

Food Packaging Company

- Est. 1969 -

Product Catalog
February 2016

From our modest start with one plant in 1969, we have grown to nineteen manufacturing facilities located throughout North America, with our headquarters located in beautiful Glens Falls, New York. We are the market leader for innovative food packaging solutions using multiple materials for both rigid and flexible items. Our product offering is the most comprehensive, serving the food service, food and bakery processing and retail markets with progressive designs and substrates that our customers have come to expect. Our commitment to our current and future customers is that we will focus on our core competency while expanding our reach into new materials and designs that will keep them competitive, now and into the future.

• Materials Used in our Manufacturing Processes •

Foamed Polystyrene – Probably the most versatile of substrates, foamed polystyrene may be made into a multitude of shapes and configurations. It has excellent insulation properties and decent thermal resistance making it applicable for both hot and cold foods. Hot foods will stay hot longer and cold foods will stay cold longer in a foamed PS container. Foamed polystyrene also takes very little energy to produce compared to other substrates and consumes virtually no water during production. It is also extremely light weight compared to nearly every other material which means it uses far less raw materials. As with many single use food service items, very few facilities exist for recycling, but recently there has been a surge in centers collecting this material. Check with your local municipality to see if a site exists near you.

Hi Impact Polystyrene – HIPS material is, for the most part, foamed polystyrene without the “foamed” part. HIPS is well known for being formed into plates and bowls. It has excellent cut resistance and can handle very heavy applications such as complete meals. Although not as light as foamed PS, HIPS is still lighter than most other materials making it a very economical choice for a wide range of applications.

PET – Polyethylene terephthalate or PET is a clear, solid plastic material most often used in water and soda bottles. At Genpak, we specialize in two types of PET. APET is a crystal clear material and is an excellent choice when displaying food items. APET may also be used in cold and frozen food applications as well and will hold up in automated fill/seal processes. CPET is another form of PET that when crystallized becomes able to withstand very high temperatures making it perfect for oven ready applications. We offer a wide range of oven ready bakery and food trays in this material. Both APET and CPET are #1 recyclable material and at Genpak, we manufacture all of our APET items with up to 40% Post-Consumer Recycled Content.

Polypropylene – When microwave safe options are required for food packaging, polypropylene is the best choice of materials. We can produce PP in clear and in colors such as black and white. We also offer a very unique “textured” PP material that allows us to make our products up to 20% lighter than most other competitive items. This translates into much less raw materials being used and lower product cost to you.

Harvest Pro –This hybrid material is produced from 60% polypropylene and 40% natural minerals that provide an enhanced environmental message. Harvest Pro products have the look and feel of traditional top-of-the-line materials and are microwave safe giving them a wide range of food packaging applications.

Harvest Paper – Our paper cone, portion and drink cups are produced from raw materials originating from forests managed with Sustainable Forestry Practices and are now all 100% BPI certified compostable. All our paper product configurations are engineered for maximum strength and durability utilizing box pleats, concave surface areas and rolled rims.

Harvest Fiber – Our fiber material is manufactured from renewable resources and is 100% BPI certified compostable. Harvest Fiber products are microwave safe and grease/water resistant. Each item is engineered with ease of use in mind. Features such as our famous Snap-It style closure and convenient stacking rims will keep customers coming back for more.

Harvest Fiber	0°F					210°F				
Harvest Pro	0°F					210°F				

These guidelines are to assist you in determining the proper use of Genpak products. They are based upon testing and published data and are reliable in most applications. However, because every food supplier's recipes, ingredients, processes and supply chains are unique, this information is not a substitute for product testing. Confirmation of product acceptability under your specific conditions of use must be done by you.

• Use and Handling Instructions For PET Items •

Genpak oven ready PET containers are engineered and manufactured to withstand rigorous manual and automated processes. Although it is impossible for us to foresee every application variable, below are several use and handling instructions that we strongly recommend you follow no matter the application. The following tips apply to end users (consumers) and processors.

Use Instructions for PET Oven Ready Items

- Safe operating temperature range is -15°F to 400°F.
- Always use a cookie sheet and place the tray on the middle rack of an oven.
 - The cookie sheet ensures an even distribution of heat and the middle rack of an oven is usually closest to the oven thermometer.
- Never use the trays without a cookie sheet or placed too close to the heat source. Melting and damage to the oven could occur.
- A thin layer of spray-on grease may be used for easy release and optimal peaking.
- Allow containers to cool to room temperature before handling without the cookie sheet. Containers will regain their strength at ambient temperature.
- If lids are being used;
 - Wait until the finished product has cooled to room temperature before applying the lid.
 - Apply the lid by placing it in position and then pinch around the perimeter area where the lid meets the tray. Never press down on the top of the lid. This could cause damage to the lid and may not secure lid entirely around the tray.
- Processors – typically bake times are reduced using CPET trays versus some permanent pans. Ask us for samples so you may test bake times and temperatures for your application.
- Consumers – always follow the cooking/baking instructions printed on the label and always remove the clear lid prior to heating.

Handling & Shipping Instructions for clear PET and Oven Ready Items

- PET items may be frozen to -15°F. The following care must be taken to ensure product integrity.
- At -15°F any item must be handled as if it were glass.
- Label finished goods corrugate as “Fragile” and “Handle With Care”. Items may break if dropped in a frozen state.
- Always stack finished product upright in a case.
- Never over-stack finished product. Use of corrugated dividers is highly recommended when stacking frozen product in a case.
- Use proper sized corrugated when packaging finished product. Too much head-space or side-space can cause items to shift during transport and break.

Genpak recommends that all these tips are followed to help ensure safe use. If you have any questions, please contact your local representative or us directly at info@genpak.com.
