

**TEST RESULTS REPORTED IN ERROR AND REMEDIAL ACTIONS  
PARENTAGE/RELATIONSHIP EVALUATION**

If a discrepancy is reported on a test result, review the records of the testing and, if the specimen is still available, rerun the test. If the specimen is no longer available, ask for a recollection. Once the test is completed and confirmed, contact the client with the new test results and issue a new written report. Complete this form and mark on the old report "**CORRECTED REPORT ISSUED**." Place the words "Corrected Report!" on the new report and keep the old report, as well as a copy of the new report, with this filled out form in the appropriate QA Manual for 2 years.

<b>Test (paternity, maternity, etc.):</b> Paternity	
<b>Case Number:</b>	
<b>Date Report was Issued:</b> April 4, 2006	
<b>Person(s) with incorrect result:</b> Child	
<b>Incorrect Result:</b> Wrong Sample / Exclusion	
<b>Correct Result:</b> Inclusion	
<b>LabCorp Staff Person Notified of the Incident:</b> Lloyd C. Osborne	
<b>Notification Date:</b> About 04/24/07 # 04/12/2007 <i>JK 4/24/07</i>	
<p><b>Description of Incident:</b> A report ) was sent excluding the child. The client submitted a new sample on the child, which resulted in an inclusionary report ). Re-evaluation of the original report revealed that the mother and child had identical alleles (clones) for all loci tested. Reprep of the original samples revealed the same results. The new sample on the child was not identical to the mother. Apparently in the original case the specimen collector swabbed the mother twice (eight swabs total) and submitted the second set of swabs as the child. The color coding of the swabs was correct.</p>	
<p><b>Corrective Action Taken:</b> The regional account manager was notified of the problem with the specimen collection. Doctoral staff was reminded to watch for cases where two people (mother/child or father/child) are clones. These "clone" cases should all be recollected to confirm sample source.</p>	
<b>Correct Result Reported To:</b> Client in case
