1.0 Preface

This statistical release presents quarterly Indices of Mining Production (IMP) for the period 2003 to the fourth quarter of 2015. Also carried in the report is the annual IMP for the period 2003 to 2015, derived as the average of the four quarters of the year. This report uses 2013 as a reference/base year. Data used in this publication is sourced from the Department of Mines; Ministry of Minerals, Energy and Water Resources.

For more information, contact the Directorate of Stakeholder Relations on 3671300. All Statistics Botswana outputs/publications are available on the website at www.cso.gov.bw and at the Statistics Botswana Library (Head-Office, Gaborone).

We sincerely thank all stakeholders involved in the formulation of this brief, for their continued support, as we strive to better serve users of our products and services.

Anna N. Majelantle
Statistician General
April 2016

2.0 Summary of Findings

All figures in this report are not seasonally adjusted.

It should be noted that revisions have been made to the 2015 data hence revising the Indices of Mining Production for the whole of the year 2015. The changes were due to the updated source data and the affected minerals are; Copper in Concentrates, Soda Ash and Salt.

Table 1 presents a summary of findings for Indices of Mining Production (IMP) from 2013 to the latest quarter (Q4 of 2015). This table forms the basis of the discussion under Sub-Section 2.1: Indices of Mining Production. Reference however, will be made to this table and other tables throughout the report.

Table 1: Key Figures in the Volume of Mining Production

Base period: 2013=100			
Period	Index of the physical volume of mining production	Year-on-year percentage change, seasonal unadjusted	Quarter-on-Quarter percentage change, seasonal unadjusted
Q1_2013	82.5	(8.7)	(9.7)
Q2_2013	111.6	25.2	35.3
Q3_2013	97.1	38.4	(12.9)
Q4_2013	108.8	19.1	12.0
Q1_2014	96.2	16.7	(11.5)
Q2_2014	106.6	(4.5)	10.8
Q3_2014	105.7	8.9	(0.8)
Q4_2014	104.5	(4.0)	(1.2)
Q1_2015	95.6	(0.9)	(8.6)
Q2_2015	98.7	(7.4)	3.3
Q3_2015	65.6	(37.9)	(33.5)
Q4_2015	77.9	(25.5)	18.7

Note: () denotes negative numbers

Table 2: Indices of Mining Production Annualized Growth Rate by Mineral Group (2005-2015)

Mineral Group	Annualized Growth Rates
Diamonds	(4.2)
Copper-Nickel Cobalt Matte	(6.3)
Copper in Concentrate	...
Gold	(13.6)
Soda Ash	(1.5)
Salt	7.4
Silver	...
Coal	7.7
Total	(4.2)

Note: () denotes negative numbers

2.1 Indices of Mining Production

The Index of Mining Production stood at 77.9 in the fourth quarter of 2015 showing a negative year-on-year decline of 25.5 percent.

The main contributors to the decline in growth of mining production came from Diamonds which contributed a decline of 17.0 percentage points, followed by Copper in Concentrates and Copper-Nickel Cobalt Matte contributing negative 5.7 percentage points and negative 2.5 percentage points respectively, as indicated in **Tables 3 and 6**.

Gold and Coal brought some resilience to the overall mining production fall, both contributing 0.1 of a percentage points during the fourth quarter of 2015. Regardless of their positive contribution to the overall index, the two minerals' combined weight is too insignificant to influence the overall year-on-year percentage change and ultimately the contribution (% points) to the percentage change in the total mining production to positive growth.

The total Mining Production for the year 2015 (base 2013=100) shows a substantial decrease of 18.2 percent as compared to the 2014 annual production. The largest contributors to the 18.2 percent decrease in the total Mining Production were Diamonds and Copper in Concentrates which declined 13.2 percentage points and 4.3 percentage points respectively (**see Table 5 and Table 6**).

Although the total Mining Production growth increased in most parts of the years since 2005, it decreased at an average annual rate of 4.2 percent, for the decade as a whole. It can be observed that diamond production has positive correlation with the total mining production, as it (diamond production) also decreased at an annual average rate of 4.2 percent (**see Table 2 and Table 5**).

2.2 Mineral Production

Discussions on mineral production compare production during the fourth quarter of 2015 to the same quarter of 2014 and are based on **Table 5**.

Diamond production declined for the fifth consecutive quarter reflecting a decrease of 20.4 percent in the fourth quarter of 2015 as compared to the fourth quarter of 2014. The decline came about as a result of weak demand for diamonds (constrained commodity market) forcing diamond producing companies to reduce production.

Table 5 also shows 2015 annual diamond production declined by 15.6 percent as compared to an annual increase of 6.6 percent during 2014.

Copper-Nickel-Cobalt Matte production declined by 31.0 percent in the fourth Quarter of 2015 as compared to the same quarter in 2014. It can be observed from **Table 5** that the commodity was recovering following a smelter shutdown which took longer than anticipated as the current decline is of lower magnitude when compared to the decline of 61.6 percent recorded in the previous quarter.

Copper in Concentrates recorded zero production in the fourth quarter of 2015. This is attributable to the provisional liquidation of the companies concerned.

Gold production increased by 12.9 percent in the fourth Quarter of 2015, after declining for six consecutive quarters. This increase was as a result of higher than expected gold recoveries from the ore as well as the improved performance of the ball mill.

Soda Ash production growth slowed down in 2015, increasing by 1.4 percent in the fourth quarter of 2015.

Salt production declined for all the quarters of 2015, registering a decline of 26.2 percent in the fourth quarter of 2015.

Silver recorded zero production in the fourth quarter of 2015. This is due to the closure of the mining operations of the concerned company.

Coal production increased by 25.3 percent in the fourth quarter of 2015 as compared to the corresponding quarter of 2014. The increase was necessitated by the need to meet both the local and external demand for coal.

**Table 3: Index of Mining Production for the latest Quarter (Fourth Quarter 2015)
by Mineral Groups and Minerals**

Base:2013=100					
	Weights (2013)	Oct-Dec, 2014	Oct-Dec, 2015	Year-on-Year Percentage Change	contribution (% points) to the percentage change in the total mining production
Diamonds	82.5	105.5	84	(20.4)	(17.0)
Copper-Nickel-Cobalt Matte	8.6	96.5	66.6	(31.0)	(2.5)

3.0 Technical Notes

3.1 Background Information

Mining activity in Botswana started in the 19th century with the production of Gold by Europeans from the Tati Reefs which is now the modern Francistown area. However, much of this activity could not be accounted for, despite its significant contribution to the economy at that time. Modern mining in Botswana started with the mining of Diamonds at Orapa in 1971 followed by Copper-Nickel production in 1973 at Selibe- Phikwe. Since the early 1980s, the mining industry has been the largest contributor to real gross domestic product (GDP), contributing between 30 and 50 percent. Its value has been increasing at an annual rate of nearly 20 percent.

These mineral contributions enabled the Government to undertake investments in both human and physical infrastructure development over time. In 2013, mining accounted for 22.4 percent of Botswana's GDP, and more than 50 percent of Government revenues. Even though the mining sector's contribution to GDP has been below 25 percent since the 2009 recession, available data indicates that the sector still leads in terms of value added contribution to GDP. Despite its great contribution to Botswana's GDP, the mining industry is capital intensive and accounts for less than 5 percent of employment in the private sector.

With such a significant contribution to the GDP, and or the national economy, the need for a measure of change in the production of minerals in Botswana cannot be over emphasized. The index of physical volume of mining production is such a measure that provides a relative change over time in mining production. IMP can also be used as a deflator to calculate the gross domestic product (GDP) at constant prices.

3.2 Data collection

A mining production survey is carried out by the Department of Mines at the Ministry of Minerals, Energy and Water Resources, covering all mining establishments operating in the country. After the completion of data collection, the Department of Mines through its data sharing agreement with Statistics Botswana provides the data to Statistics Botswana. Following international standards and guidelines, Statistics Botswana cleans and tabulates the data, then produces reports for publishing and dissemination to users.

3.3 Scope of the survey

The survey covers all mining establishments conducting activities relating to the extraction of minerals occurring naturally as solids such as Diamonds, Matte (Copper-Nickel-Cobalt), Copper in Concentrates, Gold, Soda Ash, Salt, Coal, Semi-precious stones and the quarrying of building materials. The activities are classified according to the International Standard of Industrial Classification of all Economic Activities (ISIC) Rev 4, and Central Product Classification (CPC) Version 2.

The results of the survey are used to calculate the indices of the physical volume of mining production on quarterly basis and subsequently to estimate GDP, also on a quarterly basis.

4.0 Concepts, Definitions and Methods

4.1 Index of the volume of mining productions

The index of the volume of mining production is a ratio that indicates the increase or decrease of a magnitude (Allen, 1975). The index form is used not only for intertemporal comparisons but for comparisons between countries (Bal, 2008).

The IMP is an important macro-economic indicator which monitors progress and fluctuation of the mineral sector production in the economy. The Index is also known to be an effective tool that measures current production which indicates relative changes over time in the physical volume of mining production.

4.2 Base Period

The base period, usually a year, is the period against which other periods are compared to and whose values provide the weights for an index (UNSD, 2010). The base period, also referred to as reference period used in this brief is 2013 and it is set at 100.

4.3 Index weighting

The weight of the mineral group is the ratio of the estimated value of production of a mineral group to the total estimated value of production of the mining industry. The weight of a mineral group reflects the importance of the mineral group in the total mining industry. The relative importance of various mineral groups is different and these differentials need to be reflected while measuring the performance of the entire mining sector.

4.4 Seasonal Adjustment (SA)

Seasonal adjustment is a means of removing the estimated effects of normal seasonal fluctuations and typical calendar effects from the series so that the effects of other influences on the series can be more clearly recognised. Seasonal adjustment does not aim to remove irregular or non-seasonal influences which may be present in any particular month.

The data contained in this report is not seasonally adjusted. However, there is a further scope of producing and disseminating an additional seasonally adjusted series.

4.5 Year-on-year percentage change

Year-on-Year percentage change in a variable for any given period is the rate of change expressed over the same period (OECD, 2007).

4.6 Index Contribution (percentage points)

The contribution (percentage points) of a mineral group or mineral to the percentage change in the total mining production for a given period is calculated by multiplying the difference in the index for each mineral group or mineral by the weight of the mineral group or mineral and then dividing by the previous period's total index. It indicates the extent to which each mineral group affects the overall growth of mining production.

4.7 Calculation of the Index of Mining Production

To calculate the evolution of physical volume of mining production on a quarterly basis, a Laspeyres indicator, base year 2013=100, was used. The index is calculated as the weighted arithmetic mean of the production relatives in respect of selected items. The weighted average is done to measure the importance of various mineral groups in the mining sector when calculating the comprehensive growth rate of the sector.

$$I = \frac{\sum R_i * W_i}{\sum W_i}$$

Where; I is the index, R_i is the production relative of item i and W_i is the weight allocated to item i

The production relative (R_i) of the i^{th} item for the quarter has been calculated by using the formula:

$$(R_i) = \frac{P_{ic}}{P_{io}} * 100$$

Where P_{ic} is the production of the i^{th} item in the current quarter and P_{io} is the production of the i^{th} item in the base year.
