

XProtect® Analytics enables effortless integration of multiple third-party video applications, such as license plate recognition (LPR) in a single, easy-to-manage user interface. LPR is used to recognize vehicles and control access and can be used at gate barriers, parking spaces, toll gates and in traffic enforcement. License plate information is detected and read from a digital video stream and user-defined positive/negative lists can be created that will initiate certain actions, such as opening a gate. LPR for XProtect Analytics is seamlessly configured and managed through the supported XProtect products.

XProtect Analytics integrates with the following XProtect® products: XProtect® Express, XProtect® Professional, XProtect® Enterprise and XProtect® Corporate.
