10												
11												
12												

**DIRECTIONS:** Have your student fill in the numbers on this form. Match a number in a column with the number in a row and multiply. Write the answer in the grid box for that column and row. Example, for the last square in the last column (12) and last row (12), the answer would be 144. Once completed, keep this in a sheet protector or notebook to use as a reference when doing multiplication problems. The path of least resistance is that after a while, you student will remember the answers and quit looking because remembering is faster than searching. It's not cheating, it's learning.
