**Notes**

- Stresses in excess of the absolute maximum ratings can cause permanent damage to the device. Functional operation of the device is not implied at these or any other conditions in excess of those given in the operational sections of this document. Exposure to absolute maximum ratings for extended periods of the time can adversely affect reliability.

**Notes**

- Minimum and maximum values are testing requirements. Typical values are characteristics of the device and are the result of engineering evaluation. Typical values are for information only and are not part of the testing requirements.

<sup>(1)</sup> Test voltage must be applied within  $dV/dt$  ratings.

<sup>(2)</sup>  $I_{FT}$  is defined as a minimum trigger current.

Test condition:  
 $dV/dt_{cr}$   
 $V_S = 2/3 V_{DRM}$   
 (sine wave)  
 $R_L = 33\text{ k}\Omega$   
 $dV/dt_{crq}$   
 $V_{eff.} = 30\text{ V}$   
 (sine wave)  
 $R_L = 2\text{ k}\Omega$

Fig. 1 - Test Circuit for  $dV/dt_{cr}$  and  $dV/dt_{crq}$

$dV/dt_{cr}$  Highest value of the "rate of rise of off-state voltage" which does not cause any switching from the off state to the on state  
 $dV/dt_{crq}$  Highest value of the "rate of rise of communicating voltage" which does not switch on the device again, after the voltage has decreased to zero and the trigger current is switched from  $I_{FT}$  to zero
