CARES

**Must** be isolated for a *minimum* of 10 days after onset and can be released after afebrile and feeling well (without fever-reducing medication) for at least 24 hours.

Asymptomatic cases must be isolated for 10 days after their specimen collection date.

Note: If a follow-up PCR test is positive, cases do **not** need to re-enter isolation as long as they have completed the minimum 10 day isolation and had symptom resolution for a minimum of 24 hours.

Note: Lingering cough should not prevent a case from being released from isolation.

**HOUSEHOLD CONTACTS**

**Must** be quarantined for 14 days after the case has been afebrile and feeling well (because exposure is considered ongoing within the house).

If a household contact develops compatible symptoms, they become a case. They should begin isolation and consider getting tested.

If the case is asymptomatic, the household contact must quarantine for 14 days after the case’s specimen collection date.

Note: Household contacts may need to remain at home longer than the initial case.

**NON-HOUSEHOLD CONTACTS**

**Must** be quarantined for 14 days from the date of last contact with the case while the case was ill.
