## Informasi obat dexamethasone

Currently, the drug dexamethasone is getting to words after the bbc reported that dexamethasone has been approved as a vital drug for patients with severe Covid-19 infection. Information about the dexamethasone study comes from a report by the head of the research team from the Randomised Assessment Covid-19 Therapy (Recovery) trial for dexamethasone from the University of Oxford UK. The study was not published in a medical journal, but preliminary information on the effectiveness of the drug was published. Looking at the results of this study, which will soon be published through medical journals, dexamethasone has become the first drug that can improve the survival of Covid-19 patients. The study was conducted on 2,104 patients who received dexamethasone 6 mg/day orally or intravenously for 10 days and compared to 4,321 patients who did not receive the supplementary drug dexamethasone. Patients who did not receive dexamethasone had the highest mortality rate in patients requiring a ventilator of up to 41%. While patients who use only oxygen have a mortality rate of only 25%, and patients who do not require breathing intervention have a mortality rate of 13%. In the group of patients who received dexamethasone, there was a decrease in mortality in 1/3 of cases requiring ventilator, only 1/5 in the group of patients who received oxygen. While in the group of patients who do not need respiratory help dexamethasone does not affect the mortality rate. Thus, it is clear from the results of this study that dexamethasone has a therapeutic effect on patients with severe and moderate infections and does not affect the lungs of covid-19 patients. This information is important to the medical community and the public at large. For mild cases, it is not effective in itself, especially if the drug is used to prevent covid-19 infection. Dexamethasone itself is an inexpensive drug and is also available in puskesmas. Dexamethasone belongs to the steroid group. This drug is often called God's medicine, because of its rapid therapeutic effect. For example, when a person itches due to allergies either red or bentol on the skin and the itch will disappear quickly. The drug is also used as an inflammatory drug, particularly for arthritis patients and various swelling due to inflammation. The quick operation of this drug and can be indicated in various diseases, this drug is often called God's Medicine. Even for some cancer groups this steroid is also used to combine with anticano medication like chemotherapy. This steroid type of drug is also used for some blood diseases, asthma, eye allergies, ENT, autoimmune diseases, which because steroids can suppress our system. It seems that this anti-inflammatory efficacy is used from the drug dexamethasone for patients with severe covid-19 infections, which really really really increased inflammatory reactions. As a drug that is often referred to as God's Medicine because of its effectiveness previously, this drug also has side effects that should be of concern to both doctors and patients. Side effects are mainly on long-term use. In short-term use, patients may feel stomach pain, nausea and vomiting, headaches, increased appetite, difficulty sleeping and anxiety. Acne occurs on the skin. Patients who use dexamethasone long term will cause the face to moon (his face swollen like the moon), have an increase in blood sugar, high blood pressure, bone loss (osteoporosis), the immune system becomes lowered so that it is prone to infection. Medicinal interactions can also occur, which can increase side effects in patients who already have a previous history of stomach ulcers. The combination of steroids with non-steroidal anti-inflammatory drugs, such as phenylbutazone, melenamic acid, sodium diclofenac, including the coxib group commonly used for arthritis, can cause serious gastric complications, such as gastric bleeding, until it can cause a leak of the stomach and intestines of the twelve fingers, which can be fatal to patients. The public should be wise in hearing and reading information about the results of studies around this drug dexamethasone, this drug has proven effective to reduce the risk of death in patients covid-19, but this drug has a long record of side effects, so it should be used in accordance with the doctor's instructions. Author Dr. Ari Fahrial Syam, SpPD-KGEH, MMB Loaded with the same name in a column KOMPASIANA.COM Bisnis.com, JAKARTA - Researchers found that the drug Dexamethasone is useful for infection with the corona virus causing Covid-19.Dexamethasone drug is useful for Covid-19 patients who have complications or are in a serious condition. Here are 10 facts about drug information dexamethasone and the difference with other drugs such as hydroxychloroquin cited by timesofindia.com.1. Steroid drugs Read also: Dexamethasone Price Rp1,800 to Rp2,300 per band As corona transmission of the virus continues to grow at an alarming rate across the country, researchers have found an effective treatment for the new coronavirus SARS-Kov-2 in the inexpensive steroid drug, dexamethasone. Steroid drugs are drugs that contain steroid hormones useful to add steroid hormones to the body when needed, and relieve inflammation or inflammation, as well as suppress excessive immune system function. New study yields promising results Read also: Dosage and side effects of dexamethasone for Covid-19 patients Positive events were identified on June 17, 2020, when studies in the United Kingdom that administering low doses of the drug Dexamethasone can help patients suffering from severe Covid-19.3.Deksamethasone Life-saving drugs For the rest of the world Doctors used antiviral drugs such as Hydroxychloroquine, Sepsivac, Avigan and a combination of different treatments to neutralize the corona virus, and increase antibodies in the body, but none of the drugs proved to be most effective, or without side effects. Read also: Dexamethasone, the powerful drug Warung for the treatment of patients Covid-19.4. How does dexamethasone work? There is currently no approved treatment or treatment therapy to combat Covid-19. More than 110 groups are working on the development of the Covid-19 vaccine, which has not been approved for general use. Dexamethasone is a steroid drug that has been given to many covid-19 positive patients in large studies conducted in the UK. The drug is mainly used to treat inflammation in the body. Inflammation is also a worrying symptom of Covid-19, which occurs in mild to severe cases. Why is dexamethasone used for Covid-19 patients? Dexamethasone has been used to treat a number of ailments such as asthma, allergies, rheumatism. Then, the experimental drug was also used to treat nausea caused by chemotherapy in cancer patients. The price of the drug is cheap, and available a lot, so it surpasses other candidates of coronavirus drugs. As part of the clinical trial, 2,104 patients were given dexamethasone and compared to 4,321 patients who did not receive the drug6. British studies have shown steroid drugs have been effective in treating Covid-19.The inexpensive drug, which is part of the British Covid-19 patient recovery trial, has been found to reduce mortality to a third in hospital treatment of patients with acute or severe respiratory complications. It should be noted that steroids do not show promising benefits for those suffering from mild symptoms. Since the introduction of Covid-19 six months ago, searches have been conducted for treatments that can improve survival, especially in severe patients. The initial results of this study are very clear - dexamethasone reduces the risk of death among patients with severe respiratory complications, says Martin Landray, a professor at the University of Oxford7. Reducing mortality, according to his study, the results of randomized dexamethasone trials were published this week. Researchers call it a breakthrough because it saves the lives of Covid-19 patients. The use of dexamethasone reduces 1/3 of the deaths in severe cases of Covid-19, which requires ventilation. For patients who only need oxygen support, mortality is reduced by 1/5. The researchers added that the drug should be immediately used in hospitals and medical care as a standard drug to fight the Covid-19 pandemic, which affected nearly 7.94 million Worldwide. U.S. India is one of the countries most affected by the Covid-19 at the moment. One of the researchers involved in the randomized drug trial, Peter Horby, said: Dexamethasone is the only drug that has so far been shown to reduce mortality - and it significantly reduces. 8. The inexpensive drug New Therapy plans come from the main manufacturer of dexamethasone, Wockhardt. The pharmaceutical company said it had sufficient capacity to increase dexamethasone production. Interestingly, this study of dexamethasone for severe levels of Covid-19 patients is a study that also showed that hydroxychloroquine (HC) may not be a suitable drug for coronavirus. The study also led to the World Health Organization (WHO) temporarily suspending the use of HCK drugs for Covid-19.9 patients. The benefits of using dexamethasoneDexametazone are also considered cheap and easy to obtain, compared to some other experimental drugs used to treat Covid-19 patients. Hydroxychloroquine is also controversial because it can cause heart complications in some cases. What's the next drug? In addition to dexamethasone, a number of drugs are also used to treat Covid-19 patients. Other drugs such as the antiviral drug Favipilavir must be exported from Japan, which is the main manufacturer of the drug. Remdesivir is also one of the drugs used to treat Covid-19 patients. Plasma therapy also shows promising results. Despite this, China and Russia are conducting clinical trials of the drug covid-19, which is at an advanced stage of the study. Bisnis Indonesia, together with 3 media outlets, is raising funds to assist medical personnel and citizens affected by coronavirus, which is spread through the Lumbung Pangan Indonesia Foundation (BNI Account: 200-5202-055).
