Did you know that students’ perceptions of intelligence can have a profound influence on school performance? As students discover that intelligence is malleable, not fixed, they begin to view difficult challenges as opportunities to get smarter. With this mindset they become more resilient lifelong learners.

Join me and discover how to:

**Inspire students** to embrace academic challenges, and understand their potential for intellectual growth.

**Motivate teachers** to create an enriched academic environment, and help them visualize the impact of that enriched environment on learning and brain structure.

**Deliver a message of hope**: “If you embrace challenges, give your best effort, and **practice** – you will grow in intelligence. We all have the potential to grow a better brain”.
