

What are the part numbers for the Schlage blocking rings?

Resolution:

Depending on the application, there are two types of blocking rings offered - One for use with a compression ring, and one for use without. When a compression ring is used, its diameter is larger than the face of the cylinder, so a larger blocking ring is needed. When a compression ring is not used, the blocking ring only has to match the cylinder face, so it has a smaller diameter. See Figure 1 for a comparison.
