Ives TWP and TW8 for 112HD and 224HD Series Continuous Hinge Discontinuation

With the arrival of the new and much improved design of the XY Series TWP Continuous Hinge, the 112HD and 224HD Series optional TWP and TW8 will be discontinued **effective August 14, 2017**. The HD Series replacement TWP panels will still be available for a short period of time. We are currently investigating an improved HD series TWP as a longer term replacement for any current applications.

The new XY Series TWP has a number of benefits

XY Series Features and Benefits

- **Redesigned to be the most secure and optimal solution** offered for powering your door, backed by a 5-year warranty.
- **New wire design** features a Tefloncoated wire, greatly improving performance and durability.
- **Exceeds Grade 1** testing with over a million cycles on 150lb and 300lb doors.
- **Ives Patented FOCUS Bearing Technology** delivers maximum lateral strength at the top and bottom of the door where it's most needed while allowing the hinge to flex with bowed doors and frames without binding. This also enables easy on-site trimming without cutting off bearings and compromising the XY Series loadcarrying capacity.
- **One piece cover appearance** provides no unsightly TWP seams in the cover
- **Thru-Wire Panel easily mounts and removes from mortise side of door** - No need to remove cover or pull panel from opposite side of door making maintenance and accessibility easy!
- **Mounting location aligns with common door device mounting heights** which allows easy access to the panels without the need for a ladder.
- **TWP available** on 026XY, 027XY, 112XY, 114XY, 224XY full mortise hinges
