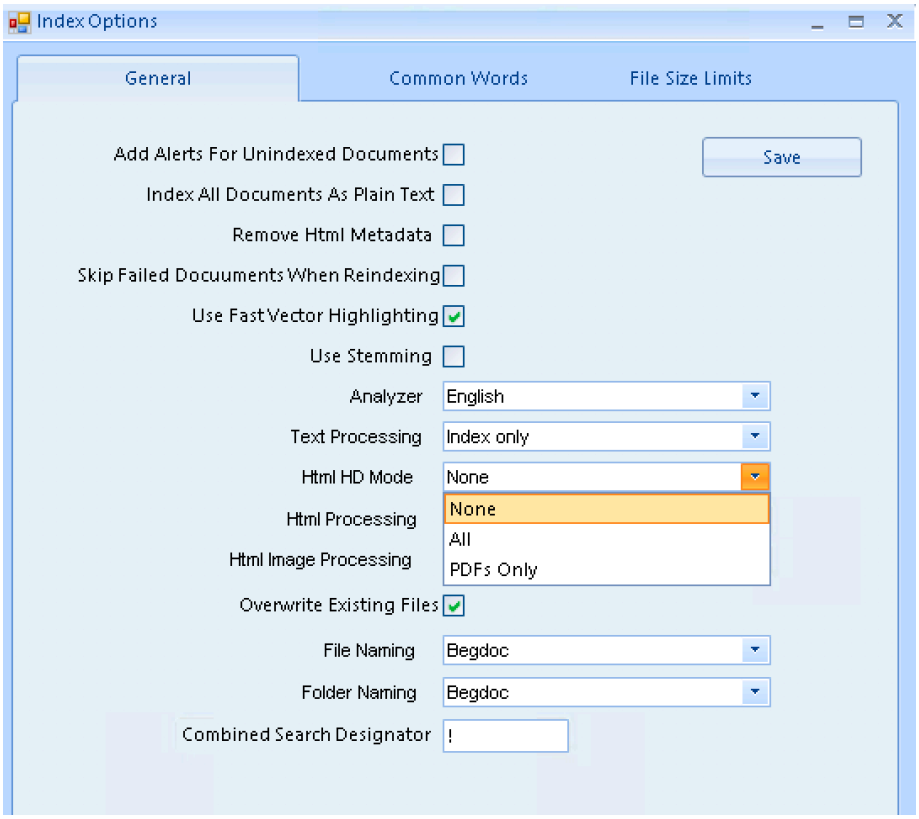

Users running production exports are able to better control included files

A user can choose to include or exclude text or native files having one of several classifications. If a document fits into more than one category, it will not be included if any of its classifications are set to “Never Export.” If a production export job is configured as shown the in screenshot below, a document that is both excluded and privileged will not be exported because privileged documents are set to never export. A document that is classified as excluded and errors would be exported.

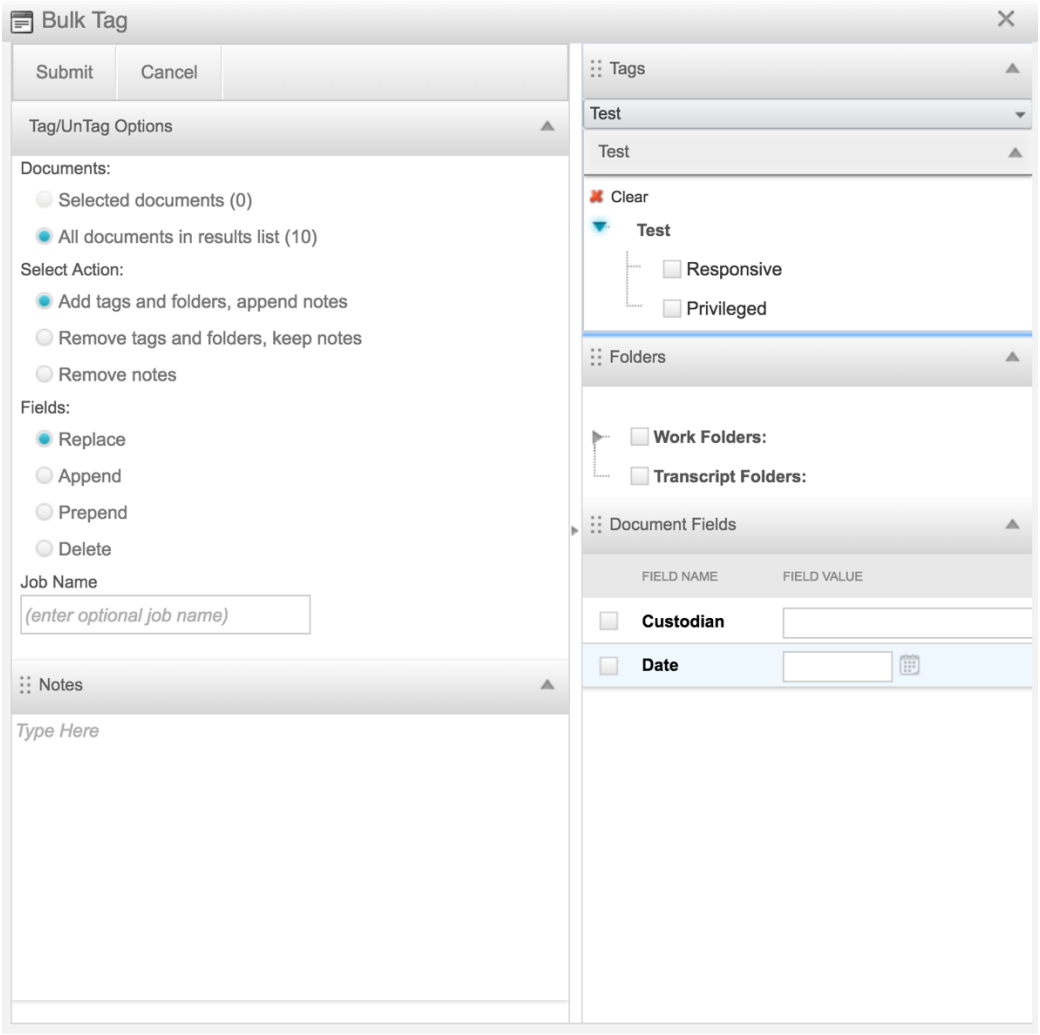

Enhanced high-definition indexing options

In prior versions, users could choose to index all documents all either standard or high-definition. Now users can choose to index all PDF documents as high-definition while all other documents are indexed as standard definition. This functionality provides additional clarity for scanned PDF documents while optimizing for speed and index size by processing other documents as standard definition.

Bulk update fields

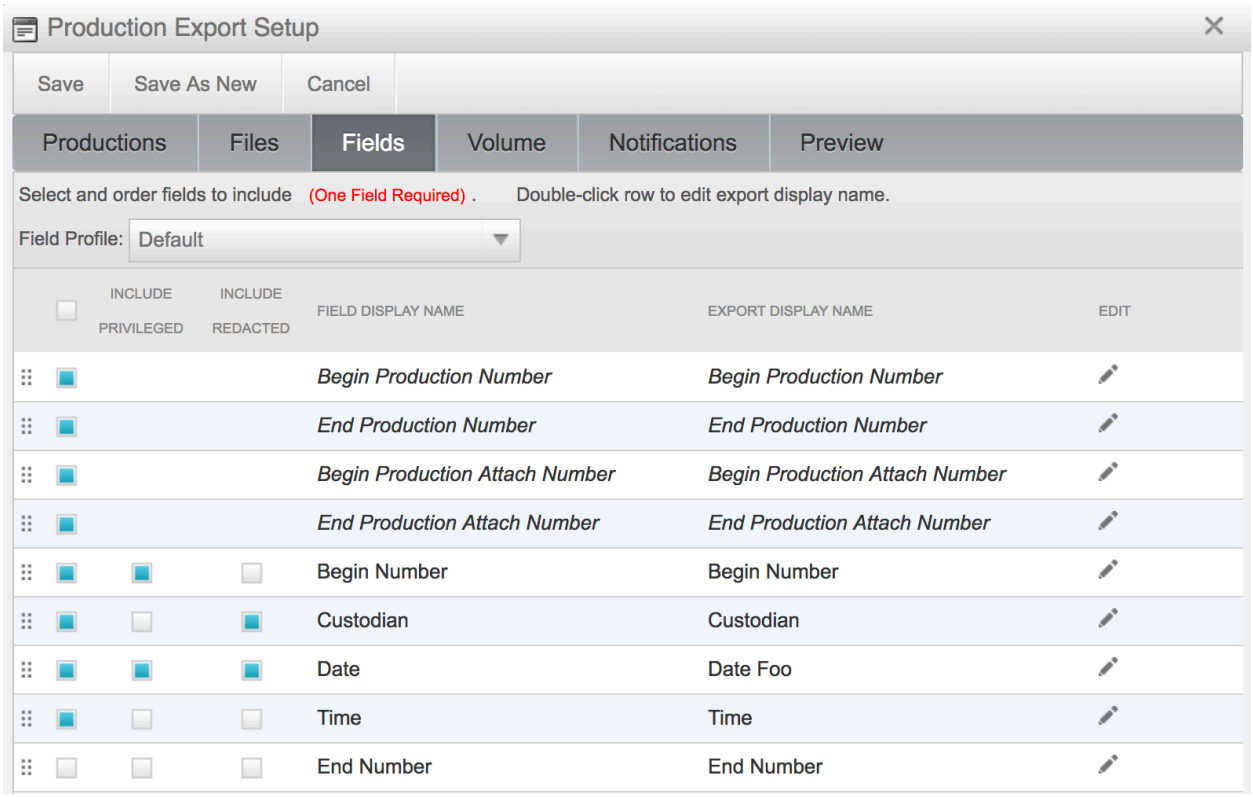

We have added the ability to update fields using the ‘Bulk Tag’ window. A field must be set as ‘Updatable’ to appear in the below list:

To update a field, check the checkbox next to the fieldname and enter the value that you wish to apply. Selecting ‘Append’ or ‘Prepend’ will combine the update text with the field’s current value, separated by a semicolon. Users must have the ‘Bulk Update Fields’ permission to update fields with this function.

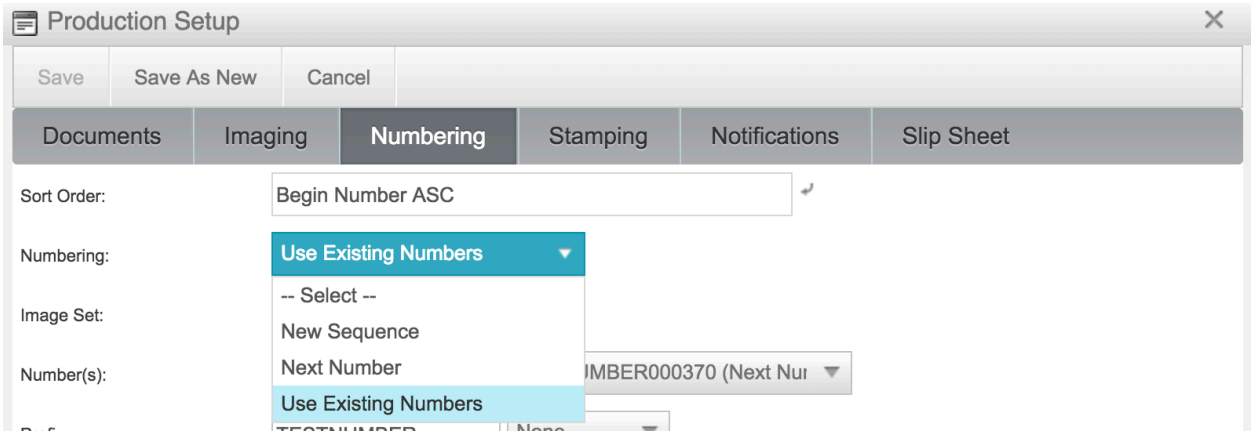

Withhold metadata for redacted files

Similar to the options for privileged documents in our last release, users can now withhold metadata for redacted documents:

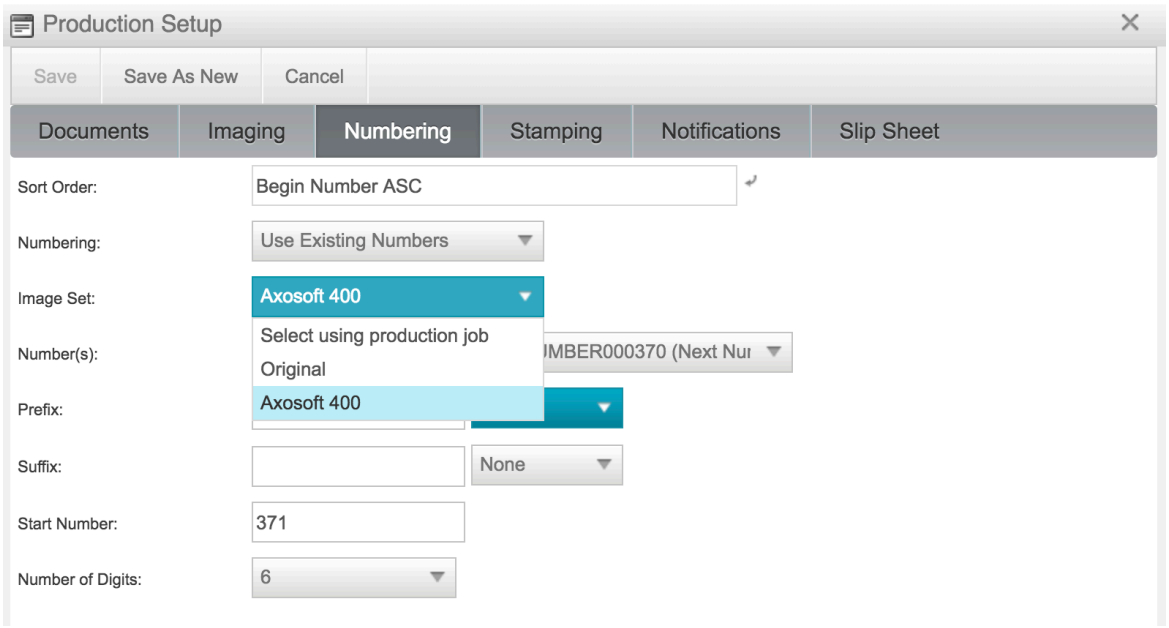

Produce documents with Bates numbers from prior production job

Users can now reproduce documents with new images and existing Bates numbers by selecting the ‘Use Existing Numbers’ option on the production job’s numbering tab.

You can select to use numbers from either an image set or a single production job:

Any documents with existing numbers in the chosen source will reuse those numbers in the current production. The remaining numbering options on the ‘Numbering’ tab are for any additional documents in the production which do not have existing numbers.

If the number of new images for a document go beyond the document’s existing numbers, overflow pages will be numbered with the final Bates number plus a suffix. Suffixes for a document start at ‘_0001’ and increase by one for each additional overflow page.

Patches

- Optimized the creation of work folders imported from a load file to increase the speed of import.
- Corrected an issue where page navigation disappeared when navigating assignment jobs.
- Changed the behavior of the user default sort order panel so that a user can close the panel without saving changes.
- Changed the email notifications for production jobs to better indicate whether the system performed pre-processing or image/stamping.
- Changed the name of the reveal-admin user to SYSTEM. This account was changed to prevent a user from logging into this system account using the web interface.
- Added a warning before executing pre-processing for a production job that has already produced images to inform the user that running pre-processing will prevent export of the previously-created images.
- Corrected an issue where case creation may timeout while provisioning the SQL database.
- Increased speed of browsing deeply-nested document folders.
- Increased default index size limits.
- Added default HTML indexing options to ensure hidden and filtered data in Excels are indexed. New options are also in place for track changes in Word documents and speaker's notes in PowerPoint documents.
- Fixed issue where an ElasticSearch indexing job would stall on the last few documents in job.
- Fixed issue which caused wordlist highlighting to fail in Elastic cases when smart quotes / curly quotes were entered into the wordlist.
