

# Beaten by sheer pace!

## Cricket analytics with yorkr!

Tinniam V Ganesh

## CONTENTS

Preface

Foreword

1. Introducing cricket package yorkr: Part 1- Beaten by sheer pace!
2. Introducing cricket package yorkr: Part 2-Trapped leg before wicket!
3. Introducing cricket package yorkr: Part 3-Foxed by flight!
4. Introducing cricket package yorkr:Part 4-In the block hole!
5. yorkr pads up for the Twenty20s: Part 1- Analyzing team's match performance!
6. yorkr pads up for the Twenty20s: Part 2-Head to head confrontation between teams
7. yorkr pads up for the Twenty20s:Part 3:Overall team performance against all oppositions!
8. yorkr pads up for Twenty20s:Part 4- Individual batting and bowling performances!
9. yorkr crashes the IPL party ! – Part 1
10. yorkr crashes the IPL party! – Part 2
11. yorkr crashes the IPL party! – Part 3!
12. yorkr crashes the IPL party! – Part 4
13. yorkr ranks IPL batsmen and bowlers
14. yorkr ranks T20 batsmen and bowlers
15. yorkr ranks ODI batsmen and bowlers
16. yorkr is generic!

About the author

# Preface

‘yorkr’ happens to be my second R package for analyzing performances of cricketers. My first cricket package was ‘cricketr’, which had a really good reception.

The idea of creating this R package, based on data from Cricsheet (<http://www.cricsheet.org>), came to me, many months back while I was creating my first R package cricketr. I wasn’t too sure about how the package would turn out. The challenge with the data in Cricsheet, was the fact that it was in ‘YAML’ format. YAML is a recursive acronym for “YAML A’int Markup Language”. The conversion of yaml to dataframes, was the biggest hurdle in the creation of the package, as I had to maintain the ball-by-ball details, details of extras, non-striker details and how the player got out. In any case, it was great fun and a process of discovery for me, as I let R discover great batting partnerships,, bowling performances against an opposition or all oppositions, and analyze individual batting and bowling performances etc.

The creation of yorkr was a great experience for me. During the course of the package creation I felt like a writer, a painter, a sculptor and a marathon runner. Here’s why

- A writer, because when the idea (plot) of the R package based on (cricsheet.org) was formed, I had to create the associated functions (characters of the plot) and their role in the story.
- A painter, who had to change the shades of the functions to make the output plots/data more informative, compact and useful to the end user
- A sculptor, as I chipped and chiseled the functions to its final shape
- But mostly like marathon runner, of whom I have seen a few up close. Once I started to code the package, and created a few functions, I realized that I had reached a point of no-return, and the only way... was forward. Like a marathon runner, I had to put one step in front of another, and keep driving myself to complete the ideas which came to me in a torrent.

The yorkr package, now has 70 functions. Most of the heavy lifting is done by R packages dplyr, ggplot2. I have been amazed at the interesting results that I got out with my yorkr functions. I am certain many interesting insights abound in the data created by the yorkr package, and available in yorkrData.

With this book, I think I have corked the yorkr genie, and flung it into the world wide sea of the internet. Hopefully, when some intrepid reader uncorks the bottle, the released yorkr genie will grant the reader his or her proverbial 3 boons!

Feel free to contact me with your comments, suggestions and thoughts.

# 1.Introducing cricket package yorkr: Part 1- Beaten by sheer pace!

*“We need to regard statistical intuition with proper suspicion and replace impression formation by computation wherever possible”*

*“We are pattern seekers, believers in a coherent world”*

*“The hot hand is entirely in the eyes of the beholders, who are consistently” “too quick to perceive order and causality in randomness. The hot hand is a” “massive and widespread cognitive illusion”*

"Thinking, Fast and Slow - Daniel Kahneman"

## Introduction

*Yorker (noun):A yorker is a bowling delivery in cricket that pitches at or around the batsman's toes. Also known as 'toe crusher'*

- My package 'yorkr' is now available on CRAN. This package is based on data from Cricsheet (<http://cricsheet.org/>). Cricsheet has the data of ODIs, Test, Twenty20 and IPL matches as yaml files. The yorkr package provides functions to convert the yaml files to more easily R consumable entities, namely dataframes. In fact all ODI matches have already been converted and are available for use at yorkrData (<https://github.com/tvganesh/yorkrData>). However as future matches are added to Cricsheet, you will have to convert the match files yourself. More details below.

You can clone/fork the code for the package yorkr from Github at at yorkr (<https://github.com/tvganesh/yorkr>)

## 1. First things first

1. yorkr currently has a total 70 functions as of now. I have intentionally avoided abbreviating function names by dropping vowels, as is the usual practice in coding, because the resulting abbreviated names created would be very difficult to remember, and use. So instead of naming a function as *tmBmenPrtshpOppnAllMtches()*, I have used the longer form for e.g. *teamBatsmenPartnershipOppnAllmatches()*, which is much clearer. The longer form will be more intuitive. Moreover RStudio prompts for the different functions which have the same prefix and one does not need to type in the entire function name.
2. The package yorkr has 4 classes of functions
  - Class 1- Team performances in a match
  - Class 2- Team performances in all matches against a single opposition (e.g. all matches of India vs. Australia or all matches of England vs. Pakistan etc.)
  - Class 3- Team performance in all matches against all Opposition (India vs. All, Pakistan vs. All etc.)
  - Class 4- Individual performances of batsmen and bowlers

In this post I will be looking into Class 1 functions, namely the performances of opposing teams in a single match

The list of functions is

1. `teamBattingScorecardMatch()`
2. `teamBatsmenPartnershipMatch()`
3. `teamBatsmenVsBowlersMatch()`
4. `teamBowlingScorecardMatch()`
5. `teamBowlingWicketKindMatch()`
6. `teamBowlingWicketRunsMatch()`
7. `teamBowlingWicketRunsMatch()`
8. `teamBowlingWicketMatch()`

9. teamBowlersVsBatsmenMatch()

10. matchWormGraph()

## 2. Install the package from CRAN

```
library(yorkr)
rm(list=ls())
```

## 3. Convert and save yaml file to dataframe

This function will convert a yaml file in the format as specified in Cricsheet to dataframe. This will be saved as as RData file in the target directory. The name of the file will have the following format team1-team2-date.RData. This is seen below.

```
convertYaml2RDataframe("225171.yaml", "./source", "./data")
## [1] "./source/225171.yaml"
## [1] "first loop"

## [1] "second loop"
setwd("./data")

dir()
## [1] "Australia-India-2012-02-12.RData"
## [2] "Bangladesh-Zimbabwe-2009-10-27.RData"
## [3] "convertedFiles.txt"
## [4] "England-New Zealand-2007-01-30.RData"
## [5] "Ireland-England-2006-06-13.RData"
## [6] "Pakistan-South Africa-2013-11-08.RData"

## [7] "Sri Lanka-West Indies-2011-02-06.RData"

setwd("../")
```

## 4. Convert and save all yaml files to dataframes

This function will convert all yaml files from a source directory to dataframes and save it in the target directory with the names as mentioned above.

```
convertAllYaml2RDataframes("./source", "./data")
## [1] 1
## i= 1   file= ./source/225171.yaml
## [1] "first loop"
## [1] "second loop"

## [1] 633  25
```

## 5. yorkrData – A Github repository

Cricsheet has ODI matches from 2006. There are a total of 1167 ODI matches(files) out of which 34 yaml files had format problems and were skipped. Incidentally I have already converted the 1133 yaml files in the ODI directory of Cricsheet to dataframes and saved then as RData. The rest of the yaml files have already been converted to RData and are available for use. All the converted RData files can be accessed from my Github link **yorkrData** under the folder **ODI-matches**. You will need to use the functions to convert new match files, as they are added to Cricsheet. There is also a file named ‘convertedFiles’ which will have the name of the original file and the converted file as below

### convertedFiles

- 225171.yaml:Ireland-England-2006-06-13.RData
- 225245.yaml:England-Pakistan-2006-08-30.RData
- 225246.yaml:England-Pakistan-2006-09-02.RData ...

You can download the zip of the files and use it directly in the functions as follows

**Note 1:** *The package in its current form handles ODIs, T20s and IPL T20 matches*

**Note 2:** *The link to the converted data frames have been provided above. The dataframes are around 600 rows x 25 columns. In this post I have created 10 functions that analyze team performances in a match. However you are free to slice and dice the dataframe in any way you like. If you do come up with interesting analyses, please do attribute the source of the data to Cricsheet, and my package yorkr and my blog. I would appreciate it if you could send me a note.*

.

## 6. Load the match data as dataframes

As mentioned above in this post I will use the functions from Class 1. For this post I will be using the match data from 5 random matches between 10 different opposing teams/countries. For this I will directly use the converted RData files rather than getting the data through the `getMatchDetails()`

With the RData we can load the data in 2 ways

### A. With `getMatchDetails()`

1. With `getMatchDetails()` using the 2 teams and the date on which the match occurred

```
aus_ind <- getMatchDetails("Australia", "India", "2012-02-12", dir="./data")
```

or

### B. Directly load RData into your code.

The match details will be loaded into a dataframe called '**overs**' which you can assign to a suitable name as below

The randomly selected matches are

- Australia vs. India – 2012-02-12, Adelaide
- England vs. New Zealand – 2007-01-30, Perth
- Pakistan vs. South Africa – 2013-07-08, UAE
- Sri Lanka vs. West Indies -2011-02-06, Colombo(SSC)
- Bangladesh vs. Zimbabwe -2009-10-27, Dhaka

### Directly load RData from file

```
load("./data/Australia-India-2012-02-12.RData")
aus_ind <- overs
load("./data/England-New Zealand-2007-01-30.RData")
eng_nz <- overs
load("./data/Pakistan-South Africa-2013-11-08.RData")
pak_sa <- overs
load("./data/Sri Lanka-West Indies-2011-02-06.RData")
sl_wi <- overs
load("./data/Bangladesh-Zimbabwe-2009-10-27.RData")
ban_zim <- overs
```

## 7. Team batting scorecard

Compute and display the batting scorecard of the teams in the match. The top batsmen in are G

Gambhir(Ind), PJ Forrest(Aus), Q De Kock(SA) and KC Sangakkara(SL)

```
teamBattingScorecardMatch(aus_ind, 'India')
```

```
## Total= 258
## Source: local data frame [8 x 5]
##
##      batsman balls Played fours sixes runs
##      (fctr)      (int) (dbl) (dbl) (dbl)

```

## 8. Plot the team batting partnerships

The functions below plot the team batting partnerships in the match **Note:** Many of the plots include an additional parameters `plot` which is either `TRUE` or `FALSE`. The default value is `plot=TRUE`. When `plot=TRUE` the plot will be displayed. When `plot=FALSE` the data frame will be returned to the user. The user can use this to create an interactive chary using one of the packages like `rcharts`, `ggvis`, `googleVis` or `plotly`.

```
teamBatsmenPartnershipMatch(pak_sa, "Pakistan", "South Africa")
```

Beaten by sheer pace!

```
teamBatsmenPartnershipMatch(eng_nz, "New Zealand", "England", plot=TRUE)
```

```
teamBatsmenPartnershipMatch(ban_zim, "Bangladesh", "Zimbabwe", plot=FALSE)
```

```
##          batsman      nonStriker runs

```

## 14. Bowler Vs Batsmen

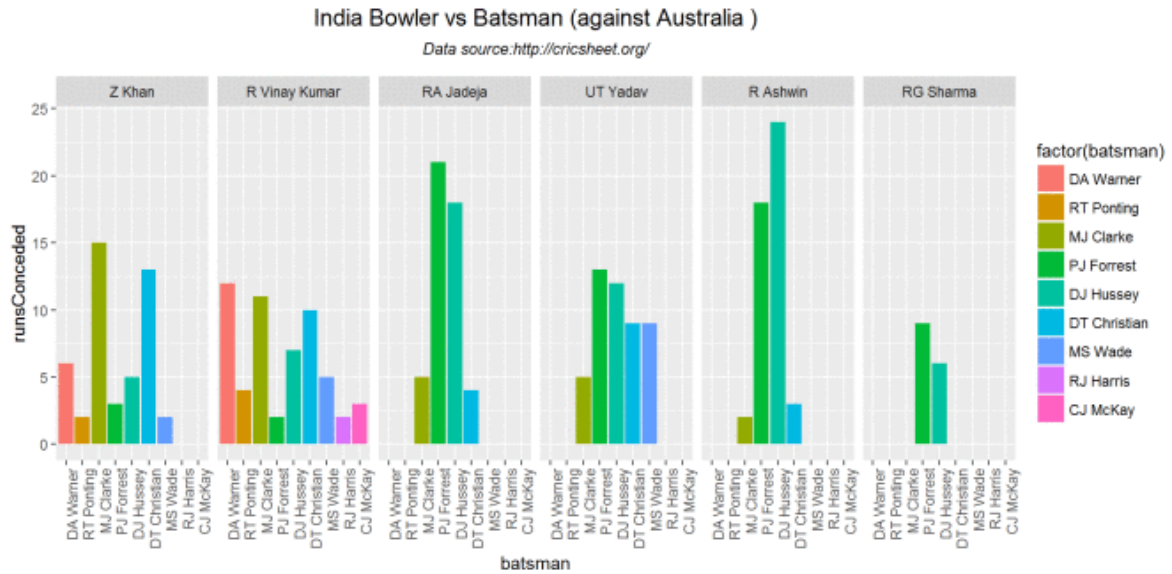

The functions compute and display how the different bowlers of the country performed against the batting opposition.

```
teamBowlerVsBatsmenMatch(ban_zim, "Bangladesh", "Zimbabwe")
```

```
teamBowlerVsBatsmenMatch(aus_ind, "India", "Australia")
```

Beaten by sheer pace!

```
teamBowlersVsBatsmenMatch(eng_nz, "England", "New Zealand")
```

```
m <- teamBowlersVsBatsmenMatch(pak_sa, "Pakistan", plot=FALSE)
```

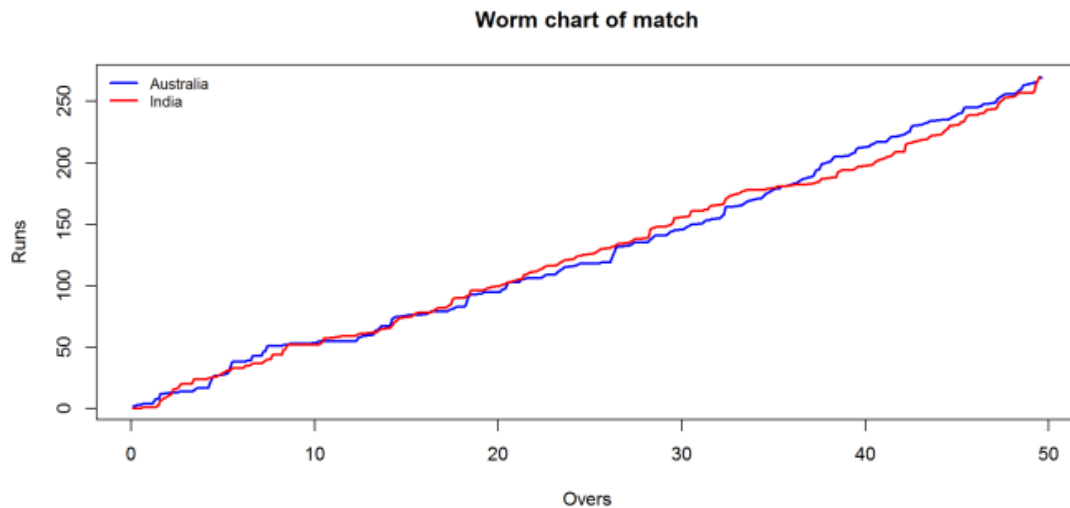

```
m

## 15. Match worm graph

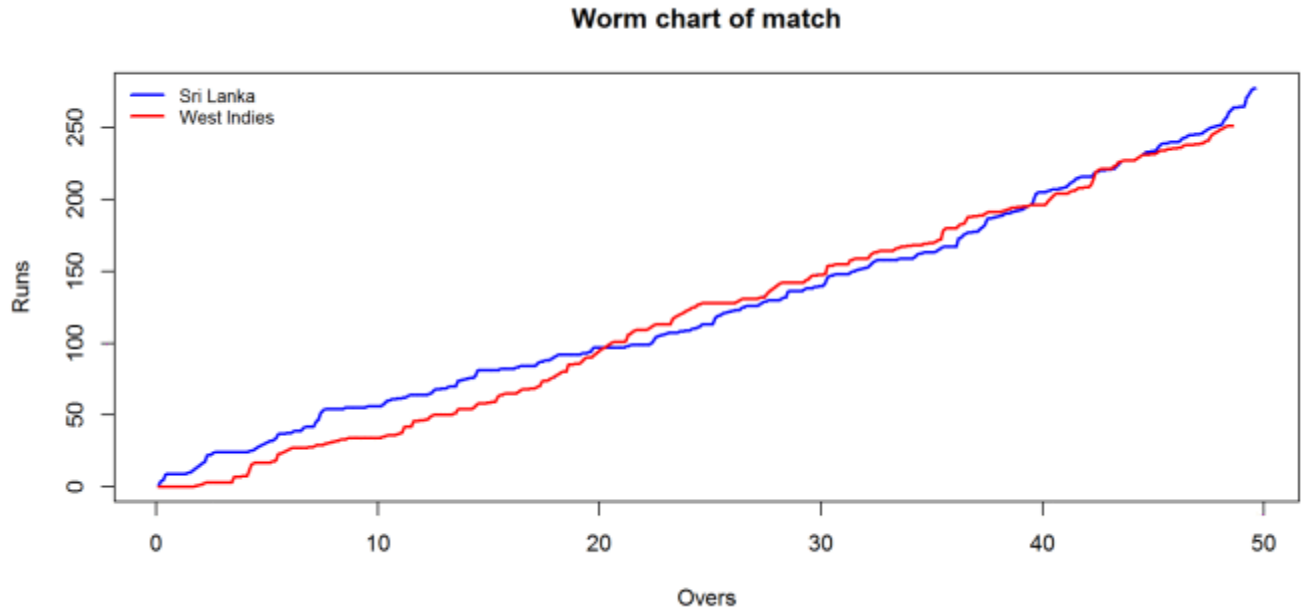

The plots below provide the match worm graph for the matches

```
matchWormGraph(aus_ind, 'Australia', "India")
```

```
matchWormGraph(sl_wi, 'Sri Lanka', "West Indies")
```

Beaten by sheer pace!

## Conclusion

This post included all functions between 2 opposing countries from the package yorkr. As mentioned above the yaml match files have been already converted to dataframes and are available for download from Github. Go ahead and give it a try!

## About the author

Tinniam V Ganesh is a pioneer-architect-programmer with 28++ years' experience in software. He is a telecom veteran, cloud Architect and data scientist rolled in one. He is the author of 'cricketr' and 'yorkr' R packages, now available at CRAN.

Tinniam V Ganesh is an International IN patent holder (US6453028, EP11300928, JP3712624, CA2331958, KR2001008597).

He did his B-Tech in Electronics from IIT-BHU, Varanasi and Masters in Computer Science from Illinois Institute of Technology, Chicago. He has completed a 10 module Data Science Specialization from John Hopkins University, Bloomberg School of Public, besides also completing online courses on Machine Learning, Statistical Learning and Cloud Computing. He is currently working in IBM, Bangalore as a Cloud Architect in Cloud CoE. He can be contacted at [tvganesh.85@gmail.com](mailto:tvganesh.85@gmail.com)
