Fast, Low-Voltage, 4』,
MAX4634 4-Channel CMOS Analog Multiplexer

## General Description

The MAX4634 fast, low-voltage, 4-channel CMOS analog multiplexer features $4 \Omega$ (max) on-resistance (RON). It offers RON matching between switches to $0.3 \Omega$ (max) and RON flatness of $1 \Omega$ (max) over the specified signal range. Each switch can handle V+ to GND analog signals. Off-leakage current is only 0.1 nA (max) at $+25^{\circ} \mathrm{C}$. The MAX4634 features fast turn-on (ton) and turn-off (toff) times of 18 ns and 11 ns , respectively. All this comes in the tiny $10-\mathrm{pin} \mu M A X^{\circledR}$ and $10-\mathrm{pin}, 3 \mathrm{~mm} \times 3 \mathrm{~mm}$, TDFN packages.

This low-voltage multiplexer operates from $\mathrm{a}+1.8 \mathrm{~V}$ to +5.5 V single supply. All digital inputs have +0.8 V and +2.4 V logic thresholds, ensuring TTL/CMOS-logic compatibility with +5 V operation.

## Applications

- Battery-Operated Equipment
- Audio and Video Signal Routing
- Low-Voltage Data-Acquisition Systems
- Sample-and-Hold Circuits
- Communications Circuits
$\mu M A X$ is a registered trademark of Maxim Integrated Products, Inc.

## Features

- Guaranteed RON
- $2.35 \Omega$ (typ) with 5 V Supply
- $4.5 \Omega$ (typ) with 3 V Supply
- $0.3 \Omega$ (max) Guaranteed RON Match Between Channels
- $1 \Omega$ (max) Guaranteed RON Flatness Over Signal Range
- $0.1 \mathrm{nA}\left(\mathrm{at}+25^{\circ} \mathrm{C}\right)$ Guaranteed Low Leakage Currents
- +1.8 V to +5.5 V Single-Supply Operation
- +1.8 V Operation
- $\mathrm{R}_{\mathrm{ON}}=30 \Omega$ (typ) Overtemperature
- toN $=30 \mathrm{~ns}$ (typ), toFF $=13 \mathrm{~ns}$ (typ)
- $\mathrm{V}+$ to GND Signal Handling
- TTL/CMOS-Logic Compatible
- -78dB Crosstalk (at 1 MHz )
- -80dB Off-Isolation (at 1MHz)
- 0.018\% Total Harmonic Distortion

## Absolute Maximum Ratings

Note 1: Signals on NO_, COM, EN, or A_ exceeding V+ or GND are clamped by internal diodes. Limit forward diode current to maximum current rating.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Note 2: The algebraic convention, where the most negative value is a minimum and the most positive value a maximum, is used in this data sheet.
Note 3: TDFN parts are tested at $+25^{\circ} \mathrm{C}$ and guaranteed by design and correlation over the entire temperature range.
Note 4: $\Delta R_{\mathrm{ON}}=\mathrm{R}_{\mathrm{ON}(M A X)}-\mathrm{R}_{\mathrm{ON}(\mathrm{MIN})}$.
Note 5: $R_{\mathrm{ON}}$ and $\Delta \mathrm{R}_{\mathrm{ON}}$ matching specifications for TDFN-packaged parts are guaranteed by design.
Note 6: Flatness is defined as the difference between the maximum and minimum value of on-resistance as measured over the specified analog signal ranges.
Note 7: Guaranteed by design.
Note 8: Off-isolation $=20 \log _{10}\left(\mathrm{~V}_{\mathrm{COM}} / \mathrm{V}_{\mathrm{NO}}\right)$, where $\mathrm{V}_{\mathrm{COM}}=$ output and $\mathrm{V}_{\mathrm{NO}}=$ input to off switch.

## Detailed Description

The MAX4634 is a low-on-resistance, low-voltage analog multiplexer that operates from a +1.8 V to +5.5 V single supply. CMOS switch construction allows processing of analog signals that are within the supply voltage range (GND to $\mathrm{V}+$ ).
To disable all switch channels, drive EN low. All four inputs and COM become high impedance during this state. If the disable feature is not needed, connect EN to $\mathrm{V}+$.

Figure 1. Overvoltage Protection Using External Blocking Diodes

## Applications Information

## Power-Supply Sequencing and Overvoltage Protection

Proper power-supply sequencing is recommended for all CMOS devices. Always apply $\mathrm{V}+$ before applying analog signals or logic inputs, especially if the analog or logic signals are not current limited. If this sequencing is not possible, and if the analog or logic inputs are not current limited to $<20 \mathrm{~mA}$, add a small-signal diode (D1) as shown in Figure 1. If the analog signal can dip below GND, add D2. Adding protection diodes reduces the analog signal range to a diode drop (about 0.7 V ) below $\mathrm{V}+$ for D 1 or to a diode drop above ground for D2. The addition of diodes does not affect leakage. On-resistance increases by a small amount at low supply voltages. Maximum supply voltage $(\mathrm{V}+$ ) must not exceed 6 V .
Protection diodes D1 and D2 also protect against some overvoltage situations. A fault voltage up to the absolute maximum rating at an analog signal input does not damage the device, even if the supply voltage is below the signal voltage.
