## Windows xp startup repair disk

By Bobson St. Pierre In Microsoft Windows, one of the most convenient ways to remove an installed program and all of its components and files uses the add programs and removes utility in control panel. On rare occasions, the utility cannot function correctly. When you click to access it, you can get an error or just a blank screen without a list of the apps. This problem can occur if certain conditions of a number of files are not met, two of the files involved are Appwiz.cpl and Mshhtml.dll. Fortunately, fixing this problem isn't as complex as you might think, and shouldn't take more than 10 minutes. Type right-winger32 Appwiz.cpl and click Enter. Click OK on the RegSvr32 dialog box. Type right-winger32 shdocvw.dll -i and click Enter. Click OK on the RegSvr32 dialog box. Type right-winger32 shell32.dll -i and click Enter. Click OK on the RegSvr32 dialog box. Restart the computer and access the add/remove programs utility, which must work properly now. A majority of businesses have migrated to Windows 7 or plan to do so. But for Windows XP keeping ready to side-step Windows 7 for the upcoming Windows 8 OS, you risk a gap in support, highlighting research firm Gartner in a new first take analysis of Windows 8 migration into the venture. Gartner analysts Michael A. Silver, David W. Cearley and Stephen Kleynhans acknowledge that for organizations running late with Windows 7, it's tempting to forget the industry, but with support for Windows XP ending in April 2014, organizations will cut it close. Microsoft has not announced a general release date for Windows 8, but Gartner believes the company could target back-to-school buyers in 2012 — in which case the RTM (release to manufacturing) of Windows 8 is likely to begin around April 2012, a date that will allow general availability by mid-year 2012. Even if Microsoft meets that very aggressive timeline, independent software vendors and businesses are likely to need nine to 18 months to acquire and test supported applications and plan deployments, the Gartner report states. This means that most organizations won't be able to start deploying Windows 8 until the end of 2013. And five or six months after that, Windows XP goes down life support. At its BUILD developer conference this month, Microsoft unveiled the Developer Preview version of Windows 8, details about the Metro tile-based UI, the compatibility with Windows 7 apps, the ease of building Windows 8 apps and the various devices and form factors on which Windows 8 will run. Microsoft focused more on what Windows 8 has for developers and consumers than it has for IT sections. But in an interview, Rich Reynolds, GM for Windows Commercial Marketing, highlighted Windows 8 enterprise security security network improvements on the well-received Windows 7. And then there's the tablet factor. Windows 8 will run on all the hardware running Windows 7 on, plus it will use ARM-based chips to run on lower-powered devices such as tablet computers, a market now dominated by the iPad and one that will become more important to enterprises as employees increasingly depend on personal devices for work purposes. Some examples of new or improved enterprise features in Windows 8, according to Microsoft's Reynolds: More efficient use of Direct Access, a network feature in Windows 7 that allows mobile workers to connect to corporate networks without using a VPN; BitLocker encryption is streamlined in Windows 8 so that only sectors of the hard drive containing data will be encrypted and the task will do while working; In addition, Windows 8 will introduce a feature called Secure Boot, which prevents malware from starting before the OS boots. Obviously, we're excited about the new features in Windows 8, but our guidance for enterprise customers using Windows XP is to focus on accelerating Windows 7 deployments, Reynolds says. End of XP extended support is in April 2014, ending little time for organizations to move to Windows 8. In fact, in most cases we think it won't even be possible. To that end, Gartner provides four recommendations for Windows XP enterprise containers that join a crossroads in their deployment strategy. Organizations run Windows XP and update on Windows 7 migrations: Continue as planned; do not switch to Windows 8. Organizations that find it difficult to do forklift upgrades: Consider getting into Windows 8 by attribution. Organizations interested in new devices enabled by Windows 8: Consider Windows 8, even if you intend to skip Windows 8 for traditional computers. Enterprise developers: Get familiar with the Metro style of apps, which will likely be the preferred desktop metaphor in the future as the focus for Windows 8 apps. I used Norton disk to scan doctor for bugs on drives, but it was part of the Systemworks package that I uninstalled. Does not look like windows a scandinated lake, or at least I can't find it. Any recommendations on what to use (prefer free utility) to scan disks for errors. I have a removable drive bay in which I want to load some hard drives and look at them to make sure they're okay. Reply from dawngbert when you're running XP opens my computer, right click on your c-drive, select properties, tools, bug checking, select automatic solution errors, restart. Reply from MobiusNZ STARTRUNCMDchkdsk/Respsns Yes when asked if you want this procedure done at the next boot. Voila.PSST: chkdsk is scandisk-Het you have a better answer? Put it in the discussion. The Startup Recovery tool in Windows Vista replaces important operating system files that might be missing or damaged. Startup recovery is an easy diagnostic and recovery tool to use when Windows Vista is not starting properly. Windows Vista Startup Recovery - Step 1. To start the Windows Vista Startup Recovery process, you must start from the Windows Vista DVD. Look for a Press any key to start from CD or DVD message similar to the one shown in the screenshot above. Press a key to force the computer to start from the Windows Vista DVD. If you don't press a key, your computer will try to get started to the operating system currently installed on your hard disk. If this happens, just restart your computer and try to restart the Windows Vista DVD. Windows Vista Startup Recovery - Step 2. No user intervention is required here and no changes are made to your computer during this step. Just wait for the Windows Vista setup process to load files in preparation for whatever task you want to complete. In our case, it's a startup recovery, but there are many tasks that can be completed with the Windows Vista DVD. Windows Vista Startup Recovery - Step 3. Select the Language to install, time and currency format, and keyboard or import method that you want to use in Windows Vista. Select Next. Windows Vista Startup Repair - Step 4. On the lower left of the Install Windows window, select Repair your computer. This link will start the Windows Vista System Recovery Options. Do not select Install now. If you already have Windows Vista installed, this option is used to perform a clean installation of Windows Vista or a parallel installation of Windows Vista. Windows Vista Startup Recovery - Step 5. System Recurrecies will now search your hard drive(s) for any Windows Vista installations. You don't have to do anything here, but wait. This Windows installation search shouldn't take more than a few minutes at most. Windows Vista Startup Recovery - Step 6. Select the Windows Vista installation on which you want to perform the startup recovery. Select Next. Do not worry if the drive letter in the not match the drive letter you know Windows Vista is installed in your computer. Drive letters are somewhat dynamic, especially when diagnostic tools such as System Recovery Options. Windows Vista Startup Recovery - Step 7. The Startup Recovery tool will now look for problems with important Windows Vista files. If startup recovery finds a problem with an important operating system file, the tool can suggest a solution of some kind that you need to confirm whether the problem can automatically solve. Whatever happens, follow the directions as needed and accept any changes proposed by Startup Repair. Windows Vista Startup Recovery - Step 8. Startup Recovery will now attempt to recover any problems it found with Windows Vista files. No user intervention is required during this step. Your computer may or may not restart several times during this recovery process. Do not start from the Windows Vista DVD on any restart. If you do this, you should restart immediately so that the startup recovery process can continue normally. If startup recovery found no problem with Windows Vista, you won't see this screen. Windows Vista Startup Recovery - Step 9. Select Finish once you see the Restart your computer to complete the recovery window to restart your computer and start Windows Vista normally. It's possible that Startup Repair didn't establish whatever problem you had. If the startup recovery tool determines it yourself, it can run again automatically after your computer has restarted. If it doesn't run automatically, but you still see problems with Windows Vista, repeat these steps to manually perform startup recovery again. If it becomes clear that startup recovery isn't going to solve your Windows Vista problem, you do have some additional restore options, including a System Restore. You can also try a clean installation of Windows Vista. However, if you tried a startup recovery from Windows Vista as part of another troubleshooting guide, you're probably best served by continuing with what specific advice that guide gives as your next step. Thank you for letting us know! Tell us why! Why!
